N

N, the fourteenth letter of the English alphabet, is a nasal consonant, and its sound is obtained by placing the tongue against the palate and expelling the breath through the nostrils. Its principal sound is that heard in *nun*, *done*, *moon*; but when followed by *g* or *k*, it takes other sounds as in *singer*, *finger*, *brink*. When final after *m*, it is silent, condemn. In the Nagari alphabet there are four symbols for *n*, the sounds of all of which occur in the English, although not represented in it by separate letters, chiefly caused by the preceding or following letter. There is an *n* in the Tamil tongue with a dental nasal sound, and in Hindustani, Guzerathi and Mahrati, there is a nasal, usually a final, although sometimes a medial, which is scarcely sounded, although it gives a nasal sound to the preceding vowel.

NA also **Sna**, **Trb**. A wild sheep of Ladak. Vigne calls it of the size of an ordinary sheep, of a dull brownish gray colour with curved, smooth, and four sided horns. It is called by de Koros, a large sheep-like-deer. Major Cunningham supposes it the same as the Nahur of Nepal, the *Ovis nahur*.

NAA, a very hard, fine, close-grained, and very ponderous Ceylon wood.

NAAD, a district. See Korambar, Nad.

NAAF, a river of Chittagong.

NAAKUI-MIN, **TAM**. *Pleuronectes solca*.

NAAT or **Nat**, **TAM**. Anything relating to a locality or district. See Nad.

NAAT CARDASI, **TAM**, Country paper.

NABALUS BUNGARUS, see Naia.

NABALUS CURTA, see Naia.

NABAR, **HIND**. *Ribes leptostachyum*.

NABATÆI, the ancient people of Petra in Arabia.

NABAT, **HIND**. Pale brown color, like sugar.

NABHA territory, Cis-Sutlej, has an area of 863 sq. m., a population of 276,000 souls, and a revenue of four lakhs. The chief is of the same stock as the maharajahs of Patiala and Jheend, but is the elder branch of the family. The family behaved ill in the Sikh war of 1845-6 but did well in the revolt of 1857 and were rewarded by a grant of land out of the Jhujjur territory.

NABHA JI, see Bhakta mala.

NABHAT, **PERS**. Candy.

NABHAY, **ODINA** wodier.

NABLOOS or **Naplouse**, as the French write it, is the Arabic attempt to pronounce the

Greek name Neapolis, the "new city," the title given to the old Canaanite town of Shechem when it was restored or rebuilt, probably during Vespasian's reign.

NABON, see Fars.

NABONASSAR. A prince of Babylon, under whose reign astronomical studies were much advanced in Chaldea. The first day of the era which he established was Wednesday the 26th February 747 B. C. He is known to the Arabs and in mahomedan literature as Bukhtoon Nasr. The era of Nabonassar, 1st king of the Chaldeans falls on Wednesday 26th February A. C. 747. Its year was of 365 days, without any intercalary day on the 4th year. The Arabic name is not very dissimilar to that used by the Hebrews, but Bakht-un-nasr is that by which the Arabs, Turks and Persians designate his king of the Assyrians and Babylon. But Oriental historians, and particularly the Persians also style him Raham, also Gudarz. *D'Herbelot*, tome 3, p. 1; *Mignan's Travels*, p. 254. See Sennacherib; Nineveh.

NABOPOLASSAR, the father of Nebuchadnezzar, became the Assyrian satrap of Babylon, in the 123rd year of Nabonassar. Sardanapalus, king of Assyria, commanded him to march against the Medes who had revolted, but he allied himself with Cyaxares, and marched with him against Nineveh, and Babylon became independent on the destruction of Nineveh in B.C. 606.—*Bunsen*.

NA-BUG-NYAH, see Kashmir.

NACCINOLE, also Aveline, **IR**. Hazel Nut.

NA'CHAN-GAON, a town in the Huzur tahsil of the Wardha district, lying two miles to the south of the Pulgaon railway station, and about twenty-one miles from Wardha. It is said to be very old, and parts of the wall which formerly surrounded it still exist.

NACHASH, see Serpent.

NACHCHU TEL. *Utricularia fasciculata*, and *U. Stellaris L.*—*R.* i. 143; *Cor.* 180.

NACHEZ, see Hindoo.

NACH'P, **HIND**. A dance, also written Nautch.

NACHNI, **HIND**. A dancing girl.

NACHRAVALI, **TAM**. the Asees, **HIND**. is a form of hindu benediction, only bestowed by women and priests: it is performed by clasping both hands over the person's head, and waving over him a piece of silver or other valuable which is bestowed in charity. The Tamil people similarly wave a fowl or sheep's

head around a sick man. This is a very ancient ceremony, and is called *Nachravali*. Col. Tod frequently had a large salver filled with silver coin waved over his head, which was handed for distribution amongst his attendants. It is most appropriate from the ladies from whom also he had this performed by their proxies, the family priest or female attendants. It is also a mahomedan rite.—*Tod's Rajasthan Vol. i. p. 618*. See Bulain Lena. Sacrifice.

NACHU TEL. *Lemna orbiculata*, also *Blyxa octandra*, *Rich.*—*Vallisneria octandra*, *R.* iii. 752; *Cor.* 165. Also applied generally to small aquatic plants.

NACRE, FR. Mother of Pearl. See Molluscs, Mother o' Pearl.

NACSHATRA, HIND. The Tyajya (wrongly spelt Thyajum and Thyagum); that portion of a Nacshatra, which is deemed unlucky, is called Varjya, and the period of its duration is the Tyajya.—It is called Devi when it occurs at day time, and Ravi when at night. It is therefore an astrological element: but is nevertheless registered every day in the Ephemerides; where the instant of its commencement is registered. Its mean duration is about 4 guddia (1h 36' European time), so that the beginning being known, the end may be supported, with sufficient accuracy for practical purposes, without actual computation.

NAD, CAN. A territorial division.

NADANAR KARU, an agricultural tribe, of Mysore, who pretend to be pure sudras.

NADA UMDALUM, a district midway between Madura and the Pulitaver country.

NADAUN, see Jawaia mukhi.

NADDI, HIND., a river, a streamlet.

NADHYA-DESA, see Inscriptions.

NADI or NARI, BENG. A caste who make ornaments of lak for mahomedan women.

NADIR SHAH, a native of Khorasan. His name was Tamas Kuli Khan. His country had been conquered in 1722 by the Ghilji, he freed his country from the Ghilji, expelled the Turks and Russians from their possessions and at the request of the people resumed the throne which he had bestowed on Thamasp, son of Shah Hussain the Sufi monarch of Persia. In 1738, he commenced the siege of Candahar, but on the emperor of Delhi refusing to restore some fugitives, he crossed the Indus with 65,000 veteran soldiers; the emperor however made his submission and Nadir Shah, in March 1739, entered the palace of Delhi with him. On the following night a false report was raised, that Nadir Shah had been murdered, on which the people of Delhi rose and murdered nearly 1000 of his soldiers. Nadir Shah on learning this, in the morning ordered a general massacre of the people. In this, 8,000 were slain, and the city was pillaged for fifty-eight

days and he returned to his country with immense plunder. Nadir Shah's plunder destroyed the Mogul empire. The Mahrattas, the nabob of the Carnatic, the Asaf Jahi family of Hyderabad, the subadars of Bengal and Oudh, and the Jat of Bhurtpore, all declared for independence and set the imperial power at defiance. In the fifty-eight days that he remained, Nadir demolished, burnt, and ransacked all Delhi, and undid the doings of several hundred years. The amount of booty that he is said to have carried off is, by the highest computation, seventy crore, and by the lowest thirty-two. Among it was the throne representing the tail of a peacock displayed, composed of precious stones, which still adorns the audience chamber in the palace at Teheran. Nadir Shah's route into India was the ordinary one, by Attock and Lahore, and he returned, as appears by Abdul Karim and M. Otter, by nearly the same route; save that instead of crossing the Indus at Attock, he went higher up, and passed the borders of Sewad, in his way to Jalalabad and Kabul. Ahmed, styled khan or shah, king of the Abdalla accompanied Nadir Shah to India in 1739. In 1747, Ahmed with an army of 15,000 men overran the Panjab, but at Sirhind he was met and defeated by Ahmed Shah, the son of the emperor of Delhi Mahomed Shah, and he returned to Afghanistan. In 1741, he returned to India, and Lahore and Multan were ceded to him. He, a third time, invaded India, took and plundered Delhi, but left for his native country, pestilence occurring amongst his troops. He had displaced Ghazi-ud-din from the post of vizier of the emperor, and on his withdrawal, Ghazi-ud-din obtained the aid of the Mahrattas, who advanced on and captured Delhi, re-instated Ghazi-ud-din; Raghoba, the commander of the Mahrattas, then marched on Lahore, defeated Timur, son of Ahmed, and wrested Lahore and Multan from the Abdalla. Ghazi-ud-din assassinated the emperor Alamgir in 1759; but in September, Ahmed had again crossed the Indus and invaded India. In 1760, he overtook the Mahratta chiefs and defeated them one after another. Sada Siva Rao, Bhao, who had replaced Raghoba, marched to meet Ahmed. His army was composed of Mahrattas, Rajput cavalry and the Jaundar Surj Mull, the whole numbering about 270,000. Surj Mull advised Sada Siva Rao, Bhao, to harass Ahmed. This advice was not followed, and the Jat and Rajpoot armies consequently withdrew. The Bhao occupied Delhi, and came in contact at Paniput, with Ahmed's army of 38,000 foot, 49,000 cavalry, besides the Rohilla and Oudh auxiliaries. Several indecisive encounters ensued, but, on the 7th January 1761, an obstinate battle was fought. The result continued doubtful until the Bhao fled from the field, leaving his

troops in disorder, and Ahmed's victory was complete and about 200,000 of the Mahratta army fell. Wiswas Rao, the son of the Peshwa was slain and after the battle, Junkaji Sindhia and Ibrahim Khan Gardi were put to death. This completely broke the Mahratta imperial power. When Nadir Shah proceeded to establish his authority in Sindh, he found the ancestor of the Bahawulpoor family, a man of reputation in his native districts of Shikarpoor. The Shah made him the deputy of the upper third of the province; but, becoming suspicious of the whole clan, he resolved on removing it to Ghuznee. The tribe then migrated up the Sutlej, and seized lands by force. The Daoodpotra are so called from Daood (David) the first of the family who acquired a name. They fabulously trace their origin to the kaliph Abbas; but they may be regarded as Sindhian Baluchi, or as Baluch changed by a long residence in Sindh. In establishing themselves on the Sutlej, they reduced the remains of the ancient Lungga and Johyya to further insignificance; but they introduced the Sindhian system of canals of irrigation, and both banks of the river below Pakpoot-hun bear witness to their original industry and love of agriculture. One of Nadir Shah's features of policy was the colonization of the countries he conquered, and in pursuance thereof he encouraged settlement in Afghanistan by the various tribes of the vast Persian empire. At the time of his death numbers, under such intention, had reached Meshed, and were subsequently invited to come by Ahmed Shah, Durani; a large Persian force escorting treasure from India at that critical period, were also induced to enter the employ of the new Affghan sovereign, and renounce their native country. Hence, at Kabul, at this day, are found, Juanshir, Kurd, Rika, Afshar, Baktiari, Shah Sewan, Talish, Baiyat, in short, representatives of every Persian tribe. Under Ahmed Shah, and his successors, they formed the principal portion of the ghulam, khana, or household troops.

Nadir Shah entered Delhi on the 9th March 1739, and in returning from India, retained all the west of the Indus at Attock. He was assassinated in his tent at Meshid in Khorassan, by three of his officers, on 8th June A.D. 1747. The fate of the Nadir has been thus recorded, doubtless by some moollah,

Nadir biduzakh raft.

"Nadir is gone to the abysses of hell."

These letters give 1161, the year of the Hijra which corresponds with A.D. 1747, in which Nadir was put to death. The Roman system of using letters to indicate figures, is followed by all mahomedans; the death of the worthy Kureem Khan, Send, is commemorated in the sentence;

Ei va's Kureem Khan moord.

"Woe and alas! Kureem Khan is dead."

The numeral values of the letters composing these few words, being added up, give 1193, the year of the Hijra, corresponding with A.D. 1779, in which this good king died. Ouseley mentions that one of the attendants who at a levee presented to him pipes and coffee, was a grandson or great grandson of the mighty Nadir Shah.—*Tr. of a Hind.*, Vol. ii. p. 320; *Rennells Memoir*, p. 112; *Cunningham's History of the Sikhs*, p. 121; *Masson's Journey's*, Vol. ii, p. 297; *Burnes; Ouseley's Travels*, Vol. ii. p. 222. See Affghan, India, Iran, Kaffir, Kandahar, Kazzilbash.

NADOONG-GASS, SINGH. Dalbergia mooniana.—*Thu.*

NADULEE, HIND. A stone engraved with a verse of the koran, and suspended as a charm round the necks of children.—*Herklots*.

NAEK. A Tamil race who have adopted brahminism, they have few lands and are largely employed as farm servants.

NAEK, or Naidu, a term in use by a class of the Tiling sudra, as an honorific distinction.

NAEK, in the British Indian Army a rank equivalent to a corporal.

NAE-MEN, BURM. Eurycles Amboinensis.—*Sal.*

NAET or Nao-ait, a mahomedan race in the peninsula of India.

NA-FARMAN, HIND. Delphinium ajacis.

NA-FARMANI, HIND. A blue colour from the flower of Cheiranthus annuum. Lilac, mauve.

NAFIEL, ARAB. Galbanum officinale. *Don.*

NAFR, PERS. HIND. A servant. In the west of Bengal the Nafr and his offspring are slaves for ever and are transferable and saleable. In Purneya the Nafr is sometimes a domestic slave, sometimes an agricultural slave. In the native cavalry of India the term is applied to a horse-keeper or groom, also, though rarely, to a person who is hired to ride a horse, equivalent to assami.

NAF-TALNA, HIND. Lit. shifting of the navel, a disease.

NAG, HIND., a serpent, See Naga; Takshak.

NAG, HIND. Pyrus communis, pear tree, see Naspati.

NAGA, a powerful Scythic race who appear to have invaded India about six centuries before Christ and occupied it prior to the appearance of the Aryans. In the mythology of India they are described as true snakes. In the Persepolitan inscription, Xerxes calls himself Nagna or Nuka, the Greeksanax, and some writers have surmised that this may be the true meaning of the Naga dynasties of Kashmir and Magadha. The Naga race seem to have ruled in Magadha until dispossessed by the Aryan Pandava; the Mannipur rulers were also of that Scythic race and most of the Mannipur people continued to worship snakes

till the beginning of the 19th century, as is still the custom amongst Aryan and non-Aryan tribes throughout the Peninsula of India. Naga and Takshac are Sanscrit names for a snake or serpent, the emblem of Boodha or Mercury. The Naga race are said to have occupied Ceylon on the northern and western coasts before the Christian era, and to have worshipped snakes. Strabo calls the people of Phrygia and the Hellespont the Ophio or serpent races, and the snake tribe was, till recently, one of the greatest of the tribes of N. American Indians. The Naga race extended their power over the country of Magadha in Bahar, and ruled there for ten generations. The brahmanical body being the chief source of learning, endeavour to deduce all descents from their ancient books, and Arjuna is said to be the ancestor of the Naga, by Ulupi. Colonel Tod is of opinion that the Naga or Takshak were buddhists. He considers the Ay of the Tatars, the Yu of the Chinese, and the Ayu of the Poorans, to indicate the great Indu (Lunar) progenitor of the three races. Boodha (Mercury), the son of Indu (the moon), became the patriarchal and spiritual leader; as Fo in China; Woden and Teutates, of the tribes migrating to Europe. Hence he believes the religion of Budha must have been coeval with the existence of the Naga nations; that it was brought to India Proper by them, and guided them until the schism of Krishna and the Surya worshippers of Bal, in time depressed them: When the Boodha religion was modified into its present mild form, the Naga race were so numerous in Ceylon that it was called Nagadwipo, the island of Snakes, as Rhodes and Cyprus received the ancient designation of Ophiussa, from their being the residence of the Ophites who introduced snake worship into Greece. According to Byrant, Euboea is from Oubaea and means serpent island. The books of the hindoos and the thoughts of the people are not without grand conceptions of a father of all and of a future state. But along with this there have ever been atheistic views, a prevalence of nature worship, worship of creatures, like the snake, and polytheism mixed with that first worship of the All-Good,—a reverence of parents,—a spirit worship, a hero worship and a pure monotheism. Of the religion of the ancient races who dwelt in India, prior to the advent of the Aryans, little or nothing is known. They are alluded to in ancient books, as the Naga, Rakshasa, Dasya, Asura. The whole of the Scythian race are mythically descended from a being half-snake and half-woman who bore three sons to Heracles (Herod. IV., 9, 10), the meaning of which probably is that the ancestral pair were of two races and the offspring, took the snake as their emblem,

similarly to the Numri or Lumri Baluch of the present day, who are foxes and the Cuchhwaha rajputs who are tortoises. The snake nation seem to have made extensive conquests and to have spread into North America. The Abbe Domenech mentions an Indian race in America, who traced their origin from the snakes of Scythia; the serpents who invaded the kingdom of the Lydians just before the downfall of Cræsus, were probably the Scythian Naga (*Herod*) race and people of this race seem to have early entered India and to have been ruling there when the Aryans arrived. The dynasty of Maghada or Behar in the time of the Pandava were of the Naga race and they held sway there, for ten generations. A branch of them, the Nagbunsee chieftains of Ramgurn Sirgooja, have the lunettes of their serpent ancestor engraved on their signets in token of their lineage. Whence the Scythic Naga came, whether they preceded or followed the Vedic Aryans, into India, or whether they came from the N.E. whilst the Aryan race advanced from the N.W. is not known. But they seem to have come in contact in the lands where the Jumna joins the Ganges at a time when the Aryans were divided as to the object of their worship between Indra, Siva, and Vishnu. One of the opening scenes of the Mahabharata describes the destruction of the forest of Khanduva and a great sacrifice of serpents; and though the application of the term Nag or Naga has come to be taken literally, there can be no doubt that the descriptions in the Mahabharata, and as to Krishna's exploits against snakes, relate to the opposing Naga race. In India, the term Nag or Naga, is applied to the cobra serpent, and the race who were so designated, are believed to have paid their devotions to that reptile. There seems no reason to doubt that the Naga rulers of India, were a Scythic or Turanian race, a body of them have preserved their independence, in Munni-pur, up to the present day, and until the beginning of the 18th century hinduism had not made any progress amongst them. The Vedic deities, Indra, god of the firmament, Varuna, god of the waters, Yama, the judge of the dead, Agni, god of fire, Surya, the sun, Soma or Chandra, the moon, Vayu, the god of winds, the Marut, the Aditya, were mere personifications of the powers of nature, which were invoked for aid or their wrath deprecated. The Aryans appear not to have had idols nor temples but they sacrificed often, the elements being clarified butter, curds, wines or spirits, cakes and parched grain, thrown into the fire: also, the roasted ox is named as an offering to Indra, and a horse was occasionally sacrificed to Indra or the sun. These sacrificial rites seem to have been connected with their meals and probably were

libations and first offerings, to the gods. Up to the present day, every morning, when performing early worship, a water libation is poured from the *denkna* or sacrificial spoon, the Aryan brahmin visits his temple and makes offerings to his gods, every hindoo in India every Saturday, offers to the village deity, flowers, coconuts, and at least once a month, the helot races make offering of cakes, and on great occasions, the non-hindoo take rice and flour, saffron, vermilion to the village deities, the Ai, Amma and Amman, and all worship the snake.—*Herod.* IV. 9-10; *Wilson*; *Sonnerat's Voyage*, p. 162.

NAGA, HIND. A class of hindoo mendicants who go naked and carry arms; they are now almost extinct; but they used to form sometimes mercenary bands in the service of hindoo princes. All hindoo sects have followers to whom this designation is applied. The Naga in all essential points, are of the same description as the Viragi or Sanyasi, but in their zeal, they used to leave off every kind of covering and go naked. They are the most worthless and profligate members of the hindoo religion. They always travel with weapons, usually a matchlock, a sword, and shield, and sanguinary conflicts have occurred between the hindoo Naga mendicants of opposite sects. The Saiva Naga are very numerous in many parts of India, they are the particular opponents of the Viragi Naga, and were no doubt the leading actors in the bloody fray at Haridwar, in 1790, which excluded the Vaishnava from the great fair there, until the country came under the sway of the British. On that occasion 18,000 Viragi were left dead on the field. A party of them attacked Colonel Goddard's troops in their march between Dorawal and Herapur, and on a critical occasion 6,000 of them aided Sindhia. The Saiva Sanyasi smear their bodies with ashes, allow their hair, beards and whiskers to grow and wear the projecting braid of hair called the *jata*; like the Viragi Naga, they used to carry arms, and wander about in bodies soliciting alms or levying contributions. The Saiva Naga are generally the refuse of the Dandi and Atit orders, or men who have no inclination for a life of study or business. When weary of the ragrant and violent habits of the Naga, they re-enter one of the better disposed classes, which they had originally quitted. The term Naga is also applied to a class of the Dadu Pant'hi hindoo sect, they carry arms and serve hindoo princes making good soldiers. A sect of the Gosain are likewise termed Naga, because they perform their ablutions (*Sth'nanam*) in a state of nudity. The Gosain profess asceticism, but well informed hindoo believe that almost all of them originally adopt the tenets of the sect, with the object of securing a living with-

out labour, and that few, not more than one in a hundred, live as celebrities, and the personal appearance of these men, sleek, with well covered muscles, supports this view. They wander to very distant places, begging for their math or monastery and have very scanty clothing, only a small strip of cloth between their thighs. Immoralities when detected are punished by fine. The ascetic Gosain can withdraw from the monastery on payment of a fine, can marry and engage in business. Only the brahman, Kshetrya and Vesya are admitted as gosains, the head of the math is styled mahant.

NAGA, a race, or races, occupying the mountains bounding to the south, the valley of Assam, from lat. 25° N., and long. 93° E. to lat. 26° 40', and long. 95° 30'. But Naga is a term applied by Europeans to forty or fifty tribes who occupy the space between the Khas-sya hills on the west, the Singpo on the east, Assam on the north and Manipur on the south. They do not call themselves Naga, but each tribe is split up into numerous clans and each is called after its village. The Naga, Mikir, Kachari, Garo and Kassia are the five races, in whose possession chiefly are the broad highlands of the Assam chain extending from the N.E. near the head of the Kynduayn and Namrup, on one side, along the valley of the Brahmaputra to its southern bend round the western extremity of the chain, and on the other side, south-westerly, along the valley of the Burak and Surmu, these highlands are thus embraced by the valleys of the Brahmaputra and its affluents on all sides but the S. E., where they slope to the Kynduayn. The Naga dialects are:—

Namsang,	Mulung,	Nogaung,	Mozame An-
Muthun,	Tablong,	Khari,	gami.
Joboka,	Tengsa,	Angami,	

On the west, the Naga march and intermix with the Rang-tsa, a branch of the Kachari or Bodo. The term Naga is supposed derived from the Hindi, Nanga, naked, because they use little clothing, and that is manufactured and dyed by their women. They come in contact with the Mikir, Kuki and Cachari; the Naga villages of from 20 to 100 houses are fixed, and they crop and leave fallow their lands. They inter their dead at the threshold of their doors. The Naga race are described as simple, social, and peaceful, unless when blood has to be avenged and then he is treacherous and cruel. Semeo is the name of their god of riches, Rupiaha, a malignant deity, with one eye in the centre of his forehead, and Kangaba, is a blind, malicious deity. The Naga lie north of Manipur and its dependencies. The Angami Naga are a rude pagan tribe on the range of hills in upper Assam, on the eastern frontier of the Mikir and Cachari. They speak one of the Naga dialects. On the southern Assam frontier we

have the numerous Naga and Singpo dialects, the Mikir and Angami, the languages of the Khassia and Jaintia hillmen, the Boro in Cachar, and the Garo in the hills of that name. The Kooki occupy parts of Tipperah and Chittagong, and the Mug race are in Arrakan and Chittagong. The Naga, Dhimali, Hayu, Kuswar, Kiranti, Limbu, Chepang and Bhramu tongues, of which the first is Indo-Chinese, and the rest Himalayan, all belong to the pronounced class of languages. The mountain range which bounds Assam on the south is known by a great diversity of names in different parts of its course, according to the different tribes by whom it is inhabited.

The Khassia hills rise abruptly on the south from the plains of Silhet to the height of about 4,000 feet, and thence more gradually to 6,000 feet. The culminating point is Chillong hill, the elevation of which is about 6,600 feet.

To the westward of the Khassia hills lie the Garo hills which are lower, the maximum elevation being probably nowhere more than three or four thousand feet. To the east, beyond Jyntea or Jaintia, which is similar in general character to Khassia, there appears to be a considerable depression in the range, a large river with an open valley penetrating far to the north. To the east of Cachar, again, there are lofty hills, inhabited by Naga tribes, but quite unexplored, except in one place, where they were crossed by Griffith in travelling from upper Assam to the Hukum valley, on a tributary of the Irawadi. The country occupied by the Angami Naga, south of Now-gong, is bounded on the north by the Dhunseeree river, on the south by a high range of mountains, forming the boundary between the Muneepoor territory and Now-gong, Poplongmaee being the most southern Angami Naga village within the district. The western boundary extends as far as Hseng Hajoo. The limit of the eastern boundary is still undefined and unexplored; but the Deeyong river on the north-east separates the Lotah Naga in the Sebsagur district from the Angami Naga. From a tubular statement it appears, that thirty-two villages contained 6,899 houses which, at four persons to each house, would give a population of 2,756 persons. The Rengma Naga are evidently descended from the Angami Naga; it is said that, in consequence of oppression and feuds in their own tribe, they emigrated to the high hills occupied by the Tokophen Naga; but further dissensions and attacks from the Lotah and Angami Naga compelled them to take refuge on their present low hills in the vicinity of the Mikir; the Rengma Naga appear degenerating. In physiognomy they differ but little from the Cachar tribes, and many have married Ca-

chari and Assamése wives. The villages are small, and they have but few domestic animals. Like other hill tribes, they acknowledge the power of a plurality of gods; and sacrifices of cows, pigs and fowls are offered on all occasions. The Rengma Naga, like the Angami Naga, inter their dead, and place the spear and shield of the deceased in the grave; a few sticks with some eggs and grains are laid upon it, and the funeral ceremonies conclude with lamentations and feasting.

In the Report of the British Association for 1845, Dr. Latham remarks that the distinction between the languages of Thibet and China, as exhibited by Klaproth, must be only provisional: over and above the grammatical analogy there is an absolute glossarial affinity. Of the languages of the trans-gangetic peninsula the same may be asserted. Where languages are monosyllabic slight changes make palpable differences. The vocabularies of Mr. Brown, for more than a score of the Burmese and Siamese tongues, have provided us with data for ethnographical comparisons. By dealing with these collectively, we find in one dialect words which had been lost in others. The Chinese, Thibetan, Bhootan, Burmese, Siamese and all the so-called monosyllabic languages hitherto known, are allied to each other. The general affinities of the Indo-Chinese tongues are remarkable. With Marsden's and Sir Stamford Raffles' tables on the one side, and those of Brown and Klaproth on the other, it can be shown that a vast number of Malay roots are monosyllabic. The Malay languages are monosyllabic ones, with the superaddition of inflections evolved out of composition, and euphonic processes highly developed. Dr. Latham is of opinion that the nations on the borders of British India, in the north-west, the north-east and east, form an ethnological group which contains the Tibetans, the Nepal tribes, several populations of the Sub-Himalayan range, the Burmese, the Siamese, the Natives of Pegu, the Cambodians, the Cochin Chinese and the Chinese, in populations which cover perhaps one-fifth of Asia. Their countries are mostly inland, and mountainous, but contain the watersheds of mighty rivers, the Indus, the Brahmaputra, the Irawadi and the Yellow river. The complexion and features of these peoples is that to which the term Mongolian has been applied. Though wild paganism and mahomedanism exist, the majority are of the buddhist religion, but all speak a language the least developed of all the forms of human speech, being generally monosyllabic and with little power of grammatical inflexions. These people are arranged under four great political powers, the British, the Burmese, the Siamese and Chinese. Ethnologically they are capable of being classed

in three considerable sub-groups. The first of these is the Bhot or Bot, which is used in compound words as Bult in Bultistan, as But in Butan, Bet in Tibet, and in the tribes known as Bhutia and Bootia, and comprises the Little Tibetans, the natives of Ladak, the Tibetans of Tibet Proper and the closely allied tribes of Butan. The Bhot area is bounded on the South by India and Cashmir, on the North by Chinese Tartary, and on the West by Little Bokhara and Kafiristan. Amongst the Bhot populations may be mentioned the mahomedan Bhot of Bultistan or Little Tibet, of Rongdo, Skardo, Parkuta and Khartakshi, of Shigar, Chorbad, &c., the buddhist Bot of Ladak, Hungrung and Kunawar, the Bhot of the Chinese Empire; the Tibetans of Rudok, Garo, Goga, &c., of Lhasa and Tishu Lumbu, the Sifan, the Lhopa of Butan, the Tak, the Bhot of Garwal, Kumaon and Nepal, the Chepang and probably the Rhondur, the Chak and Drok, the Hor and the Kolo. Further east are the Kocch, the Dhimial and Bodo, arranged into the Western Bodo of Sikkim and the Butan frontier, and the Eastern Bodo or Burro of Assam and Cachar,—the Garo, the Kasia, the Mikir. On the south are the hill tribes of Assam, the Aka, Dofla, Abor, Miri and Bor. Abor tribes, the Mishmi, Muttuck, Singpho and Jili, with the Naga in Assam. The color of the Bhot and buddhist populations are of various shades of white, yellow and brown; while that of the pagan races is various hues of black.

The Naga do not consume milk, and cattle are not used for tilling the ground, but are kept chiefly for sacrifices and feasts. They have many pigs and fowls, and eat every kind of flesh. That of the elephant is highly esteemed and a dead elephant is a glorious prize for a whole village. It is also said that they are not averse to tiger's flesh. Their houses, are gable-ended, and about thirty or forty long by twelve or sixteen feet wide. Each house is divided off into one or two rooms; the pigs, fowls, wife, and children, are all huddled together, with the grain in large bamboo baskets five feet high and four in diameter, in the same room. In one corner is seen a trough filled with some kind of fermented liquor made of rice, which was thick and white and most offensive to the sense of smell. In this trough they dip their wooden cups or gourd bottles, and all the morning the Naga lounge about in the sun in their little courtyards, and seated upon a high stone commanding some extensive view, sip this abominable beverage. The Naga of Moxo-mah manufacture a strong thick cloth well adapted for their changeable and cold climate, it is made of the bark of the stalks of the nettle plant, is of a brown colour with black red stripes, or quite plain, and is ge-

nerally used by the Naga as chadder or sheet covering thrown over the body. The climate is not favourable to the growth of cotton, but they procure abundance from Sumokhoo-Ting. In a large building called Rangkee or the Dakachang, all the boys of the village reside, until they are married. The building is about sixty feet long, and twenty high, with gable ends. The inside of the house consists of one large room, in the centre of which a wood fire was burning on the ground, and wooden stools were arranged in rows for the boys to sleep upon. At one end, a small room is partitioned off for the accommodation of an elderly man, who is superintendent of the establishment. The Hilokee (a building of similar dimensions and construction with the Rangkee), is devoted entirely to the use or residence of the girls of the village, who live in it altogether, in the same manner as the boys, until the day of their marriage. The damsels are all decently attired, a large sheet with coloured stripes is worn round the waist, extending to the knees, a blue cloth is folded over the breast under the arms; a profusion of glass bead necklaces adorned their necks with a number of brass ear-rings of all sizes. An old woman superintends the establishment, and the utmost order prevails in both the Rangkee and the Hilokee. The boys and girls take their meals with their parents, work for them during the day, and at night retire to their respective asylums; all the youths see the girls during the day without the smallest restraint, and they select their own wives, and are married by the consent of their parents. Mr. Butler relates that "in the afternoon, the chief came down to our camp with all the unmarried girls of the village. Line having been formed, and the camp assembled, two damsels stepped out in front of the party, and danced with a peculiar kind of hop-step on one leg alternately, different from anything I have ever seen, in excellent time, to a song and clapping of hands by the young men. In stature the Naga women are short and athletic, with flat noses, small sharp eyes, the upper front teeth projecting a little; and the hair cut short whilst single, but when married, the hair is allowed to grow long. They are coarse and plain, which is not to be wondered at, as they perform all manner of drudgery in the field, supply the house with water and fuel, and make whatever clothing is required by the family. The Naga he adds eat dogs, rats, elephants, tigers, rhinoceroses, cows, pigs and fowls; but, strange to say they have no ducks.

The Kooki race, now inhabitants of Northern Cachar, in the Nowgong district, aver that they (the Kooki) emigrated from Tipparah to Northern Cachar, in the reign of Kishen Chunder, about

A. D. 1800, and in the years 1828, 1829, Gobind Chunder, rajah of Cachar, employed them to wage war with Tooleeram Senaputtee. In the year 1846-47, several colonies of new Kooki immigrated from Tipparah, via the bed of the Barah river, and joined their brethren in Northern Cachar. The number of tribes, and the total population of all classes residing in Northern Cachar, is estimated by the following table at 21,345 souls, reckoning five to each house.

Names of Clans.	Number of Houses.	Total of each Clan.
Hozae Cachari.....	234	1,170
Hill Cachari.....	788	3,040
Mikir	364	1,820
Old Kooki.....	667	3,335
New Kooki	1,515	7,575
Naga.....	701	3,505

They live in the most friendly terms with the Kachang Naga and Mikir tribes, and are greatly respected by them for their known martial character. The marauding Angami Naga look on the Kooki with awe or respect and have, in consequence, never dared to attack them. In the Tipparah district there are innumerable tribes or clans of Kooki under the rule of hereditary rajahs or chiefs. In Northern Cachar the principal old clans are four in number, viz.: Khelemah, Ranthoe, Bete, Lamkron, and with the last colony several rajahs or chiefs had arrived, whom all the Kooki seem to respect. They are divided into three clans, with 41 villages and 1,515 houses, as follows:—

Jangsen clan.. ..	28	907
Taddaee „	12	556
Shingshoon	1	52

If a woman leave her husband, and is guilty of adultery, the injured husband, invites the members of the council to visit him at his house, places a jug of liquor before them, and states his complaint. The faithless woman is not taken back by her injured husband, but is permitted to remain with the defendant.

The dress of the Angami Naga consists of a blue or black kilt, prettily ornamented with cowrie shells: and a coarse brown cloth made of the bark of the nettle-plant is loosely thrown over the shoulders. The warrior wears a collar round the neck, reaching to the waist, made of goat's-hair, dyed red, intermixed with long flowing locks of hair of the persons he has killed, and ornamented with cowrie shells. No one is entitled to wear these insignia of honour, unless he has killed many of his enemies, and brought home their heads. Every Angami village has a polity of its own. Their government is decidedly democratic. The crime of murder cannot be expiated; the relations of the murdered person instantly, if possible, spear the murderer, without

reference to the council of elders, unless the delinquent take refuge in another village, when he may escape for years, but he is never safe. Years after the deed has been committed he may be surprised and killed, for revenge is considered a sacred duty never to be neglected or forgotten. Adultery is also an offence that admits of no compromise. If a man's wife is seduced, the injured husband will surely spear the seducer on the first opportunity. The Angami Naga imagine there are many gods, or good and evil spirits, residing in their hills. To one, they offer up sacrifices of cows and mithun; to another, dogs; and to a third, cocks and spirituous liquor. At sixteen years of age a youth puts on ivory armlets, or else wooden, or red-coloured cane collars, round his neck. He suspends the conch shells with a black thread, puts brass earrings into his ears, and wears the black kilt; and if a man has killed another in war, he wears three or four rows of cowries round the kilt, and ties up his hair with a cotton band. If a man has killed another in war, he is entitled to wear one feather of the dhune's bird stuck in his hair, and one feather is added for every man he has killed, and these feathers are also fastened to their shields. They also use coloured plaited cane leggings, wear the war sword, spear, shield, and choonga or tube for carrying panjies. They also attach to the top of the shield two pieces of wood in the shape of buffalo horns, with locks of hair of human beings killed in action hanging from the centre. Before they set out on a war expedition, all assemble together and decide on the village to be attacked, and the chief appointed to command the party consults the usual omens, which proving propitious, a fowl is killed and cooked, and all partake of it. They then provide themselves with spears, shields, and a panjie choonga, and cooking two days food wrap it up in leaves in baskets with some meat, and set out for the village to be attacked, near which they lie in ambush during the night till the break of day, when they rush in upon it with a great noise, and spear the first they meet with, and afterwards cut off the head, hands, and feet, of their enemies, roll them up in a cloth, and return home. They then take the skulls to each house in the village and throw rice and spirits over them, and tell the skulls to call their relatives. The man who has cut off the head keeps it under his bedstead five days: during that time the warriors eat no food prepared by women, and do not cook in their accustomed cooking pot. After the fifth day, however, the heads or skulls are buried, and a great feast is given of pigs and cows, after which they bathe and return to their avocations. They do not go

out singly on inroads, but in bodies. A Naga can never give up his revenge: he must avenge the death of a relative in some way or other, either by stealth or surprise; kill one or two in return, and carry off their heads, panjying the road after their retreat to prevent their being pursued. When a respectable man dies in the village, the inhabitants do not quit it for three days, and keep the body in the house, after which they kill cows and pigs, and give a feast of rice and spirits to the whole community. The body is then conveyed to the burying-ground, where it is interred, and a stone tomb is built over the grave, three or four feet high, and all the men, being dressed in their war habiliments, make a great noise, and jump about, and say, "What spirit has come and killed our friend? Where have you fled to?" They then place on the grave all the articles of dress worn by the deceased, as well as his arms, his sword, spear, shields, panjie tube, wearing apparel, bamboo spirit-cup, spirit-gourd bottle, waistband, shells worn round the neck and arms, red cane armlets, cane bands worn on the legs, and coloured cane leggings and dhunes feathers worn in the head. Such is the custom on the death of men; but if a woman die, her petticoat waistband, cloth tied over the breasts, brass ornaments worn on the arms, and necklaces and spirit-gourd bottle, shuttle for weaving, spinning stick for cotton, cotton thread, dhan grain, pestle and mortar for cleaning rice, are all placed on her grave. The skulls of pigs and cows are likewise stuck upon sticks at one end of the grave in memory of the hospitality exercised by the deceased. A woman may live with a man without being married, and then go to another; but she gives up her progeny, and the children remain with the father. If a Naga divorce his wife for any fault, she does not return to her parents, but resides in a house by herself, and she can marry again. If a man commit adultery his head is cut off. If a chief is caught in the fact, he is killed. When the Angami Naga have nothing to do, they sit about on the tombs in groups, and pass the day in drinking spirits and gossiping, and forming plans for hostile inroads on their neighbours. The Naga sink pits in the jungles six or seven feet deep, and fill them with panjies, that if any animal should fall into the pit it would be killed. The surface of the pit is covered over with branches and leaves of trees, and the new earth taken out. Their mode of taking oaths is singular. When they swear to keep the peace, or to perform any promise, they place the barrel of a gun or a spear between their teeth, signifying by this ceremony that, if they do not act up to their agreement, they are prepared to fall by either of the two weapons. Another simple but equally binding

oath is, for two parties to take hold of the ends of a piece of spear-iron, and to have it cut into two pieces, leaving a bit in the hand of each party; but the most sacred oath, it is said, is for each party to take a fowl, one by the head and the other by the legs, and in this manner to pull it asunder, intimating that treachery or breach of agreement would merit the same treatment. They likewise erect a large stone as a monument on the occasion of taking an oath, and say that, "as long as this stone stands on the earth, no differences shall occur between

" The only weapons used by the Angami Naga are a spear and dao, a short sword or hand-bill. Amongst the Naga it is considered a point of honour to recover the skulls of their friends. It is also totally incompatible with Naga honour to forego taking revenge, and it is incumbent on him to ransom or recover the skull of a relative murdered or captured in war.

NAGA. BENG. *Cyperus pertennis*.

NAGA, also Nag, HIND. The term by which, in the Hindi tongue, the Naja snake is designated. It is the venomous snake known to Europeans as the cobra, also cobra di capello, the term cobra, being the ordinary name by which Europeans in India designate the Naja genus of venomous Colubrine snakes of the family Elapidæ. There is only one species, the Naja tripudians, *Merr.*, which has a moderate body with rather short tail. It has a small or moderate eye with a round pupil, a poison fang in front of the maxillary, which is but little moveable or erectile, and only one tooth behind. The anterior ribs are elongate and erectile, and the skin of the neck is dilatible. When the cobra rises in play, or for amusement, it spreads out the skin of the neck, from which it gets the Spanish name of "Cobra di Capello," in English the "Hooded Snake." Its bite is certain death. It is said that the poison can be combatted by injecting potash into the veins, but, owing to the rapidity of the poisons action, this, even if true, is valueless. Notwithstanding this, the natives of Ceylon do not kill the cobra when caught, but enclose it in a mat bag with some boiled rice for food, and place it thus in a flowing stream. In Guzerat the hindooes do not kill this or any other snake. There are two varieties of the Naja tripudians; (a.) The spectacled or Bin-ocellate cobra, has its neck, on the steel brown skin, marked with a white, black edged  or  enclosing at either extremity a black ocellus. It is only seen when the hood is expanded. It is found in

Southern India and in Burmah? It grows to 5½ feet. (b.) The monocellate or one marked cobra, has a plain white ocellus, with black centre, and margin, and grows to 4½ feet in length. It is the cobra of Central India and Burmah. The cobra is worshipped by all the races following hinduism and by nearly all the non-Aryan races in British India, and its form, as an idol, with one, three or nine heads, in stone or brass, may, in India, be everywhere seen. It is generally bending over the idol of the lingam. The cobra sometimes swims out to sea. The Indian genera and species of the family Elapidae are as under:

NAGA-KULI. Battisa-S'iralen is a town in Sattara collectorate in lat. 16° 57', N. long. 74° 15', famous as a place of serpent-worship. Here, at the present day, the snakes called Nagakuli, said to be not very poisonous, are actually caught on the day of the Nagapan-chami, and kept either in earthen pots or covered bamboo baskets. They are fed with milk and edibles, and worshipped in other respects, like the snake images and drawings of snakes. The day after the Naga-panchami, they are taken back to the jungles and set free. There is at this town a curious tradition in connection with the Gorakha-chincha tree (*Adansonia digitata*) or the tamarind of Gorakha. Tradition ascribes this tree to be the result of a miracle performed by a saint called Gorakhanatha or Gorakshanatha.

NAGANTAKA, SANS., from naga, a serpent, and antaka, the end. See Garuda or Guruda, Serpent.

NAGA-PANCHAMI, a festival much attended to by all the hindoo religionists of British India. The Naga serpent deity is worshipped by all hindoos on the Nagapanchami, held on the fifth lunar day of the month Sravan; offerings are then made to snakes, of milk, grain and other articles poured into holes. The crest and signature of the raja of Chota Nagpur is the head and hood of a snake called Nagsant. Nagapanchami is the fifth day of the first or bright half of the lunar month, named S'ravana, which generally corresponds with August and September of the Christian year. S'ravana is a month in which the hindoos generally have some vrata or ceremony, to perform every day, and sometimes more than one festival occurs on one and the same day. The fifth day of the month is considered sacred to the Naga or serpent. On this day, early in the morning, each family brings an earthen representation of a serpent, or paints a family of five, seven, or nine serpents, with rubbed sandalwood or turmeric. If there be a temple of the Naga in the village, every one goes there to perform worship. The serpent goddess is worshipped in the *Euphorbia antiquorum*. The goddess mother of the serpents, and goddess presiding over them is Manasa, the object of love and devotion, and, as the name implies, an allegorical creation. Indeed, tree and serpent worship may be said to have originated partly, if not entirely, in the imagination of the people, and in figures of speech. The chief of the serpents is Ananta, eternity, literally endless, of which the universally acknowledged symbol is a coiled snake. Though represented as the support of Vishnu, while floating on the fathomless sea of chaos before creation (God in eternity), he is, in the Puranas, described as having the form of Vishnu meaning, perhaps, the eternity of Vishnu. The Canara district in the South of India may be said to be sacred to serpent-worship. In the Canarese districts generally, the Nagapanchami festival is celebrated, as in the Dekkan, on the fifth of the bright half of S'ravana. Sonnerat relates (Voyage p. 162) that "the

term of Nagapoutche signifies office of the snake: women are commonly charged with this ceremony. On certain days of the year, he says when they choose to perform it, they go to the banks of those tanks where the arichi, and margosier grow; they carry under these trees a stone figure, representing a lingam, between two snakes: they bathe themselves, and, after ablution, they wash the lingam, and burn before it some pieces of wood particularly assigned for this sacrifice, throw flowers upon it, and ask of it riches, or numerous posterity and a long life to their husbands." A Singhalese does not kill a cobra, but encloses it in a wooden cage. A Naga temple, dedicated to the goddess Naga Tambiran, exists in the island of Nainativoe, S. W. of Jaffna, in which consecrated serpents are reared by the pandarams and daily fed at the expense of the worshippers. Such temples are to be seen in many places in the south of India: there are several in the town of Madras, and one of great extent at Vasarapad a suburban village on its north, where crowds of brahman women come every Sunday morning to worship. The priests are the wild Yenadi. Amongst the Tartar races, who designated their septs after some beast, as the Naga or snake, the lungaha or wolf, the lumri or numri or fox, the sessu or hare, cutchwah or tortoise, &c., the sept revered the creature from which they took their name. Few subjects have more occupied the notice of the learned world than the mysteries of Ophite worship, which are to be traced wherever there existed a remnant of civilization, or indeed of humanity; among the savages of the savannahs of America, and the magi of Fars, with whom it was the type of evil, their Ahrimanes. The Naga, or serpent-genii of the Rajpoots, have a semi-human structure, precisely as Diodorus describes the snake-mother of the Scythæ, in whose country originated this serpent-worship, engrafted on the tenets of Zerdusht, of the Purans, of the priesthood of Egypt, and on the fables of early Greece. Dupuis, Volney, and other expounders of the mystery, have given an astronomical solution to what they deem a varied ramification of an ancient fable, of which that of Greece, "the dragon guarding the fruits of Hesperides," may be considered the most elegant version. Had these learned men seen those ancient sculptures in India, which represent "the fall," they might have changed their opinion. The traditions of the Jains or Budhists, (originating in the land of the Takyac, or Turkisthan) assert the creation of the human species in pairs, called joogal, who, fed of the ever-fructifying calpa vrishta, which possesses all the characters of the Tree of Life, like it bearing

"Ambrosial fruit of vegetable gold;"

which was termed amrita, and rendered then immortal. A drawing brought by Col. Coombs from a sculptured column in a cave temple the south of India, represents the first pair the foot of this ambrosial tree, and a serpent entwined among the heavily laden boughs presenting to them some of the fruit from his mouth. The tempter appears to be at that part of his discourse, when

"his words, replete with guile,
"Into her heart too easy entrance won,
"Fixed on the fruit she gazed."

This is a curious subject to be engraved on an ancient pagan temple; if Jain or Buddhist, the interest would be considerably enhanced. The fifth of Sravan is the Nagpanchami, or day set apart for the propitiation of the chief of the reptile race, the Naga or serpent. On this festival at Oodipoor, as well as throughout India, they strew particular plants about the threshold to prevent the entrance of reptiles.

NAGAPATTANA, a town in the district of Tanjore, with a celebrated temple of Naga-natha: inside the temple near the idol of Naga-natha, there is a white ant hill to which large offerings are made in honor of the serpent-god.

NAGA-PUSING, MALAY. The auras of a species of anisthria? growing at Singapore, which display much irritability when warmth is applied.

NAGA and KHASIA HILLS. The mountain range which bounds Assam on the south is known by a great diversity of names in different parts of its course, according to the different tribes by whom it is inhabited.

The Khasia or Cossyah hills rise abruptly on the south from the plains of Silhet to the height of about 4,000 feet, and thence more gradually to 6,000 feet. The culminating point is Chilling hill, the elevation of which is about 6,600 feet.

To the westward of the Khasia hills lie the Garo hills, which are lower, the maximum elevation being probably no where more than three or four thousand feet. To the east, beyond Jyntea or Jaintia, which is similar in general character to Khasia, there appears to be a considerable depression in the range, a large river with an open valley penetrating far to the north. To the east of Cachar again there are lofty hills, inhabited by Naga tribes, and also quite unexplored, except in one place, where they were crossed by Griffith in travelling from upper Assam to the Hukum valley, on a tributary of the Irawadi. The Burak and Surmu rivers run in valleys of the Assam chain.

The Naga, Mikir, Kachari, Garo, and Khasias, are the five races in whose possession chiefly, are the broad lands of the Assam chain extending from the N. E. near Kynduayn and Namrup on one side, along the valley of the Brahmaputra to its southern bend round the

western extremity of the chain; and, on the other side, south-westerly along the valley of the Burak and Surmu: these highlands are thus embraced by the valleys of the Brahmaputra and its affluents on all sides but the S. E., where they slope to the Kynduayn. The Garo are called by the villagers and upper hill people, Coonch Garo; though they themselves, if asked of what race they are, will answer, "Garo," and not give themselves other tribal appellation though there are many tribes of the Garo. A Garo is a stout, well-shaped man; hardy, and able to do much work; of a surly look; flat cafre-like nose; small eyes, generally blue or brown; forehead wrinkled, and over-hanging eye-brow; with large mouth, thick lips, and face round and short: their colour is of a light or deep brown. The women are short and squat, with masculine expression of face; in the features they differ little from the men. The dress of these people corresponds with their persons. They eat all manner of food, even dogs, frogs, snakes, and the blood of all animals. The last is baked over a slow fire, in hollow green bamboos, till it becomes of a nasty dirty green colour. They are fond of drinking to an excess. Liquor is put into the mouths of infants almost as soon as they are able to swallow. Their religion is a mixed hinduism and shamanism, they worship Mahadeva; and at Baunjaur, a pass in the hills, they worship the sun and moon. To ascertain which of the two they are to worship upon any particular occasion, their priest takes a cup of water, and some wheat: first calling the name of the sun, he drops a grain into the water; if it sink, they are then to worship the sun; and should it not sink, they then would drop another grain in the name of the moon, and so on till one of the grains sink. All religious ceremonies are preceded by a sacrifice to their god, of a bull, goat, hog, cock, or dog. Except milk they use everything. They live in houses raised from the ground on piles. The youngest daughter inherits. The woman marries the brother of her deceased husband; if he die, the next: if all, the father. The dead are kept four days, then burnt amidst feasting and drinking and the ashes buried on the spot. A small dish of bell metal with embossed figures, called a Deo-Kora is hung up as a household god and worshipped and sacrificed to: and the Garo believe that when the household are asleep, the Deo or figure of the Kora issues in search of food and returns to its lair to rest. The Garo are under British control. They are classed as Che-anna (8 Annas) and Das Anna (10 Annas) but they consider themselves one and the same people. They use sharp bambu panji or stakes, four inches long as a means of opposing invasion. In a treaty

in 1848, they consented to abstain from hanging human skulls in their houses. They build their houses on piles. The Marquis of Hastings' description, however, somewhat differs from the above. He says they are divided into many independent communities, or rather clans, acting together from a principal of common origin, but without any ostensible head of their league. With them all property and authority descends wholly in the female line. On the death of the mother, the bulk of the family possessions must be to the favourite daughter (if there be more than one,) who is designated as such, without regard to primogeniture, during the life-time of her parent. The widower has a stipend secured to him at the time of marriage. A moderate portion is given to each of the other sisters. A son receives nothing whatever, it being held among the Garo that a man can always maintain himself by labour. The woman acknowledged as chief in each of the clans is called Muhar. Her husband is termed Muharree. He is her representative in all concerns, but obtains no right in her property. The clan will interfere if they see the possessions of the Muhar in course of dissipation. If a daughter be the issue of the marriage, a son of the issue of the Muhar's father is sought in preference to become her husband; and in default of such a person, the son of the nearest female relation of the Muhar (he being of due age) would stand next for selection. The husbands to the sisters of a Muhar are called Lushkur, and it is a denomination to which a notion of rank is attached.

They have frequently made descents on the plains. A party of them, in May 1860, murdered sixteen natives of the plains in the North of the Mymensingh district, and afterwards mutilated the bodies. They confessed the crime and three were executed in their own villages before their own people. Their accomplices, in number some 20 men, were condemned to transportation for various periods. Their object was not so much plunder, as human heads to offer to their spirit of the mountains. The rajah of Nustung one of the Khassyah states subsequently undertook to aid in repressing these raids. The Garo hills are a confused assemblage from 1,000 to 6,000 feet in height of estimated area, 4,347, square miles. Character of country, wild. The rock formation is supposed to be chiefly of gneiss, or stratified granite. The rajah of Nustung, one of the Cossyah states, is well nigh independent and the most powerful and influential of all the hill chiefs, not alone from his position but from his unusual popularity. He had conferred upon him, about the year 1868, the titles of Rajah Bahadur in consideration of his uniform loyalty to

the British, notwithstanding the strenuous efforts made to enlist him in the revolts of the hill tribes. The Nustung territory forms the South West portion of the Cossyah district, and borders on the Garo country; and its rajah entered into a convention with the British that, should it be at any time requisite to the latter power to move troops in the Garo hills from the eastward, they shall have a free passage through his territory. His turbulent and refractory neighbours are the Jynteah, Cossyah, Garo, Bhootanese, Naga, and Abor. Dr. Buchanan Hamilton says, the under bark of the *Celtis orientalis* tree, like that of the West India *Celtis*, consisting of numerous reticulated fibres, forms a kind of natural cloth, used by the Garo for covering their nakedness. ('*Lin. Trans.*, xvii, p. 209). He also describes it in his report on Assam, as a kind of rug worn by the Garo in the cold weather, and serving them as a blanket by night. Captain Reynolds sent a specimen of it to the Agri-Horticultural Society; the Garo make several such cloths of different colours from various barks. The Garo who come to the plains, generally buy some small ends of cloths from the Bengalees, to attend the hauts (fairs) in, not as clothing to protect them from wind and weather." Mr. Hodgson, writing in the Bengal Asiatic Society's Journal, inclines to the opinion that the aborigines of the Sub-Himalaya, as far east as the Dhansri of Assam belong to the Thibetan stock and east of that river to the Chinese stock—except the Garo and other tribes occupying that portion of the hills between Assam and Sylhet; and that the aborigines of the tarai and forest skirting the entire Sub-Himalaya, inclusive of the greater part of the marginal circuit of the Assam valley, belong, like those last mentioned, to the Tamulian stock of aborigines of the plains of India generally. Mr. Robinson tells us that in the Assam valley and its mountain confines, are three classes of languages. One of Sanscrit origin and the others of two great classes, viz., those connected with the Thibetan and those deriving their origin from the Tai or Shyan stock. Of the Assamese proper, that is the language of the valley, eight-tenths of the language is identical with Bengali, and nearly four-fifths of the words in common use, are derivations from the Sanscrit. The country from time immemorial had been governed by rulers of Shyan origin, and the very small number of Tai words that can be traced to Tai origin is remarkable. The Thibetan and the Tai or Shyan languages, all approximate towards the Chinese colloquial system and more or less possess the characteristics of being originally monosyllabic and all intonated. The Tai or Shyan class are also destitute of inflections. The borders of

the valley are remarkable for the numbers of its populations. Many of them are of that great Bhot family which we find extending from the west of Chinese Tartary eastwards. All the native populations here are more or less akin to the peoples of the Burmese empire, and seem to be remnants of Bhot tribes left behind in the pressure of the larger bodies to the south. Several writers have noticed the tribes in and near the Assam valley. Dr. W. W. Hunter, names those of them in the N. E. of Bengal as the Bodo; Dhimal; Kocch; Garo; Kachari; in the Eastern Frontier of Bengal are the Muni-puri; Mithan Naga; Tablung Naga; Khari Naga; Angami Naga; Namasang Naga; Nowgong Naga; Tengsa Naga; Abor Miri; Sibsagor Miri; Deoria Chutia; Singpho.

Dr. Latham observes that the nations on the borders of British India, in the north-west, the north east and east, form an ethnological group which contains the Tibetans, the Nepal tribes, several populations of the Sub-Himalayan range, the Burmese, the Siamese, the Natives of Pegu, the Cambodians, the Cochinese and the Chinese, in populations which cover perhaps one fifth of Asia. Their countries are mostly inland, and mountainous, but contain the water-sheds of mighty rivers, the Indus, the Brahmaputra, the Irawadi and the Yellow river. The complexion and features of these peoples are those to which the term Mongolian has been applied. Though wild paganism and mahomedanism exist, the majority are of the buddhist religion, but all speak a language the least developed of all the forms of human speech, being monosyllabic and with little power of grammatical inflexions. These people are arranged under four great political powers, the British, the Burmese, the Siamese and Chinese. Ethnologically they are capable of being classed in three considerable sub-groups. The first of these is the Bhot or Bot, a term which is used in compound words as Bult in Bultistan,—But in Butan,—Bet in Tibet, and in the tribes known as Bhutia and Bootia, and comprises the four little Tibetans, the natives of Ladak, the Tibetans of Tibet Proper and the closely allied tribes of Butan. The Bhot area is bounded on the south by India, and Cashmir, on the North by Chinese Tartary and on the West by Little Bokhara and Kafiristan. Amongst the Bhot populations may be mentioned the mahomedan Bhot of Bultistan or Little Tibet, of Rongdo, Skardo, Parkuta, and Khartakshi, of Shigar, Chorbud, &c., the buddhist But of Ladak, Hungrung and Kunawar, the Bhut of the Chinese Empire; the Tibetans of Rudok, Garo, Goga, &c., of Lhasa and Tishu Lumbu, the Sifan, the Lhopa of Butan, the Tak, the Bhot of Garwal, Kumaon and Nepal, the Chepang and probably

the Rhondur, the Chak and Drok, the Hor and the Kolo. Further East are the Kooch, the Dhimal and Bodo, arranged into the Western Bodo of Sikkim and the Butan frontier, and the Eastern Bodo or Borro of Assam and Cachar,—the Garo, the Kasia, the Mikir. On the South are the hill tribes of Assam, the Aka, Dofla, Abor, Miri and Bor Abor tribes, the Mishmi, Muttuck, Singpho and Jili, with the Naga in Assam. The colors of Bhut and Buddhist populations are of various shades of white, yellow and brown; while that of the pagan races is various hues of black. *Latham's Desc. Ethn. Ben. A. Soc. Journal No. cci. March, 1869.*—*Cole Myth. Hind.*, p. 320; *Hasting's Private Journal*, Vol., p.p. 132, 316; *Royle Fdb.*, Pl. 317. *Buchanan, Hamilton, Linn. Tr.*, xvii, p. 209. See Khassya, Mikir, Kuki, Singpho, India, Krishna, Hindoo, Serpent, Sikh.

NAGAR or Bednur, a town in the northern part of Mysore. It belonged to the ancient Chalukya dynasty. It is usually written Bednore but is also called Nagar. The Nagar district, in Mysore, is to the north of Coorg. It consists of table-topped hills, 4,000 to 5,000 feet in mean elevation, the Baba-buden hills are 5,700 feet, and some parts are 6,000 feet. Coffee is largely grown, its climate and vegetation appear to be identical with that of Malabar. For the most part it consists of rounded or table-topped hills, 4-5,000 feet in mean elevation, often cultivated to that height, and rising in some places to upwards of 6,000 feet, the portion called Baba-buden hills being said to be 5,700 feet. As with all other parts of the western chain the climate of the western parts is excessively humid; the rains at the town of Nagar (or Bednor) elevated 4,000 feet on a spur to the westward of the chain are said to last for nine months, during six of which they are so heavy that the inhabitants cannot leave their houses.—*Hooker & Thomson*. See Chalukya.

NAGAR, a river near Surkole in Bauleah district.

NAGAR, HIND., from Nagara, a town, any town as Nagar, Ahmednugger, Vizianagram.

NAGARA, SINGH. A tribe of Guzerati brahmins.

NAGARA, harbour, is an inlet of the sea.

NAGARAHARA or Jalalabad, is the Nanggo-lo-ho-lo of the Chinese. Its capital was at Hidda, the Hi-lo of the Chinese, and it was the Nagara, or Dionysopolis of Ptolemy. From Lamghan, the Chinese pilgrim Hwen-Thsang proceeded for 100 li, or nearly 17 miles, to the south-east, and, after crossing a large river, reached the district of Nagarahara. Both the bearing and distance point to the Nagara of Ptolemy, which was to the south of the Kabul river, and in the immediate vicinity of Jalalabad. The natural boundaries of the district are the

Jagdalak Pass on the west, and the Khybar Pass on the east, with the Kabul river to the north, and the Safed Koh, or snowy mountains, to the south. Within these limits the direct measurements on the map are about 75 by 30 miles, which in actual road distance would be about the same as the numbers stated by Hwen-Thsang. The position of the capital would appear to have been at Begram, about two miles to the west of Jelalabad, and five or six miles to the W. N. W. of Hidda, which every inquirer has identified with the Hi-lo of the Chinese pilgrims. The town of Hilo was only four or five li, or about three-quarters of a mile, in circuit; but it was celebrated for its possession of the skull-bone of Buddha, which was deposited in a stupa, or solid round tower, and was only exhibited to pilgrims on payment of a piece of gold. Hidda is a small village, five miles to the south of Jalalabad; but it is well known for its large collection of buddhist stupas, tumuli, and caves which were explored by Masson. Similarly the skull-necklace of Siva is called simply the asthi-nala, or bone-necklace. Nagarahara was identified by Lassen with the Nagara or Dionysopolis of Ptolemy, which was situated midway between Kabul and the Indus. The second name suggests the probability that it may be the same place as the Nysa of Arrian and Curtius. This name is perhaps also preserved in the Dinus or Dinuz of Abu Rihan, as he places it about midway between Kabul and Parashawar.—*Cunningham's Ancient Geography of India*, p. 44, 46.

NAGA-RAMA-KATTI. *Tril. Calonyction grandiflorum.* It has very large, pure white flowers is a native of the W. Indies but cultivated in India.—*Choisy*.

NAGARATRA, a hindoo sect who appear to belong both to the Vaishnava and Saiva creeds, some following the tenets of the Lingayata.—*Buchanan*, "Journey from Madras through Mysore, Canara and Malabar."

NAGARI, in lat. 13° 18' N.; long. 79° 35' E. in the Karnatic, a small village on the southern foot of the Nagari ghat bangalo is 406 feet above the sea.—*A. Schl.*

NAGARI GHAT, in lat. 13° 21' N., long. 79° 35' in the Karnatik, a pass in the eastern ghats. Top of the ghat is 558 feet.—*Schl., A.*

NAGARI, *Hind.* Relating to a town or city, applied, especially, to the alphabet of the sanscrit language; and its modifications in Hindi, Marathi, &c., sometimes with deva- (divine) prefixed as Devanagari. At the present day, the hindi tongue is written in Deva Nagari character, the Burmese in the Pali, the Tamil, Telugu, Canarese, Mahrati, Malealum, Bengali, Guzerati, Urya and others have each their own separate character.

NAGAR JAMIAN, *Hind.* *Ficus reticulata.*

NAGARJUNA CAVE, one of the Behar caves, in the neighbourhood of Rajagriha: the milkmaids cave and brahman girls cave have inscriptions, in the Lath character; they are about 200 B. C. and are the most ancient caves of India. The Nagarjuni cave and Haft Khaneh or Satghar group are situated in the southern arm of the hill at some little distance from the brahman girl and milkmaid's cave. Another group is the neighbouring Karna Chapara and Lomas Rishi caves. Nagarjuna cave, at Buddha Gaya, has numerous inscriptions in sanskrit; but requiring the aid of a Pali scholar to translate it. The date is Samvat 73 or 74 of the Gopala or Bhupala dynasty of Gaur, corresponding to 1197 A.D. or 1140? The character used in the inscriptions is the Gaur alphabet, the immediate parent of the modern Bengali, and like the Harsha. Amongst religions or divinities or sages mentioned is a salutation to Budda, Mahavira swami. Sahasrapa, the treasurer of the raja, is called a conscientious bodhisatwa. The kings or princes mentioned are Asoka Chandra Deva; his brother, Dasaratha Kumara, and Sri Mat Lakshamana; Seva Deva. This inscription is of considerable importance, as, by its era of 73, it confirms Mr. Colebrooke's correction by a thousand years of Dr. Wilkin's date of the Gaya inscription translated by the latter. It is of great importance, also, as it distinctly shows the buddhist impression in those days of what Nibutti or Nirvana meant, namely—as expressed in the inscription—"the absorption of his (the writer's) soul in the Supreme Being," disposing of the question of buddhist atheism. The inscription shows that the buddhists had still a hold in India in the twelfth century. It was recorded by Sahasrapada, the treasurer of the raja Dasaratha Kumara. The princes are not met with in hindu history. In another, of date the 1st century B. C. the character used in the inscriptions, is No. 2 Lat.—Yajna Varma, Ananta Varma are mentioned. This remarkable inscription, found inscribed in a buddhist cave, records the consecration of the saiva images, Dheetapati and Devi. In the Budda Gaya vaulted cavern, or Nagarjuni, other inscriptions in the Sanskrit are of the date after Allahabad No. 2 and of the ninth or tenth century. The character used in the inscriptions is the Gaya; and differs slightly from the Gujarat alphabet of Mr. Wathen, having many compound letters, and is therefore more modern than it. Yama is mentioned, also son of Ananta Varma. These inscriptions, in the same character as the preceding, only contain praises of the Varma princes, who, Mr. J. Prinsep thinks, were of the Gupta family. They are all in the Buddha cave of Nagarjuna.—*Vol. v. p. 660; xvi. p. 595; See Burabur Caves, Inscriptions.*

NAGARKOTE, see Kathi or Katti.

NAGAR MOTHA, or Nagar mothi, HIND. *Cyperus juncifolius*, also *Cyperus longus*, and *C. rotundus*, &c.

NAGA-RUNGA, also Swadoo Naringa, SANS. Orange.

NAGARU TIGE, TEL. *Tephrosia racemosa*, W. and A. 855.—*Robinia* rac. R. iii 829.

NAGASAKI, a chief sea-port town in Japan. The entrance to Nagasaki harbour is lovely. Porcelain made at Nagasaki is solid and at the same time elegant. It is a government monopoly. To procure a service for twelve persons, the permission of the authorities was required, and then, an ordinarily handsome one would cost at least £10. Exquisitely worked basket cups of the thin porcelain is bound by a fine net-work of cane or young bamboo, so neatly woven that the meshes are imperceptible. There are some grosser specimens of this workmanship, but the well-finished platting is inimitable. The origin of this beautiful texture was, no doubt, a protection to the fingers of tea-drinkers: and many are so well done, that they appear to have been painted on the cup. The French word, biblo, comprehends in its meaning anything, and all things which have no use, but still are curiosities or ornaments, and bought as such.—*Frere Antipodes*, p. 388. See Japan, Kiu-siu.

NAGA SAMPANGI, TEL. ? *Mesua ferrea*.

NAGA SARA, TEL. *Amphidonax karka*.

NAGASSARIAM, *Rumph Amb.*, *Mesua ferrea*, Linn. DC.

NAGELU BALA KURA, TEL. An amarantaceous plant so named by the Konda Doralu, probably a var. of *Digera muricata*.

NAGERKOT, not far from Nagerkote, is Joallamooky, a temple built over the subterraneous fire.—*Pennant's Hindoostan, Vol. i, p. 36.*

NAGERY, a village about 30 miles N. E. of Madras, in the Collectorate of North Arcot. It is built near a hill, the projecting point of which in lat. 13° 25' N. is known to mariners as Nagery nose.

NAGESAR, HIND. *Mesua ferrea*.

NAGESH-ALU, TEL. *Cassia* Buds.

NAGGAN KOT, See India.

NAGHA-MUGHATI, also Valad ambu, TAM. *Calonyction grandiflorum*, Choisy.

NA GHEE, BURM. A timber of Tenasserim, of maximum girth 3 cubits, and maximum length 15 feet. When seasoned it floats in water. It is a tolerably good wood, used for mallets, but not durable enough to be recommended.—*Captain Dance.*

NAGHORI, GUZ. A tribe of mohammadans in Guzerat, usually employed in driving carts and keeping cattle.

NAGILUM PALAM, TAM. Pomegranate.

NAGISHVORO, URIA. Of Ganjam and Gumsur, supposed to be *Mesua ferrea*? Its extreme height is 30 feet, circumference 3 feet, and height from the ground to the intersection of the first branch, 9 feet. A medicine used for diarrhoea, rheumatism &c., is extracted from the flower. The flowers are also worn by the Oriyas and the rajahs stuff their pillows with them. The tree is tolerably common, but no use seems to be made of the wood.—*Captain Macdonald.*

NAGKESAR, HIND., *Mesua ferrea*, Linn. D.C. In hindoo mythology, the five arrows of Kama, the hindoo god of love, are each tipped with the blossom of a flower, which is devoted to

supposed to preside over, a sense: the flowers are of a heating, inflaming quality; and are named, and well described, in the lines of the hymn by Sir William Jones, which paint Vasanta preparing the bow and shafts for his mischievous friend;

"He bends the luscious cane, and twists the string

With bees, how sweet! but, ah! how keen their sting!

He with five flowrets tips their ruthless darts,
Which through five senses pierce enraptur'd hearts:

Strong Chumpā, rich in odorous gold;

Warm Amer, nurs'd in heavenly mould;

Dry Nagkeser, in silver smiling;

Hot Kitticum, our sense beguiling;

And last, to kindle fierce the scorching flame;

Loveshaft, which gods bright Bela name"

The Chumpā, or Champā, more classically called Champaka, is the the *Michelia champaca* of European botanists: it is of two sorts, white and yellow, small, and in its foliage like an expanded rose-bud. Hindoo gardeners make, and expose in the shops, chaplets and long strings of the blossoms, with which the hindu women, on the supposition that its fragrance excites favourable sensations in the votaries of Kama, decorate their hair, and wear round their necks; its potency is, however, so great, that nerves unaccustomed to it can scarcely bear its odour within doors. Another flower commonly called mugri, or mogri, is of the same description, and may, perhaps, be one of these classically named in the hymn. The fragrance of the Chumpā is so very strong that bees refuse to extract honey from it a circumstance that could not escape the keen eye of the hindu poets; and they accordingly feign the Chumpā to be sadly mortified at this neglect. They have, however, afforded it consolation, dedicating it to Krishna, the black deity, as they, contrary to some European poetical naturalists, consider the union of yellow and black peculiarly beautiful. Krishna is mostly seen profusely decorated with garlands of flowers. The Chumpā is farther consoled by the preference it has obtained in bedecking the glossy locks of black haired damsels, as just noticed, also in the following stanza, literally translated from the Sanskrit:—That thou art not honoured by the ill-disposed bee, why, O Champaka! dost thou so heavily lament? The locks of lotus-eyed damsels, resembling the fresh dark clouds adorning the sky; let these embellish thee.—

NAG-PHOOLEE, BENG. *Heliotropium coramandelianum*.

NAG-POOT, HIND. *Bauhinia anguina*.

NAGPORE, or Nagpur is the name of a town and a province in Central India, the Nagpore district now forming part of the Central Provinces. The Nagpur district is bounded on the north-west by a short stretch of the river Wardha, on the north by the districts of Chindwara and Seoni, and on the east by the district of Bhandara. A small portion of the Chanda district adjoins its extreme southern frontier, and throughout its whole length, from north-west to the south-east, it is bounded by the new district of Wardha. The early history of the last Nagpore ruling family is somewhat obscure, but its importance in Indian history may be said to date from Raghojee, who, as a leader of predatory expeditions, had, at the time of his death, in 1755, established the Mahratta supremacy over the country between the Nerbudda and the Godavery, from the Adjuntah hills eastward to the sea. On the death of Madhojee in 1788, the uncontrolled power devolved on Raghojee, who was then twenty-eight years of

age. Raghojee died in 1816, and was succeeded by his only son Pursojee. This prince being incapacitated for government by a complication of diseases, a regency was formed under Madhojee Bhonsla, better known as Appa Sahib, Pursojee's cousin. In 1817 Pursojee died suddenly, having been murdered, as was afterwards discovered, by Appa Sahib. Soon after his accession, Appa Sahib made common cause with the peshwa, who was then inciting all the Mahrattas to unite against the English. After an unsuccessful attempt to regain his hold of Nagpore, he fled to Hindostan in February 1819. He died at Jodhpore in 1840. On the deposition of Appa Sahib, a grandson of Raghojee by his daughter was placed in power on 26th June 1818. In 1826, when the rajah attained his majority and was entrusted with the administration, a Treaty was made with him, by which he ceded for ever territories to pay the cost of the subsidiary force, and assigned lands as a guarantee for the payment of the troops which he was bound to maintain, and which were thenceforth to be under the control of the British government. Raghojee retained the administration of affairs till the day of his death, 11th December 1853. He died without a son, without any heir whatever, and without any adopted child, and it was determined to incorporate with the British territories the Nagpore state, which had, in 1818, been forfeited by the treachery and hostility of Appa Sahib, had been declared to belong to the British Government by right of conquest, had been conferred by free gift on Raghojee, his heirs and successors by the Treaty of 1826, and had now lapsed to the British Government by default of heirs. In 1855, the surviving widows of the late rajah adopted as their son and heir, Janojee Bhonsla, a collateral relation of the rajah in the female line. In consideration of the loyalty of the family during the rebellion of 1857, the title of Rajah Bahadoor of Deor, and the lands of Deor in the district of Sattara, were conferred in perpetuity on Janojee and his heirs, whether by blood or by adoption. The family receive pensions amounting at present to Rupees 2,33,000 a year. The zamindars with whom written engagements were contracted were those of Chutesgurrh, Chanda, and Deogurrh or Chindwara. The Chutesgurrh zamindars, including the rajah of Bustar, with whom a separate Treaty had been concluded, and the rajahs of Kharond and Kakair, were twenty-seven in number, and paid an annual tribute of Rupees 1,28,032. In Chanda there were eighteen petty Gond zamindars, paying altogether a tribute of only Rupees 420. The Gond zamindars of Deogurrh were fourteen in number, who usually paid only a trifling

quit rent. Besides these there were thirty-two zamindars in the Wyn Gunga districts, who paid a total tribute of Rupees 1,41,594, but with whom no written engagements were formed. The Nagpore territory and the Saugor and Nerbudda territory have been formed into a separate administration under a chief Commissioner, to which have been added Sumbulpore and its dependences. The territories under the jurisdiction of the chief Commissioner are now known as the Central Provinces. The principal chiefs in the Central Provinces are the rajahs of Bustar, Kharond, and Mukrai, to all of whom the right of adoption has been conceded. The rajah of Bustar pays an annual tribute of Rupees 4,000. The Kharond chief pays Rupees 4,500. The revenues of Bustar and Kharond are respectively Rupees 25,870, and Rupees 29,878, and the population about 80,000 in each state.

Madhoji's sons were Bapuji, Parsoji, and Sabaji, contemporaries of the great Sivaji, and in his military service. Pursoji only was distinguished; and under Sahu Raja he was entrusted with an extensive military command and the collection of "chaauth" in Berar. He died about the year A.D. 1709 and was succeeded by his son Kanhoji, who fixed his residence at Bham in Berar. Raghoji Bhonsla was the son of Bimbaji, the third son of Bapuji, the brother of Parsoji. Taking advantage of the difficulties in which the Peshwa found himself placed in 1744, Raghoji obtained for himself a sanad conferring on him the right of collecting all revenue and contributions from Lucknow, Patna, and Lower Bengal, including Behar, and vesting him with the sole authority to levy tribute from the whole territory from Berar to Cuttack. Bold and decisive in action, he was the perfect type of a Maratha leader. He saw in the troubles of other states only an opening for his own ambition; he did not wait even for a pretext for plunder and invasion. Though he was unscrupulous in his dealings with his neighbours, yet he was liked and admired by his countrymen, who even now look with pride to Raghoji Bhonsla, the first and greatest of the Nagpur house. With him occurred the great influx of Marathas, which resulted in the spread of the Kunbi and cognate Maratha tribes over the entire district. And in this there was deep policy, as the Bhonslas would be seen holding the Nagpur territory from the Gonds, and not subject to the paramount power at Puna, and thus deriving a position superior to that of other military chiefs of the Maratha empire, who owed their elevation to the Peshwa, and held their fiefs by his favour. Raghoji was succeeded in A.D. 1755, by his eldest son Janoji, though not without opposition from the other brother Mudhoji. After the death

of Janoji, before Mudhoji with his youthful son Raghoji the late king's nephew and heir by adoption, could reach Nagpur, Sabaji, another brother of Janoji, had usurped the government. He was succeeded by his son Parsoji—a man blind, lame, and paralysed. Very soon after his accession the new raja became totally imbecile, and it was necessary to appoint a regent. A few days after his departure the Raja was found dead in his bed—poisoned, by his cousin Appa Sahib.

The Rev. Stephen Hislop of Nagpore, writing on the age of the coal strata in Western Bengal and Central India, observes that perhaps the most interesting part, in a section of the rocks of Central India, is the junction of the thick bedded sandstone above, with the laminated strata below. The latter, however various they may be in different localities as regards their lithologic and sometimes even their paleontologic features, may readily enough be distinguished by their relation to the superior beds, whose identity again is sufficiently attested by the iron bands which run through their mass. This ferruginous sandstone is well developed at the Mahadeva Hills, in the north of the province of Nagpore, in the vicinity of the city itself, and at Kota on the Pranhita, in the dominions of the Nizam. The subjoined sections represent the succession of the strata at these places respectively, as far as they are known :

1. Mahadeva Hills.		2. Near Nagpore City.		3. At Kota.	
Massive sandstone with iron bands.	Carbonaceous and other shales with ferns, vertebraria, phyllothea, &c.	Massive sandstone with iron bands.	Laminated argillaceous sandstone with ferns, vertebraria, phyllothea, &c.	Massive sandstone with iron bands.	Argillaceous limestone.
2000ft.	18ft.	50 to 100ft.	15ft.	50 to 600ft.	4ft. 8ft.
75 feet.		80 feet.		80 feet.	
Sandstone.		Sandstone.		Bituminous shales with argillaceous limestone.	
25ft.		30ft.		11ft.	
Green shale.		Green shale.		Limestone.	
4ft.		30ft.		23ft.	
4ft.		40ft.		25ft.	
				Clays with limestone.	
				27ft.	
				Red shale.	
				Limestone.	

Immediately under the upper sandstone, laminated rocks are seen in all. In section 1st, the shales are bituminous and carbonaceous, while in section 2nd, they are of argillaceous sand. But they are of the same age, many species of fossils being common to both. Section 3rd, instead of having the limestone all collected in the lower part the section, as is the case at Nagpore and in many parts of the Nizam's country, has it interstratified with the shale; but the bituminous strata occupy the same position as in section 1st: choosing section 2nd, as being better known for comparison with it, instead of section 1st, gives us, in descending order sandstone and clay, red shale and limestone. It has been a question whether the fern-bearing coal shales and laminated sandstones of Nagpore are the same as the fish-producing bituminous shales of Kota. The Kota fishes that rewarded the researches of Drs. Walker and Bell were pronounced by Sir P. Egerton to be true Oolitic forms, and probably of the age of the Lias; between Nagpore and Chanda, the upper sandstone has the usual iron bands, and the lower laminated beds the common vegetable remains, there is a district with Mangali as the centre (sixty miles S. of Nagpore) where the superior sandstone is less ferruginous, and the inferior or laminated beds are coloured by iron of a deep brick red. In the latter strata the remains of reptiles, fishes and entomostraca predominate, while the few vegetables that are found, are generally very different from those occurring in other parts of the Nagpore territory. The skull of a Labyrinthodont, named *Brachyops laticeps* by Owen, might suggest for it a Triassic or even Carboniferous age, but the plentifulness of scales of lepidotoid fishes forbids us to assign a more ancient epoch than the Jurassic; and the conclusion is unavoidable, not that our laminated sandstone is older than the age we have attributed to it, but that in India any Labyrinthodont family has come down to a more recent period than in Europe.

The vegetable remains are *Tæniopteris*, *Equisetum laterale*, *Tæniopteris magnifolia*, *Phyllotheas*, *Knorria*, *Lepidodendron*, *Aphyllum*, *Aspidiaria*, *Entomostraca* belonging to the genus *Estheria*.

In the bituminous shales of the Mahadevas we have the following Bengal fossil plants: *Tryzygia speciosa*, *Vertebraria indica*, and a species of *Phyllothea*, a fragment of which is figured by Dr. McClelland as *Poacites minor*. Geol. Surv. Tab. XVI. f. 4. In the carbonaceous shales of Umret, besides the *Phyllothea* now alluded to, another stem, but unfurrowed, which seems to resemble McClelland's *Poacites muricata* Tab. XIV. f. 6. In the laminated sandstone of Kamptec, in addition to *Vertebraria* and the two *Poacites* as above, *Tæniop-*

teris, perhaps of the same species as at Rajmahal, and McClelland's *Pecopteris affinis*, Tab. XII. f. 11. b., which in Nagpore is a well marked species with a tripinnate frond.

In all these localities the genus *Glossopteris* abounds. Nagpore seems to have outstripped North Eastern India in *Cyclopteris* and several other vegetable remains, but is decidedly behind in regard to the *Cycadacæ*. The only specimen procured is a small fragment from the sandstone of Kamptee, the leaflets of which are narrower than a minute blade of grass.

Though amongst the Cutch oolitic strata some are evidently marine, yet from what Mr. Hyslop had seen of those in the Deccan or those in Bengal, none of them in either of these districts exhibit the least evidence of having been deposited in the sea or ocean: all seem to be of fresh-water origin.

In Chanda and Berar, one of the great sources of doubt as to the extent of the coal deposits rose from the fact that the beds in the group of rocks in which the coal here occurs (known to Indian Geologists as the Barakur group) had invariably a tendency to exhibit very great variations both in thickness and quality within short distances. They are often of great thickness locally, but thin out and nearly disappear within short distances: this variation also being not only in the thickness, but also in the quality of the beds, so that what shows as a bed of good coal in one place may, within a few yards or a few hundred yards, pass into a shale without coal or even into a sandstone. Coal was found about fifteen miles north of Dumagudiam, near the junction of the Tal river near Lingala.

Mr. Medlicott is of opinion that the present limits of the coal measure fields in North India coincide approximately with the original limits of deposition and are not the result of faulting, or even mainly of denudation. All these successive beds (possibly with the exception of the Talchir) representing an enormous lapse of time, agree in one respect, that they seem to be purely fresh-water (fluvial or fluviolacustrine) or estuarine deposits. The Ranigunj, the Jherria, the Bokaro, the Ramghur, and the Karunpura fields all belong to the drainage basin of the Damudah river.

Mr. W. T. Blanford reports that the coalbearing (Damoodah) beds of Korba extend for about forty miles to the eastward, as far as Rubkub in Udipur (Oodeypore). They also extend far to the south-east towards Gangpur, and to the northwards towards Sirguja, and in all probability are continuous, or nearly so, with the deposits of the same nature known to occur in these districts. Main Pat and the neighbouring hills, and all the country on the road from Main Pat through Chandargarh and

Jashpur to Ranchi, consist of metamorphic rocks with the exception of a cap of trap and laterite on Main Pat.

Indications of the existence of coal seams were afforded by the occurrence of fragments of coal in the rivers, especially in the Mand, he found a few seams near Chitra, twelve miles west of Rabkub and nearly thirty east of Korba. Two or three are seen in the Mand about three to four miles east-north-east of Chitra, but they are only from a foot to 18 inches in thickness. In a small stream, the Koba Naddi, which runs south of Chitra, one seam about three feet in thickness is seen near the village of Tendumuri, more than a mile south-west of Chitra. It is nearly horizontal, having a very low irregular dip to the west or south-west. Part consists of fair coal, the remainder is shaley.

The only seam examined from which it is possible that a useful supply of fuel might be obtained, is exposed in the same stream rather nearer to Chitra, being about a mile from that village, close to the boundary of the village of Tendumuri, it appears to be of considerable thickness, perhaps 20 feet, and the lower portion appeared to be fair in places. The dip is about 15° to north-north-west. Lieutenant Sale, of the Chota Nagpur Topographical Survey found a seam of coal about four miles north-west of Rabkub in a small stream running into the Mand, and this may be the source of the blocks in the river bed.

Several coal localities have been lately found by the officers of the Topographical Survey and recorded in their maps. They are all north of Korba and Udipur. The rajah of Jashpur told that coal occurred in his territory in the Khurea country, twenty-four miles north-west of Jashpur Nagar, about one hundred miles or rather more west by south of Ranchi.

The Rev. Stephen Hislop makes the following remarks on the age of the fossiliferous, thin-bedded sandstone and coal of the province of Nagpur.

Nagpur Circle.—If with a radius of 14 miles a circle be drawn around the city of Nagpur, it will include within its northern half Kampti, Bokhara, Silewada, Tondakheiri, Babulkheda and Bharatnada; but it will leave out Arajunct, which lies 20 miles west of Nagpur, and Chorkheiri, which is 35 miles to the north-east, while Chanda is situated 85 miles to the south. At all these places the thin-bedded sandstone with vegetable remains is the same, as it presents the same appearance both palæontological and lithological.

Barkoi and Mahadeva Hills.—He ascertained that this thin-bedded sandstone is identical with the coal-shale at Little Barkoi near Umret, and at the base of the Mahadeva Hills, in the N. N. W. part of Nagpur province.

Kota on the Pranhita.—Under a great thickness of coarse iron-banded sandstone, developed in the neighbouring hills we have thin-bedded strata abounding, as at Mangali, in animal remains, including, *Lepidotus decanensis*, *L. longiceps*, *L. breviceps*, and *Æchmodus egertoni*, in addition to those ganoid fishes obtained by the late Drs. Walker and Bell. Mr. Hislop procured from the same locality the *exuviae* of insects and entomostraca. He inferred their contemporaneity, and from the discovery of what appears to be a species of *glossopteris* at Kota, he was led to the conclusion that the rocks there are connected in age with those near Nagpur.

Rajmahal Hills.—The equivalents of the upper Rajmahal beds have been met with by Mr. H. B. Medlicott, on the Hurd river, a little south of the Nerbudda.

According to Dr. Oldham's views the age of the Indian coal-fields between the parallels of 20° and 25° N., is upper carboniferous of a rather later stage than that of the coal measures of Britain, and more closely allied to the "fern-coal" series of Silesia. Some doubts have been expressed as to the correctness of this view, at least of the age of the Silesian coal-fields, which are known to rest on limestones containing large *Producti* and other fossils of the carboniferous limestone. The following is a brief summary of the formation of the Indian Peninsula in ascending order as described by Dr. Oldham:—

1. Laurentain granitoid gneiss—highly metamorphic and traversed by innumerable trap dykes. This is the floor of all the other formations.

2. Quartzose, micaceous, and hornblendic rocks much contorted.

3. Lower Silurian, or Cambrian.—Sub-metamorphic schists and massive conglomerates of local rocks. These rocks occur in the eastern ghauts.

4. Devonian.—The Vindhyan series, principally sandstones, distributed into four groups.

5. Carboniferous—(a.) Mountain limestone of the salt range, classified as such from the fossils collected by Dr. Fleming.—(b.) The Talcheer series, sandstones of a peculiar character and colour, resting on a "boulder bed," or ancient shingle beach.—(c.) The coal-bearing rocks of India forming the coal-fields of Damuda, Nerbudda, &c.

6. Permian? or intermediate.—Beds with reptilian remains, representing in Dr. Oldham's opinion the physical break between the palæozoic and mesozoic periods of Europe. It is indicated here as doubtfully permian.

7. Triassic, upper and lower.—In this latter there are beds of limestone with *ceratites* (*muschelkalk*?)

8. Rhaetic Beds—with characteristic fossils.

9. Liassic Group—divided into an upper and lower series.

10. Jurassic Group—with cycadæ. Divided into upper, middle and lower stages.

11. Cretaceous Series—with fine forms of ammonites and other shells.

12. Eocene.—(a.) Nummulitic limestones.

—(b.) Fresh water deposits of lakes, over and through which sheets of lava have been erupted.

13. Miocene.—Laterite, and other strata of several kinds.

14. Pliocene.—Ossiferous gravels, clays, &c.

15. Recent.—Gravels, clays, and mud of rivers, &c. It is impossible to go over the above great series of beds so truly representative as they are of the European system, and presenting often in minute detail a marked correspondence with the English sub-divisions and formations without being struck with the wonderful uniformity of nature's operations in ancient times over vast portions of the globe. The stratigraphical resemblances are also not less remarkable than the palæontological for the genera and some species of fossils of the triassic, liassic and cretaceous formations are identical with those of Europe.

The great drainage basin of the Godavery includes Nagpur, Bhandara, Wardah, Chanda and Sironcha. These districts have no considerable elevation, Nagpur and Bhandara are principally on gneissose rocks, with much trap in Nagpur. Wardah is almost entirely on trap rocks; Chanda and Sironcha have a very varied structure including more or less of all the formations that have been named. The crystalline and metamorphic rocks consist of gneiss of different varieties, often highly granitoid and form the substratum of the whole area, and are seen all around the border of the trappean rocks.

The Nagpore district has a population 634,121 : Europeans 2,462

The language is a mixture of Hindi and

Marathi. The bulk of the population worship Siva as Mahadeva. The agriculturists are chiefly the Kunbi, Marathi, Pardesi, Teli, Lodhi, Mali, Barai, and Pardhan, of whom the Kunbi is the best and the most numerous.

The Koshti and Dher are weavers.

Bhuhar or Boyar race, are in the north of Chota Nagpur. The Government of India constituted a separate Chief Commissionership from the Nagpore Province and the Saugor and Nerbudda territories, which was designated the Central Provinces, and is administered on a system similar, in most respects, to that which exists the Punjab and in Oudh. The following districts are comprised in the Central Provinces:—

NAGPORE PROVINCES, VIZ.

Nagpore.	Raepore, (Chuttees-
Chanda.	gurrh.)
Bhundara.	Scroneha.
Chindwarra.	With dependencies of
	Bustar and Kuronde.

SAUGOR AND NERBUDDA TERRITORIES, VIZ.

Saugor.	Seonee.
Dumoh.	Baitool.
Jubbulpore.	Nursingpore.
Mundlah.	Hoshungabad.

The principal timbers in the Nagpore Province are as under :

Tectona grandis, Teak, ENG. Sagwan, HIND.
Theaca marum, TAM.
Pterocarpus marsupium, Bejasar or Bejasal, HIND. Bheulah, MAHR. Vengay marum, TAM.
Pentaptera tomentosa Eyne, HIND. Ain or Eyne, MAHR. Marudam marum, TAM.
Diospyros ebenum, Tendoo, HIND. Tainaram or Tendoo, MAHR. Toombie maram, TAM.
Gmelina arborea, Seeyum or Seeven, HIND. MAHR. Coommy marum, TAM.
Bassia latifolia, Mowah, HIND. Moho, MAHR.
Terminalia chebula, Hurra or Hurda, HIND., Kaducal marum, TAM. Pilla murdah marum, TAM.
Acacia odoratissima, Sirsa, HIND. Chechooh or sunkour (?) GOND. Sirris, MAHR. Curry vaugay maram, TAM.
Erythrina indica, Paunjerah, HIND. Moochoo maram, TAM.
Conocarpus latifolia, Thoura, HIND. MAHR., Vellay naga marum, TAM.
Swietenia febrigufa, Rohun, HIND. Rohuni, MAHR.
Dalbergia sisso, Seesum, HIND. Yettee marum, TAM.
Acacia arabica, Babool, HIND. Babool, MAHR.
Curvalia marum, TAM.
Butea Gibsonii (?) Dhamin, HIND. Dhamun, MAHR.
Cedrela toona, Thoon. HIND., MAHR., Thoona marum, TAM.
Pentaptera arjoona, Arjoon or Unjen, HIND. Azan, MAHR.
Dalbergia—(?) *Thevus*, HIND., MAHR.
Kyam, HIND. Kem, MAHR.
Dereah or *Dareah*, HIND. Bhera, MAHR.
Naualea—(?) Bahdah or Behra or Bhada, HIND. Hirda, MAHR.
Dhewas, Dhaves, HIND. MAHR.
Vatica robusta, Saul.
 Nagpur town is large and straggling, about

seven miles in circuit; it is 85 miles to the north of Chanda. It is the head-quarters of the Chief Commissioner: the British Military Cantonment of Kamptee is in its neighbourhood. The Bhonsla rajas of Nagpur commenced in 1734, when Raghoji Bhonsla was nominated Sena Sahib Suba or general of the Mahratta confederacy. The family became extinct in 1865 during the administration of Lord Dalhousie, on the demise of Goozur, grandson of Raghoji, who, in 1818, had been seated on the throne when Mudaji (Appa Sahib) was deposed. Nagpur is situated in an extensive plain, and is, strictly speaking, an open city. A rampart in the usual native style, with occasional round towers, had on some former occasion been commenced, but had in no place been carried to a greater height than eight feet, and is in general less. The extent of the city, as defined by this unfinished rampart, is scarcely three miles, but the suburbs, which run close up to the city wall, are not less than seven miles in circumference, extending chiefly on the north and east sides, and not exceeding 400 yards in depth on the west and south.—*History of the Sikhs*, Capt. Cunningham, p. 35; *Quarterly Journal of Geological Society*, Vol. xvii, August 1861, pp. 47, 48, 49, 346; Vol. xi, p. 555.

NAEK, or Naidu, many of the Tiling race are called Naidu, the plural of Naik, an honorific term applied to masters or chiefs of tribes. The bulk of the Tiling sudra race take this honorific appellation, see Naik.

NAGRANGA, also Jambira, SANS. *Citrus aurantium*, Linn.

NAGRE, HIND. *Arundinaria falcata*.

NAGRE, BENG., HIND. *Euphorbia antiquorum*.

NAGSARA, or Nagkesur, HIND. *Mesua ferrea*,

NAGUA, or Nuka, see Hindoo.

NAGU BENDA, TEL. *Abutilon indicum*, Don.

NAGUNI, in the hinduism of Rajputanah, figures half-serpent, half-woman. The Gras is the griffin of Rajputanah. At Barolli, the Gras and Naguni are represented in a highly finished sculpture.—*Tod's Rajasthan*, Vol. ii, p. 716.

NAGUR MOOTHA, also Nagur Muthi, BENG., DUK., HIND. *Cyperus juncifolius*, also *Cyperus pertennis*.—*Roxb.*

NAGYR, see Tibet.

NAHANI, HIND., of Ravi, *Valeriana hardwickii*, Wall.

NAHAR of Central India. *Felis tigris*. Linn.

NAHAR, AR., PERS. A river.

NAHARAINA, or Nahrain, the Neharajim of the scriptures; in Syriac, Nahrim, is a pure Semitic word, signifying the country between the two rivers, the Mesopotamia of the Greeks,

the Jezirah, or island of the Arabs and the Doab of India.—*Layard Nineveh*, Vol. ii, p. 225.

NAHI CADAGHOO, TAM. Polanisia icosandra W. and A., also Polanisia viscosa.

NAHIR, a strath, the Mahadeo Koli reside in the valleys of the Syhadri range, extending from Moosa S. W. to Poona, northwards to Trimbuk, the source of the Godavery river, between lat. 18° 15' and 20° N. and long. 73½ and 74° E. These small valleys are known as Mawil, Kho-rah, Nahir and Dang, i. e., valleys, glens, straths and wilds. The Mahadeo Koli are classed into 24 kula or clans, each of which has many subdivisions. Their numbers in 1837, were estimated at about 50,000 souls. The members of the same Kula do not intermarry. With the exception of the cow and village hog, the Koli eat all other animals. The women are generally slender and well formed with a pleasing expression of features and some are very pretty. They are chaste and have large families. The Koli are fond of charms and amulets.—*Captain Mackintosh in Madras Lit. Soc. Journ.* See Koli.

NAHI UROOVI, TAM. Achyranthes aspera.

NAH-OO, BURM. This tree of Burmah, attains a diameter of eighteen or twenty inches. Blossom very beautiful and fragrant, yellow, size of a large rose; grows only in wet places. Timber is very worthless.

NAHOOR, or Nervate, also Sna, TIN. Ovis aries. The Nahoor, if not identical, is very closely allied to the burrel of the Borendo pass. It is called the nahoo in Ladakh, and is the sna of Tibet; and, judging from the quantity of its horns on the chaits and cairns of both countries, it would appear to be their most common wild ruminant. Mr. Blyth's distinctions between the two sorts of burrel have reference chiefly to the form of the horn. He says the burrel is more rounded, the annual dents are better marked, with larger bulgings between them.—*Adams*.

NAHOR, grandfather of Abraham, who set out from Ur of the Chaldees.—*Bunsen*.

NAHOWN, the fairy bath.

NAHR, HIND. ARAB., a canal.

NAHRI, HIND. of Jhang district, &c. Canal watered land.

NAHUS, see Bactria.

NAHUSHA, see Hindoo.

NAI, HIND. Arundo donax, also Hordeum hexastichum.

NAI, SINDHI. Is synonymous with the Italian "fiumara;" being the bed of a mountain stream, generally dry but converted by a few hours rain into a raging torrent. Arrian mentions the loss incurred by Alexander's army in consequence of encamping too close to one of these channels.—*Richard F. Burton's Sindh*, p. 391.

NAI-AMBANA, PERS. Nai, signifies a reed,

pipe, &c., and Anban or Anbanah, a bag made of the skin taken entire off a sheep. It is a musical instrument not often seen in Persia beyond the Garinsir (or "warm region") about Bushahr. In sound as in make it resembles the bag-pipe; which is expressed by its name, nai ambanah, or according to the usual pronunciation here, nai amboonah.—*Ouseley's Travels*, Vol. i, p. 241.

NAIA TRIPUDIANS, MERR, the Cobra di Capello snake, common in all parts of British India, Ceylon, the Malay peninsula. There are several varieties, see Cobra, Naga, Ophidia, Reptiles.

NAIA-VELI, TAM. Polanisia icosandra; W. and A.

NAIB, ARAB., a deputy; plural, Nawab; Nabob.

NAI-CARANA, HORT. MAL. Cowitch; Mucuna pruriens.

NAICHA or Necha, HIND. The mouth-piece and drawing tube of a hukka.

NAIDAM PAINI, the Malayala name of a tree which means long Pains. It grows to about two feet in diameter, and seventy feet high, and produces a sort of varnish which is used with wood-oil for paint or wood. The natives use the spars for rafting timber down the rivers, and for the yards of small vessels. It is a wood of little value, being neither strong nor durable.—*Edye. Mal. Can.*

NAIDU, a division of the Tiling sudra race.

NAIGA PAHARIAH, see India.

NAIGRE SEED, an article of export from Malabar; it is probably the name of the seed of Pongamia glabra.

NAIK, a division of the Tiling sudras, commonly stated Naidu as Lutchman Naidu. Also the titular distinction of the Bhil chieftains.

NAI-KADUGA, TAM. Cleome viscosa.

NAI-KADUGOO, TAM. Gynandropsis pentaphylla.—*D. C. W. and A.*

NAIKAN, a slave class in Karnata.—*Wils.*

NAI-KARMA, MALEAL, Mucuna prurita, Hook.

NAIKER, see Naek; Naidoo, Polyandry.

NAIKRA, a tribe in the hills of Udipur said to be like the Bhil, but less humanized.—*Campbell*, pp. 30 45-6.

NAI-KUDE, a Gond tribe that inhabit the jungles on both banks of the Pain Ganga, especially in the tract between Digaras and Umarkher and found about Aparawapet and as far as Nir-mul. They have adopted the hindu dress and will not eat beef; but they live by the chase, cut wood and grass and are a terror to their neighbourhood, by their depredations.

NAI KUDUGA, TAM. Gynandropsis pentaphylla, D.C.

NAI KUTTEN KAI, MALEAL. Fruits of Sapindus emarginatus.

NAIRS.

Spikes.	DUT.	Progos.	Port.
Clous.	FR.	Gwosdi,	Rus.
Negel, Spiker,	GER.	Clavos,	Sp.
Kha, Mekh,	Guz. Hind.	Negangul,	Tam.
Chiodi, Chiovi, Aguti, It.	Golha.	Golha.	Tel.
Faku,	MALAY.		

Small metal spikes.—*McCulloch's Commercial Dictionary*, p. 811.

NAIMNATH, the 22nd Buddha. *See Nimmath.

NAIMUNI, see Nepal.

NAINSUKH. A valley in kaghan famous for ghee, which is quite solid and cuts like cheese; about a dozen mules, laden with this commodity passed Dr. Cleghorn daily.—*Cleghorn Punjab Report* p. 178.

NAIPALA, see Nepal.

NAIPES, Sr. Cards.

NAIR, a race on the Malabar Coast, following the hindoo religion and claiming to be of the sudra caste. The royal family of Travancore are of this race; the whole of the Nair race follow the rule of female descent, but as with other races also both there and in other parts of India, from this custom results the curious practice that a man's heirs are not his own, but his sister's children. In British India the Kasia, the Kooch and the Nair races, as also the artizans the Teer race and some of the Moplah mahomedans of Malabar have this custom; among the Buntar in Tulava, also, a man's property does not descend to his own children, but to those of his sister. Most of the people of Malabar, notwithstanding the same diversity of caste as in other provinces, all agree in the usage of transmitting property through females only. It is the custom in Travancore, among all the races except Ponan and the Namburi brahmins. The Nairs marry before they are ten years of age, but the husband never afterwards associates with his wife. Such a circumstance, indeed, would be considered as very indecent. He allows her oil, clothing, ornaments and food; but she lives in her mother's house, after her parents death, with her brothers, and cohabits with any person that she chooses, of an equal or higher rank than her own. If detected in associating with any low man she becomes an outcaste. It is no kind of reflection on a woman's character to say that she has formed the closest intimacy with many persons; on the contrary, Nair women are proud of reckoning among their favoured lovers many brahmins, rajas, or other persons, of high birth. In consequence of this strange manner of propagating the species, no Nair knows his father; and every man looks upon the sister's children as his heirs. He, indeed, looks upon them with the same fondness that fathers in other parts of the world have for their own children; and he would be consider-

ed as an unnatural monster were he to show such signs of grief at the death of a child, which, from long cohabitation and love with its mother, he might suppose to be his own, as he did at the death of a child of his sister. A man's mother manages his family, and after her death his eldest sister assumes the direction. Brothers almost always live under the same roof;—but, if one of the family separate from the rest, he is always accompanied by his favorite sister. Even cousins, to the most remote degree of kindred, in the female line, generally live together in great harmony: for in this part of the country, love, jealousy, or distrust, never can disturb the peace of a Nair family. A man's movable property, after his death, is divided equally among the sons and daughters of all his sisters. His land estate is managed by the eldest male of the family, but each individual has a right to a share of the income. In case of the eldest male being unable, from infirmity or incapacity, to manage the affairs of the family, the next in rank does it in the name of his senior. Under these social rules it is not easy to see the inducement to the Nair to marry, as he has all the burthen without any of the enjoyments of wedded life. As Latham states, 'no Nair son knows his own father, and vice versa, no Nair father knows his own son. The property of the husband, descends to the children of his sisters. Picart quotes Oviedo as stating that the Nair women regard association with men to be an institution so holy that they believe virgins to be secluded from paradise, but this seems merely an excuse put forward by some one of the race, who has been ashamed of this social custom. A Nair writer observes that the Teyettee or Teeyer women, are notorious harlots and become the concubines of strangers of any caste or religion, and this without the least prejudice to their own caste or any loss of esteem in society; on the other hand, any such act proved against any females of the other castes, subjects the person to excommunication from caste, banishment from society, and all religious advantages. The Teeyer females of South Malabar however, do not so readily as those of the North, yield themselves to this practice.

With the Nair, the Teeyer, and indeed all the other numerous castes of Malabar (including the Cochin and Travancore countries, these being indeed the most striking in this respect), reformation is much needed. It is, he says, very lamentable to find them dormant in their original state of depression and not seeking for reformation rather than growing blindly proud of their vain and different castes and privileges and ready to run any risk even that of sacrificing their lives, only to preserve their castes,

Nair women. The customs are alluded to by Van Linschoten in the 16th, Fryer in the 17th, and Buchanan and Day in the 19th century. The Zamorin of Calicut is a Nair. Nairs are of 11 classes, the Villium are namburs and brahmans. The Nair people of the Malaya and Tulava country are frequently educated and good accountants; they hold many public offices and compete for office employments with the brahmans. The Nairs are a good sized, well featured race, but rather dark. They serve as soldiers. The Nairs of Malabar were formerly accustomed to duelling. The practice was called Ankam, but hired champions were often substituted.

It may be mentioned, while noticing the customs of the Nair race, that among the Limboo tribe in N. E. India, near Darjeeling, the boys become the property of the father on his paying the mother a small sum of money, when the child is named, and enters his father's tribe, girls remain with the mother, and belong to their mothers tribe. Among the Batta of Sumatra, the succession to the chiefships does not go, in the first instance, to the son of the deceased, but to the nephew, by a sister, the same rule, with respect to the property in general, prevails also amongst the Malayas of that part of the island, and even in the neighbourhood of Padang.—*Tennent's Ceylon*, Vol. ii., p. 459; *Perry's Birds Eye View*, Ch. xiv., p. 84; *As. Researches*, Vol. v., p. 12; *Buchanan, Mysore*, Vol. ii. p. 412; *Beng. As. Soc. Journ.* Vol. ix. p. 834; *Buchanan Hamilton quoted in Journ. In Arch.*, Vol. iii., No. 6., June 1849; *Lubbock, Origin of Civil*, p. 106; *Picart*, Vol. vi., p. 242; *Ibid.* p. 54; p. 75; *Wils., Gloss*; See India, Kuki, Kummalar, Korambar, Marumaka-Tayam, Polyandry.

NAIGUE, a non-commissioned rank in the native army equal to a corporal. See Naek.

NAINITAL, in lat. 29° 23' 6; L. 79° 30' 9; in Kamaon, a sanitarium in the outer ranges of the Himalaya. The cistern of the barometer at Dorett's Hotel, showed a height of 6,565 feet.—*Schlg.*

NAIRANJAR, the ancient name of a river, near the town of Gaya it is now called Phalgu, is opposite Gaya, and the name of Lilajan, or Nilajan, is restricted to the western branch, which joins the Mohani 5 miles above Gaya. The town was thinly peopled, but it contained about 1,000 families of brahmans. The city is still called Brahm-Gaya, to distinguish it from Bauddh-Gaya.—*Cunningham's Ancient Geography of India*, p. 45.

NAIRITTI or Niritti, the dread earth goddess, of whom terror and deprecation were the only worship, is all but certainly the evil goddess of the hill tribes to whom the Khonds till lately offered human victims. She seems

thrust by fear, rather than adopted, into the Vedic pantheon—the germ of the bloody Kali and the murderess, Bhawani, in a day mercifully late, and to the Vedic men far away in the future. The Arians performed human sacrifices? In a legend, there is mention of a king so devoting his son. There are bonds alluded to in the Vedas, most probably, allegorical, but there is little doubt that the imagery is drawn from real human sacrifices, offered by the wild tribes in the neighbourhood to Nairitti, “with unfriendly looks,” as she is expressly named in this Sakta. The legend may perhaps point to an earlier practice, which Viswamitra and his party set themselves against. A god named Nairita, of a fierce and evil nature, is said to have been worshipped by the Sakæ. See Brahminicide, Hindoo, India.

NAISO GATA, JAPAN. *Grampus sieboldii*.

NAI URUVI, TAM. *Achyranthes aspera*, Linn.; *Roeb.*

NAI VEDYA, HIND. Food offered to a hindoo god, a meat offering, belonging to the puja or worship of a hindoo deity.

NAI VELLA, TAM., also Nai-Veli. *Gynandropsis pentaphylla*, DC., *Cleome viscosa*, W. & A.

NAJA BALLI, MAL. *Bauhinia scandens*, Willd.

NAJACEÆ, Lindl., an order of plants comprising, 6 gen., 24 sp., viz.:—1 *Caulinia*; 4 *Najas*; 1 *Ruppia*; 1 *Zamichellia*; 13 *Potamogeton*; 4 *Spathium*.

NAJAF, according to some mahomedans, the place where Adam was buried: See Abu-kubays.

NAJI, BURM. *Pterocarpus acerifolium*; *Pterocarpus subacerifolium*.

NAJARAN, a town in the north of Yemen; it was once filled with christians, Dzu Nowas obtained possession of it by treachery, and gave it up to plunder. Large pits were dug in the neighbourhood and filled with burning fuel, and all who refused to abjure their faith, amounting to many thousands, were committed to the flames.

NAJUK, BENG. *Mimosa pudica*, Linn., *Roeb.*; Sensitive plant.

NAK, HIND. *Pyrus communis*.

NAKA BALLI, see Hindoo.

NAKAL, see Mahabharata.

NAKANDA, a kind of rice, of Kangra.

NAKA PUTA CHETTU, TEL. *Rostellaria procumbens*, Nees.

NAKARA, HIND., a drum; a kettle-drum; nakarah khanah, literally signifies the “kettle-drum house,” from nakareh, a small brazen bodied drum; and khanah a house. But it is generally used to express an assemblage of military, or field musicians, whose instruments, are loud, harsh and disagreeable, long brazen trumpets, called Karrena, the sounds of which,

may be compared to the braying of asses, and two Surna, in appearance not unlike clarionets, but sending forth notes such as might be expected from two discordant bag-pipes without a drone. The royal Nakarah Khanah, at Tehran, does not excite a more favourable opinion of the Persian field music. The Sihtara, the Kamancheh and other string-instruments; produce with good voices in chamber concerts, very soft and pleasing melody.—*Ouseley's Travels*, Vol. i.

NAKAREE, a river near Pittooreeah in Chota Nagpore.

NAKATIYA, SINGH., an astrologer; the practice of astrology at the present day, in Ceylon, and the preparation of the ephemeris predicting the weather and other particulars of the forthcoming year, appears to have undergone little or no change since this custom of the inhabitants of India was described by Arrian and Strabo. But in latter times the brahmans and the buddhists have superadded to that occupation the casting of nativities and the composition of horoscopes for individuals, from which the Sophistæ described by Arrian abstained. It is practised alike by the highest and most humble castes of Singhalese and buddhist, from the Vellala or agricultural aristocracy, to the beaters of tom-toms, who have thus acquired the title of "Nakatiya" or astrologers. The attendance on particular ceremonies, however, called Bali, which are connected with divination, belongs exclusively to the latter class. Amongst the mahomedans of British India, astrology is almost unheard of, though they keep their calender, or Jantri, and the hindoo Joshi calculates the ephemeris. The hindoos also have their calender or Panjagam, but they all practice divination from books, of which the Chintamani pastakam is in use in the south of India.

NAKBEL, HIND. Boerhaavia diffusa.

NAK-CHIKARA. The leaves of a small plant found about Ajmeer, also imported from Delhi: are very hot, and a good sternutatory: three massee are given in pills, as a dose, in colic, which is said to be thus speedily relieved.—*Genl. Med. Top.*, p. 147.

NAKCHIKNI, HIND. Myriogyne minuta.

NAK CHILNI, DUK. Epicarpus orientalis, *Blume*.

NAKDOUN, HIND. Asparagus officinalis, *Willde*.

NAKED, the practice of appearing naked, is alluded to in Deut. xxviii, 48, in Job xxii, 6, and 24, 7, in Ezekiel xviii, 7 and 16, Matthew xxv, 36 and 44, and 2nd Corinth. xi 20 James, ii, 15. See *Naga*.

NAKERA CHETTU or Nakeru, TEL. Cordia myxa, *Linn*.

NAKHAE, a fabulous race, dwelling under

the earth.—*Bishop Pallegoix; Bowring's Siam*, Vol. i, p. 40.

NAKHCHINKNI, HIND. Myriogyne minuta.

NAKHI, see Hindoo.

NAKHIIS, religious ascetic mendicants, amongst the hindoos, who live by begging; they resemble the Urddha-bahu and Akas-mukhi.

NAKIL OOS SHAYTAN, ARAB. The Devils date palm, a dwarf-giant of palms which grows near Zanzibar. It has no trunk, but the mid rib of each branch is thick as a man's thigh. Eccentric in foliage and frondage, it projects over the waves its gracefully curved arms, sometimes thirty and forty feet long.—*Black. Mag. March* 1858, p. 285.

NA-KHONG-VAT, a great temple in Cambodia, which seems to have been built in the tenth century. It is 600 feet in the base, and in the centre 180 feet high. Every angle of the roof, every entablature, every cornice bears the seven-headed serpent.—*Horsburgh*.

NAKHODA from Nao, a vessel, and Khoda, lord or master, a ship captain.

NAKHTAR, HIND. Cedrus deodara, Pinus longifolia; the generic name of pines among the Affghans, of which there are several kinds, perhaps from Nashtar a lancet, owing to the sharp points of its leaves.—*Cleghorn's Punjab Report*, p. 215.

NAKHTIAN, HIND. Faba vulgaris.

NAKHUD, PERS. Cicer arietinum, *Linn.*, Bengal gram.

NAKHUN, HIND. A kind of shell used as a drug. It is like a finger nail, hence the name.

NAKIRI GADDI or Nakka korra, TEL. Panicum helvolum, *L*.

NAKKA, TEL. Canis aureus. *Linn. Bly*. The jackall.

NAKKA DOSA or Dosa, TEL. Cucumis utillissimus, *R*. var. This variety is grown largely by the ryots in their grain fields.

NAKKA KORRA, TEL. Panicum helvolum, *L*.—*P. glaucum*. *R*. i, 284.

NAKKA NARAYANA, TEL. Indigofera, *sp*. This name was attached to a dried specimen from Kondavid, which was not *I. trita*.

NAKKA NARU, TEL. Indigofera trita, *L*.—*W. & A.* 636; *Io.* 315-386.—*R*. iii, 371; *I. cinerea*, *R*. iii, 372—*Rheed*, ix. 36. also *Poa koenigii*, *Kunth*, or *Poa interrupta*, *R*. i. 335.

NAKKA NEREDU, TEL. Flacourtia sapida, *Roeb. W. & A.*

NAKKA NEREDU, TEL. Flacourtia sapida, *R*. iii, 835; *Cor.* 69—*W. & A.* 104, *Io.* 84. also applied to *Ardisia solanacea*.

NAKKA PASUPU or Konda pasupu, TEL. Curcuma, *sp*. Wild turmeric, *C. montana* or *C. angustifolia*.

NAKKA RENU, or Lakuchamu, TEL. *Artocarpus lacoocha*, R.

NAKKA TOKA GADDI, TEL. *Poa* sp. Fox-tail grass.

NAKKA TOKA PONNA, TEL. *Uraria lagopoides*, D'C.—W. & A. 689; also *Hemionitis cordifolia*, R. The name means "fox-tail plant" syn. Dhavani, W. 44.

NAKKAVIRI CHETTU, TEL. *Cucumis*, sp. Br. 473—where it is explained by Uruvaru, W. 163, "a sort of cucumber."

NAKKENA, TEL. *Canthium didymum*, Gaertn.—R. i, 535.—W. & A., 1301.

NAKKERU or Ura nakkeru, TEL. *Cordia myxa*, L.—R. i, 590.—*Rheede*, iv, 37, also *Ximenia americana*, L.

NAKL, BENG. Tree.

NAKL-KHWAJA—? *Buchanania latifolia*.

NAKL OOS SHAYTAN, ARAB. The Devil's Date palm, a dwarf-giant of palms grows near Zanzibar. It has no trunk, but the mid rib of each branch is thick as a man's thigh. Eccentric in foliage and frondage, it projects over the waves its gracefully curved arms, sometimes thirty and forty feet long.—*Black. Mag.*, March 1858, p. 285.

NAKO, see India, Kunawer.

NAKOOREE, a river and town in Almorah.

NAKRABAG, HIND. *Hyena striata*, *Zimmerman*.

NAKRIZE, HIND. *Lawsonia inermis*.

NAKSHAN, HIND. *Faba vulgaris*.

NAKSHATRA, a Lunar mansion. In hindoo astronomy there are 27, of 13° 20' each,

Their names are :—

1 Aswini.	15 Swati.
2 Bharani or Antakam.	16 Vaisakha.
3 Kritika or Agniya.	17 Anuradha.
4 Rohini or Brahmam.	18 Jyeshtha.
5 Mrigasiras.	19 Neriti or Mula.
6 Ardra, or Raudra.	20 Purva Asharha.
7 Punarvasa, or Aditya.	21 Uttara Asharha.
8 Pushiya or Tishiya.	22 Sravana.
9 Aslesha or Sarpan.	23 Sravishtha.
10 Magha or Pitriyam.	24 Satabhisha.
11 Purva Phalguni.	25 P. Bhadrpada.
12 Uttara Phalguni.	26 U. Bhadrpada.
13 Hasta, or Arka.	27 Revati or Fausnha.
14 Chaitra.	

See Hindu; Surya.

NAKSHATRA-MALA, a garland of twenty-seven pearls, the number of the Nakshatra or lunar mansions.—*Hind. Theat.*, Vol. ii. p. 66.

NAKSH-BANDI, HIND. A mohammadan fakeer or darvesh, characterized by carrying a lighted lamp in one hand and going about singing verses in honor of the prophet, &c., they derive their institution and name from Khaja Baha-ud-din of Naksh-band.

NAKSH-I-KEJEB, Sculptures in the mountains of Rahmat, near Persepolis.

NAKSH-I-RUSTOOM, the rocks on which the bas-reliefs of Naksh-i-Rustoom are sculptured, bear the name of Koh-i-Hoossain; they form the

continuation of the ridge lying south of the valley of Kamin and serve for a northern boundary to the district of Hafrek. They are rugged cliffs of white and yellowish marble with hardly any slope towards the plain. The more ancient sculptures are known by the designation Royal Tombs. These are seven in number, of which four are at Naksh-i-Rustoom, and three in the rocks of Rahmet, at Takht-i-Jamshid. The former are supposed to contain the four Persian monarchs who immediately followed Cyrus, namely, Cambyases, Darius I., Xerxes and Artaxerxes I. The remaining three kings of the Achemenid race are supposed to have been interred in the three other tombs in the rock of Rahmat, at Takht-i-Jamshid.—*Baron C. A. DeBode's Travels in Luristan and Arabistan*, pp. 97, 98, 99.

NAKTRUSA, HIND. *Sisymbrium iris*.

NAKULA, one of the five Pandava.

NA-KYEEN, BURM. This is the soondri wood of Calcutta, *Heritiera minor*, where it is so common as to serve for firewood, although, from its superior qualities for buggy-shafts, hackery or cart axles and wheels and other purposes requiring great strength and toughness, it is highly prized. In Amherst the timber is employed for house posts and rafters.—*Cat. Ex.* 1862.

NAL, HIND. *Arundo donax*.

NAL, also Nul, BENG. *Amphidonax karka*, *Lind.*

NAL, HIND. A hollow reed or cane, a tube, a pipe. The reeds used as pens or kalm, for writing in the Persian character. The best are red without, white within, and hard as stone. See Graminaceæ.

NAL, also means 'a tube,' whence the warlike nal-gola, a kind of arquebuss; a ball propelled by whatever force from a tube; a term used by the old martial poets of India for a warlike engine, long before gunpowder was known in Europe. A single barrelled gun is ek-nalli-ka-banduq; do-nali-ka-banduq, a double barrel.—*Tod's Travels*, p. 25.

NAL, TAM. Day.

NAL, see Kelat.

NAL (?) HIND. A gang of freebooters in Bundelkhund as Sanoria, or Uthaigir.

NALA, HIND. Is a term applied to a mountain stream, from nal, 'a defile,' indicating that the course of a stream always presents some mode of penetrating into mountainous regions. Vulg. a nullah, a water-course or stream: often a long inlet from one of the great rivers and receiving the drainage of the country, but not having any origin in a spring or snow bed, as rivers and streams have; usually a rivulet, a channel cut in the soil by rain-water, or water course.

NALA and Damayanti, a story of ancient

hindoo life, in the later Vedic period preceding brahmanism. Nala inhabited Nishada, the Bhil country and Damayanti was a daughter of the Vidarbha, in the modern Berar. Nala, lost, for a time, both his kingdom and his faithful wife Damayanti. The rajah of Jeypore claims to have sprung from the ancient rajah Nala of romantic memory.

NALANDA, a famous monastery in Magadha, near Gaya, now called Baragaon. It is the most famous buddhist monastery in all India.—*Cunningham's Ancient Geog. of India*, p. 15.

NALAPANA KULINGOO, *Cureuligo orchioidea*.

NAL BANS, HIND. *Bambusa arundinacea*. The bamboo.

NALCHE, see Kunawer.

NALDRUG, a fortress in the western part of the Hyderabad dominions, 27 miles from Sholapore.

NAL ENNE, TAM. Oil of *Sesamum orientale*, Gingelly or *Sesamum* oil.

NALI, TEL. *Ulmus integrifolius*, *Roxb.*

NALI, HIND. *Ipomoea reptans*.

NALKAPUR, 17° 17'; 78° 48', in the Dekhan, 32 miles east of Hyderabad. Mean height of the village, above the sea is 1,591 ft.

NALKEE, BENG. *Hibiscus cannabinus*.

NALKI, a kind of palanquin.

NALKIA, HIND. *Tulipa stellata*.

NALL, HIND. A hollow bamboo. See Nal.

NALLA, TEL. Black, hence

Nalla-agisi, or *Avisi*, TEL. *Linum usitatissimum*, *L.*, Sans. *Atasi*, *W.* 15.

„ *ariti*, TEL. *Musa paradisiaca*, *var.* also *Michelia*, *sp.* Sk. explains it by *Champa* which *W.* 318, renders both *Michelia* and a *var.* of the plantain.

„ *asakalu*, TEL. *Paspalum*, *sp.*?

„ *ativasa*, TEL. *Curcuma coccia*, *R.*, i, 29. One of the Sans. syn. is *Sati* which *W.* 828, says, is a kind of *Curcuma*, and in Bengal, *C. coccia* is still called black *Haldi* and *Nilakantha*.

„ *balusu*, or *Nakkena*, TEL. *Canthium didymum*, *Gertn.*

„ *budama*, TEL. *Cucumis turbinatus*, *R.*, iii, 723, *W.* and *A.* 1059.

„ *chamalu*, TEL. *Panicum miliare*, *Lam.* *R.* i, 309.

„ *chandra* or *Chandra*, TEL. *Acacia sundra*, *DC.*

„ *chikkudu*, TEL. *Lablab*, *sp.*

„ *chitra mulam*, TEL. *Plumbago capensis*, *Th.*

„ *chukka kada*, TEL. *Eleiotis sororium*, *DC.*—*W.* and *A.* 711. *Roxb.* has *Nalla sora kada* evidently a mis-print for *Nalla sukka* or *chukka kada*, *i. e.*, “black spot” from the dark mark in the middle of each leaflet.

„ *daduga*, TEL. *Milisia velutina*, *Hook. f.* and *Th.*—*Uvaria villosa*, *R.* ii, 664.

„ *dintena* or *Dintena*, TEL. *Clitoria ternatea*, *L.* a. *caeruleoeflora*.

„ *doggali*, TEL. *Amarantus spinosus*, *L.* A dried *sp.*, with this name was sent from Kondavid, but it probably refers more properly to some of the many dark-coloured *sp.*

„ *gaggera* or *Tulasi*, *Ocimum sanctum*, *L.* *W.* 218, *Krishnarjaka* and *Kala tulasi* in Bengal.

„ *nalla gilli gicheha*, *Crotalaria hirsuta*, *Willd.* *R.* iii, 270.—*W.* and *A.* 582. The flowers are black or purple spotted.

Nalla giri gilli gicheha, TEL. *Crotalaria linifolia*, *L.* *W.* and *A.* 589—*C. coarctata*, *R.* iii, 269. So called from the ovoid, black legume—*nalla*, black; *giri* round.

„ *gilikarra*, TEL. *Nigella sativa*.

„ *nalla giniya*, TEL. Occurs in Sk. as the equivalent of *Katabhi* which *W.* 180, makes to be *Cardiospermum halicacabum*—also *Clitoria*.

„ *guli vinda* or *Gulivinda*, *Abrus precatorius*, *L.* γ. *melanospermus*, *Roxb.* ii, 292, applies the same name to *Cardiospermum halicacabum*, the seeds of which are black with a white spot, very like the seeds of *Abrus precatorius*.

„ *gunta kalagara* or *Gunta*, *Kalagara eclipta*, *sp.*? The Sans. syn. is *Maha bhiringah* or great *Eclipta*, not in *W.*

„ *gurujiinja*, TEL. *Abrus precatorius*, *Lim.*

„ *irugudu*, TEL. *Dalbergia latifolia*, *W. & A.*; *R.*

„ *iswara*, TEL. *Aristolochia acuminata*, *L.*—*R.* iii, 489.

„ *jidi chettu* or *Jidi chettu*, *Semecarpus anacardium*, *L.*—*R.* ii, 83; *Cor.* 12—*W.* and *A.*, 523; *Id.* 558.

„ *jila karra*, *Nigella sativa*, *L.*, δ *Indica*, *DC.* *Jilakarra* or *Jira* is *cumin*, black, or *Kali jira*, *Nigella sativa*.

„ *jilledu* or *Jilledu*, *Calotropis procera*, *R. Br.* This application is made from the dark color of the flowers. *Hamilton* identifies this *sp.* with *C. Hamiltonii*, *R. W.*

„ *jiluga*, *Cassia pumila*, *Lam.*—*W.* and *A.* 904—*Senna prostrata*, *R.* ii, 352.

„ *kaka mushti*? *Diospyros*, *sp.*—*D. sylvatica*, *R.*? A doubtful name. *Mushti* is *Strychnos*—*Beddome* adds, “only found in fruit, *D. sylvatica*?” or *Gata*, p. 58. It is more probably *D. cordifolia*. See *Kaka ulimera* and *Nalla ulimera*.

„ *kakara*, *Momordica*, *sp.* From *Kondavid*.

„ *kakasi*, or *Devata malle*, *Randia uliginosa*, *DC.*

„ *kaluva*, *Nymphaea stellata*, *Willd.*—*W.* and *A.* 55; *Id.* 178—*R.* ii, 579; *N. cyanea*, 577; *Nilotpalam*, *W.* 486.

„ *kamanchi* or *Kamanchi*, *Solanum rubrum*, *Mill.*—*β. melanopyrenum*.

„ *kasana*, *Ormocarpum sennoides*, *Beauv.*—*W.* and *A.* 672; *Id.* 297—*Hedysarum sen.* *R.* iii, 216.

„ *kavani*, *Dicerna biarticulatum*, *DC.*; *W.* and *A.* 710; *Id.* 419—*Hedysarum bi.*, *R.* iii, 356.

„ *kokkita*, *Ipomoea obscura*, *Ker.*—*Conv. obs.*, *R.* i, 472.

„ *kuppi*, also *Nalla opie*, TEL. *Clerodendron inermis*, *Gert.* Syn. of *Volkameria inermis*, *L.*

„ *mada* or *Mada*, *Avicennia tomentosa*, *R.* iii, 88.

„ *maddi*, *Terminalia tomentosa*, *W.* and *A.* 972; *Id.* 195.—*Pentaptera tom.*, *R.* ii, 440, also *Maba buxifolia*, *Pers.* The bark dyes black.

„ *manga*, *Randia*, *sp.* Perhaps *R. uliginosa*.

„ *marri*, *Ficus*?

„ *mulu goranta*, *Barleria obovata*, *L.*—*B. buxifolia*, *R.* iii, 37. The syn. is *Sairiyaka*, *W.* 944.—Common in Mysore and Malabar with pinkish violet flowers; another variety occurs in *Guntur* with pure white flowers, or *tella mulu goranta*.

„ *nela gummodu* or *Bhuchakra gadda*, *Batatas paniculata*, *Ch.*?

„ *nilambari*, *Eranthemum nervosum*, *R. Br.*—*E. pulchellum*, *R.* i, 111; *Justicia pul.*, *Cor.* 177.

„ *nallani padmam*, *Euryale ferox*, *Salisb.*; *Nymphaea stellata*, *Willd.*? *Nallani padmam* is a black or purple lotus. The only species an-

- swering to this description is *Euryale ferox*, which however is unknown in the south, but it is only given in Sk. as a syn. of the Sans. word Padma.
- „ pagadapu chettu or nalla purugudu, TEL. *Anisonema multiflora*, *R. W.*
- „ palleru, or nili palleru, TEL. *Indigofera echinata*, Willd.—*R. iii*, 371—*W. and A.* 617; *IC.* 316.
- „ pamulagedda, TEL. *Spilornis cheela*, Daud.
- „ pedda goranta, *Barleria cristata*, L.—*R. iii*, 37—*W. IC.* 453.
- „ pesalu or pesalu, TEL. *Phaseolus mungo*, L.—*β. melanospermus*—*Ph. max.*, *R. (not L.) iii*, 296.
- „ ponuku, *Peltophorus myurus*, Blain.—*Manisurus my.*, *R. i*, 361; *Cor.* 117.
- „ pulugudu or purugudu, *Anisonema multiflora*, *R. W.*—*Phyllanthus mul.*, *R. iii*, 664—*Rheede*, x, 27. Fruit black. The reference to Rheede is Wight's. Dillwyn assigns the figure to *Ph. reticulatus*.
- „ putiki, *Aristida depressa*, Retz., *R. i*, 351.—*Chaetaria dep.*, Beauv.
- „ puuvula ufrulli, *Allium*, *sp.* The words mean black-flowered onion.
- „ rantu, *Endopogon*, *sp.* This was the name given by the Konda Doralu at Sinhashalam to a very pretty sp. with pale blue flowers, whether an *Endopogon* or a *Stenisiphonium*, doubtful.
- „ ratiga, TEL. *Vitis quadrangularis*, Wall.; *W. & A.*, *W. IC.*, *Rheede*.
- „ regu, *Acacia amara*, Willd.—*W. and A.* 848—*Mimosa am.*, *R. ii*, 548; *Cor.* 122.
- „ sugandhi pala, *Hemidesmus indicus*, *R. Br.* var. The flowers are always dark purple or blackish, but there are several well marked varieties.
- „ tady gudda, also nalla-tata-gudda, TEL. *Curculigo orchoides*, Gert. See Musli.
- „ tapeta, TEL. *Sonchus orizensis*, *R. iii*, 402. Br. under nalla tappeta 389, has “name of a tree” and adds the syn. *grishma sundaramu*, which *W.* 306, explains to be a kind of pot-herb, quoting *Erythraea (Chironia) centauroides*!—Wight contr. 27, considers *sonch. oriz.* and *oleraceus* to be the same—tappeta is *Asystasia*.
- „ tegada or Tegada, Black tegeda. The Sans. syn. given is *palinda* which according to *W.* 531, is *jasminum pubescens*; *palindi* is explained to be *teori*, and *palindhi* to be the black *teori*. *Teori* occurs in *Pid. Ind.* in *Speede's calendar* and in *Voigt*, as the hindoo name of *Iponoea turpethum*. *Teori* is also the hindin name of *Lathyrus sativus*, the expressed oil of the seeds of which, is, according to *O'Sh.* 317, a powerful purgative, and as it has large blue flowers, the similarity of the name may have led to the use of the term black or nalla tegada, the root of *Ip. turpethum* possessing similar qualities.
- „ tige or illa katte, *Ichnocarpus frutescens*.—*R. Br.*
- „ toomi kara, TEL. Ebony.
- „ tumiki or Tumiki *Diospyros*, *sp. Br.* 428, under *tubiki*, has *karra tumiki*, “ebony,” but, goes on to refer to *embryopteris*. The name in the text probably refers to *D. melanoxylon*.
- „ tumma, *Acacia arabica*, Willd.—*W. & A.* 858.—*Mimosa ar.*, *R. ii*, 557; *Cor.* 149; *Br.* 428. *Jour. As. Soc., Calc.*, vi, 392.
- „ ummetta, TEL. *Datura fastuosa*, Mill. Roxb.
- „ vavali, TEL. *Gendarussa vulgaris*, also *vitea negundo*, Linn., Roxb., *W. IC.*

- Nalla valu*, TEL. *Sinapis glauca*, *R. iii*, 118. SANS. Syn. *krishnika*.
- „ vandi karra, a name given by the Konda Doralu to an undetermined tree at Sinhashalam.
- „ vatti veru, or vatti vera, *andropogon muricatus*, Retz. The syn. in *Pt. II*, *Jalasayah*, *W.* 345, is stated to be *Khashhas*.
- „ vavili, *Vitex negundo*, L.—*R. iii*, 70—*W. IC.* 519—*Rheede* ii, 12.
- „ vegisa or vegisa, *Pterocarpus*, *sp.*
- „ vishnu kranta, or Vishnu kranta, *Evolvulus alsinoides*, L.
- „ udata, or bali komma, *Cansjera rheedii*, Gm., *W. IC.* 1861.—*C. scandens*, *R. i*, 441; *Cor.* 103., *Rheede* vii, 2-4. *Opilia amentacea*, *R. ii*, 87; *Cor.* 158. This name is applied to both plants by the Konda Doralu.
- „ uduga, or uduga, *Alangium hexapetalum*, Lam.—*W. IC.* 194. *III.* 96—*Rheede* iv, 26. This name was given to specimens from Konda-vid. It is probably the same as *Rheede's* *karangolum* which Dillwyn identifies with *A. hexapetalum*, Lam. (not Willd.) Are they different? V. Wight, *III.*, ii, 2.
- „ ulimera, or Kaka ulimera, *Diospyros cordifolia*, *R.*
- „ ummetta, *Datura fastuosa*, Mill.—*R. i*, 561—*W. IC.* 1396.
- „ uppi, *Capparis sepia*, L.—*R. ii*, 568—*W. & A.* 92. Br. 105, under Uppi quotes this name, and also *Monetia* which is Tella uppi adding a “thorny, medicinal, styptic shrub, with a ligneous, hollow fruit or gull, as large as a nut-meg” and gives as a syn. *Mouktika phala*.
- „ urimida, or nalla ulimera, *Diospyros cordifolia*, *R.*
- „ yirugudu chettu, *Dalbergia latifolia*, *R. iii*, 221; *Cor.* 113—*W. & A.* 814; *IC.* 1156. *D. latifolia* is called *Sveta sal*, i. e., white sal in N. India. The *Krishna sinuupa* which is the syn. of *Nalla yirugudu* in Sk. seems to refer to another species, *V. Patsa yirugudu chettu*, but the Tel. name exactly corresponds with its Eng. syn. “black-wood.”
- „ nalleru, *Vitis cissus quadrangularis*, Wall.—*W. & A.* 410—*W. IC.* 51—*R. i*, 407. Br. 480.
- „ nalli or medakava, *Grewia pilosa*, Lam. Br. 480.

- NALLA JUTE, ANGLO-BENG. *Corchorus olitorius*.
- NALLAK, TEL. The male bird of *Eudynamis orientalis*, Linn.
- NALLA MALLA, two hill ranges near Cud-dapah.
- NALLA-PAT, BENG. Jute.
- NALL-ENNAI, TAM. Gingelly oil.
- NALLERU, TEL. *Vitis quadrangularis*.—*Wall., W. & A., W. IC., Rheede.*
- NAI-SAHIB (lit. Mr. Horse-shoe) an Alam or standard of mahomedans.
- NALTA-PAT, BENG., HIND. *Corchorus capsularis*.
- NALU, HIND. *Arundo donax*.
- NAM, HIND. A name.
- NAMA, HIND. A name applied to the marks which the sects of hindoos wear on their foreheads.
- NAMA, AMB. *Arenga saccharifera*, Labill.

NAMBUDIRI.

NAMA, also Nama dampo, TEL. Aponogeton monostachyon, *Willd.*

NAMA KARANA, SANS. From nama a name, and kree, to make, a hindoo ceremony of naming a child.

NAMAK-ARANAM, see Hindoo.

NAMAK DULLA, HIND. A salt of soda, a natron salt from the waters of the lake of Loonar. It is used in dyeing, in medicine and the arts.

NAMA ? KETTI GADALU, TEL. Aponogeton monostachyon, *Willd.*

NAMA KIRTANA. In the hindoo religion the constant repetition of any of the names of the deity.

NAMAK KA TEZAB, HIND. Muriatic acid.

NAMALLI PILLI, TAM. *Felis rubiginosa*, *Is. Geoff.*

NAMA SIVAYA, the principal Mantra of the Saiva sect of hindoos.

NAMASKARA is a reverential salutation to an idol or a brahman.

NAMASUDRA, corruptly, Numoosoodr(?) BENG. A low caste, a chandala.

NAMAZ, PERS., HIND. Prayer. The mahomedan prayer-time occurs five times daily.

Ta dil ba mihnat dadim,
Dar bahr-i-fikr uftadim,
Chun dar namaz istadim,
Kuwat amad anderim.

—*Yule Cathay*, Vol. ii, p. 499.

NAMBAIL PAIO, MALEAL. *Eugenia malaccensis*, *Linn.*

NAMBI, TAM., MALEAL.

Nambiyana, KAR. | Nambiyan, TAM.
Nambadi, MALEAL.

The title of an inferior class of brahmans said to be sprung from a Kshatriya mother and brahmin father, and usually officiating as priest in Vaishnava temples in the South of India.

NAMBOGUM, MALEAL. See Tibilebu.

NAMBUDIRI, commonly pronounced and written Namburi, MAL., TAM. A brahman of the highest order in Malabar. The Namburi brahman race of Malabar are arranged into two tribes, the Panniar grammakar or Boar-villagers, and the Choour grammakar or Bird-villagers. When the Namburi brahman women are guilty of connection with inferior castes, they are often sold by their relatives and chiefly to the mahomedan Mapilla. Under the terms head-price and breast-price, the princes of Malabar, in granting certain lands to the christians in A. D. 316, allowed them the revenues derived from the sale of males and females for serious caste offences, a practice which the Namburi continue. A Namburi brahman of Malabar is always the Rawal or chief priest of the temple of Badarinath in the Mana Pass of the Himalaya.—*Wilson*. See *Sankara Achari*.

NAM-PHRIK.

NAMBU VETUVAR? a class of slaves in Karnata.

NAMBYARA, MAL. A tribe of Nayar, or Nair in Malabar.

NAMCUL, near Salem, a fortified detached hill with a pretty large town at the foot. The hill is steep but not high; its rock is sienitic, in which white quartz and felspar prevail: in some places it contains garnets in hornblende and a greenstone which possesses the characters of felspar and is composed of the same constituents; the latter compound seemed to prevail particularly in the lower country. The sand in the nullas and in some part of the road was mostly an aggregate of small garnets and hornblende.

NAMDAH, HIND. PERS. A thick felt used by the nomade races of Persia and Afghanistan for their tents, hence the term nomade. The numda is also largely used as a sleeping rug and for carpeting. See Nammad.

NAMDUNG, a river at Rungpoor.

NAMEDE. A rather hard, very fine, close-grained, heavy Ceylon wood.

NAMELUDDOOGOO, TEL. See Jungle shunbaloo, HIND.

NAMI, a root of the form of a large potato, which grows in Mindoro, cultivated also in Timor and in the Moluccas. It is said to be the Manioc or Cassava of South America.

NAMILLE, TEL. *Ulmus integrifolia*, *Roxb.*

NAMMAD, PERS. Narrow strips of thick soft felt, handsomely ornamented with various colours, which are placed round the rooms in Persia and Koordistan, and serve instead of sofas and chairs.—*Rich's residence in Koordistan* Vol. i. p. 85. See Namdah.

NAMMA DUMPA, or Gotti gadda, TEL. *Spathium chinense*, *Lour.*

NAMMAM, ARAB. *Thymus chamædrys*.

NAM ME, BURM. A river.

NAMO, or Lamo Island, called also Nan Gaou, on the south coast of China, is 12 miles long from east to west, and 5½ miles broad. It is very barren, but well peopled by a fishing population.—*Horsburgh*.

NAMOONE-KOOLE, a mountain near Badulla in Ceylon, nearly 7,000 feet high.

NAM PAPATA. *Pavetta tomentosa*, *Sm*—*Ixora tom*, *R. i.* 386—*W. Ic.*, 186.

NAM-PHRIK. A sauce used by all classes in Siam, it is prepared by bruising a quantity of red pepper in a mortar, to which are added kapi (paste of shrimps or prawns), black pepper garlic, and onions. These being thoroughly mixed, a small quantity of brine and citron-juice is added. Ginger, tamarinds, and gourd seeds are also employed. The nam-phrik is a most appetite-exciting condiment.—*Bowring's Siam*, Vol. i., p. 108.

NAMRUD. Nine miles from Baghdad is the small Akarkouf, the ground around the ruined pile is called by the Arabs Tall Namrud, and by the Turks Namrud Tapassi. Both these terms mean the hill, not the tower, of Nimrod and the term Akarkouf or Agargouf given by the Arabs, is intended to signify the ground only, around it.

NAM SAKI, SANS. Namesake.

NAMSANG, a rude pagan tribe on the hills of Assam, on the eastern frontier of the Mikir and Cachar. See India, Naga.

NAMUM, TAM. Pipeclay.

NAMUM, the marks hindooes make on their foreheads.

NAMUM, TAM. The marks on the foreheads of the hindooes indicating the sects to which they belong. That of the Ramanuja consists of two perpendicular white lines, drawn from each root of the hair to the commencement of the eyebrow, and connected by a transverse streak across the root of the nose. In the centre is a perpendicular streak of red, made with red Sanders or with Roli, a preparation of turmeric and lime. They have also patches of Gopi chandana with a central red streak on the breast and each upper arm. The marks are supposed to represent the Sankh (Shell), Chakra (Discus), Gada (Club), and Padma (Lotus).

NAMUTI, BENG. Grangea Maderaspatana, Poir.

NAMZAD BAZI, PERS. Pushto, in Affghanistan a custom of allowing the engaged couple to see each other.

NAM ZEYLANICA, Linn. Syn. of *Hydrolea zeylanica*, Vahl.

NAN, PERS. Leavened bread.

NAN, a dependency of Siam, N. E. of Bangkok. Its capital is in a fertile valley. Lu, one of the Laos tribes, are perpetually at war with Nan.

NANA, ARAB. PERS. Mint, *Mentha sativa*.

NANA, MAHR. Ben-teak.

NANA BALA, TEL. *Euphorbia hirta*, L.—R., ii., 472.

NANA FARNAVES, see Baji Rao.

NANAH, the Tamil name of a tree, probably the *Morinda citrifolia*, which grows in Travancore and Malabar to about twelve feet in height, and ten inches in diameter. It is generally curved in its growth, and very soft and light. It resembles the American red-birch as to its silvery grain. The native carpenters use it for the frames of small vessels. It is of little value in consequence of its early decay.—*Edye M. and C.*

NA-NAH. BURM. Is a very large tree, thorny. Fruit deep red, size of a small plum, skin very thin, full of hard, white triangular seeds. Prized only by the Natives.—*Malcom*, Vol. i., p. 181.

NANAH, MAHR. *Lagerstræmia parviflora*, R. also *Lagerstræmia macrocarpa*.—*Roeb.* :

NANAK, was the son of a grain-factor at Talwundee, in the neighbourhood of Lahore. He was born in the year 1469, and in early life deserted the humble shop of his father to seek, in study and retirement, a more genial occupation for a naturally reflective mind. The tenets of the hindoo and mahomedan of that day alike dissatisfied him; and he came forward as a reformer of his country's faith. He began to teach A. D. 1490. For the gross polytheism of hindoo mythology he substituted what may be defined a high philosophic deism, and succeeded in collecting together a large body of followers, whom he called Sikh, or "disciples;" and these he organized under a theocratic form of polity, being himself recognised as their Gooroo, or "teacher." For many years this rapidly increasing body of converts continued to lead a peaceful meditative life, absorbed in the study of their holy book, the "Grunth," which contained all the recorded dogmas of their founder. They gradually spread over other parts of India, a college of them existed so far south as Patna, probably founded by gooroo Tegh Bahadur. An interesting account of this college is given in an early number of the Asiatic Society's Journal, from the pen of C. Wilkins, Esq., dated March 17, 1781. But in the beginning of the seventeenth century, Govind Singh, the tenth gooroo, gave a new character to this religious community. He was a man of a naturally warlike spirit and ambitious views, and, thirsting to be revenged for domestic wrongs, soon converted the hitherto contemplative Sikhs into a band of warriors. These were the men who a century afterwards formed the flower of Runjeet Singh's army, and whose rampant fanaticism presented so formidable an array on the different battle fields during the Sutlej and Punjab campaign.

NANAK SHAHI, religious mendicants or vagrants. See Kabir panthi.

NANAMBOO, TAM. A wood of Travancore, of a brown colour. Used for common buildings.—*Col. Frith.*

NANA PADAM, TEL. Bleaching.

NANA RAO, or the Nana sahib, of Bithoor, who claimed to be an adopted son of Baji Rao the last Mahratta Peshwa was infamous for his cruel outrages at Cawnpore in 1857 against helpless men, women and children. He joined early in the revolt of 1857-8-9 and his cruelties in Cawnpore were great. The most notorious and distinguished characters among the rebels in 1857 were Tantia Topee, once a shroff in the Oudh bazaar and subsequently servant of the Nana at Bithoor; Jwalla Pershad, the Kotwal of Cawnpore, subsequently Commander-in-Chief of the Nana's Army; Khan Bahadoor Khan of Bareilly, an old servant

and pensioner of the British Government, and long the successful leader of revolt in his district—all three were hanged. Mummoo Khan, a low menial whom the passions of the Begum of Lucknow raised from the kennel to power, was transported to the Andamans. His paramour and her boy Brijis Kudr, who claimed the throne of Oudh went to Katmandoo, under the care of the Nepaulese, where also the Ranee Chunda of Lahore, that Messalina of Indian history, had long found an asylum. Bala Rao, the brother of the Nana; Azeemoolah whom, once a khitmutgar, he sent to London as his Agent and who was his confidant throughout the revolt, and the Nana himself are said to have died in the Dookurh valley of fever. Feroz Shah, the aspirant to the honours of Delhi and the companion of Tantia Topee, was never captured. The three claimants for power in India were the Nana, Brijis Kudr and Feroz Shah. The claim of the second was to Oudh and of the third to Delhi.

NANAS, MALAY. Pipe Apple.

NANASAI? MAHR. A religious mendicant in the west of India, who extorts alms from the shop-keepers and others by importunities, abuse, and threats. These seem to be the Nanak shahi, vagrant mendicants, professing to be followers of Nanak shah, the founder of the sikh religion.

NA-NAT, BURM. Pine Apple, *Ananas sativus*, *Schult.*

NAN BAI, HIND. A bread-seller, a baker.

NANCOWRY, in lat. 8° 0', long 93° 46' E. one of the Nicobar Islands.

NANDA, a person not of princely extraction, who successfully rebelled against Pingamkha, the last of the Sisunaga kings of Maghadha, captured Patalipura and ascended the throne, B. C. 378. His younger brother was dethroned and killed by Chandragupta, B. C. 313. Nanda, and his sons, B. C. 378 to 313, and the Maury dynasty, B. C. 312. B. iii, 541.

NANDA, the cow-keeper foster-father of Krishna, in whose house Krishna grew up. Gokul is a small town on the banks of the Jumna, below Mathura, and Radha, the mistress of Krishna was wife of a cowherd of Gokul. Hence one of Krishna's titles is Gokul Nath, lord of Gokul. Gokul, is almost an island, and is one of the prettiest spots in the holy land of the hindoos. The scene there is still as pastoral as it had been three thousand and five hundred years ago. Large herds of heavy-uddered kine remind us of the days of Nanda, though their number is far short of nine lacs, possessed by that shepherd-chief of old. See Kasyapa, Krishna, Magadha.

NANDA DEVI, a peak in the Himalaya, 25,749 feet high, 3,253 feet less than Gaurisankar. The villages in most cases are built considerably above the bed of the river, some-

times on terraces remaining within the eroded channel, but more generally upon the slopes above the erosion.

NANDA MAHAPADMA B. C. 415, but Wilson 340 and Jones 1602. "He will bring the whole earth under one umbrella. He will have eight sons, Sumalya and others, who will reign after Mahapadma. He and his sons will govern for 100 years. The brahman Kautilya will root out the nine Nandas." See Bhattiya, Barhadraha, Chandragupta, Inscriptions, Kabul.

NANDAN SAR, a small lake in the Pir Panjal range.

NAND BANSA, a branch of the Ahir.

NANDER, 19° 9'; 77° 20', in the Dekhan, on the left bank of the Godaveri: Level of the Godaveri here is 1,152 feet. The mean height of the village 1,276 feet.—*Cull.*

NANDI, also called Basavi, also Rishaba, the sacred bull of Mahadeva, or Siva: it is his vahan, and by some described as the emblem of justice. In the institutes of Menu, Ch. 8, Vol. 16, the divine form of justice is represented as Vrisha, or a bull; and the gods consider him who violates justice as a Vrishala, or one who slays a bull. Nandi is the epithet always given to the vehicle of Siva. We sometimes find it is used in speaking of Garuda, the vehicle of Vishnu, and of the goose or swan, Hanasa, the vahan of Brahma; but the term Vahan would be more correct.—*Moor.* See Bull, Burabur caves, Hindoo, Lustral ceremonies, Mahadeva, Siva, Vrishala.

NANDI, TEL. Cedrela toona.—*Roxb., Cor., W. & A.*

NANDIAL, a town in the Cuddapah district. There is a forest race in the district called Chenchwar. They have no language of their own, but speak Telugu, with a harsh and peculiar pronunciation. Brahmins say they formerly were shepherds of the Yerra Golla caste. They have large dogs, and a few are employed as hill police, in the pass from the Kuman to Budwail. The Nandial Chenchwar, assert their ignorance of a god or a soul. They have no images. They are polygamists; they bury their dead, but sometimes burn, and like the Tartars, the Nandial Chenchwar carry the deceased's weapons to the grave. They have the spear, hatchet, the matchlock and a bamboo bow and reed arrow tipped with iron. They look on weaving and other manufacturing arts with contempt, and they have in general only a rag for covering. They are patient and docile. It is suggested by Mr. Logan that the Chensuar are a continuation of the wild forest Surah of the mountainous tracts, further north in the line of the Eastern Ghats. Vocabularies of six of the non-Arian tongues, the Kond, Savara, Gadaba, Yerukala, and

Chentsu are given at p. 39, No. of 1856, of *Beng. As. Soc. Journal*; Newbold in *R. As. Soc. Journ.*, 1845; Logan in *Journ. Ind. Arch.*

NANDIA VATAM, TAM. *Tabernæmontana coronaria*, *R. Br.*, *Roxb.*, *W. Ic.*, *Rh.*

NANDIDÆ, a family of fishes as under:

FAM. 33.—Nandidæ.

FIRST GROUP.—Plesiopina.

Gen. 5 Plesiops, 1 Trachinops.

SECOND GROUP.—Nandina.

Gen. 2 Badis, 3 Nandus, 3 Catopra.

THIRD GROUP.—Acharnina.

Gen. 1 Acharnes.

NANDIER VATAM, MALEAL. *Tabernæmontana coriaria*, *R. Br.*

NANDI-KESVARA, a form of Iswara or his vehicle.

NANDINA, see Lustral ceremonies.

NANDINA DOMESTICA, *Thbg.* A tree of Japan, with red berries, a plant, which takes the place of the English holly: the *Nandina domestica*, is called by the Chinese the "Tein-chok," or sacred bamboo. Large quantities of its branches are brought in from the country and hawked about the streets. Each of these branches is crowned with a large bunch of red berries, not very unlike those of the common holly, and, when contrasted with the dark shining leaves, are singularly ornamental. It is used chiefly in the decoration of altars, not only in the temple, but also in private dwellings and in boats, for here every house and boat has its altar—and hence the name of "sacred bamboo" which it bears.—*Fortune*, p. 122; *Roxb*, *Vol. ii*, p. 184; *Voigt.*, p. 27.

NANDI REKA, or Billa juvvi, TEL. *Ficus nitida*, *Thumb.*

NANDI VARDHANA CHETTU, TEL. *Tabernæmontana coronaria*, *R. Br.*— β plena—*R. ii.*, 23; *W. Ic.* 477; *Rheede*, *ii.*, 55.

NANDOBAR, see India.

NANDRA-KALA, TEL. Crab.

NANDRAMI, Rupees of Kabul.

NANDRU, HIND. *Scopolia præalta*.

NANDUS MARMORANTHUS and *Nandus malabaricus*, are fish of the rivers of Malabar, which build nests among the rushes at the margin of the water, deposit their eggs therein and keep guard over them like a stickleback. The *Ophiocephalus striatus*, *Ophiocephalus marubus*, and *O. diplogramme*, exhibit parental affection, swimming always close below their offspring and attacking everything that comes near them. This they do till the fry are about three inches long, when they turn on and eat them themselves if they do not disperse. Other fish spawn in the sand, in the gravel, and even on rock. Some fish seem to be almost entirely herbivorous, and they find an ample supply of fresh water weeds on all the rocks in the rivers. Six different sorts of podostemaceæ have been

gathered in flower and seed, but the names of only two of them have been ascertained. These are *Moriopsis hookeriana* and *Dalzellia pedunculosa*. Others prey on their brethren, and others again are omnivorous, and none more so than the mahseer.—*Mr. Thomas*.

NANEH GHAT, in the Dekhan, has a cave chamber with an inscription in old Pali of date B.C. in the old Lat character. The inscription relates to the buddhist religion and has the words Glory to Dharma, Indra, the Lords of Sakra, sun and moon, sanctified saints, Yama, Varuna, and spirits of the air, and Lokapala, or upholders of the world. It mentions the young prince Rakesa, the great warrior Tunakayiko, prince Hakusaro, connected with the house of Amara Pala. This is part of a long inscription in a chamber cut in the rock overlooking the Konkan in one of the passes, which was evidently the high road from Adjunta, Ellora, Junir, to Kalian and the cave temples in Salsette. The inscriptions in all these localities are very numerous, and call for translation.—*Vol. vii*, p. 565.

NANESHWER, a subordinate incarnation of Vishnu, described by Major Moor as having taken place at Alundy, near Poonah, about, as some state, seven, or according to others, twelve hundred years ago. In that gentleman's work he is stated to have been a religious ascetic, and to have been buried alive at Alundy, where his tomb is seen under a splendid temple, and where he yet appears (for, although buried, he is not dead) to pious, if at the same time, wealthy visitors.—*Cole. Myth. Hind.*, p. 390.

NANG, HIND. *Cornus macrophylla*.

NANGAL, a village, generally inhabited by the hindoo Sadhasect. Their body is left naked, except the lower part, which is covered by a piece of coarse cloth. They wear wooden shoes, and commonly do penance in the Himalaya mountains. Their hair is exceedingly long, and made brown by ashes.—*Mohan Lal's Travels*, p. 19.

NANGALA, see Hindu.

NANGAR, HIND. A plough.

NANGARWAL, HIND. *Ephedra alata*.

NANGASAKI, see Japan.

NANGIRA, HIND. Derajat, a wild grain. A kind of amaranth.

NANGKA, MALAY. *Artocarpus incisa*, in several districts of Java where teak is not found, the timber of this tree is almost exclusively used in the construction of houses and for other domestic purposes: the wood is more close and ponderous than the suren, which it otherwise resembles; it takes a tolerable polish and is sometimes employed for furniture. The colour is yellow; but it is made to receive a brownish hue, by the application of the young teak leaves in polishing: its bark is used as a

yellow dye. This and the Champadah, are species of *artocarpus integrifolia*, and differ from each other in the smaller size, and hairy stems of the latter.—*Wild.; Low's Sarawak*, p. 73.

NANGKE, HIND. *Ribes rubrum*.

NANG KOD, the name applied to Balti by the Dard race.

NANGO. In descending from Nango in East Nepal, Dr. Hooker passed at first through *Rhododendron* and *Juniper*, then through Black silver fir (*Abies webbiana*), and below that near the river, he came to the Himalayan larch, a tree quite unknown, except from a notice in the Journals of Mr. Griffith, who found it in Bhotan. It is a small tree, twenty to forty feet high, perfectly similar in general characters to a European larch, but with larger cones, which are erect upon the very long, pensile, whip-like branches. He adds, its leaves, now red, were falling, and covering the rocky ground on which it grew, scattered amongst other trees. It is called "Saar" by the Lepchas and Cis-Himalayan Tibetans, and "Boargasella" by the Nepalese, who say it is found as far west as the heads of the Cosi river: it does not inhabit Central or West Nepal, nor the North-West Himalaya.

NANG-PUT, HIND. *Bauhinia anguina*.—*Roob*.

NANING, an inland territory in the Malay peninsula, in length about forty and in breadth about ten miles, to the north of the old Portuguese capital. It is an undulating district, composed of jungly knolls and round valleys—inhabited chiefly by Malays—about 6,000 in number. They dwell in rudely built villages.—*John's Indian Archipelago*, Vol. ii, p. 91.

NANKA. Nankin.

NANKA ISLANDS are three in number, and are situated about four or five miles from the Banca shore, in the Straits of Banca.—*Horsburgh*.

NANKAR. There are two kinds of recognised perquisites which landholders enjoy in Oude, and in most other parts of India—the nankar and the seer land. The Nankar is a portion of the recognised rent-roll, acknowledged by the ruler to be due to the landholder for the risk, cost and trouble of management, and for his perquisite as hereditary proprietor of the soil when the management is confided to another. It may be ten, twenty, or one hundred per cent. upon the rent-roll of the estate, which is recognised in the public accounts, as the holder happens to be an object of fear or of favour, or otherwise; and the real rent-roll may be more or less than that which is recognised in the public accounts. The seer lands are those which the landholders and their families till themselves, or by means of their servants or

hired cultivators. Generally they are not entered at all in the rent-rolls; and when they are entered, it is at less rates than are paid for the other lands. The difference between the no rent, or less rates, and the full rates is part of their perquisites. These lands are generally shared out among the members of the family as hereditary possessions. The word Nankar used to mean a grant to zemindars and other hereditary local officers, is a compound Persian phrase of Nan "bread," and Kar "work," meaning support for service. Some of them in Malwa have rich endowments. The zemindary of Nolye is estimated at above sixty thousand rupees per annum.—*Sleeman's Journey*, Vol. iii, pp. 23-6; *Malcolm's Central India*, Vol. i, p. 8.

NAN-KHOAH, PERS. Ajwain seed, Ptychotis ajowain.

NANKEEN, also Nankin.

Nankings linnen,	DUT. Nankin,	HIND.
Toile-de-Nankin,	FR. Nanquino,	IT.
Nanking,	GR. Langking,	MALAY.
Nankin,	GUZ. Nanguina,	SP.

A Chinese cotton cloth either of white, blue, or brownish-yellow colour. In point of strength and durability, it is unrivalled by any of the cotton fabrics of Europe. In some of the southern parts of Europe, the warmer parts of America, and the British settlements in Africa, Nankeen is worn by both sexes all the year round, and constitutes the principle article of attire. In Great Britain and India it is now almost disused. This kind of cotton cloth is so named from Nanking, where the reddish threads were originally made. Nankeens are also manufactured in Canton and other parts of the empire, but the fabric is of an inferior quality. Those made in Canton still maintain their superiority in colour and texture over the imitations of other countries. The price varies from \$45 to \$90 per hundred pieces. This cloth is extensively worn by the Chinese themselves, who usually dye it with indigo. The exportation is now trifling. The duty, which was formerly a discriminating one, has been equalized under the new tariff, and includes nankeens and all other kinds of native cotton cloths. The durable cotton cloth made in the central provinces of China, called Nan-keen by foreigners, is the chief produce of Chinese looms from cotton, the serial muslins so highly admired by the hindoos not being woven. The nankeen is generally exported without dyeing, but the people usually colour it blue before making it into garments. The import of raw and manufactured cotton constitutes a large item in the foreign trade, but forms a small part of the native consumption. In preparing the cotton for spinning, it is cleaned and freed from knots by placing the string of a bow under the heap, and striking it with a beater; the recoil separates it into flocks with-

out injuring the staple. Nankeens were formerly sent abroad in considerable quantities, but instead of exporting their own fabrics, the Chinese now purchase cottons from their former customers to a large amount. There are few fabrics more durable than the nankeen, and it forms the principal material for cheap garments among the people.—*Faulkner; Morrison; Wilham's Middle Kingdom, Vol. ii, page 124; McCulloch's Commercial Dictionary, p. 812.*

NANKIN, GUZ., HIND. See Nankeen.

NANKIN COTTON, *Gossypium religiosum*.

NANKING, or, according to the court pronunciation, Nanchang, is not a corruption, but is the Chinese name of the old metropolis of the empire, and means "southern capital" just as Peking (in the court pronunciation Peiching) means northern capital. King, in Chinese, means an imperial capital, as in Peking, Nanking; Tu, in Chinese is a court or imperial residence, as Taitu, Shangtu; Fu, in Chinese is a city of the first class, or rather the department of which it is the head; Cheu is a city of the second class, or the district of which it is the head. The great porcelain tower at Nan-kin, in the province of Kiang-nan, is the most extraordinary building in China, it was built by the emperor Yong-lo, and is called by the Chinese the Temple of gratitude. The tower is erected upon a pile of bricks, and is formed upon a most substantial timber frame-work; it stands about two hundred feet high, and is of an octangular shape.—*Meadow's Desultory Notes, p. 10; Yule Cathay, ii, p. 262; Sirr's China and the Chinese, Vol. ii, p. 426.*

NANKING, GER. Nankeen.

NANKINGS LINNEN, DUT. Nankeen.

NAN-LUNG-KYEN, BURM. *Acacia arabica*.—*Willd., Linn., W. & A., also Vachellia farnesiana, Wight.*

NAN MAH, CHIN. A kind of cedar, of China. See Deodar.

NANNA, see Sati.

NANNA, MAHR. *Lagerstroemia reginæ, Rb.*

NAN NAN, BURM. *Coriandrum sativum, L.* Coriander seed.

NAN-NAN-YA-WET, BURM. Fennel, *Nigella sativa*.

NANOCK, see Nanak.

NAN-PARVARASHI, HIND., PERS. A pension.

NANQUIUNA, SP. Nankeen.

NANQUINO, IT. Nankeen.

NAN SINH, see Sikhs.

NANSJERA-PATSJA, Hoya pendula.

NAN TARUK, BURM. *Liquidambar altissima*.

NANTU-YOK, BURM. Liquid amber.

NANUK, the founder of the Sikh religion, is often styled Nanuk Shah or king Nanuk by

the Sikh historians, who likewise styled him Nanuk Narinkar, or Nanuk the Omnipotent. Nanuk was a hindoo of the Kshatriya caste and Vidi tribe, was born A. D. 1469, at the small village of Talwandi (since become a town and now called Rayapur,) on the banks of the Beas, in the district of Bhatti and province of Lahore.—*History of the Punjab, Vol. i, p. 79.*

NANURI, or Nonari ver, MAL., TAM. Hemidesmus indicus.

NAO, HIND., PERS. New, used in many compound words, W.

NAO, HIND. A ship, a boat; Nao-khuda, a shipmaster.

NAO-AIT, HIND. A mahomedan sect.

NAOO, BURM. In Amherst, a timber used for house posts: the leaves, flowers, and roots are said to be used for medicine. It is a brown, substantial, solid wood, not liable to the attacks of insects.

NAO-ROZ, the Parsees of India have a New year's day in March. The mahomedans of Persia reckon the year, from their Nao-roz or New year's day, the day on which the sun enters Aries, but the mahomedans of India follow the lunar months and have no intercalary periods, so that their anniversaries and festivals make, continuously, circuits of the seasons. The hindooes of India follow the lunar months, but every twenty-fifth year insert an intercalary month to adjust. See Era.

NAOSHIRWAN, the celebrated son of Kobad, in his reign an embassy came to the Persian court from the emperor of China, bringing splendid presents.—*Yule Cath., Vol. i, p. 85.*

NAPA-BIJ, HIND. Fruit of *Nymphaea lotus*.

NAPALA OIL. Croton oil.

NAPALAM, TEL. The *Jatropha curcas, Linn.*

NA PEW GEE, or Let Thouk Gee, BURM. In Amherst, Tavoy and Mergui, a wood of maximum girth 1½ cubits, and maximum length 14 feet. Abundant all over the provinces. When seasoned, it floats in water. It is a wood of inferior grain, and not durable.—*Captain Dance.*

The term naphtha is usually limited to the thinner and purer varieties of rock oil; and petroleum to the darker and more viscid liquids. Naphtha, rock oil, or petroleum, are mixtures of various hydrocarbons; but in its purest form naphtha may be said to consist of C⁸ H₈, and yielding a vapour of the density of 2.8. Such a hydrocarbon is obtained as a natural product at Baku on the shores of the Caspian, where the soil is a clayey marl im-

pregnated with naphtha. In the peninsula of Abcheran, on the western shore of the Caspian, naphtha rises through a marly soil in vapour, and is collected by sinking pits several yards in depth, into which the naphtha flows. It is also procured from Monte Ciaro near Piacenza in Italy, by sinking pits in the horizontal beds of argillite, which gradually fill with water; and the naphtha oozes out of the rock and floats upon the surface, from which it is skimmed off. There is an abundant spring near Amiana, in the Duchy of Parma. The spring at Amiana is used for illuminating the city of Genoa. Mr. Dana says that in the United States it was formerly collected for sale by the Seneca and other Indians; the petroleum is therefore commonly called Gensee or Seneca oil, under which name it is sold in the market. This substance has also been obtained pure in a liquid form from the coal-pits of Derbyshire. In the Burman empire, on one of the branches of the river Irawaddy, there are upwards of 500 naphtha and petroleum wells, which afford annually 412,000 hogsheds. The Burmah petroleum contains the compound Parafine. Petroleum is used as lamp-oil in Burmah, and when mixed with earth or ashes as fuel, naphtha is used both for fuel and light by the inhabitants of Bakou, on the Caspian. The vapour is made to pass through earthen tubes, and is inflamed as it passes out, and used in cooking. Naphtha may be obtained by the distillation of petroleum, it is also one of the results of the destructive distillation of coal, it often passes with the gas to the distant parts of the apparatus, and may be found in gas-meters and gas-meter tanks, and even in the mains. Carefully rectified naphtha, whether from natural or artificial sources, appears to possess similar properties. The sp. gr. of the purest Persian and Italian naphtha is said to vary from 0.750 to 0.760, while that of coal-naphtha may be .820 or higher. The odour of the natural naphtha is bituminous but not unpleasant; that of coal is penetrating and disagreeable. It does not congeal at Zero. It ignites readily, and burns with a voluminous sooty flame. It is not soluble in water, although it communicates its odour to that fluid. It dissolves in absolute alcohol, in ether and the oils. The boiling-point varies in different specimens from 320° to 365°. Naphtha has been found to be a good stimulant in some chronic diseases. It has been externally applied as a lotion in cutaneous affections. It is sometimes substituted for drying oil in making paints. It is also employed for preserving the metals of the alkalis, potassium and sodium, which cannot be kept in contact with any substance containing oxygen. It is used for the purpose of diminishing the friction of machinery as a substitute for sperm-oil. It

is now obtained artificially from coal, and also in a solid form, from which candles are made. Naphtha dissolves the greater number of the essential oils, and the resins; and is extensively used for dissolving caoutchouc to render cloth waterproof; with certain vegetable oils, it forms a good varnish and for this purpose is sometimes substituted for turpentine. The naphtha pit near Kifri is in the pass through which the Ak-su penetrates to the plains. The hills are about a mile S. E. of the town of Tuzkurmatti close to the gypseous hills of Kifri and the pit being in the bed of the torrent is sometimes overflowed by it, and, for a time, spoilt. The pit is about fifteen feet deep, and, to the height of ten feet filled with water; on the surface of which black oil of naphtha floats, small air-bubbles continually rising to the surface. They skim off the naphtha, and ladle out the water into a channel, which distributes it into a set of oblong, shallow, compartments, made in the gravel, where they allow it to crystallize, when it becomes very good salt, of a fine, white, brilliant grain, without any intermixture of bitterness. Great quantities of this are exported into Koordistan; and it is worth annually about 20,000 piastres, which is distributed among the different members of the family of the late dafterdar. The oil of naphtha is the property of the village. Part of it is consumed by the manzil khaneh, or sold for its support, and part for religious establishments, &c. About two jars, each containing six oaks, or one Bagdad batman, of naphtha, may be skimmed from this well in twenty-four hours. The spring is at the bottom of the pit, and once a year they cleanse the well, on which occasion the whole village turns out, victuals are distributed to all the poor, and sacrifices of sheep are made, to the sound of drums and oboes, in order to insure the good flowing of the spring again—a ceremony, in all probability, derived from remote antiquity. The principal naphtha springs are in the hills, a considerable distance south of this, towards Kifri. They are five or six in number, and are much more productive than this pit, but no salt is found there. Indeed, it is probable that naphtha may be found in almost any part of this chain. Near the naphtha-pit in the hills are alum (zak or sheb) and chalk (tabashir), of a very fine close white grain, but the natives make no use of these productions. An earth is found, which they employ to give an acid flavour to some of their dishes, no doubt it is vitriolic. Sulphur is also found, and is used by the peasants to cure the itch in their cattle and themselves. Naphtha is obtained near Kirkook. It is scooped out with ladles into bags made of skins, which are carried on the backs of asses to this town, or to any other mart for its sale. The profits are estimated at thirty

or forty thousand plasters annually. The Kirkkook naphtha is principally consumed by the markets in the south-west of Kurdistan, while the pits not far from Kifri (see Kifri) supply Bagdad and its environs. The Kirkkook naphtha is black; and close to its wells lie a great pool of stagnant water, very muddy, and covered with a thick scum deeply tinged with sulphur. A few hundred yards to the eastward on the summit of the same hill, is a flat circular spot, measuring fifty feet in diameter, full of small holes, to the number of a hundred at least; whence issue as many clear flames without an atom of smoke, but smelling most sulphureously. In fact, the whole surface of this perforated plot of ground appeared a crust of sulphur over a body of fire within; and on Major Porter digging a hole into it with his dagger, to a depth of ten or twelve inches, a new flame instantly burst forth. From this spot the government derives another source of revenue from the sale of its sulphur. The natives call the place Baba Gurgur. Gur being an Arabic name for naphtha or bitumen. Mr. Rich describes the principal bitumen-pit at Kit (which place must have furnished the builders of Babylon) as having two sources and being divided by a wall, on one side of which the bitumen bubbles up, and on the other the oil of naphtha. The manner of qualifying the bitumen for use as a cement, he observes, is very troublesome, for to render it capable of adhering to the brick it must be boiled with a certain proportion of oil. Its chief purpose, when applied to building, appears to have been in the lower parts as a preservative against damp; and at present it is used for coating cisterns, baths, caulking boats, &c.; in short, to every thing put in the way of injury from water. The black naphtha springs at Baku, on the Caspian, are of similar benefit to the inhabitants of that part of the country; and Jonas Hanway describes their appearances and applications, to be nearly the same as they exist at the present day. He mentions, that when the weather is thick and hazy, the springs boil up higher; and that the naphtha, sometimes taking fire on the surface of the earth, runs like burning lava into the sea. In boiling over, the oily substance makes so strong a consistency as to gradually become a thick pitchy substance all round the mouth of the pit. The poorer sort of people use it as we would do oil, in lamps, to boil their food. They find it burn best with a small mixture of ashes: but, for fear of accidents, they preserve it in earthen vessels, under ground, and at some distance from their dwellings. There is also a white naphtha, of a thinner fluid than the black, and not found in such great quantities. It is sometimes recommended medicinally, inwardly, for chest complaints, and outwardly, for cramps and rheumatisms. Both it and the black are

used for varnish. When it takes fire by accident, the consequences have often been fatal; and Strabo, who calls it liquid bitumen, asserts that its flame cannot be extinguished by water. The experiment tried by Alexander was horrible in its effects; and with a very little addition made by a poetical fancy, might induce us to believe that the celebrated consuming garments which Medea bestowed, were robes dipped in the naphtha that flowed so near her native land. The flaming soil or everlasting fire, as it is called, of Baku, is not less famous than its naphtha springs. It is now part of the eastern territory of Russia. The bitumen so famous in the Babylonian history, and so often described by travellers, is, when taken from the pit, a thick dark liquid resembling pitch, similar, although of a finer quality, to the pitch from the lake in the island of Trinidad. It is undoubtedly a most excellent substitute for pitch. The bottoms of most of the vessels which navigate the Euphrates and Tigris are covered with it; and it is also used in the lamps, instead of oil, by the natives. There are several fountains of this bitumen in Irak Arabi, and the lower Kurdistan. The most productive are those in the vicinity of Kerkook Mendali and Hit on the banks of the Euphrates. The white naphtha is, of a much thicker consistency, and more like tallow. It has no resemblance to pitch, affords a better light, and, at the same time, emits a less disagreeable smell than the other. It floats like a crust on the surface of the water, whilst the black, on the contrary, is procured by digging a small pit, about three feet in diameter and ten or twelve in depth. The pit fills of itself after a certain period, and is then emptied with a leathern bucket, and fit for use immediately afterwards. The only fountain of white naphtha which Major Porter had seen, is situated at the foot of the mountains of Bucktiari, half-way between the city of Shuster and the valley of Ram Hormuz. Naphtha springs occur at Ayer-i-Nosh. The flaming soil or everlasting fire of Baku is the attraction to pilgrims and is not less famous than its naphtha springs. Naphtha holding in solution a bituminous matter was obtained by Vigne near Deraband in the Suliman mountains.

At Tung-shao, near Tam-sui in the island of Formosa are wells yielding paraffin, or thick bitumen differing from the Burmah or American rock oils. A naphtha is said to be obtained in Corea. During the war between the Chinese and the British in 1842, much naphtha was brought from Sech-uen, stored at Ningpo for the purpose of destroying the British Fleet. Naphtha, of a reddish colour, by the Japanese called Tasutsona Abra, which signifies red earth, is found in a river of the province Jetsingo. It is taken up in such places,

where the water hath little or no run, and the natives burn it in lamps instead of oil. Naphtha is used for cheap varnishes. It dissolves the resins more readily than ordinary spirit of wine, but the varnish is not so brilliant.—Tomlinson; Dana, *Manual of Mineralogy*; Gregory, *Hand-book of Organic Chemistry*; Eng., Cyc.; Faulkner; Rich's *Residence in Koordistan*, Vol. i. pp. 27—9; Porter's *Travels*, Vol. ii, p. 440 to 443.; Smith *Mat. Med.*, p. 155; *History of Japan*, Vol. i, p. 111. See Kirkcok, Kifri, Jogi, Asphalte, Bitumen, Earth oil, Petroleum, Rock oil.

NAPIER, Sir Charles, K. C. B., a British Infantry officer who commanded an army in Sindh, and fought and won the battles of Dubbee and Mcanee. He was afterwards Commander-in-Chief of India. He died on the 29th August 1853.

NAPIER, Robert, Lord Napier of Magdala, an officer of the Bengal Engineers, who rose to the rank of General officer, was engaged in the wars against Lahore and was styled the Bayard of the Punjab. Subsequently he was engaged in the wars of the rebellion in 1857-8-9, in the second China war, was a member of the Viceroy's Council, then Commander-in-Chief of Bombay, and commanded the expedition to Abyssinia, into which he led successfully a mixed army of Natives of India and Europeans through the mountains of Abyssinia to the storm of Magdala, the capital of the emperor Theodore of Abyssinia. Theodore destroyed himself at the gateway. The march to and from Magdala has not been surpassed since Hanibal crossed the Alps.

NAPIT, HIND. A barber, a shaver, who usually acts also as a surgeon, the village barber and barber-surgeon. Along with the original term, the dialects have various modifications of the word, as Nai, Hind., Naida, Nainda, Napig, Karn, Nau, Nahir, Nhawi, Nahawi, Nahu, and Nhawi, Mar.

NAPUTA, HIND. Didynamia gymnosperma.

NAQOOS, AR. A bell or conch-shell.

NAQSHA, HIND. Chart, map, plan.

NAR, HIND. Arundo donax, Amphidonax karka, also Rhamnus virgatus.

NAR, HIND. of Kaghan, Hazara, &c., used for malah, and meaning mountain stream.

NAR, TURK. Pomgranate.

NAR or Nul, BENG. Amphidonax karka, employed for making the mats known by the name of Durma, which are formed of the stalks split open. In Sindh the grass called Sur, which perhaps is Arundo karka, has its culms, sur jo kanee, made into chairs, and its flower-stalks beaten to form the fibres called moonyah. These are made into string or twine (moonyah jo naree,) and into ropes (moonyah jo russa).—Royle.

NAR, TAM. Fibre.

NARA, HIND. The tape or band for the trowsers.

NARA and Naraiyana in one hindoo legend, sons of Dharma and Ahinsa: devoted themselves to ascetic exercises which alarmed the gods, and Indra sent Kama and Vasanta, or love and spring, with the nymphs of heaven to inflame the sages with passion and thus end their penance. Narayana observing the gambols of the party suspected their purpose. He invited them to approach, and treated them with so much civility, that they thought their object was attained. The sage, however, taking up a flower-stalk, placed it on his thigh, when a beautiful nymph appeared, the superiority of whose charms covered the nymphs of heaven with shame. Narayana then told them to return to Indra, and bear him a proof he needed not the company of beauty, in the present he made him of the new-born nymph, who accompanied the Apsaras to Swerga, and was called Urvasi from uru, a thigh (Vamana Purana). A commentator on the drama says, Nara and Narayana were Avataras, descents or incarnations of Arjuna and Krishna.—Wilson's *Hindu Theatre*, Vol. p. 201; *The Hero and the Nymph*, see Yoni.

NARA or Kinara, see Zingarri.

NARABALI, see Hindoo.

NARA BOTUKU, TEL. Eriochloa hookeriana, W. and A. 259. The term nara implies a fibrous texture.

NARA CHETTU, TEL. Tetranthera monoptala, R. iii, 821; Cor. 148.

NARADA, in hindoo mythology, a famous rishi and the prince of musicians, frequently going on errands, usually regarded as one of the ten Rishi or Prajapati, first created by Brahma and called his sons. He is described as a friend of the god Krishna, as a celebrated lawgiver, and as the inventor of the vina or lute. Narada is mentioned in Manu 1, 34, 35, as one of the 'ten lords of created beings, eminent in holiness.' In the hindoo plays Narada usually acts as a kind of messenger of the gods. See Vikramorvasi end of Act v; and Sakuntala, end of Act vi. He is constantly employed in giving good counsel. He is by some considered to belong to the order of the Denashi, and by others to the Brahmarshi. It was Narada who declares to king Harischandra the benefit of having a son.—William's *Story of Nala*, p. 167.

NARA DABBA or Dabba, TEL. Citrus medica, L.

NARADIDI VRIKSHA, CAN. Eugenia caryophyllifolia.

NARA EPE or Epe, TEL. Hardwickia binata, R. ii, 423; Cor. 209—W. and A. 879. The

bark yields a strong fibre which people extract in considerable quantities and employ as cordage, without further preparation, in the island of Sivasamudram.

NARAGA MARAM, TAM. *Ehretia ovalifolia*.

NARAH, MALEAL. A tree of Malabar and Canara that grows to about twelve feet high, and ten inches in diameter. It is curved in growth, and is used for the frames of vessels. It is not very durable, and ranks as one of the inferior sorts of jungle wood.—*Edye, M. and C.*

NARAIN, a river near Moondura in Saugor.

NARAINA, 40 miles from Jaipur, the chief site of the Dadu Pant'hi sect.

NARAKA or Narakam, SANS. Hell, the abode of the wicked.

NARAKARU, part of the inferior village servants of India, they are similar to the menials of the ballotta system.

NARA MAMIDI, TEL. *Tetranthera roxburghii*, *Nees*—*a. apetala*, *R.* iii, 819; *Cor.* 147. Nara or Nara chettu, is a generic term for *Tetranthera* at Vizagapatnam.

NARA MEDHA, SANS. A human sacrifice.

NARANG, AR. *Citrus aurantium*, *Linn.*

NARANGAMU, TEL. *Citrus aurantium*, *L.*

NARANGI, HIND. *Citrus aurantium*.

NARANGAS, SP. *Citrus aurantium*, *Linn.*

NARANJ, PERS. *Citrus aurantium*, *Linn.*

NARANJA, SP. Orange.

NARANI, a river in Sagor.

NARAPATI or Chola dynasty of Karnata, Dravira, and the southern portion of the Peninsula of India, embraced a period of 534 years, during which 27 rajas reigned, from A. D. 266 to A. D. 800. After the overthrow of the Narapati dynasty, Karnata and Dravira seem to have been separated from the southern districts, in which the Chera, Chola and Pandava lines were at first united, under one sovereignty. Thereafter, 13 maharajas of Madura, Tanjore and Coimbatore, reigned 239 years, after which follow the Belal rajas of the Karnata, and the petty Polygar dynasties of Madura, &c.—*Prinsep, p. 275.*

NARA-SHIJ, BENG. *Euphorbium antiquorum*, *Linn.*

NARASIMHA, Vishnu's incarnation as man-lion.

NARA-SINGHA or Man-lion avatar, of Vishnu in which he took the form of a monster to punish the wickedness of Hiranya-casipa, a profane and unbelieving monarch, the brother of the gigantic demon mentioned in the third avatar, and his successor on the throne, who also refused to do homage to Vishnu. Quarrelling with his son, Pralhad, the king boasted that he himself was Lord of the Universe, and asked wherein Vishnu was greater than himself. Pralhad replied that Vishnu was

supreme over all and was everywhere. Is he, cried Hiranyacasipa, in this pillar? striking it at the same moment with his sceptre, if he be, let him appear. In an instant the magnificent column was rent in twain, and Vishnu in the form of a man with the head of a lion, issued from it and tore Hiranyacasipa in pieces. See Avatar, Sacti, Salagrama, Inscriptions, Vishnu.

NARASINGHI, a name of Lakshmi, as the sacti of Vishnu in the Narasingh avatar.—*Cole. Myth. Hind., p. 390.*

NARA TEGA or Nara tige, or Eddu toka dumpa, *Dioscorea glabra*, *R.* Tega is the tuberosous root, tige the twining stem.

NARAVALI FIBRE, ANGLO-TAM. Fibre of *Cordia angustifolia*.

NARAVARMA, see Inscriptions.

NARAVELIA ZEYLANICA, *DC.*

Chagul-bati, BENG. *Atragene zeylanica*, *L.* A handsome flowering climbing plant of Ceylon, British India, Burmah and Tenasserim.—*Drs. Roxb., Mason, Voigt.*

NARAYANA, in Hindu mythology, the Spirit of God, Brahm. The term means moving on the waters. By the Vaishnava sect, he is identified with Vishnu, but in the Saiva theogony, Narayana and Siva coalesce. Narayana, is pronounced and written Narayan, or sometimes Narrain: it is a common name with hindoos of several sects, and often occurs in their writings without reference beyond mere mortality. Dasa, usually written by the English, Dass, or Doss, is a common termination to hindoo names of men, especially among the tribe of Baniyas, as Narayan Doss. Bhagavan Dasa, for instance, signifies the slave of Bhagavan, Vishnu, or Crishna; similarly to Abid Ullah, the slave of God, among the mahomedans, Ramdas is, in like manner, the slave or servant of Rama. In the Ins. of Menu, c. 1, v. 10, the waters are called Nara, because they were the first production of Nara, or the Spirit of God; and since they were his first ayana, or place of motion, he is thence named Narayana, or moving on the waters. Narayana in his watery cradle, is a most mystical and profound subject: his boat-shaped Argha, its rim, its termination; the endless figure he assumes by the conceit of putting his toe in his mouth, symbolical of eternity, furnish enthusiasts with fancies of a corresponding endless and puerile description. The cradle is also styled *vat patra*, meaning of the leaf of the sacred pipala; and *pan-patara*, or leafy vessel; as well as *Argha patra*, and by each of the words forming the last. In marriage, and funeral ceremonies, as well as in that copious sacrifice of *Srad'ha*, an Argha is an indispensable utensil. At the very extremity of a promontory on the island of Bombay, called Malabar Point, is a cleft rock, a fancied resema-

blance of the Yoni, to which numerous pilgrims and persons resort for the purpose of regeneration by the efficacy of a passage through this sacred type. This Yoni, or aperture, is of considerable elevation, situated among rocks of no easy access, and, in the stormy season, incessantly buffeted by the surf of the ocean. The hindoos are prone to fancying a type of something mysterious in almost every subject that can come under their contemplation: any thing hollowed out, conveying an idea of capacity, they deem typical of the Yoni, or Argha, itself a type of female nature, or the Sacti, or power, of Siva. The sea, a pond, a well, a cave, the palm of the hand, or any thing similarly hollowed, convey to their enthusiastic minds an idea of the Argha; and their periphery, real or imaginary, an idea of the Yoni. In like manner, a mountain, a hill, a tree, deprived of its boughs, a mast, a pole, an obelisk, a pyramid, or anything conical or erect, excites an idea of the Linga; and such objects as they can fancy its symbol; a conical stone is particularly so esteemed, or fire or flame whose natural and necessary form is conical. Hence a triangle, with its apex upwards, is the immediate type of Mahadeva, who in some relations, is fire personified. Vishnu is, in like manner, a personification of the principle of humidity; and water is symbolized by a cone, or triangle, with its apex downwards: these types correctly denoting the ascending and descending properties of their respective prototypes, elemental fire and water. The two conjoined, express the junction or union of the two elements, or deities: this mark or character, is said to represent also Vishnu and Prit'hivi, of whom an equilateral triangle is severally the type. The larger the object, the more venerable. The *As. Res.*, Vol. ii, p. 478, mention a cone, in Bengal, of 363 feet diameter. The sea itself, or rather its containing concave, is regarded as the Argha of the world. In hindoo mythology, the beverage of immortality drank by the gods, Narayan's gem and other gifts to man are fabled to have been produced by churning the ocean, along with other precious gifts to man. Chitra-ratha describes in song how

"Whilom from the troubled main,
The sov'reign elephant Airavan sprang;
The breathing shell, that peals of conquest rang;
The patient cow, whom none implores in vain;
The milkwhite steed, the bow with deafning clang;
The goddesses of beauty, wealth, and wine;
Flowers, that unfading shine;
Narayan's gem; the moonlight's tender languish;
Blue venom, source of anguish;
The solemn leech, slow, moving o'er the strand,
A vase of long-sought Amrit in his hand—
To soften human ills dread Siva drank
The poisonous food that stain'd his azure neck;
The rest, thy mansions deck,
High Swerga stord in many a blazing rank."

—*Moor*, pp. 79 & 399; *As. Res.*, Vol. vii, Arts.

viii and ix, by Mr. Colebrooke. See Argha, Bhaktamala, Brahma or Hiranyagharbha, Hindoo, Linga, Narayan Das, Sati, Vishnu, Yavana, Yoni.

NARAYANI, a name usually applied to Lakshmi, as the Sacti of Vishnu; but may also be applied to Parvati and Saraswati. See Lakshmi, Narayana, Sacti, Salagrama.

NARBADA, a river of Central India, which rises on the plateau of Amarkantak and disembogues in the Gulf of Cambay. It is written Nerbadah, Nerbuddah. From Haran Pal or the Deer's Leap to the temple of Sulpani Mahadeva, a distance of some seventy miles, there occurs the main barrier of the Narbada. Here the Narbada displays all her terrors. Thereafter the Narbada enters on the rich plains of Broach which border on the sea. In this particular section it is securely navigable, and is actually navigated by country craft. The Narbada, then rising in the highest land of Central India, 5,000 feet above the sea, and pursuing a serpentine westerly course for 750 miles through a hilly tract, which runs parallel to, and borders closely both its banks, may be said to flow through a longitudinal cleft rather than a distinct valley, and to present the general characters of a mountain stream more than anything else. No great depth of water can ever be expected in it, from the nature of its tributaries, except in the monsoon; neither, were they to promise better, could it be retained, owing to the great declivity of the bed of the river, which from Jhansi Ghat, near Jabalpur, to the sea falls 1,200 feet in 500 miles. The falls are those of Kapiladhara and Dudhdhara near its source, the former of 78 feet. The next is at Umaria in the Narsinghpur district of about ten feet. At Mandhar, ninety miles below Hoshungabad, and about twenty-five below Handia, there is a fall of forty feet; at Dadri, near Punasa, twenty-five miles below Mandhar, there is another fall of forty feet. The classes which prevail most among the agricultural population of the Narbada valley, are the Gujar, the Jat, the Kaohra, and the Kirar; these are hardly represented in Damoh. The Kurmi are the most numerous caste. Then follow the Lodhi, Chamar, Gond, Brahman, Ahir, &c. In number 262,641, they may be roughly classified thus:—

Kurmi.....	34,907	Ahir.....	15,281
Lodhi.....	31,980	Bania.....	9,783
Chamar.....	28,401	Rajput.....	9,187
Gond.....	29,724	Other castes.....	82,712
Brahman.....			

See Nagpore, Sagor and Nerbuddah.

NARCINE, a genus of Fishes inhabiting the Indian Ocean.

NARCISSUS. From the habit of planting the Narcissus upon tombs and shrines, it has

acquired a certain sacredness of character. The hindooes have few tombs. They have shrines however, many of which have been adopted by the muhammadans. The Narcissus is common in the Panjab. The Narcissus flowers are of easy culture in a light soil, though they throw out a profusion of leaves, they rarely blossom.—*Ben. As. Soc. Jour.*, No. 11 of 1854, p. 146; *Riddell*. See *Hemerocallis fulva*, Nargus.

NARCONDAM, see Volcanoes.

NARCOTICS, in use amongst eastern nations, are commonly of vegetable origin, such as opium, bhang, madad, majum, ganja.

NARD.

Narden,	GR.	Jatamansi,	HIND.
Nardoon,	LAT.	Bekh-i-Sanbal,	PER.
Balchur,	HIND.	Nartu,	TAM.

Nard, said to be the spikenard of Solomon and of St. Mark, is the Nardos indike, or Nardos, also N. gangetica, and the Nardostachys jatamansi, *De Candolle*. Celtic nard is the Valeriana celtica and mountain nard the Asarum europæum. The term Nard was in use amongst the ancients to designate any Indian essence, as Attar (Otto) is now used. The spikenard of Solomon's song, is the Nardostachys jatamansi. Alabastron, of the ancients, were phials used for holding their precious scents or cosmetics. Dioscorides (I. i, c. 6) describes three kinds of Nard, of the first and principal of which, there are two varieties, Syrian and Indian, the latter is also called Gangites, from the river Ganges, near which, flowing by a mountain, it is produced. The second kind is called "Celtic," and the third "Mountain Nard." On consulting Avicenna, we are referred from Narden to Sunbul, pronounced Sumbul, and in the Latin translation from Nardum to Spica, under which the Roman, the mountain, the Indian and Syrian kinds are mentioned; and Sanbul, misprinted Senbel, is given as the synonymous Arabic name. This proves, as stated by Sir Wm. Jones, that Sumbul, in Persian dictionaries, translated, the hyacinth,—the spikenard, to which the hair of a mistress is compared—an ear of corn, &c., was always considered by Arabian authors as synonymous with the Nardos of the Greeks. On consulting the Persian works on the *Materia Medica* in use in India, and especially the *Mukhzun-ool Adwiah*, we are referred from Narden, in the index to Sumbul, in the body of the work. Under this name, however, four separate articles are described—1st, Sumbul-hindee; 2nd, Sumbul-roomee, called also Sumbul ukletee, and Narden-ukletee, evidently the *νάρδος ἰνδική* of Dioscorides, said also to be called Sumbul-italoon, that is; the Nard, which grows in Italy, the 3rd kind is Sumbul-jibullee, or Mountain Nard (*νάρδος ορεινή*); and 4th Sumbul farsee, which is a bulbous plant, and probably a kind of hyacinth. *Polygonum tuberosa* is described as being one of the

kinds of Persian Sumbul. But the first alone is that which is valued for its fragrance. The synonymes of it, given by Persian authors are in the Arabic, Sumbul-ool-teeb, or fragrant nard, in the Greek narden; in Latin, nardoom, in Hindee, balchur and jatamansee. The last is a Sanscrit name, and that which was given to Sir Wm. Jones, as the equivalent of Sumbul-hindee and which he informs us, like other Sanscrit names applied to the same article, has reference to its resemblance to locks of hair.—*Willd.*; *Royle's Ill. Him. Bot.*, p. 242.

NARDAR BOUTHAAH, see Bazecegur, Nat : Nut.

NARDEN, also Nardos, Gr. Spikenard.

NARDJIL, ARAB. *Cocos nucifera*, L.

NARDOSTACHYS GRANDIFLORA has a glabrous stem, oblong glabrous leaves, with solitary terminal flowers; the capsule is downy, and the lobes of the calyx evidently denticulated. It is a native of Nepaul and Kumaon.—*Lindley, Flora Medica; Eng. Cyc.*

NARDOSTACHYS JATAMANSI, DC.

Valeriana jatamansi, Jones.

Patrinia jatamansi, Don.

Sumbul-ul-tib,	AR.	Nardos indike,	GR.
" hindi,	"	Sanbul,	HIND.

Muygiah,	"	Chehur,	
Jatamansi, BENG., HIND.,	"	Indur-latib,	
" SANS., TAM.	"	Narawastu,	MALAY.
Spikenard, ENG.	"	Nard,	PER.
Indian "	"	Mattusal,	of Ravi.
	"	Shadamanji,	TAM.

A dwarf herbaceous plant with a long hairy taproot; stems perennial, very short, and simply divided into a number of shaggy, scaly crowns, from which the leaves are produced; the branches erect, downy, and a few inches high; leaves obovate, lanceolate, 5-ribbed, downy, those at the base acute, the upper ones obtuse; the flowers are of a pale pink colour, clustered in the axils of the upper leaves, which form a kind of involucre for them. The true spikenard of the ancients is supposed to have been obtained from the Nardostachys jatamansi. Considerable discussion has arisen as to the true origin of the celebrated spikenard of the ancients, but the labours of Sir William Jones and Professor Royle leave no longer any reasonable doubts as to its being truly referable to this plant. It is a native of Nepaul, on the Himalaya mountains, and in Delhi, Bengal, the Dekhan, and Punjab Himalaya, where it ranges from 10,000(?) feet upwards. The roots of the jatamansi are brought down from the mountains in large quantities. The root is of a blackish colour, and resembles the bushy tail of the ermine. Its odour is strong and fragrant, and is much esteemed by all eastern nations. For medicinal purposes experience leads to the belief that the species is a perfect representative of the

valerian of the English Pharmacopœia; it is used to scent and clean the hair, also in medicine as a stimulant and antispasmodic. This species of valerian smells strongly of patchouli, and is a very favourite perfume. It is used in scents for its strong odour; it is also used as refrigerant. Dose, gr. v. to 3 j. in infusion. Price 6 annas per lb., employed chiefly as an expectorant in coughs and colds. Dose, grs. xlv. of the powder, price 9d. per lb. In Chumba, its root is said to be added to the beer of that tract, and it is exported to the plains to be used in medicine, being considered cordial. The Indur latib, of which Davies' Trade Report states that five maunds are imported from Persia via Kabul and Peshawar annually, has been dubiously identified with this drug.—*Simmond's Comm. Product*, 572; *O'Shaughnessy*, pages 403, 404; *Powell Hand-book*, Vol. i, p. 354; *Hooker's Him. Jour.*, Vol. i, p. 217; *J. L. Stewart, M.D.*

NARDUM, LAT. Spikenard.

NARE, TAM. Fox.

NAREDA, in hindoo mythology, is a son of Brahma and Saraswati. He is the messenger of the gods, and the inventor of the vina, or hindoo lute. He was not only a wise legislator, an astronomer, and a musician, but a distinguished warrior. The mythological offspring of Saraswati, patroness of music, was famed for his talents in that science—so great were they, that he became presumptuous, and emulating the divine strains of Krishna, he was punished by having his vina placed in the paws of a bear, whence it emitted sounds far sweeter than the minstrelsy of the mortified musician. In a picture of this joke, Krishna is forcing his reluctant friend to attend to his rough visaged rival, who is ridiculously touching the chords of poor Nareda's vina, accompanied by a brother bruin on the symbols. To this day Nareda is represented in the hindoo Jatra under a long grizzled beard.—*Cole's Myth. Hind.*, p. 7; *Tr. of Hind.*, Vol. i, p. 269. See Brahmadica, Krishna, Narada, Saraswati, Veda.

NAREDE CHETTOO, TEL. *Eugenia caryophyllifolia*.

NARODA, in Guzerat a tribe of half-caste Rajputs.

NAR-PUTTE, TAM. A Ceylon tree which is used for canoes, planks of vessels, &c. It grows to about thirty feet in height, and twenty inches in diameter; is not durable, and is of little use.—*Edye, Ceylon*.

NARR, HIND. *Malva parviflora*.

NARRA CANAL, a Canal in Sind'h. See Canal.

NARRAINPETT, Dhanwar and Muktul, in the Nizam's territories; Gudduk and Bettigherry in Dharwar, Kolapoor, Nassik, Yeola, and many other are manufacturing towns in the Deccan; Arnee in Chingleput and elsewhere, send out cotton fabrics of excellent texture, with beautifully arranged colours and patterns, both in stripes and checks. Comparatively few native women of any class or degree wear white; if they do wear it, the dress has broad borders and ends. But women of all classes wear coloured clothes, black, red, blue, occasionally orange and green, violet and grey. All through Western, Central and Southern India, sarees are striped and checked in an infinite variety of patterns.

NARRI, HIND. *Polygonum barbatum*, also *Arundinaria falcata*: bag narri, is the Arundonax.

NARRI-COMBOO, TAM.? The Jackal's horn, which natives say only grows on the head of the leader of the pack. The Singhalese and the Tamil races regard it as a talisman, and believe that its fortunate possessor can command by its instrumentality the realization of every wish, and that if stolen or lost by him it will invariably return of its own accord. It is the popular belief that the fortunate discoverer of a jackal's horn becomes thereby invincible in every law suit, and must irresistibly triumph over every opponent. In the Museum of the college of Surgeons, London, is a cranium of a jackal which exhibits this strange osseous process on the super-occipital bone and Sir J. E. Tennent placed along with it a specimen of the horny sheath, which was presented to him by Mr. Lavalliere, district Judge of Kandy.—*Tennent's Sketch, Nat. Hist.*, pp. 36-37.

NARROOVALLAY PALLAM, TAM. Fruit of *Cordia obliqua*, also of *C. angustifolia*, Roxb.

NARROW-BEAKED CROCODILE of the Ganges, see *Crocodylidae*, Sauria.

NARROW-LEAVED TURMERIC, *Curcuma angustifolia*, Roxb.

NARSINGA, or Nursoo, a hindoo deity. See Salagrama.

NARSINGHPUR, a district of Central India between 22° 45' and 23° 15' of north latitude, and 78° 38' and 79° 38' of east longitude. It consists of three distinct portions. The largest of these lies south of the Narbada, and on the north has the Narbada, on the east by the Sone, and on the west by the Dudhi.

The southern boundary is an irregular east and west line including a strip of the Satpura table-land, generally narrow, but of varying width. The trans-Narbada portions are two isolated tracts. The easternmost, a mere insignificant patch of hill and ravine, the westernmost is a small but fertile valley, enclosed by the Narbada in a crescent-shaped bund of the Vindhyan range. The whole area of the district is 1,916 square miles, of which about half is cultivated. The extreme length from east to west is about seventy-five miles, and the extreme breadth about forty miles. The number of villages is 1,108, giving an average area to each village of nearly a square mile and three quarters. The face of the Satpura range overlooking the valley is generally regular, probably nowhere rises more than 500 feet above the low land. The Vindhyan range of flat-topped cliffs is marked by great uniformity of outline, averaging from three hundred to four hundred feet above the level of the valley, in rare cases rising to eight hundred. In a similar manner the line of escarpment bounding the valley on the south marks the northern limit of the Talchir, Damuda and Mahadeo series of rocks, &c.

On both sides of the valley the high ground is often occupied by basaltic trappean rocks. On the north such rocks spread into wide patches over the country towards Bhopal, Sagar, and Damoh, in which direction they gradually die out, on the S. and S. W. the trap is found to cover considerable areas among the Gondwana hills, and it becomes gradually more and more the prevailing surface rock in this direction, and so far as known, connects itself with the great trap area of the Deccan. The prevalence of regularly-bedded fine-grained grits, with a characteristic red colour, is the most striking lithological feature of the Vindhyan group, and speaking of the formation generally, its most marked characteristic certainly is the persistency of this lithological aspect over great areas. This sameness of texture is strongly in contrast with the prevailing character of all the more recent sandstone formations to the south. Ripple-marking may be considered as a phenomenon characteristic of the Vindhyan series; almost totally absent in all the other groups of sandstone of Central India, it is almost everywhere throughout them found preserved in the most extraordinary perfection. The Narbada is fed almost entirely from the south, as the watershed of the Vindhyan table-land stands but little back from its southern face. As soon as the limits of the "haweli," or black soil tracts, are passed, the characteristics of the country change. The population of the Narsinghpur district is 336,000, of whom rather more than one-third are non-agricultural classes. The

average population rate is about 175 to the square mile. The mohammedans number little more than three per cent. of the whole. Most of the Gond race who dwell in the valley conform to hindoo rites and observances. There are a few Jain merchants and mountain Gonds. The most influential landholding classes are the Brahman, Rajput, Raj-Gond, Lodhi, Kurmi, and Kaonra. The Brahman and Rajput zamindars are scattered all over the district. The Raj-Gond and Kaonra are to be found principally in the western sub-division—Gadarwara; the Lodhi in the eastern and central sub-divisions and the Kurmi in Narsinghpur. Besides genuine Rajputs and the Kaonra there are three other castes, well represented among the land-holding body, who claim Rajput descent, viz: Bundela, Raghubansi, and Kirar. The total number of land-holding classes is thirty-two, and the total number of castes represented in the district is not less than twice that number. The people of the valley are generally well-grown. Among men of the peasant class the favourite colour of the angarkha, or long coat, is yellow, with a green shade from the mhowa dye. The sleeves are turned back on the wrists, and the waist-cloth is worn on or below the hips, with a white turban. The chiefs affect the Maratha turban tied so much on one side as almost to cover one eye, or what appears to be a Gond fashion—a turban composed of innumerable folds of cloth twisted like a rope. Their dress seldom corresponds with their pretensions, and some of the oldest rajas and thakurs might be taken for poor peasants. Titles of honor are so common as to have lost much of their significance. Raja, Thakur, Rao, Diwan and Chaudhari abound in every part of the district, and it is so much the custom to adopt any available distinction, that such designations as Jamadar and Mukhtar are pressed into the service as hereditary honors. There is certainly neither the closeness of ritual observance, nor the rigidity of social usage, which prevail in Hindustan. Among brahmans, the Kanojia still keep up their intercourse with their parent country, and adhere to their traditionary rights and habits; but the Sanoria who take a high rank in Upper India, are here very lax, forming connections with women of other classes, and neglecting the niceties of hindoo worship.

The four known periods of the history of this part of the valley are the Gond rule, the dominion of the Maratha subas of Sajar, the rule of the Bhonsla rajas of Nagpur, and British administration. The origin of the Gond rajas of Garha Mandla is lost in antiquity, but the Gond Rajput family, which was supplanted by the Marathas, is said to have sprung from Jadhava Raya, a Rajput, who succeeded his father-in-

law, the Gond raja Nagdeo, in A.D. 358. Forty-eight in descent from him was raja Sangram Sa, who is stated to have extended his dominions over fifty-two districts, only three or four of which he received from his father. The Narsinghpur district came under the Mandla rule in his reign, and he is said to have built the fort of Chauragarh. The principal implements of husbandry now employed are the "bakhar" and the ordinary plough. The former is a kind of scarifier, having, instead of a share, a broad iron blade set horizontally and at right-angles to its body. It is used in preparing the land for the rain crops, twice if possible before the setting in of the rains, and twice afterwards. Iron pits lie north of the Nabada, near the Vindhyan hills; and the excavations for coal have been made at Mohpani, in the Satpura hills at the debouchure of the Chita-Rewa river.—*Gazetteer of Central Provinces.*

NARTHEX ASSAFÆTIDA, Syn. of *Ferula assafætida*.

NARUL KA-TEL, HIND., of Dera Ghazi Khan, a compound oil used as a drug in some eye complaints.

NARUMPANEL, MALEAL. *Uvaria narum*, Wall.

NARUNGEE, PERS., also Narunghi, also Kounla, GUZ., HIND. *Citrus aurantium*; orange, sweet orange.

NARU NINDI, MALEAL. *Hemidesmus indicus*, R. Brown.

NARUVALLI, TAM. *Cordia angustifolia*, R.

NARU VALLUM, MALEAL. *Croton tiglium*.

NARVALI FIBRE, ANGLO-TAM. See Narwuli.

NARVALLI MARAM, TAM. Species of *Cordia*.

NARVELI, a Ceylon tree, sometimes called Jambu, in Tamil and Portuguese. It grows to about eighteen inches in diameter, and from ten to fourteen feet in height. It is used for the frames of native vessels and boats, but is not considered a very durable wood. After it has attained its full growth it produces a berry which the natives use as food. This seems a species of *Eugenia*, or the *Dillenia speciosa* of Thunberg.—*Edye, Ceylon.*

NARWALI or Narvali, fibre of *Cordia angustifolia*, ropes are made of the fibres.—*M. E.*

NARWULI, TAM. *Cordia angustifolia* and *Cordia obliqua*.

NARYANA, see Inscriptions

NARYEL, HIND. A cocoa nut shell, a kind of hukka.

NAS, HIND. *Hordeum cæleste*, Thibetan barley.

NAS, HIND. Snuff.

NASA-BHAGA, BENG. *Peristrophe bicalyculata*.

NASAL, Ar. Family. Nasal-Namali, HIND., PERS. A genealogical tree.

NASALIS LARVATUS.

Kahan of Borneo, | Bangkatan of Labuan.

The proboscis monkey, well known in Labuan and Borneo, its glossy coat is richly coloured. It is shy.

NASHA—? *Phyllanthus*, species.

NASHDAK, RUS. Emery.

NASHPATI, HIND. *Pyrus communis*.

NASHTAR, HIND., PERS., PERSU. *Cedrus deodara*, deodar or Himalayan cedar. Nashtar or nakhtar, PERSU, is the *Pinus longifolia*, long-leaved pine, any pine, gul nashtar Hind., is the *Erythrina arborescens*.

NASHTAR, PERS. Lancet.

NASIRI, a nomade race of Affghans, who occupy the Tohki and Hotuki countries in summer, and the Daman, or skirts of the Suliman range in winter. In their migrations, they appoint a Chahlwasti or Captain of Forty, and a Khan or Director General.

NASIR-UD-DIN ABDALLAH bin Umrul, Baizavi. Baizavi was the literary takhallus of kazi Nasir-ud-din Abdallah bin Omar, Albeizavi, who died in the year 1299, Hig. 699. His book is in Persian, entitled, *Nizam-ut-Tuarikh*, which signifies the Order of Chronological Histories. He was a kazi or judge. He has treated of most of the Asian monarchs, and particularly of the ancient Moguls.—*History of Genghizcan*, p. 413.

NASJEERA RATSJA, MALEAL. Hoya pendula, *Wight and Arnott*.

NASKEL, Nari, Nargel. BENG., HIND. *Cocos nucifera*.

NASNIJANGI, DUK. *Trianthema obcordata*, Roxb.

NASPAL, rind of the pomegranate, *Punica granatum*. Besides its astringency this is itself used alone as a dye, giving a somewhat feeble yellow.—*Powell's Hand-book*, Vol. i. p. 452.

NASPATI, HIND. *Pyrus communis*, pear tree

NASRIN, HIND. *Rosa*, sp.

NASSARA, Nazarene, a term used by mahomedans in India, when intending to speak abusively of christians.

NASSERI, regiments of soldiers raised at the suggestion of Sir David Ochterlony from the Gurkhas who took service with the British, after the first Nepal campaign.

NASSICK, a town in the Bombay Dekhan.

NASSICK DIAMOND, taken in the Dekhan war, originally valued at £30,000, was sold to Lord Westminster for £7,000.

NASSIR JUNG, second son of Nizam-ul-Mulk, on whose death, in 1748, he assumed the subahship of the Dekhan. He took part with Mahomed Ali and the British against Chandah Sahib and the French. After varied fortunes

he dwelt at Arcot in an indolent and voluptuous manner, in 1750, however, he again took the field against the French but was killed by the Pathan nabob of Cuddapah, and three of the conspirators to his death fell in one day. His death gave great joy to Dupleix, Chandah Sahib and Pondicherry.—*Orme*.

NASTI, SANS. Non-existence; annihilation.

NASTIKA, S. An atheist, also one who denies the authority of the Vedas.

NASTRO DI SETA, It. Ribbon.

NASTURTIIUM, a genus of plants of the order Brassicaceæ. The water-cress. N. officinale, *R. Br.*, the *Sisymbrium nasturtium*, *Linn.*, the Lutputiah of India, is cultivated in gardens.

NASTUS ARUNDINACEUS, Zcy. *Bambusa arundinacea*.

NASTUS STRICTUS, Sm. Syn. of *Dendrocalamus strictus*, *Nees*.

NASUA, see *Viverridæ*.

NASUK, see Nazuk, Vishnu, Viswakarma.

NASURANGI, DUK. *Trianthema obcordatum*, *Roxb.*, also *Trianthema monogynia*.

NASUT, HIND. *Ipomœa turpethum*.

NAT, BURM. Spirit. The Nat are supposed to have been objects of Burmese worship, in pre-buddhistic times. They correspond to the Deo of the hindoos, whose place they take in the Burman buddhist system.—*Yule*, p. 17.

NAT, or Nut, in Bengal, a wandering tribe, who are dancers, actors, athletes. They resemble the gypsies in habits. The Nut are called also Nut Sirki bash (dwellers under mats); those in the Dekhan are not distinguishable from Dher.

NATA, BENG., also Nata Kanja, HIND. *Guilandina bonduc*, *Linn.*

NATA, MAL., TAM., TEL. A country, relating to the country, used to form many compound words.—*Wils.*

NATA KARANJA, BENG. *Guilandina bonduc*, *Linn.*, *W. and A.*

NATA-KOTHIAR, a race in the south of the peninsula; all speak Tamil and follow brahminism, they are large merchants, and all of them have the marked African protruding lips and nose, sharply cut at the forehead.

NATAL, a district in Africa; also one in Sumatra.

NATAM, or Nattam, an extensive tract of mountainous country beginning about 10 miles N. of Madura, through which a pass leads.

NATARU, Guz. Second marriage.

NATATOIRES, an order of swimming birds, viz;

ORDER VIII.—Natatores.

A. Tribe, Longipennes.

Fam. Laridæ.

The *Grallatorial* and *Natatorial* birds begin to arrive in Nepaul, from the north, towards the close of August, and continue arriving till the middle of September. The first to appear are the common snipe, and jack snipe, and *rhyngchæ*; next, the *scolopaceous waders* (except the wood-cock;) next, the great birds of the heron and stork, and crane families; then, the *Natatores*; and lastly, the wood-cocks, which do not reach Nepaul till November. The time of the re-appearance of these birds, from the south is the beginning of March; and they go on arriving till the middle of May. The first which thus return to Nepaul are the snipes; then come the teal and ducks; then the large *Natatores*; and lastly, the great cranes and storks. The *Grallatores* which visit Nepaul or pass over it, are much more numerous than the *Natatores*; and Mr. Hodgson was of opinion that observation in the plains of India would satisfactorily prove that this is a just and decisive indication of the superior prevalence of wading over swimming birds in that extensive region. India, as he supposes, is too hot for the *Natatores*—a great majority of which seem to affect arctic regions, or, at least, high latitudes. The wild swan was never seen there but once, in the mid winter of 1828, when the apparition suggested a new version of the well known hexameter,—

‘*Rara avis in terris, alioque simillima cygno.*’

Such a bird is never seen, he supposes, in the plains of India? None of the *Natatores* stay in Nepaul beyond a week or two, in autumn (when the rice fields tempt them) or beyond a few days, in spring, except the teal, the widgeon, and the coot, which remain for the whole season, upon some few tanks whose sanctity precludes all

molestation of them. There are cormorants throughout the season upon the larger rivers within the mountains; but none ever halt in the valley, beyond a day or two: for so long, however, both they and pelicans may be seen, occasionally, on the banks just mentioned. The *Larus* and *Sterna* are birds which usually affect the high seas,—but Mr. Hodgson had killed both the red-legged gull, and a genuine pelagic tern, in the valley of Nepaul, but so had he fishing eagles; and in truth who shall limit the wanderings of these long-winged birds of the ætherial expanse?

NATCHENNY, SANS.

	ROB., LAT.		

Eleusine coracana, a useful grain, is grown throughout British India and is eaten by the labouring classes. It is about the size of mustard seed, and darkish coloured. It is made chiefly into cakes, but is also prepared in several other ways; it has a sweetish taste.

NATCHENNY RAJIK, SANS. Eleusine coracana. See *Graminaceæ*.

NAT-GYEE, BURM. A tree of Moulmein, wood used for posts and knife handles.—*Cal. Cat. Ev.* 1862.

NATH, SANS. Lord; hence Jaganatha, verna-cularly Jagannath or Juggernath, Lord of the world, a name especially applied to Krishna in the form in which he is worshipped at the temple of Jaganath at Puri in Orissa. All the land within 20 miles round this pagoda is considered holy, but the most sacred spot is an area of about six hundred and fifty feet square, which contains fifty temples. The most conspicuous of these is a lofty tower about one hundred and eighty-four feet in height, and about twenty-eight feet square inside, called the Bur Dewali, in which the idol and his brother and sister, Subhadra, are lodged. Adjoining are two pyramidal buildings. In one, about forty feet square, the idol is worshipped, and in the other, the food prepared for the pilgrims is distributed. These buildings were erected in A. D. 1198. The walls are covered with statues, many of which are in highly indecent postures. The grand entrance is on the eastern side, and close to the outer wall stands an elegant stone column, thirty-five feet in height, the shaft of which is formed of a single block of basalt, presenting sixteen sides. The pedestal is richly ornamented. The column is surrounded by a finely sculptured statue of Hanuman, the monkey chief of the *Ramayana*. The establishment of priests and others belonging to the temple has been stated to consist of three thousand nine hundred families, for whom the daily provision is enormous. The holy

food is presented to the idol three times a day. His meals lasts about an hour, during which time the dancing girls, the Deva-dasi, belonging to the temple exhibit their professional skill in an adjoining building. Twelve festivals are celebrated during the year, the principle of which, is the Rath Jatra. Jaganath's temples are also numerous in Bengal, and are, invariably, of a pyramidal form. During the intervals of worship they are shut up. The image of this god in Orissa, is a rude block of wood, and has a frightful visage with a distended mouth. His arms, which, as he was formed without any, have been given to him by the priests, are of gold. He is gorgeously dressed, as are also the other two idols which accompany him. In a compartment in the temple of Rama, he is represented in company with Bala Rama and Subhadra without arms or legs. These idols are doubtless handed down from pre-brahmanic times.—*Cole's Myth. Hind.*, p. 52.

NATHA, Sans., or Nath, corruptly Nauth, Naut, Nautum, and Natan, Tam. A lord, a master, a name borne by some classes of religious mendicants. See Kala Priyanath.

NA-THAT, Burm. In Pegu, a forest term for trees that have died from natural causes. The term seems to be applied also to seasoned timber, or to trees that have been girdled. Nathat teak trees ought to be removed, but besides these, no teak tree below six feet in girth ought to be felled.—*McClelland's Report*, No. xxviii, p. 2; *Dr. Brandis, Selection from the Records of Govt. of India Foreign, Dept.*, No. 28, p. 24.

NATHDWARA. This is the most celebrated of the fanes of the hindoo Apollo. Its etymology is 'the portal (dwara) of the god' (Nath), of the same import as his more ancient shrine of Dwarka at the 'world's end.' Nathdwara is twenty-two miles N. N. E. of Oodipoor, on the right bank of the Bunas. Although the principal resort of the followers of Vishnu, it has nothing very remarkable in its structure or situation. It owes its celebrity entirely to the image of Krishna, said to be the same that has been worshipped at Mathura ever since his deification between eleven and twelve hundred years before Christ. As containing the representative of the mildest of the gods of the hindoos, Nathdwara is one of the most frequented places of pilgrimage, though it must want that attraction to the classical hindoo which the caves of Gaya, the shores of the distant Dwarka, or the pastoral Vrij, the place of the nativity of Krishna, present to his imagination; for though the groves of Vindra, in which Kaniya disported with the Gopi, no longer resound to the echoes of the flute; though the waters of the Yamuna are daily polluted with the blood of the sacred

kine, still it is the holy land of the pilgrim. It was in the reign of Aurungzeb, that the pastoral divinity was exiled from Vrij, that classical soil, which, during a period of two thousand one hundred years had been the sanctuary of his worshippers. He had been compelled to occasional flights during the visitations of Mahinood and the first dynasties of Affghan invaders; though the more tolerant of the Mogul kings not only reinstated him but were suspected of dividing their faith between Kaniya and Mahomed. Akbar was an enthusiast in the mystic poetry of Jydeva, which paints in glowing colours the loves of Kaniya and Radha, in which lovely personification the refined hindoo abjures all sensual interpretations asserting its character of pure spiritual love. Jehangir, by birth half a Rajpoot, was equally indulgent to the worship of Kaniya: but Shah Jehan, also the son of a Rajpoot princess, inclined to the doctrines of Siva, in which he was initiated by Sid-rup the Sanyasi. Sectarian animosity is more virulent than faiths totally dissimilar. Here we see hindoo depressing hindoo: the followers of Siva oppressing those of Kaniya; the priests of Jupiter driving the pastoral Apollo from the Parnassus of Vrij. At the intercession, however, of a princess of Oodipoor, he was replaced on his altar, where he remained till Aurungzeb became emperor of the Moguls. In such detestation did the hindoos hold this intolerant king, that in like manner as they supposed the beneficent Akbar to be the devout Mokund in a former birth, so they make the tyrant's body enclose the soul of Kal-yamun, the foe of Krishna, ere his apotheosis, from whom he fled to Dwarka, and thence acquired the name of Rinchor.—*Tod's Rajasthan*, Vol. i, pp. 521-522.

NATH'H—? Timber, a log of wood, a beam.

NATH'H BAWA, see Jogi.

NATHUR, Guz. Canes.

NATICA MELANOSTOMA, see Molluscs, Neritidæ.

NATIKI—? Tetranthera, sp.

NATI-SCHAMBU—? Eugenia malabarica.

NATIVE, the terms Hindoo, and Native of India, are the ordinary names by which the idol-worshipping people and mahomedans of British India are at present known, but the terms are all of very recent use. The hindoo peoples to whom they are applied are only now fusing, under the firm sway of the British rule, and never before had, nor could have had, one common designation. Natives of India first sat on the petty jury on the 25th July 1828:

NATIVE BLISTER-FLY, *Meloe talini*.

NATIVE CINNABAR, see Cinnabar.

NATIVE COMPANION, see Egret.

NATRALOO, Hind. Sweet Potato, is the

root of *Batatas edulis*, *Choisy*, which is boiled, roasted, and eaten. It is of two kinds or colours, white and red. The white is supposed to have been brought from some foreign land, and under this supposition it is called *Walaitee natraloo*, European or Foreign natraloo, and the other *Nat ka Natraloo* or country Natraloo. The white is the better, the correct spelling for the *Batatas edulis* or sweet potato is *Natr-alu*.

NATRÖN, FR., GER. *Sodæ sesquicarbonas*. *Sodæ biboras*, Carbonate of soda. Natron is abundant in the vicinity of Ava, where it is used by the Burmese instead of soap, and they call it "earth soap."—*Mason*.

NATRON LAKE of Lunar, see Lunar Dyes, Alkaline minerals.

NATSJATAM-CIVA, *Cocculus cordifolius*.

NATSO-KARAM, TAM. Soap.

NATSU-PIA, BROT. *Gallus ferrugineus*. *Gmel*.

NATTALA (?) The name of a class of slaves in Karnata.

NATTAMAKAN, also *Nattamakal* and *Nattamar*, TAM. A sub-division of the *Valala* tribe, husbandmen, farmers.

NAT-TA-MIN, BURM. A reddish grey wood of British Burmah, loose grained, and recommended for cigar boxes. Breaking weight 129 lbs.; a cubic foot weighs 33 lbs. In a full-grown tree on good soil the average length of the trunk to the first branch is 60 feet, and average girth measured at 6 feet from the ground is 6 feet. It sells at 4 annas per cubic foot.—*Dr. Brandis, Cal. Cat. Ex. 1862*.

NATTA VADAM COTTAY, TAM. The fruit of *Terminalia catappa*.—*Linn., Roxb., W. & A., Rheede*.

NATTES, FR. Mats.

NATTOO-BADAM, TAM. *Terminalia catappa*. **NATTU**, TEL. *Ischœnum pilosum*, *R. W., Mad. Jour. Lit. and Sc.*, ii, 139, cum. *Id.*, p. 144, Br. 475. This is the grass that infests the regada or black cotton-soil to the great detriment of cultivation. It is called *kundururu nattu* or "grievous-weed," Br. 237, to distinguish it from *jaraka nattu*, or "grass-weed" which is *Cynodon dactylon*.

NATTU VADOM MARAM, TAM. *Terminalia catappa*, *Linn., Roxb., W. & A., Rheede*.

NATUM MUNGALA VANLOO, TEL. Barbers.

NATUNAS ISLANDS, in the China Seas, extend from the coast of Borneo a great way to the north-west and are arranged into the north, great or grand, and south Natunas. The north Natunas comprize Pulo Laut, Pulo Stokong. The great or grand Natuna, is called by the Malays Pulo Boong Ooran, and extends from lat. 3° 39' to 4° 16' N. The interior is high with two high mountains, Goo-

nong Bedong or Quoin Hill, in lat. 4° 3' N., and Gooñong Ranay in lat. 4° N.

NATURAL HISTORY, see *Ajaib ul Maklukat*, much of which is fabulous. Nature and its varied scenery and objects, its birds or trees or beasts or seas, form no subject of wonder to either the Indian mahomedan or hindoo.

NATURE-WORSHIP, or Totemism, is a cult in which natural objects, trees, lakes, stones, animals, &c., are worshipped. According to Bunsen, the earliest Bactrian faith was a pure nature-worship as recorded in the Vedas. That was superseded by an ethical faith, when light and darkness, sunshine and storm, became represented by good and evil, but in the change, Zoroaster denotes the spirits of evil by the term *Deva*, common to the old Aryan divinities. The Bactrian religion continued unchanged amongst the Aryan emigrants until they reached the Punjab. In the west, Zoroaster of Spitama, the Zoroaster of Europe, one of the mightiest intellects and greatest men of all time, appeared in the reign of Vistaspa, a Bactrian king, towards the year 3000 B. C. His contemporaries accounted him as a blasphemer, atheist, firebrand, worthy of death, and he was regarded, even by his own adherents, and after some centuries, as the founder of magic, a sorcerer and deceiver; but Hippocrates, Eudoxus, Plato and Aristotle looked on him as a great spiritual hero and the earliest sage of a primeval epoch. Zoroaster's views are expressed in a hymn, or Gatha, consisting of eleven 3-line strophes. It seems to have been composed on some great public occasion, and offers the choice of following a true path or of continuing in the existing superstition, and in the 3rd strophe, announces the presence of two twin spirits, the Good and the Base, and commands them to choose between them. In the fifth strophe, he names Ahura Mazda, the All Holy and All True; there is no mention of the name of Ahriman, later regarded as that of the evil principle, but in the seventh strophe Armaiti is named as the mother of the corporeal world who comes with Power, and with Truth and with Piety to succour this life. Later, this religion degenerated into magism: from this, Persians have derived their Shah-River: Ashta, or Truth is the second, which has become the *Ardi Behesht* of the Parsi; and the third is *Vohu Mano*, signifying the good pious mind or piety, out of which has grown the later term *Bahman*. Zoroaster's doctrine spread from Bactria into Media. But in the year B. C. 2234, Zoroaster, a king of Media, conquered Babylon where the true magism as taught by the disciples of Zoroaster, soon mingled with Chaldean philosophy, and under the despotisms of Xerxes and other

NAUCLEA

rulers, so early as the times of Artaxerxes, rites were introduced into Persia, glaringly contradictory of the ethico-spiritual nature of Zoroaster's religion, which has now-a-days degenerated into a fire-worship and magical formula. Zoroastrians used the Zend language which is newer than the language of the Vedas, but older than Sanscrit. The Bactrian language is commonly called Zend: the Vedic language is stereotyped Bactrian, the Zend is the continuation of this old Bactrian tongue, with two phases of which we are acquainted. One of them, the language of the Zend books, the other that of the cuneiform inscriptions from Cyrus and Darius down to Artaxerxes II. The Sanscrit is the weakened prose form of the old Bactrian, the poetical form of which exists in the hymns of the Rig Veda. These hymns were transmitted, orally. Literature proper only commences with Sanscrit after it became a learned language, and it became the sacred language about the year 1000 B. C. at the beginning of the fourth age. Both Vedic and Sanscrit were at first living languages, spoken by the people. Spirit-worship, amongst the Aryan hindoo, the non-Aryans and the Parsees or Zoroastrians, has almost displaced the Nature worship of the Vedas.—*Lubbock, Origin of Civil* p. 119; *Bunsen, God in Hist.*, Vol. i, pp. 270 to 293; *Tod's Rajasthan*, Vol. ii, p. 217; *Bunsen's Egypt*, Vols. iii and iv. See Afghanistan, Aryan, Greeks of Asia, Iran, Koh, Kabul, Inscriptions, Semiramis, Hindoo, Kattywar, Zoroaster.

NATU VADOM COTTAY, Seeds of Terminalia catappa.

NAU, HIND. A boat, a ship. Nau-Khodah, ship master, corrupted into the Anglo-hindi Nakodah.—*W.*

NAU, HIND. Saccharum, sp.

NAU, HIND., SANS. Nine; nau-naga, nine-headed snake; also Nau, HIND. New.

NAU-AIT, in the south of India, a class of mahomedans engaged in civil life, who came from Persia to Guzerat. They are fair men.

NAUCLEA, a genus of plants of the natural order Cinchonaceæ, *Lindl.* The following species are known to occur in the East Indies, viz.:

acida, *Hunt.* Penang, Java.
cadamba, *Roxb.* Peninsula, Bengal.
capitelata, *Watt.* —
cirrhiflora, — Malayana.
coadnata, *Roxb.* Ceylon.
cordifolia, *Roxb.* British India.

NAUCLEA ? ?

Babdat,	HIND.	Behra,	HIND.
Bhada,	"	Hirida,	MAH.

Under these names, Captain Sankey notices a nice, clean working, Nagpore wood, of a yellow colour and straight grain, which has apparently but little essential oil. It is very scarce but, when obtainable, is used by the natives for all purposes; in strength it ranks next to "cyne," and, therefore, if procurable in large quantities and of a proper size, would be a most valuable wood. The timber procurable ranges from 15 to 17 feet in length and is about 3 feet in girth. Major Pearson considers that this is the Terminalia bellerica; the timber in colour is similar to the Hurdo.—*Capt. Sankey.*

NAUCLEA, species.

Hagin-kao,	CAN.	Hagin mara,	CAN.
------------	------	-------------	------

A tree of Canara and Sunda, frequent in the upper third of the ghats to the south. Wood described as being strong and serviceable for houses and implements.—*Dr. Gibson.*

NAUCLEA, Species. Htein-ga-lah, BURM. A wood of British Burmah of a light chestnut colour, recommended for furniture. Breaking weight 208 lbs. A cubic foot weighs lbs. 43 to 56. In a full-grown tree on good soil the average length of the trunk to the first branch is 40 feet, and average girth measured at 6 feet from the ground is 6 feet. It sells at 8 annas per cubic foot.—*Dr. Brandis, Cal. Cat. Ex.* 1862.

NAUCLEA, species. Hteinthay, BURM. A wood of British Burmah. Breaking weight 170 lbs. A cubic foot weighs 35 lbs. In a full-grown tree on good soil, the average length of the trunk to the first branch is 30 feet, and average girth measured at 6 feet from the ground is 6 feet. It sells at 8 annas per cubic foot.—*Dr. Brandis, Cal. Cat. Ex.* 1862.

This is a noble ornamental tree of all British India and British Burmah, it has orange-coloured flowers, collected into heads the size of a small apple, it is common in Ceylon, up to an elevation of 2,000 feet; it is found in Travancore and in the Dekhan. It attains a height of 70 to 80 feet with a girth of from 6 to 15 feet and a stem of 32 feet to the nearest branch. It is made into boats, its flowers are offered to the hindoo deities, it is used for various kinds of furniture. The wood is of a deep yellow colour

but loose grained. A cubic foot weighs lbs. 37. It sells, in Burmah, at 8 annas per cubic foot, is suitable for furniture, and is used for building purposes. According to hindoo mythology, this is one of the four shady trees that grow on mount Meru, the others being the Eugenia, the Ficus indica and Ficus religiosa.—*Thw. En. Pl. Zeyl., Captain Macdonald, Dr. Cleghorn, Cal. Cat. Ex. of 1862, Captain Puckle in Mad. Cat. Ex. 1862, Irvine's Med. Top.*

Hedoo,	MAHR.	Holondho,	URIA.

This large tree grows in the hot drier parts of Ceylon, and abundantly in the mountainous districts of the peninsula of India; it is a common tree in the coast forests of the Bombay Presidency, but never found inland,—it is getting scarce in Ganjam and Gumsur, it is common in the N. W. Provinces. It is said to be a tree of Jubbulpore, abundant, and its wood much in request, being light and easily worked. In Behar it is common and resembles a young sycamore. Its strength is not great, but it is lasting if not exposed to the weather. In the Siwalik hills it yields a poor wood used for planks, but which quickly decay. In British Burmah it appears as a large tree of regular growth, but not very common. Wood, yellow, rather close-grained: used to make combs, may be expected to prove valuable for furniture; it decays when exposed to wet. In Gaujam and Gumsur, it attains an extreme height of 75 feet with a circumference of 7 feet, the height from the ground to the first branch being 36 feet: but, in British Burmah, in a full-grown tree, on good soil, the average length of the trunk to the first branch is 80 feet, and average girth measured at 6 feet from the ground is 10 feet, and there, a cubic foot weighs 42 lbs. and sells at 12 annas. The wood is pretty, yellow, rather close-grained, soft, and easily worked. In Coimbatore, it is much used for common purposes and sustains a weight of 320 lbs. In the Bombay Presidency, it is most extensively used for all purposes of planking in in-door work. The timber deteriorates from steeping, and therefore should not be floated to its destination. In Gumsur and Ganjam, on account of its size and lightness, it is used for boats, which are made from a single log by simply scooping out the inside and afterwards shapening in a rough manner. It is also used for the masts of native dhonies, and bazar meastres, and is cut into

planks and made into doors, boxes, &c. It is best suited for work which is sheltered, bedsteads, house carpentry furniture, said to be a good wood for model work, it polishes well, resembles box-wood, and is good for turning; but it cracks and warps. It is used for making slates for scholars in native schools. Is close-grained, very durable, much employed in building and joiner work, and when varnished looks very pretty being much affected by alternations of dry and wet weather, could probably be creosoted with advantage. At one time there were great forests of this tree in Kamaon, but these have been thinned. The tree rises with a clear stem of 30 to 40 feet, and has a girth of 6 to 12 feet. When growing singly it throws out branches close to the ground, and gives support to itself by projecting large buttresses, from the bole. Timber when freshly cut is of a light yellow, turning to a nut-brown on seasoning.—*Dr. J. L. Stewart, p. 116; Cal. Cat. Ex. 1862; Cleghorn, Punjab Report, Kullu and Kangra, p. 82; Thw.; Drs. Wight, Gibson, Brandis, Roxb., Hooker, Him. Journal, Vol. i, p. 26; Captain Macdonald, Cal. Cat. Ex. 1862; Madras Exhibit.; Mr. Rohde, MS.; Mr. Thompson.*

Kuddum,	MAHR.	Moondo-monde,	URIA?

This large tree is found in the western and northern provinces of Ceylon, in the hot, drier parts of the island, where its close-grained hard timber is used for common house-building purposes. It weighs lbs. 42 to the cubic foot and is calculated to last 40 years. Dr. Wight, writing in Coimbatore, says, it has a strong fine grained timber, sustaining 400 lbs., and yielding considerable beams, dark-coloured, but soon rots if exposed to wet. From the fineness of its grain it seems well fitted for cabinet purposes, and has the advantage of being easily worked. On the western coast it is

valued for yielding flooring planks, packing boxes, &c. It is mentioned by Captain Macdonald as a tree of Ganjam and Gumsur, of extreme height 60 feet, circumference 4½ feet and height from the ground to the intersection of the first branch, 22 feet. The wood is used there, occasionally for beams, planks, &c., but is not in much request, and the tree is not very plentiful. In the Bombay Presidency, it is rather a common tree in the coast forests; less so inland, but is found in quantities in the dells above the ghats; the wood is reddish coloured, close-grained, and rather valuable for gun-stocks, in the making of which it is chiefly used. That of the Sunda and Canara forests is valued as affording the best plank for flooring of houses and house beams. It is found in the Nalla mallai, and is a hard, tough wood, light red in colour and, used there, for yokes, posts and small beams. In British Burmah, a cubic foot weighs lbs. 43, and it is used for planking. In a full-grown tree on good soil the average length of the trunk to the first branch is 30 feet, and average girth measured at 6 feet from the ground is 6 feet. This tree grows in the Philippines; it grows to a considerable size, and in some numbers in the Siwalik tract up to the Beas. At Sanpla, west from Delhi, there are some hundreds of trees up to 10 feet (one about 13) in girth, and 50 or 60 feet high. The leaves are given as fodder, and might be suitable for sleepers if impregnated with mineral salt.—*Mr. Mendis, Drs. Wight, Gibson, Stewart Clegg., Roxb. and Brandis; Captain Macdonald; Cal. Cat. Ex. 1862; Mr. Latham; Thw.; Powell.*

NAUCLEA PEDUNCULARIS, *Wall. Cat. N. triflora, Moon's Cat. | N. purpurea, Roxb., var.*

A moderate-sized tree of Ceylon in the Saf-fragam and contiguous districts, up to an elevation of 1,000 feet, not uncommon in the Central Province.—*Thw. Enum. Pl. Zeyl., Vol. ii, p. 137.*

NAUCLEA TUBULOSA, *Thw.* A small tree of Ceylon, one variety very abundant in the Kokoolcorle. Another variety in the hot, drier parts of the island.—*Thw., Enum. Pl. Zeyl., Vol. ii, p. 137.*

NAUCLEA UNDULATA, *Wall.*

Ma-oo lettan, *Burm.*

A soft useless wood in British Burmah, decays in less than a year. Breaking weight 80 to 120 lbs. A cubic foot weighs 22 to 34 lbs. In a full-grown tree on good soil the average length of the trunk to the first branch is 100 feet, and average girth measured at 6 feet from the ground is 15 feet. It sells at 2 annas per cubic foot.—*Dr. Brandis, Cal. Cat. Ex. of 1862.*

NAUCRATES, the Pilot-fish genus of fishes,

belonging to the family Scombridae, which may be thus shown:—

FAM. 16.—Scombridae.

FIRST GROUP.—Scombrina.

Gen. 12 Scomber, 13 Thynnus, 5 Pelamys, 12 Auxis, 9 Cybium, 1 Naucrates, 1 Elacae, 10 Eche-neis, 1 Hypsiptera.

SECOND GROUP.—Nomeina.

Gen. 1 Gasterochisma, 2 Nomeus, 2 Cubiceps, 1 Neptomenus, 1 Platystethus, 1 Ditrema.

THIRD GROUP.—Cyttina.

Gen. 6 Zeus, 2 Cyttus, Oreosoma.

FOURTH GROUP.—Stromateina.

Gen. 9 Stromateus, 3 Centrolophus.

FIFTH GROUP.—Coryphanina.

Gen. 6 Coryphæna, 4 Brama, 1 Taractes, 4 Pterac-lis, 3 Schedophilus, 1 Diana, 1 Ausonia, 1 Mene, 1 Lampris.

The Pilot-fish, *Naucrates ductor*, usually accom-panies the shark: its ordinary length is from 4 to 8 inches.

NAUGEI, *HIND.* *Jasminum officinale.*

NAUGOOLOO. Chicacole is the principal civil station in the Ganjam district. It is in lat. 19° 18' N. long. 83° 58' E., about 567 miles from Madras. It lies four miles direct west of the sea, and is situated on the north bank of the river Naugooloo. It is the station of the judge and the sub-collector.

NAUGULI, *SIND.* *Eleusine coracana, Gert., Roxb.*

NAUJA, *TAM., TEL.* Soil where rice can be cultivated.

NAUKRA BAG, *BENG.* *Hyæna.*

NAUNGOO, *TAM.* A wood of Tinnevely, of a red colour, specific gravity 1·009. Used for building, wheel-wrights' work, handspikes.—*Colonel Frith.*

NAUPATTI (?) *HIND.* A banker of the highest caste, a mahajan.

NAU-RATN, *HIND.* 'Nine gems,' an orna-ment worn in the arm, which indicates the only jewels that are esteemed as precious, they are—diamond, ruby, emerald, sapphire, topaz, pearls, coral, turkis, tansala. The others, and also the inferior gems, agates, blood-stone, &c., are mostly in use for signet rings, in the art of engraving which natives of India are extremely skillful.

NAU RATRI, a hindoo festival lasting nine days, three of them in honour of Saraswati and six for Siva's consort.

NAUREI, *TAM.* *Eugenia caryophyllifolia, Roxb., W. Ic.*

NAURIA, *HIND.* A class of merchants trading with the Panjab from the south coun-try, &c.

NAURVEALY, *TAM.* A Ceylon tree which grows to about twenty inches in diameter, and fifteen feet in height. It produces a small red fruit of a very glutinous nature, much esteemed by the natives of Malabar. From the bark a kind of cordage is made, which is

used for the purposes required in the hills, and in the conveyance of timber, &c. This seems to be the Narwali or Narvali tree, *Cordia angustifolia*; ropes are made of the fibres.

Edye, Ceylon; M. E.

NAUSHADAR, HIND. Sal-ammoniac; chloride of ammonium.

NAUSHADAR-KANI, HIND. An artificial bi-sulphuret of arsenic.

NAUTCH, HIND. A dance, a Hindustan nautch-girl does not dance like Taglioni and Cerito, but by a movement of women's feet to music. The dancing of nautch-girls on public occasions is always decorous. They are to a European dreary, not only not graceful but monotonous, wearisome.—*Kaye's Christianity in India, p. 309.*

NAUTILIDÆ, a family of cephalopodous molluscs; according to Lamarck, they constitute the sixth family of his Polythalamous cephalopoda, consisting of the genera, Discorbites, Siderolites, Polystomella, Vorticialis, Nummulites, and Nautilus. To these, Mr. G. B. Sowerby, jun., adds Simplegas and Endosiphonites. In the system of M. DeBlainville it is the fifth family of his Polythalamacca, and comprises the genera Orbulites, Nautilus, Polystomella, and Lenticulina. The genus Nautilus is the type of this family. The species inhabit the seas of warm climates, especially those of Asia and Africa, and their islands, Amboyna Zanzibar, and New Guinea; and the Pacific and Australian Oceans. The position of Nautilus amongst the Cephalopod may be thus shown:

CLASS I.—Cephalopoda Cephalopods.

ORDER I.—Dibranchiata.

SECTION A.—Octopoda.

FAMILY I.—Argonautidæ.

GENUS. Argonauta, Argonaut or paper sailor recent, 4 sp., fossil 1 sp., Syn. oothoe, nautilus.

FAMILY II.—Octopodidæ.

GENERA. Octopus, rec. 46 sp. Syn. cistopus.

Sub-genus. Tremoctopus, rec. 2 sp.

Pinnoctopus, Finned octopus, rec. 1 sp. P. cordiformis.

Eledone, rec. 2 species.

Cirrotheuthis, rec. 1 species C. Mulleri.

Philonexis, rec. 6 species.

SECTION B.—Decapoda.

FAMILY III.—Teuthidæ. Calamaries, or Squids.

SUB-FAMILY A.—Myopsidæ. Eyes covered by the skin.

GENERA. Loligo, Calamary, rec. 21 sp. Syn. teuthis.

Sub-genus. Teudopsis, fossil, 5 sp.

Gonatus, rec. 1 species; G. amæna.

Sepioteuthis, rec. 13 sp.

Beloteuthis, fossil, 6 sp.

Geoteuthis, fossil, 9 sp. Syn. belemnosepia.

Leptoteuthis, fossil.

Cranchia, rec. 2 sp.

Sepioida, rec. 6 sp.

Sub-genus Rossia, rec. 6 sp.

SUB-FAMILY B.—Oligopsidæ. Eyes naked.

Loligopsis, rec. 6 sp.

Cheirotheuthis, rec. 2 sp.

Histioteuthis, rec. 2 sp.

Onychoteuthis. Uncinated calamary, rec. 6 sp. Syn. ancistroteuthis, onychia.

Enoplateuthis. Armed calamary, rec. 10 sp. Syn. ancistrochirus and abralia, octopodoteuthis.

Ommastrephes. Sagittated calamary, rec. 14 sp.

FAMILY IV.—Belemnitidæ.

GENERA. Belemnites, fossil, 100 sp.

The belemnites have been divided into groups by the presence and position of furrows in the surface of the guard.

SECTION I.—Acæli.

Sub-section 1. Acuarii, 20 sp.

2. Clavati, 3 sp.

SECTION II.—Gastrocæli.

Sub-section 1. Canaliculati, 5 sp.

2. Hastati, 19 sp.

SECTION III.—Notocæli, 9 sp.

Belemnitella, fossil, 5 sp.

Acanthoteuthis, fossil. Syn. kelæno.

Belemnoteuthis, recent, also fossil.

Conoteuthis, fossil.

FAMILY V.—Sepiadæ.

GENERA. Sepia, rec. 30 sp., fossil, 5 sp. Syn. belosepia.

Spirulirostra, fossil.

Beloptera, fossil, 2 sp.

Belemnosis, fossil.

FAMILY VI.—Spirulidæ.

GENUS. Spirula, rec. 3 sp.

ORDER II.—Tetrabranchiata.

FAMILY I.—Nautilidæ.

GENERA. Nautilus, rec. 2 or 4 sp. fossil, 100 sp.

Sub-genera. Aturia, fossil, 4 sp.

? Discites, fossil.

Temnocheilus, fossil.

Cryptoceras, fossil.

Lituites, fossil, 15 sp. Syn. hortolus trocholites.

Trochoceras, fossil, 16 sp.

Clymenia, fossil, 43 sp.

FAMILY II.—Orthoceratidæ.

GENERA. Orthoceras, fossil, 125 sp. Syn. gonioceras, cycloceras.

Sub-genera. Cameroceras, fossil, 27 sp.

Actinoceras, fossil, 6 sp.

Ormoceras, fossil, 3 sp.

Huronia, fossil, 3 sp.

Endoceras, fossil, 12 sp.

Gonioceras.

Gomphoceras, fossil, 10 sp. Syn. apioceras, poterioceras.

Oncoceras, fossil, 3 sp.

Phragmoceras, fossil, 8 sp.

Cryptoceras, fossil, 36 sp. Syn. campulites, aploceras.

Gyroceras, fossil, 17 sp. Syn. nautiloceras.

Ascoceras, fossil, 7 sp.

FAMILY III.—Ammonitidæ.

GENERA. Goniatites, fossil, 150 sp.

Bactrites, fossil, 2 sp.

Ceratites, fossil, 25 sp.

Ammonites, fossil, 530 sp.

Crioceras, fossil, 9 sp. Syn. tropæum.

Toxoceras, fossil, 19 sp.

Ancyloceras, fossil, 36 sp.

Scaphites, fossil, 17 sp.

Helicoceras, fossil, 11 sp.

Turrillites, fossil, 27 sp.

Hamites, fossil, 58 sp.

Ptyhoceras, fossil, 7 sp.

Baculites, fossil, 11 sp.

The Paper nautilus is one of the Argonauta.

The Nautilus Pompilius, or Pearly nautilus, occurs at Ambayna.

NAUTILUS, a genus of molluscs of the family Nautilidae,

Light as a flake of foam upon the wind,
Keel upward, from the deep emerged a shell,
The native pilot of this little barge,
Puts out a tier of oars on either side;
Spreads to the wafting breeze a two-fold sail,
And mounted up and glided down the billow.

Montgomery.

NAVACHARUM, TAM. Sal ammoniac, Muriate of ammonia.

NAVAGRAHA ARATANAM, see Hindoo.

NAVA-KHANDA, or Nine-divisions, is the title of an account of India, which was first described by the astronomers Parasara and Varaha-Mihira, although it was probably older than their time, and was afterwards adopted by the authors of several of the Puranas. According to this arrangement, Panchala was the chief district of the central division, Magadha of the east, Kalinga of the south-east, Avanta of the south, Anarta of the south-west, Sindhu-Sauvira of the west, Harahaura of the north-west, Madra of the north, and Kauninda of the north-east. The division of India into five great provinces would appear to have been the most popular one during the early centuries of the christian era, as it was adopted by the Chinese pilgrims, and from them by all Chinese writers. According to the Vishnu Purana, the centre was occupied by the Kuru and Panchala, in the east was Kamarupa, or Assam; in the south were the Pundua, Kalinga and Magadha, in the west were the Surashtra, Sura, Abhira, Arbuda, Karusha, Malava, Sauvira and Saindhava, and in the north the Huna, Salwa, Sakala, Rama, Ambashta and Parasika.—*Cunningham, Ancient Geog. of India*, pp. 5, 7.

NAVAKIRE, near Pootoor, 21 miles from Jaffna, in Ceylon, is a remarkable well which rises and falls once every twelve hours and retains the same quantity of water however drawn. It is alluded to in Sinbad's travels.

NAVA MALIKA, TEL. Jasminum sambac, var. β . duplex.

NAVANAGGAR, see Kattyawar.

NAVANAY, CAN. Setaria italica, Italian millet; it is grown in very few places in Mysore, and serves as food for poor people.—*M. E. Cat.*

NAVANDGARH, or Naondgarh, is a ruined fort from 250 to 300 feet square at top and 80 feet in height. It is situated close to the large village of Lauriya, 15 miles to the N. N. W. of Bettiah, and 10 miles from the nearest point of the Gandak river. The ancient remains consist of a handsome stone-pillar, surmounted by a lion and inscribed with Asoka's edicts, and of three rows of earthen barrows or conical mounds of earth, of which two rows lie from

north to south, and the third from east to west. The stupas usually met with are built either of stone or of brick; but the earliest stupas were mere mounds of earth, of which these are the most remarkable specimens that General Cunningham had seen. He believes that they are the sepulchral monuments of the early kings of the country prior to the rise of buddhism, and that their date may be assumed as ranging from 600 to 1500 B.C. Every one of these barrows is called simply bhisra, or "mound," but the whole are said to have been the kots or fortified dwellings of the ministers and nobles of raja Uttanpat, while the fort of Navandgarh was the king's own residence. The word stupa meant originally only a "mound of earth," and this is the meaning given to it by Colebrooke, in his translation of the 'Amara Kosha.' The author of the Ceylonese 'Atthakatha' explains that they are yakhatthanani, or edifices belonging to Yakha, or demon-worship. The Yakha in Sanskrit, Yaksha and Jaksha were the attendants of Kuvera, the God of Riches, and the guardians of his treasures, and their chief residence was called Alakapura. Somewhere in the neighbourhood of the Gandak there was a city named Alakappa, inhabited by a people named Balaya or Buluka who obtained a share of Buddha's relics.—*Cunningham, Ancient Geog. of India*, pp. 448, 450.

NAVARA CHETTU, also Navili chettu, TEL. Ulmus integrifolia, R. ii, 68; Cor. 78. Holopetala integrifolia, Planchon, W. Ic. 1968. Roxb. calls it Nali, it is also pronounced Nemali or Namali by the mountaineers.

NAVARATRICAM, TAM. See Kali, Navaratri, Nau-ratri.

NAVARIA, MAL. Setaria italica, Italian millet.

NAVASARAM, TEL. Hydrochlorate of ammonia.

NAVELLU MARAM, TAM. A Malabar tree which signifies "tongue-wood." It grows to about fifteen inches in diameter, and twenty feet high: it is considered a strong and durable wood, and more particularly so under water. The native carpenters prefer it for the frames of small vessels in consequence of its strength and durability.—*Edye, Forests of Malabar and Canara.*

NAVICELLA, a genus of Molluscs; see Mollusca, Neritidae.

NAVILE—? Oil seeds of Bassia latifolia.

NAVILI, TEL. Ulmus integrifolia, Roxb.

NAVILI JUTTU, or Mayura sikhi, TEL. Actinopterus radiata, lit. "Peacock's crest."

NAVIS, PERS. Writing, Khush-navia, a good penman, W.

NAVURU, or Nagaru, TEL. Premna tomentosa, Willd., R. iii, 78, W. Ic. 1468.

NAVY, during the rule of the English East India Company, the first application of ships in war was to suppress piracy along the coast of Malabar. The fleet was named the Bombay marine, but about 1833 was changed to the Indian Navy. In 1850, the fleet was as under:—

Steam Vessels.

NAWA, AMB. Arenga saccharifera, Labill. The Gomuti palm tree.

NAWAB, AR. plural of naib, a sovereign, a viceroy, corruptly Nabob, also the highest title under a mahomedan sovereign in India. The mahomedan titular distinctions are Bahadur, Khan, Dowla, Umra, Jah, Nawab.

NAWAB GANJ, the battle of Nawabganj, in Oudh, occurred on the 14th June 1858.

NAWAB NADDI, a small river in the Bareilly district.

NAWATT, HIND., lit. new comers, a body of mohamedans of a fair xanthous colour. They seem to be Persians, but the mohamedans of southern India describe them as descendants from some citizens of Medina who attempted to carry off the corpse of Mohammed, and were therefore exiled and driven from city to city.—*Qanoon-i-Islam*. See Nau-ait, Mahomedan.

NAWAR, HIND., of Spiti, mustard seed.

NAWEL, HIND., Syzygium jambolanum.

NAWEL BUSI ERAGU, TEL. Vitex arborea, Roxb., Rheede.

NAWEL MARAM, TAM. Calyptanthus caryophyllifolia, Eugenia caryophyllifolia, the Syzygium jambolanum, Willd., Swartz, Roxb., W. Ic. Nawel Pullum, TAM. Fruit of Calyptanthus caryophyllifolia. Nawel Wood, ANGLO-TAM. Wood of Eugenia caryophyllifolia, Calyptanthus caryophyllifolia.

NAWLEE ERAGU, TEL. Vitex arborea, Roxb., Rheede.

NAWLEE, TEL. Ulmus integrifolia Roxb.

NAW-MARAM, or Nagoo maram, Pterocarpus, species, a very strong and durable wood, common on the lower elevations of the Neilgherries: an ordinary sized tree.—*McIvor, M. E.*

NAWROZ, PERS. New year's day. Jemshid's institution of that festival is placed by Sir William Jones at eight hundred, and by Bailly and D'Hancarville at three thousand two hundred years before the christian era. If one was too sparing of centuries in his calculation, the others appear extravagantly profuse in theirs.—*Jones's Short Hist. of Persia; Ouseley's Travels, Vol. i, p. 225.* See Nau-riz.

NAXOS EMERY, is regarded as granular or amorphous corundum coloured with iron, and is not known to occur in India, where corundum is used by the people in its place. It is principally imported into Britain from the island of Naxos in the Grecian Archipelago, and was found by Mr. Smithson Tennant to consist of Alumina 86, Silica 3, Oxide of Iron 4, total 93.

NAYADI, corruptly Naiade, MAL. An out-caste tribe, found only in the northern parts of Cochin. They are the most degraded of all the low tribes.

NAYAKA, this is an honorific appellation, used amongst most of the races in the south of India, under the pronunciations Naik, Naikan, and in the plural Naidu. It is also in use in the native army of British India as the designation of a non-commissioned officer equivalent to a corporal.

NAYAKAH, see Polyandry.

NAYAKU PONNA, or Muyyaku ponna,

TEL. *Pseudarthria viscida*, *W. and A.*, probably an erroneous form of Muyyaku, q. v.

NAYA KUROONDU, SINGH. Cinnamon.

NAYALU, HIND. In Spiti, an astringent wood or twigs used in dyeing.

NAYANA PALA, see Inscriptions.

NAYAVAYLIE—? Polanisia icosandra.

NAY-KYAT-HGYING, BURM. Eclipse of the sun.

NAY NAMPA, also Pynaru, CAN. *Mesua ferrea*.

NAYLA-TUNGADU, also Nila Ponna, TEL. Senna.

NA-YOO-GA, BURM. A Tenasserim wood, of maximum girth 3 cubits, and maximum length 22 feet. Scarce, but found all over the Tenasserim provinces. When seasoned it floats in water. It is a durable, tolerably good wood with a curled grain; used by Burmese for oars, much like English oak in appearance, but deficient in tenacity. It is scarce, and equally good woods are abundant.—*Captain Dance*.

NAYOOTTA, or Munja, i. e., presents carried in state, a mahomedan ceremony.

NAYOR, BENG. *Cicca indica*, *W. and A.*

NAYPALAM VITILU NUNAY, TEL. Croton oil.

NAYPALUM VITILU, TEL. Croton seed.

NAZAR, AR., HIND., PERS. A present, a fine or fee paid to the state.

NAZARETH, or Nassara, as it is now called, a small town six miles west from Mount Tabor. It is situated at the western slope of a delightful valley, encompassed by rocky mountains of no great height, but meeting together, as it were, to guard it from intrusion. Within this secluded enclosure, all smiling and verdant, Christ was conceived. Here he returned at an early age, and passed the days of his youth. So certain are these facts in a historical point of view, that to this day throughout the east, those who believe in the divinity of his mission are called by way of derision Nazerani, or Nassara, meaning followers of the man of Nazareth.—*Robinson's Travels in Palestine and Syria*, Vol. i, p. 209; *De Syria*; *Morier's Second Journey*, p. 109.

NAZARITE, Numbers, vi. 18, 'the Nazarite shall shave the head.' The hindooes after a vow, cease to cut their hair during the term of the vow; at the expiration of which time they shave it off, at the place where the vow was made. It is a very ancient form of votive offering. Acts, xviii, 18. Cenchrea was a port on the east side of the Isthmus of Corinth, opposite to the Lecheum, another port on the west. Here a christian church was planted by Paul; for we find him commending Phoebe to the regards of the Roman believers, as a servant of the church which is at Cenchrea. (Rom., xxi, 1.) By this pious female he sent

from Corinth his epistle to the Romans. It has been a subject of much dispute, whether it was Paul who shaved his head, or Aquila. Chrysostom, Isidore of Seville, Grotius, Hammond, Zegerus, Erasmus, Baronius, Pearce, and Wesley, refer the vow to Aquila; while Jerome, Augustine, Bede, Calmet, Dodd and Rosenmuller, attribute it to Paul. The latter opinion is the more probable. The Æthiopic and the Latin versions refer the vow to both, reading they shaved, instead of having shaved, perhaps on account of the difficulty of deciding. It is probable that Paul had become a Nazaræus votivus, and, consequently, had bound himself to observe the law of the Nazarites for a certain time. The Nazaræi votiivi (Num., vi,) were required to abstain from wine, grapes, and all inebriating liquors, during the time of their separation. They were also to let their hair grow without cutting, till the days of their vow were fulfilled; then it was to be shaved off, and the appointed sacrifice to be offered in the temple. From this practice of the Jewish Nazarites, the heathens probably derived their custom of consecrating their hair, in times of danger, &c., to their divinities, which Lucian represents as of frequent occurrence, and with which he himself had complied. The emperor Nero is said, by Suetonius, to have cut off his first beard, and to have devoted it to Jupiter Capitolinus, placing it in a golden box, set with jewels. Nazaritism was partly a religious institution, and partly civil and prudential. Its laws were promotive of the strictest sanctity, and calculated to preserve the health, sobriety, and temperance of the community. Hence, we read, "her Nazarites were purer than snow, they were whiter than milk." (Lam. iv, 7.) Samson, Samuel, John the Baptist, and, according to the rabbins, Absalom were Nazarites, and Joseph is said to have been nazir echaiv, which we translate, "separated from his brethren," but which the Vulgate renders "Nazaræi inter fratres suos." Persons recovering from sickness, or preserved from danger, frequently took upon them the vow; and it is probable, that Paul had experienced some deliverance on this occasion, which the historian has not narrated. At the present time in Persia, if a child be sick, the mother frequently makes a vow, that the razor shall not come upon his head for a certain time, and sometimes for life, as in Sam, i, 11. When the time that is limited expires, the child's head is shaved, money is collected from the relatives, and sent as nazr or offerings to the mosque, and consecrated. Homer speaks of parents dedicating to some deity, the hair of their children which was cut off when they came to manhood, and consecrated to the gods. Achilles

cut off his golden locks at the funeral of Patroclus, and threw them into the river, his father having dedicated them to the river-god Sperchius. In the South of India, at the sacred hill of Tripaty, thousands of both sexes annually cut off their hair, and leave it as a votive offering.—*Milner's Seven Churches of Asia*, pp. 110-111; *Iliad*, Vol. xxiii, p. 149, &c.; *Æneid*, Vol. i, p. 698.

NAZIM, AR., HIND. A supervising servant, a mahomedan official name for a eunuch. Jeipoor and Boondi are the only two of the Rajpoot principalities who, adopting the mahomedan custom, have contaminated the palaces of their queens with the presence of these creatures.—*W.*; *Tod's Rajasthan*, Vol. ii, p. 382.

NAZIR JUNG succeeded Nizam-ul-mulk in the Dekhan and gave to Mahomed Ali the title of Nabob of the Carnatic.

NAZM, AR., HIND., PERS. Order, arrangement: poetry, as distinguished from Nasr, prose.—*Wils.*

NAZR, an offering from an inferior to a superior, a present, a sight, a look: it is the present sent before as in the time of (Gen., xxxii, 18) Jacob and Esau, when the servants said it is a present sent unto my Lord Esau. I. Samuel, ix, 7. Then said Saul to his servant, "But behold, if we go, what shall we bring the man? for the bread is spent in our vessels, and there is not a present to bring to the man of God: what have we?" It is very common in British India for a person, who is desirous of asking a favour from a superior, to take a present of fruits, or sweetmeats in his hand. If not accepted, the feelings of the offerer are greatly wounded. The making of presents to appease a superior is also very common. There are periodical occasions in Persia, at which all who are admitted to stand in the presence of its monarch are expected to appear before him with a present. Of these, the chief is the No-Roz, or new year, which occurs about the end of March or beginning of April. Plural Nazrana, taxes or presents.—*Fraser's Journey into Khorasan*, p. 214.

NAZUC, HIND. Zizyphus jujuba.

NAZUL, HIND. Property belonging to Government usually in charge of District Local Fund Committees, the property is chiefly houses, gardens, or plots of land in cities. In the Panjab the various nazul gardens, (i. e., Government property) are generally planted with mangoes, as well as other trees; and the right to sell the fruit is sold on contract by auction at the beginning of the season; the property of a large garden like that of Shalimar, at Lahore, is something very considerable.—*Powell*, p. 279.

NEUBAY, BURM. A Burmese wood, one of

the Anacardiaceæ, has a dense wood, but brittle.—*Major Benson*.

NDALO—? Colocasia macrorrhiza.

NE, HIND. Hordeum hexastichum.

NEAGAM, EGYPT. Achyranthes aspera, Linn.

NEAMAH, also Tir-ud-jammel, ARAB. The ostrich. See Struthionidæ.

NEARA—? Cocoa-nut palm.

NEARCHUS, the general whom Alexander the Great commissioned to survey the Southern Asiatic coast from the mouth of the Indus to that of the Tigris. He sailed along the coast.—*Ind. in 15th Cent.* See Inscriptions, Kishm Island.

NEATS FOOT OIL, used as a softener of leather, &c., &c. See Oil.

NEBBE, AR. A prophet.

NEBEDE, SINGH. A Ceylon wood, used for common house-building purposes. The tree grows in the southern and western parts of the island. A cubic foot weighs 51 lbs., and it is esteemed to last 20 years.—*Mr. Mendis*.

NEBKHI, AR. Rhamnus nabeca.

NEBONG, a Penang wood of a dark colour. It is from a tall and thin, but straight tree; used for railings. See Nibong.

NEBOO, BENG. Citrus acida, acid lime.

NEBUCHADNEZZAR, king of Babylon, defeated Nechao II, near Kar-chemish B. C. 605 while crown prince: he burned and pillaged the palace and temple of Jerusalem. B. C. 586, Jerusalem razed, Zedekiah's children slain and his eyes then put out. He died B. C. 563. The name of Nebuchadnezzar is written in many ways in the Bisutun inscription, we have Nabokhodrossor, Nabukhadrachar, and Nabukhudrachar. In pure Babylonian inscriptions it undergoes even more numerous changes. In Daniel he is called Nebuchadnezzar or Nabuchodonosor, in Ezekiel (ch. xxvi, v. 7) the name is written Nebuchadrezzar. The first component of the word, Nebo, was the name of a Babylonian divinity. (Isaiah, ch. xlii, v. 1.) The interchanges which take place in consonants is shown by the names of several Babylonian kings, as given by the Greeks; thus, the Labunitus of Herodotus is called Nabunidus by Berosus.—*Layard's Nineveh*, Vol. ii, p. 177; *Bunsen*. See Kranganore, Nineveh.

NECHA, HIND. A pipe of a hooka or of a still. Necha-Changhani is a kind of hooka.

NECHETTY KALUNG, TAM. Isoetes coromandeliana.

NECHO, a king of Egypt who reigned about 600 years B. C. He was desirous of joining the Red Sea with the Mediterranean. He is also said to have commanded some Phœnicians to sail from the Red Sea to the Mediterranean, round the Cape of Good Hope—a voyage which they accomplished in two years. If the Phœ-

nicians really did complete the voyage, which is by no means improbable, they anticipated the discovery made by the Portuguese about 2,000 years afterwards! In any case, it is apparent that the king was in those days fully alive to the advantages of the trade from the East. About 100 years later, Egypt fell under the kings of Persia, and Darius determined upon completing the projects of Sesostris and Necho by digging a canal between the Red Sea and the Nile; but being assured by the engineers of the period that the Red Sea was higher than the Nile, and that its salt water would overflow and ruin the whole land of Egypt, he abandoned his purpose.

NECKLACE. Necklaces of the precious metals, of shells, seeds, &c., are worn by all races of British India, by men and women amongst hindoos, by women amongst mahomedans, but no mahomedan man wears such.

NECTARINIA ZEYLANICA, the Sun-bird of Ceylon. See Birds.

NECTOPODA, see Carinaria, Molluscs.

NEDEL AMPEL, TAM., MAL. Villarsia indica, *Vent.*

NEDJD, a district of Arabia. See Nejed.

NEDON, SINGH. Dalbergia lanceolaria, *L. fil.*

NEDSITU, TAM. Vernonia cinerea, *Less.*

NEDUM SCILETTI, MAL. Memecylon amplexicaule.

NEEBRUNG, see Kunawar.

NEEDLES.

Sui,	Guz., HIND.	Wusigal,	TAM.
Jarum,	MAL.	Sudulu,	TEL.

Needles are made from the best steel, reduced by a wire-drawing machine to a suitable diameter. The construction of a needle requires about 120 operations; but they are rapidly, and uninterruptedly successive.—*Faukner.*

NEEDLE-LIKE ANDROPOGON, Andropogon aciculatus.

NEEJA, a lance carried about at the Mohurum.

NEEKAH, AR., HIND. The solemnization of matrimony. Neekah ka seegal, the mahomedan marriage contract; properly Nickah.

NEEK'HUR. The Gudurea, also written Gadarra, is a shepherd race of which there are several sub-divisions in Hindustan, Neek'hur; Tusselha or Puchhade, Chuck, Dhangur, Bureyea, Pyhwar and Bhyeatur. Of each of these there are also many sub-divisions.—*Ell. Supp. Gloss.*

NEEL, HIND. Neelum, TAM. Indigofera tinctoria, Indigo, the Indigo-plant.

NEELA, SANS. Dark-blue.

NEELA-KANTA, SANS., from neela, dark-blue, and kanta, the throat; a name of Siva.

NEELAMPELLAH, TAM.? A Travancore wood of a light brown colour, used for house-building, ceilings, &c., also written Neelum pala.—*Col. Frith.*

NEELA-PARVATA, SANS., from neela, blue, and parvata, a mountain.

NEELA-THEROOVATTAY, TAM. Bauhinia purpurea.

NEELA-VULLY-POOCHADDY, TAM. Pontederia vaginalis.

NEELGHERRY MOUNTAINS, a range in the southern parts of the Peninsula of India. See Neilgherries.

NEEL-JHANJEE, BENG. Utricularia reticulata.

NEEL-KALMEE, BENG. Pharbitis nil.

NEEL-MALL, HIND. Strychnos potatorum.

NEELUM, TAM. Indigofera tinctoria.

NEELUMPALLAH, TAM.? A Travancore wood of a light brown colour, used for light work.—*Col. Frith.*

NEEL-LUTA, BENG. Thunbergia grandiflora.

NEEL-PUDMO, BENG. Nymphœa cyanea.

NEEL-UPURAJITA, BENG. Clitoria ternatea.

NEEM, HIND. The Margosa tree, or Vepa maram, TAM. Azadirachta indica, and all the species of Azadirachta and Melia.

NEEM, PERS. Half. Neemcha, a mixed race.

NEEMA — ? dress.

NEEMBOLEE — ?

NEEMI CHAMBELI, HIND. Bignonia suberosa, *Roxb.*

NEEM NUDDY, a rivulet near Abrowlie in Allygurh, runs near Khasganj in Budaon.

NEEMOOKA, HIND. Root of several species of Cissampelos.—*Ben. Phar.*

NEEN-THA, BURM. A very abundant tree along the sea coast near Tavoy and Mergui. Its wood when seasoned sinks in water. It is used for rafters of houses, is a very heavy wood, but liable to split, therefore not recommended for ordnance purposes.—*Captain Dance.*

NEERADI MOOTOO, TEL. Species of Jatropha.

NEERADI MOOTOO OIL, ANGLO-TAM.

Jungli Badam ka tel,	Neerada Mootoo Yennai,
HIND.	TAM.

This valuable oil was sent to the Madras Exhibition under the various names of Neeradesmootoo, jungle Almond, Maroty, Tamana, Maravetti, Neervetti and Soorty. It is in great repute, as a medicine amongst native practitioners, and the kernel enters largely into their prescriptions. It might probably be found of use in the arts, it much resembles almond oil but is rather thicker. The seeds cost in Madras As. 2-6 per seer—excellent specimens were contributed by the Madras Tariff, Travancore and Cochin Local Committees and Lieut. Hawkes.

NEERADI-MUTOO, TEL.? Hydrocarpus inebrians.

NEER-CUDEMBA, TEL. Nauclea parviflora.

NEERGOBBI VAYROO, TEL. The root of Barleria longifolia, *Linn.*

NEERGOONDABY,—? *Vitex bicolor*, W.
NEERIJA BARK, ANGLO-HIND. Bark of
Elceodendron roxburghii.—*Ben. Ph.*

NEER-MOOLLIE, TAM. *Asteracantha longifolia* or *Barleria longifolia*, *Linn.*

NEERMOOLIE VAYR, TAM. The root.
NEEROODEE.

Neeroodee, HIND. | *Chinna neeroodee*, TEL.
NEER-PIRIMI, TAM. *Herpestis monniera*.
NEETEE PASS, a pass in Kunawer. See
Mountains, Passes.

NEETI, SANS., from nee, to obtain.

NEEUT, AR., HIND. A vow.

NEEUT KHEYR-KI-FATEEIIA, a thanks-
giving.

NEFRUARI, see Hindu.

NEFT, ARAB., PERS. Is a good avenue tree,
Naphtha.

NEGALYA-PONYA, NEP. *Ailurus elegans*,
F. Cuv., *Bly.*, *Hard.*

NEGAPATAM, on the Coromandel Coast,
is in lat. $10^{\circ} 45\frac{1}{2}'$ N., long. $79^{\circ} 55'$ E., in the
Tanjore district. The town has a considerable
coasting trade, is near one of the mouths of the
Cauvery. It was taken from the Portuguese
by the Dutch in 1660, and henceforward
became the head-quarters of the Dutch trade on
the Coromandel Coast.—*Cal. Rev.*, Jan. 1871.

NEGHA, MALAL. Fruit of *Tamarindus*
indica, *Linn.*, *Roxb.* Tamarind.

NEGOMBA, on the west coast of Ceylon, in
lat. $7^{\circ} 12'$ N., is a place of some trade.

NEGRAIS, an island, a river, and a cape of
this name. The cape is in lat. $16^{\circ} 2\frac{1}{2}'$ N.,
long. $94^{\circ} 13'$ E., is the south-west land of the
coast of Ava. A river of the same name is
navigable a great way inland, by a channel on
each side of the island.

NEGRETTI, see Red Sea.

NEGRO RACES. Ethnologists are of opinion
that Africa has had an important influence in
the colonization of Southern Asia, of India and
of the Eastern islands, in times prior to au-
thentic history or traditions, and numerous
races of an Africo-Turanian type are found
in British India. The marked African features
of some of the people in the extreme south of
the Peninsula of India, the Negro and Negrito
races of the Andamans and Great Nicobar, the
Jakun of the Malay Peninsula and the Negrito
and Negro, Papuan and Malagasi races of the
islands of the Indian Archipelago, Australia
and Polynesia, indicate the extent which cha-
racterises their colonization. Much of this
needs further inquiry, but it is a subject which
will well reward investigators. Historical re-
searches have shown how frequent during the
past four thousand years were emigrations and
conquests between Media, Arabia, Persia, Pale-
stine and Africa. Negro races occupy the hill
in the Dandilli district of N. Canara. Their

origin has not been traced, but since the maho-
medans of Arab origin have been fighting in
India for dominion almost all the rulers have
retained large bodies of Africans, either of
the large-lipped, curly-haired, negro type, or
of the softer-featured Abyssinian, and one
family of these Abyssinian races, the Habshi
or Sidi of Janjirah near Bombay, is still ruling.
The Adal-shahi and Nizam-shah Bhairi dy-
nasties, who ruled in Bejapore and Ahmed-
nuggur in the 15th and 16th centuries had
considerable bodies of negro soldiers as their
household troops; the negro sailors of the Sidi
of Janjira continued up to the 18th century,
the most ruthless pirates on the pirate coast
of India; the Amirs of Sind had, till the latest
hour of their rule, bodies of African negroes
around them, the nabobs of the Carnatic had a
small body of the negro race as their house-
hold slaves, the race are still numerous in Lus
and Mekran, and at Hyderabad in the Dekkan
they still form part both of the regular and
irregular troops of the nizam of the Dekkan.

According to Mr. Logan, the oldest races of
India, Ultra-India and Asianesia, were of a
variable African type, the two principal forms
being Australo-Tamulian or quasi Semitic and
Negrito, followed in Asianesia by the Malagasi.
He is, likewise, of opinion, that the present pre-
valent Ultra-Indian races entered the region from
the north-east and at a very remote period spread
on the one side over Ultra-India and the basins
of the Brahmaputra and Ganges, and partly
into southern India; and, on the other, were
diffused by a long succession of movements all
over Asianesia. Throughout these regions,
they came in contact with more ancient races,
and have in some places variously blended
with them and in some dislodged or extermi-
nated them, while in others, the old tribes
have been able to maintain a certain degree
of independence and purity. In southern India,
the ancient element was preserved in some
degree, owing apparently to a civilization early
received from partially allied Semitico-African
and Semitic nations. In the Andamans, the
interior of the great Nicobar, the jungles of
the Malay Peninsula, in Australia and in the
various Papuan and partially Papuan Islands,
the African element has been maintained from
the comparative isolation of the tribes. In the
Gangetic province, as in the greater portion of
Ultra-India, including the Malay Peninsula, the
intrusive race appears to have been recruited
by the entrance of new tribes from the north-
east and to have ultimately assimilated the native
race, although the influence of the latter is still
slightly perceptible. He remarks that when
we consider the position of India, between the
two great negro provinces, that on the west
being still mainly negro, even in most of its

improved races, and that on the east preserving the ancient negro basis in points so near India as the Andamans and Kidah, it becomes highly probable that the African element in the population of the peninsula has been transmitted from an archaic period before the Semitic, Turanian and Iranian races entered India, and when the Indian Ocean had negro tribes along its northern as well as its eastern and western shores. The basis of the present population of the Dekhan, he says, was of an African character which was partially improved by Turanians or Irano-Turanians and Semitico-Turanians from the N. W. and afterwards by more advanced ancient N. E. African and Semitic settlers. Perhaps all the original population of southern Arabia and even of the Semitic lands generally, was once African; and the Semitic race had descended on them from a tribe located in the mountains at the head of the Euphrates. From the time when the adjacent shores of the Indian ocean began to be the seats of general commercial and maritime nations, the peninsula must have been exposed to the regular influx of foreign traders and adventurers. From the antiquity of the Egyptian civilization, it is probable that the earliest commercial visitors were Africans from eastern Africa or southern Arabia. It is certain that the subsequent Semitic navigators of Arabia at an early date established that intercourse with India which they have maintained to the present day. The trade between India and the west, appears to have been entirely in their hands for about 3,000 years. During this period, the Arab navigators not only remained for some months in the Indian ports, between the outward and home voyages, but many settled in them as merchants. Mr. Logan thinks that the influence of African and Arabic blood must have preceded that of the Arian in the peninsula. In after-ages, the Arian ingredient in the peninsular population became considerable, but it has not modified the native races in the same degree as it has done the Bengali. The languages are still essentially distinct and the non-Arian physical element remains strong. In southern India, are languages of one formation which is broadly distinguished from the Arian or Sanscrit on the one side, and from Tibetan and Ultra-Indian on the other. Physically, the population of Southern India is one of the most variable and mixed which any ancient archaic province displays, the number of varieties amongst the people being too great to allow of their being referred to a single race of pure blood. Some are exceedingly Iranian, more are Semitico-Iranian, some are Semitic, others Australian; some remind us of Egyptians, while others again have Malaya-Polynesian and even Simang and

Papuan features. Yet when the eye takes in the whole group at once, they are seen to have all something in common. They are not Iranians, Polynesians, Papuans, &c., but South Indians. The strong Africanism of some of the lower south Indian castes, is believed to be the remnant of an archaic formation of a more decided African character. In certain of the classes of Southern India, in which the complexion is fairer, an Egyptian style of features is not unfrequently observable. In this, the nose is not indented at the root. It is long and slightly curved; the eyes almond-shaped and slightly oblique and the chin is short. In general, the physiognomy is more the Iranian than the East African and Egyptian. Where the Arian or Semitic crossing is not striking, the person is generally rather small and slender, the legs in particular being very thin, compared with those of the Gangetic race. The colour varies from black to different degrees of brown and yellowish brown, in general contrasting strongly with the Ultra-Indian and Indonesian races. There is a tendency to certain peculiar physical traits, neither Ultra-Indian, Tibetan nor Arian, but seem to be East African. The typical East African head is removed both from the exaggerated prognathous form, prevalent amongst the Guinea negroes and the highly Semitic form characteristic of tribes that have been deeply crossed by Arab blood, and is in some respects intermediate between the Iranian and Turanian, while it has specialties of its own. The cheek bones are often much more prominent than in the Iranian, and less so than in the typical Turanian, the projection being frequently anterior more than lateral. The lips are full or turgid and turned out, frequently with sharp edges. Slightly prognathous heads are not infrequent. In the south Indian population as a whole, the bridge of the nose is generally less prominent than in the Iranian, and much more so than in the Turanian. Even where the root of the nose, between the eyes, sinks in, the upper line as a whole is much more thrown out from the face than in the Turanian head, so as to render the point comparatively sharp and prominent. The alæ have an upward expansion, leaving the upper part of the septum exposed and the elongated nares open and conspicuous. This is a Semitico-African trait. In the Turanian the septum is contracted and thickened at the base, pulling down the point of the nose or rendering it low and obtuse, forcing the nares to spread out laterally and making the nares rounded. The eyes in the Dravidian are large, are of full size, horizontal and well-separated and the beard is generally sufficiently strong. The Africo-Papuan pyramidal nose, with a deep and sharp sinking in at the root, is

common, particularly in some of the lower castes, in which the colour is nearly black. Mr. Logan thinks it probable that this lower and apparently the more normal southern type characterised the whole population of India at one period. Amongst the Vindhians, some tribes are found who seem to approximate to it such as the little ill-flavored Tamariah, the neighbours of the Ilo and the short and jet-black Surah who are spread for 200 miles from the hilly southern side of the basin of the Ganges along the eastern face of the ghauts to the Godavery who are much in person, in civilization, akin to the Gangetic population. The Chensuar, (Suar-Surah?) who occupy the western portions of the continuation of the ghauts between the Pennar and the Kistna, and who are probably a continuation of the Surah, are described by Captain Newbold as having small and animated features, the cheek bones higher and more prominent than those of the generality of hindoos: the nose flatter and the nostrils more expanded, the eye black and piercing, the stature lower than that of their Telugu neighbours, and the person light but well-formed. He characterizes them as being between a Telugu and Jakun of the Malay Peninsula. The Chensuar live in beehive-shaped huts like the African, Nicobarian and many of the ruder Asianesian tribes.

The Jakun of the Malay Peninsula, is the most African and prognathous of the lank-haired Indianesian tribes.

In the Neilgherry hills, the Kurambar and Erular belong to the same low type. In the ghauts of the northern part of the peninsula, the Koli, Ramusi, Beder, Warali, Katadi or Katkar tribes appear to be allied to the lower type, but in general the African element has been eliminated. One of the most African of these petty northern tribes is the Katadi. They are of a deep black colour, and Mr. Vauvill describes them as being more like monkeys than any race of men he ever saw. The Warali are more slender and somewhat darker than the common Marathi.

The sequestered tribes of Southern India appear to belong chiefly to the lower form. In some cases they approximate to the more Turanian African type, in which the nose is flatter, the beard scanty, and the person shorter. There is so considerable a difference between this type and the more semitic, that, whatever may be the original relationship of the two it is necessary to recognize both as existing in India at the earliest era which ethnology can decry. A similar phenomenon presents itself on the western side of the Indian ocean and, what is still more important with reference to India, it is found also in the negro population of the eastern side. Many of the East-African

tribes are very short and slender, small-eyed, flat-faced, and beardless, while others are middle sized and even tall and robust, with the Semitico African beards, aquiline or pyramidal noses, raised nares and large eyes, of the other archaic types of Southern India. Both types preserve a black complexion, alike in Africa, India, the Andamans, the Malay Peninsula, the Malayo-Polynesian Islands, and Australia, although modifications of colour also occur throughout this area. He thinks that little weight is to be attached to the present absence of spiral hair in S. India, for some of the spiral-haired Papuan tribes of New Guinea and Torres straits are often more Africo-Semitic and S. Indian, in their physiognomy, than the Australians, while the latter have the fine hair of S. Indians and some Mid-African nations and a linguistic formation which resembles the S. Indian more than any in the world.

In further India, in the extreme South East of Asia, are two marked types of the human family. These are the lank-haired Malay and brown races, and the curly-haired races, to whom the terms Negro, Negrito, Papuan, Alfura, &c., have been applied. The Ultra-Indian races in their fundamental characters, physical and mental, and in all their social and national developments, from the lowest or most barbarous stage in which any of their tribes now exist to the highest civilization which they have attained in Burmah, Pegu, Siam and Kambojia, are intimately connected with the predominant Oceanic races. The tribes of the Niha Polynesian family who appear to have proceeded those of the Malayan, resemble the finer type of the Mon, Burman and the allied Indian and Himalayan tribes.

The Malayan family approximates closely to the ruder or more purely Mongolian type of Ultra-India, and the identity in person and character is accompanied by a close agreement in habits, customs, institutions and arts, so as to place beyond doubt that the lank-haired populations of the islands have been received from the Gangetic and Ultra-Indian races. The influx of this population closed the long era of Papuan predominance and gave rise to the new or modified forms of language which now prevail. It is generally supposed that when they entered on their career of conquest, the Malays spread from the Menangkabau district in Sumatra. The language of the rude maritime tribes who frequent the coasts and islands of the Malayan peninsula, and amongst whom several distinct tribes are distinguishable by their physical characters, is one mainly Malay but with differences in pronunciation. In all the seaports and courts of the Archipelago, the Malays are a tall handsome class, whose fine eyes and well-shaped features

betray the presence of Arab or Indian blood. The Malayan races of Pinang and province Wellesley, is short; five feet, two or three inches being considered the average height of a man, and that of a woman is a few inches shorter. Their bones are large and clumsily put together, but strongly knit; arms and legs usually short compared with the end of the body, and the whole frame robust and capable of much labour. The head is round and elongated at the summit, broad at the back, and set on a stout, thick neck. Eyes long and narrow, rather deep set, black or dark hazel in colour and seldom clear about the white. Nose long, wide at the nostrils and not very flat. Forehead broad and receding: cheek bones very prominent and jaws wide and square; teeth regular, large and white, unless discoloured by lime and gambier. The facial angle seldom exceeds fifty degrees, while that of the European is seldom less and sometimes is nearly ninety or perpendicular, hair black and coarse. It is plentiful on the head, but other parts of the body are smooth. The moustaches alone are retained on the face, other hairs being removed by pincers,—mouth large with thin lips: ears large and ill-shaped. The body is fleshy and muscular, legs remarkably so, thighs so large as to be unwieldy. Habit of body lean, Malays seldom become obese. The women are pretty when young, but soon show signs of old age: they become wrinkled and haggard after bearing a few children, and in old age are hideous. Malays are frank, courteous and honest, brave, generous and sensitive to a fault, in youth grave at times and anon overflowing with mirth; in advanced life sedate. They are proud, and if ill-treated, revengeful; but under generous treatment are gentle, kind, humane, grateful, docile and faithful. Capable of the warmest attachments, and yet impelled to madness and the commission of the most revolting deeds by real or imaginary unkindness. They are dutiful children and kind parents. They treat their aged kinsmen with the greatest kindness and even feel it a duty to relieve the wants of an indigent relation. Old men and women are always regarded with respect. The Malays are frequently quite Burmans in appearance, but the normal and least mixed Malays are more Binua and also more Siamese than the western Burmans. The Malays of Johor when employed in gathering camphor, use a fictitious vocabulary, constructed in a similar manner to the deferential dialect of Javan, and used to propitiate the spirit of the camphor tree.

From Timur to New Guinea, there runs a long chain of islets, forming as it were, a wall or barrier to the south-eastern portion of the Archipelago. In some of these islands the in-

habitants are of a different race from the Malays, and speak many languages. Till recently, by far the most ample and authentic account of them has been given by Mr. Winsor Earl, who, after a longer experience of the countries in which they are spoken than any other European, makes the following observations. "In the south-eastern parts of the Indian Archipelago, where opportunities of social intercourse between the various petty tribes are of rare occurrence, every island, every detached group of villages, has its own peculiar dialect which is often unintelligible, even to the tribes in its immediate neighbourhood. In some of the larger islands, Timur, for example, these tribes are so numerous, and the country occupied by many of them so extensive, that it becomes impossible to form even an approximate estimate of their number." Of one language, the prevailing one, among several languages of the island of Kisa, one of the Sarawati group, in the chain of islets already mentioned, Mr. Earl furnished a curious and instructive vocabulary of 330 words. The Kisa is an unwritten tongue, but its vowels are the same as those of the Malay and Javanese. Timur is a word which means the east, and was probably imposed on this island by the Malays, to whose language it belongs, because this was the extreme limit of their ordinary commercial voyages to the south-east. Timur is about three times the extent of Jamaica. Its principal inhabitants are of the Malayan race, but it contains also Papuans or Negroes, and tribes of the intermediate race. The two languages of Timur are the Manatoto and the Timuri, the first spoken at the north-east end of the island, and the last used by many of the tribes as a common medium of intercourse. No alphabet has ever been invented in Timur; but judging by the specimens of its languages, the vowels are the same as those of the Malay and Javanese.

In the Archipelago, there seemed to Mr. Crawfurd to be four races of man, the Malays proper; the Semang or dwarf Negro of the Malay peninsula; the Negrito or Acta of the Philippines; the larger Negro race or Papua of New Guinea and a race whom Crawfurd styles the Negro Malay, intermediate between the Papuan and Malay.

The Malay are superior to all the others in intellect and civilization. They occupy the whole of the Malay peninsula, half of Sumatra, all the sea coast of Borneo. Their numbers are estimated at 1,500,000 in Borneo; 1,250,000 in the Malay peninsula; and 1,000,000 in Sumatra. The Malay are short, squat, with round face, wide mouth, large high cheek bones; short small noses, black, small, deep-set eyes. Their hair is lank, black and harsh, and the men have little or no beard.

The Semang are a small Negro race.

The Jakun of Jahore, are superior to others in many respects, are the best dressed, having also a great number of rings on their fingers.

The Negrito are short, but well-made, active, soft frizzled hair, nose slightly flattened, features more regular and skin-less dark than the African Negro.

The Papua of New Guinea are true Negroes and have made some advances in civilization.

The Negro-Malay are fairer than the Negro, darker than the Malay, intermediate between the Malay and Papua.

Mr. Wallace, however, believes that the Archipelago is divisible into an Asiatic and an Australian portion, that the flora and fauna differ, and that all the peoples of the various islands can be grouped either with the Malay or the Papuan, two radically distinct races who differ in every physical, mental and moral character, and he states his belief that under these two forms, as types, the whole of the peoples of the Malay Archipelago and Polynesia can be classed. He considers that a line can be drawn which shall so divide the islands as to indicate the one-half which truly belong to Asia, while the other no less certainly is allied to Australia, and he designates these respectively the Indo-Malayan and the Austro-Malayan divisions. He gives to Mr. Earl (*pp.* 12, 13 and 36) the credit of having been the first to indicate the division of the Archipelago into an Australian and Asiatic region. All the wide expanse of sea which divides Java, Sumatra and Borneo from each other, and from Malacca and Siam, rarely exceeds forty fathoms in depth, and the seas north to the Philippine islands and Bali, east of Java, are not a hundred fathoms deep; and he is of opinion that these islands have been separated from the continent and from each other by subsidence of the intervening tracts of land. In the islands of Sumatra and Borneo are the elephant and tapir, and the rhinoceros of Sumatra and the allied species of Java, the wild cattle of Borneo and the species long supposed to be peculiar to Java all inhabit some part or other of southern Asia. Of the birds, and insects, every family, and almost every genus of the groups found in any of the islands, occur also on the Asiatic continent and in a great number of cases the species are exactly identical. The resemblance in the natural productions of Java, Sumatra and Borneo with those of the adjacent parts of the continent, lead to the conclusion that at a very recent geological epoch the continent of Asia extended far beyond its present limits in a south-easterly direction including the islands of Java, Sumatra and Borneo, and probably reaching as far as the present 100 fathom line of

soundings. The Philippine Islands agree in some respect with Asia and the other islands, but present some anomalies which seem to indicate that they were separated at an earlier period and have since been subject to many revolutions in their physical geography.

But all the islands from Celebes and Limbok, eastward, exhibit almost as close a resemblance to Australia and New Guinea as the western islands do to Asia. Australia in its natural productions differs from Asia more than any of the four ancient quarters of the world differ from each other, and all its striking peculiarities are found also in those islands which form the Austro-Malayan division of the Archipelago, and the contrast between the Asiatic or Indo-Malayan forms and those of the Austro-Malayan are abruptly exhibited in passing from the island of Bola to that of Limbok, though the strait is only 15 miles wide, and in travelling from Java or Borneo to Celebes or the Mollucas the difference is still more striking, leaving the only inference that the whole of the islands eastwards beyond Java and Borneo do essentially form a part of a former Australian or Pacific continent although it may never have actually been joined to it, and it may have been broken up before the western islands were separated from Asia, and probably before the extreme south-eastern part of Asia was raised above the waters of the ocean.

The Arn, Mysol, Waigiu and Jobi islands are called Mo-toung, also Moo-long. Their language is said to be distinct. Of the two great races of Malays and Negroes, most of the former have embraced mahomedanism. The Malays apply to the people of New Guinea, the epithet of Puwa-puwa, or Papuwa, which is the adjective "frizzly," or "crisping," and is equally applied by them to any object partaking of this quality. The term Negro, from the Latin niger, is that usually employed to designate the races of whom mention is now made. Their numbers in Africa are vaguely estimated at twenty millions, including the Hottentot and Kafir off-shoots from the great family. The race on the American continent number about five millions. Their numbers on the Asiatic continent, on the shores of the Red Sea and Persian gulf, and on the Malay Peninsula, may not exceed half a million, but from the Andaman islands eastwards to the races in the Pacific, of the people generally classed as Negroes, there are at least twelve varieties differing from each other in physical appearance, some being pigmies under five feet and others large and powerful men of near six feet. Excepting in the Andamans, in all the Negro languages of which Mr. Crawford had seen specimens, Malayan words are to be found. Negro races occupy the Andaman and Great Nicobar islands,

and the Minkopi of the Andaman group have some peculiarities which indicate a difference from others of the Negro tribes. The Semang, a pagan tribe of the Malay Peninsula, are certainly of Negro origin, also, the Aheta, Ita or Negrito race of the Philippines. The Negros of Buglos Island from lat. 9°4' to lat. 9°50' N. The inland inhabitants of New Guinea, Ceram and all the larger islands in the south-eastern part of the Indian Archipelago, also of Mindanao are Papuans. The Arruans of the Arru Islands have African features and bear a strong resemblance to the natives of Port Essington.

Mr. Logan thinks there is no doubt that Southern Asia had always been occupied as at present with several races, tribes and languages, and that S. W. Asia and Asianesia had been contemporaneously occupied by 1st, Archaic Indo-Australian; 2, Papuan; 3, Tibeto-Chinese or Ultra-Indian; 4, Dravidian; 5, Scythic; 6, Iranian; 7, Semitic races, and the spiral-haired Negro race seems to have preceded the lank-haired brown race: whether Negro tribes and dialects did not in a still more ancient era, occupy Ultra-India and India, before any of the present non-negro races moved into their regions, he says, is a question deserving investigation. At present, a Negrito race, of small stature, is found in several parts of Asianesia; traces of the Negro race are also found in Formosa and Japan. Lesson alluding to the Australian Negro says the race does not differ in any essential thing from the Oceanic race, of which the Papuans alone form another somewhat distinct branch. They have a similarity of form and external character to the inhabitants of New Britain, New Ireland and very probably those of New Caledonia. He supposes that they have emigrated from New Guinea and Madagascar.

The Negroes of the Andamans are in the very lowest and most abject state of human society, without fixed dwellings, unclad, and unacquainted with the meanest of the useful arts of life. In disposition they are shy, unsocial, and mischievous. They seem to have been isolated for the past two or three hundred years, and when the British last settled on their islands, in 1858, they were found in the lowest condition to which human beings can fall. They are not cannibals as was long supposed,—but live on pork, fish, grains, roots, cocoanut and other fruits, and broil the flesh of their animals before eating it. They may be called hunters and fishermen, hunting game in their own wilds and jungles, using the bow and arrow, with which they are expert, and employ the bark of a tree for fishing lines. They have no clothing, but go entirely naked and seem unconscious of that feeling of shame which guides the other races in the world

to cover their persons. They construct huts, but of the rudest character. They are intensely averse to the intrusion of strangers and so far as known, up to the year 1865, only two persons had been allowed to live. They are small in stature, seldom rising in height over five feet. The head is smaller than that of the ordinary Asiatic, and depressions exist in the temporal region. The teeth are nearly white, but often so irregular as to seem in double rows. They are muscular, and are deficient in the roundness and fulness which give such symmetry of form to other races. In youth, to beautify their persons, their bodies are scarified all over with broken glass, which gives the skin a bead-like appearance, the lines running longitudinally down the arms and bust. Their religion is supposed to be a kind of Fetishism. When pleased with any thing to which their attention is drawn, they gently bite with their teeth the lower edge of the palm of the right hand and then smartly strike the left shoulder. They also contract the lips as in kissing and make a hissing noise like that of grooms in cleaning horses. When they speak to one another their pronunciation is so indistinct as to resemble a chatter, but they are sharp in catching words and sounds. They are said to be passionately fond of music, though they have no musical instrument. In dancing, they hop on one foot, beating it down smartly in regular time, keeping both hands raised above the head. They change feet, keeping cadence with the song, work the head, bow the body and thus spring and jump till the dance is closed. The Andaman language is dissyllabic.

Further eastward, in the northern portion of the Malayan Peninsula, within the territories of the Malay provinces of Quenda, Perah, Pahang and Tringanu, is a negro race known to the Malays under the names of Simang and Bila. Their complexion is black, or sooty, the hair woolly, the features approaching to the African, and the stature dwarfish. An adult Simang male, said to be of the mean height of this people, was found to be only 4 feet 9 inches high. Some of the Simang, or Bila, have fixed habitations, and practice a rude agriculture, but the majority lead an erratic life, gathering the rude products of the forest to exchange with the Malays for the necessities of life, or substituting by the chase. The Simang and Bila of the Malay peninsula appear to have several tongues, and that of the Simang though containing Malay and Javanese words is considered by Mr. Crawford to be an original tongue. The Simang and the Philippine Negroes are of diminutive stature. The average height of the wild tribe of Simang on the Malay Peninsula appears to be under five feet. In

the remoter portions of Asianesia, some of the black tribes possess all the traits of the Guinea Negro, but the Simang and Andaman appear, like the greater number of Asianesian Negro tribes, to have been partially modified by mixture with other races. This is certainly the case with the Simang, some of whom are Australo-Tamulian in appearance, while others differ little save in their frizzled or spiral hair and dark complexion, from some of the adjacent Binua. The average height of the adults of a party of Simang Bukit on the Ijan, a feeder of the Krian was four feet eight inches, the highest four feet ten inches. Head small, ridged, that is, rising above the forehead in an obtuse wedge-shape, the back rounded and markedly narrower than the zygomatic or middle zone; the face generally narrower and smaller than the Malay: eye-brows very prominent, standing out from the forehead and projecting over the ocular furrow which extends across the face, the root of the nose sinking into it and forming a deep angle with the base of the superciliary ridge. The nose short and somewhat sharp at the point, and often turned up, but the alæ spreading; eyes fine, middle-sized and straight: iris large, piercing, conjunctive membrane yellow, the upper eye-lashes, owing to the deep ocular depression or prominent ridges are compressed or folded, the roots of the hair being hidden. The cheek bones generally broad, but in some cases not remarkably prominent, save with reference to the narrow forehead. Mouth large or wide but lips not thick or projecting, the lower part of the face oval or round but not square. The deep depression at the eyes and sinking in at the root of the nose gives a very remarkable character to the head compared with the Malay. The projecting brow is in a vertical line with the nose, mouth and chin, and the upper jaw is not projecting or prognathous. The person is slender, the belly protuberant owing to their animal life in the jungle and precarious food. This induces them to cram themselves whenever they can, and the skin of the abdomen thus becomes flaccid and expansible like that of an ape. The skin generally is fine and soft, although often disfigured by scurf, and the colour is a dark-brown, but in some cases lighter and approaching to the Malay. The more exposed hordes are black. The Simang of Tringanu are not of such a jet-black glossy colour as the Kidah tribe. The hair is spiral not woolly, and grows thickly on the head in tufts. They have thick moustaches, the growth being much stronger than in the Malay race. The head is neither Mongolian, nor Negro of the Guinea type. It is Papua-Tamulian; the expression of the face is mild, simple and

stupid. The voice is soft, low, nasal and hollow or cerebral; a line of tattooing extends from the forehead to the cheekbones. The right ear is pierced, the orifice being large. The hair is cropped save a ring or fringe round the forehead. Simangs are found in all the rivers of Pera and are classed as the Simang paya who frequent the low and marshy alluvium between the sea and the hill; the Simang bukit who wander in the forests of the hills, and the Saki who are confined to the mountains of the interior. There are said to be thousands of Simangs in the interior of Patani, Tringanu, Kidah and Pera, wherever the country is covered with forest and there are few or no Malays. Simang tribes of Kidah and Pera have a language mainly dissyllabic like other Asianesian ones. The people of Kidah more often approximate to the eastern Negro type than in southern Malaya, and Mr. Logan was particularly struck with the repeated occurrence of the deep nasal depression of the Simangs, the Australians and Papuans. Small heads, with all the features as it were contracted or compressed, were common.

The ruder Binua dialects of the peninsula are rapidly disappearing. The Binua or Sakai of Pera appears to resemble in its phonetic character, the ruder dialects of the Burman group. This character is intermediate between that of the Simang on the one side and that of the ruder Sumatran, Javan and Borneon on the other. The Johor Binua, is more guttural, aspirate and harsh, remarkably broad and slow. In the Binua, the cheekbones are broad in all directions and prominent, giving to the face below the base of the forehead a marked lateral development, beyond it or to the forehead an appearance of being compressed. The lower jaw is massive, spreads out and does not rise rapidly, thus producing an obtuse chin and the anterior maxillary projection considerable.

The Arru Islands extend 100 miles from north to south. Inland are many fresh water swamps with thick impenetrable jungle in other places. Their produce is pearls, mother of pearl, tortoiseshell, birds of paradise and trepang. The timber of the Islands is much praised. Arru Islanders have much intercourse with strangers. They are fond of arrack, and purchase from the Bugis the Papuan slaves brought from New Guinea, who are then employed in diving for pearls and in the beche de mer fishery. The Arru Islanders are impoverished by their excessive use of intoxicating liquors, imported from Java and Macassar. In personal appearance the people are between the Malayan and Polynesian Negro. They are not many degrees further advanced in civilization than the natives of the north coast of Australia to whom many

of them bear considerable personal resemblance. Some of the Arru men profess christianity and some are mahomedans. In stature they surpass the civilized natives of Celebes. The dress of the men is a piece of matting or cloth girded round the loins and drawn tight between the thighs, and a salendan or shawl. No fillet is worn round the head. The hair is woolly and frizzled out like that of the Papua. The men are of a jealous disposition and easily roused to anger by abuse of their women or ancestors, otherwise they are mild of disposition. The women wear a mat in front and one behind. When a person of consequence dies, these are stripped off and they rush into the sea where they disport for some time. In the Arru Islands, christianity was introduced many years ago by the Dutch of Amboyna and nearly all the principal people profess this creed. The Arru Paupan ornament their houses with brazen trays, dulam or takam, and elephant's teeth, which are broken up when the owner dies.

In *Dori*, the Papuans are called Myfore. They are about 5 feet 3 inches high, few attain 5 feet 6 inches. They wear their crisped hair its full length, and generally uncared for, which gives them a wild scared appearance. The men, not the women, wear a comb. The beard is crisp. The forehead is high and narrow; eyes large, dark-brown, or black: nose flat and broad: mouth large, lips thick and teeth good: few have regular features, and most are apathetic. The ordinary men wear a waist cloth made of the bark of a tree, called "mar," which is wrapped round the waist and passed between the legs. Women wear a short sarong to the knee, generally of blue cloth. Men and women tattoo their bodies on occasions, by pricking the skin with a fish-bone and rubbing in lamp black. The Dori people are a sea-faring people and are expert swimmers and divers. Their Prahu have outriggers and are excavated from the trunk of a single tree. Their food consists of millet, obi, maize, a little rice, fish and hog's flesh and fruits, sago is imported in small quantities. Theft is considered a grave offence: they are chaste and marry one wife.

Flores, New Guinea.—It is not known that the great islands of Sumatra, Java, Borneo and Celebes, ever contained any Negro race. But a Negro race occurs in the Island of Flores, and, in the great Island of New Guinea, they form the whole native or aboriginal population, as they also do of the islets near its coasts. Even within New Guinea itself, there would seem to be more than one race. M. Madera, of the Dutch Navy, quoted by Mr. Earl in the *Journal of the Indian Archipelago*, describes two of them whom he saw on the south-west

coast. Mr. Earl describes the features of the New Guinea Papuans as of a decidedly negro character:—broad flat noses, thick lips, receding foreheads and chins, and that turbid colour of what should be the white of the eye which gives a peculiarly sinister expression. Their complexion is usually a deep chocolate-colour, sometimes closely approaching to black, but certainly a few shades lighter than the deep-black, that is often met with among the Negro tribes of Africa. In New Guinea, the many Papuan tribes are generally in a state of warfare with each other and return from their war-like expeditions with heads. The New Guinea people worship a wooden deity called Karwar, 18 inches high, whom they consult on all occasions. A widow remains in the family of her deceased husband. The Negroes of New Guinea are in various states of civilization. Some of the rudest dwell in miserable huts and seek a bare subsistence by the chase or the spontaneous productions of the forest. There are, however, other Negro tribes living on the coast who have made some advance in civilization. These dwell by whole tribes in huge barn-like houses raised on posts, like those of the wild inhabitants of Borneo, but ruder.

Philippines.—Negroes are found in several islands of the Philippine Archipelago, especially of the principal island, Lucon, and in Negross, which is said to take its Spanish name from them.

Waigyu.—The inhabitants of the Islands of Waigyu, lying between New Guinea and Gilolo, one of the Moluccas, are Negroes. M. Du Perry represents them as having more regular features.

Gebbe.—M. Freycinet has described the Negroes of Gebbe, an island also between New Guinea and Gilolo, and not far from the latter. The nose is flat, the lips thick and projecting, the complexion a dark-olive, the eyes deep-seated, and on average the facial angle 72° , but as high as 81° . In Gebbe, Waigyu and some parts also of the coast of New Guinea, the Malayan race may have become intermixed with the Negro, as the complexion is lighter and peculiar texture of the Negro hair altered or obliterated.

All the islands extending from New Guinea up to the Fiji group appear to be inhabited by Negroes. But they differ greatly in physical appearance in New Ireland, Malicollo, one of the great Cyclades, Tanna and New Caledonia in the New Hebrides.

The Alfuro seem to have affinities with the Tagala race of the Philippines through the Sanguir islands. A Papuan or Timorese is darker, and with more frizzly hair than the Polynesian, New Zealander or Otaheitian, but their features are almost identical.

Mr. Wallace (ii, 280) believes that the nu-

merous intermediate forms which occur among the countless islands of the Pacific are not merely the result of an intermixture of these races but are to some extent truly intermediate or transitional, and that the brown and the black, the Papuan, the natives of Gilolo and Ceram, the Fijian, the native inhabitants of the Sandwich islands and those of New Zealand are all varying forms of one great Oceanic or Polynesian race. Professor Huxley, however, is of opinion that the Papuans are more nearly allied to the Negroes of Africa than to any other race. The whole of the great island of New Guinea, the Ke and Aru islands, with Mysol, Salwatty, and Waigiou are inhabited almost exclusively by the typical Papuan, and the same Papuan race extends over the islands east of New Guinea as far as the Fiji islands. The people on the coast of New Guinea are in some places mixed with the browner races of the Moluccas. In the typical Papuan, the colour of the body somewhat varies: generally it is a deep sooty-brown or black, somewhat approaching but never quite equalling the jet-black of some Negro races, but it is occasionally a dusky brown. The hair is harsh, dry and frizzly, growing in little tufts or curls, which in youth are very short and compact, but afterwards grow out to a considerable length forming the compact frizzled mop, which is the Papuan's pride and glory. The face has a beard of the same frizzly hair, and the arms, legs and breast are also more or less clothed with hair of a similar kind. In stature the Papuan is superior to the Malay, and the equal or superior of the average European. The legs are long and thin, and the hands and feet larger than those of the Malay. The face is somehow elongated, the forehead flattish, the brows very prominent, the nose is large, rather arched and high, the face thick, the nostrils broad and the aperture hidden, owing to the tip of the nose being elongated. The mouth is large, the lips thick and protuberant. He is impulsive and demonstrative in speech and action, his emotions and passions express themselves in shouts and laughter in yells and frantic leapings, women and children take their share in every discussion. The Papuan has much vital energy. In the Moluccas, Papuan slaves are often promoted to places of considerable trust. He decorates his canoe, his house, his domestic utensils with elaborate carving. They are often violent and cruel towards their children. The Papuan is taller, black-skinned, frizzly-haired, bearded and hairy-bodied, long-faced, has a large and prominent nose, and projecting eyebrows, bold impetuous, excitable and noisy, joyous and laughter loving and displays his emotions. If the tide of European civilization turn towards New

Guinea, the Papuan like the true Polynesian of the farthest isles of the Pacific will no doubt become extinct. A warlike and energetic people who will not submit to national dependence or to domestic servitude must disappear before the white man. A race identical in all its chief features with the Papuan, is found in all the islands as far east as the Fiji.

Mysol and Waigiou are Papuan, mixed, partly from Gilolo, partly from New Guinea.

Alfura, is written Alfora, Alafora, Arafura, Alfur, Arafura and Halafora. According to Mr. Crawford it is from the Arabic article Al, and fora, but another source is said to be the Portuguese word Alforias and to mean free men, manumitted slaves, also independent tribes of the interior.

The Atheta or Negrito race, are found in the Philippines, the second name, meaning little Negro, being given to them by the Spaniards; but that of Ita or Ahetas, written Ajetas, is their usual appellation among the planters and villagers of the plains. The woolly-haired tribes are more numerous in the Philippines than in any other group of the Indian Archipelago, they were estimated by M. Mallat in 1842 to amount to 25,000. The islands Samar, Leyte and Zebu, have not any of them; but they are found in Negros, Mindanao, Mindoro and Luzon. In the early accounts of them by Spaniards, they are described as being smaller, more slightly built and less dark in colour, than the Negroes of Africa, and as having features less marked by the Negro characteristics, but as having woolly instead of lank hair; and their social condition could not then have been much better than now, since they are described as living on roots and the produce of the chase; and as sleeping in the branches of the trees, or among the ashes of the fires at which they had cooked their food. The name bestowed on them by the Spaniards is 'Negritos,' or little negroes, but that of 'Ita' or 'Athetas,' so pronounced but written Ajetas, seems to be their usual appellation among the planters and villagers of the plains. They are all well-formed and sprightly, but very low in stature, as they rarely exceed four feet and a half in height. The character of the Negrito is untameable, and it is impossible to surmount their tendency to idleness. Prompted by an irresistible instinct to return to the place of their birth, they prefer a savage life to all the charms of civilization. The Ajetas or Negritos are ebony-black like Negroes of Africa. Their utmost stature is four feet and a half; the hair is woolly, and as they take no pains in clearing it, and do not know how to arrange it, it forms a sort of crown round the head, which gives them an exceedingly fantastic aspect, and

makes the head appear, when seen from a distance, as if surrounded with a sort of aureole. The Negrito of the Philippines, black and woolly-haired, are of small dwarfed stature, 4 feet 6 inches to 4 feet 8 inches high, which is 8 inches less than the Malays. The hair agrees with that of the Papuan and many Negroes of Africa, but the Papuans are taller than the Malays. The Negritos of the Philippines are polytheists, but without temple or ritual. They believe in omens, invoke Camburan (God), the moon and stars, and adore the rainbow after a storm. They have also a worship of ancestors, a god of the harvest, of the fisherman and hunter; and a remnant of fetichism in a grotesque native devil. Mindanao and Mindoro contain several tribes of Negritos, and they form the chief population of the less accessible parts in the mountain ranges of Lucon, the largest island of the Philippine group. The accounts of the Negritos given by the early Spanish navigators perfectly apply to their present condition. They are described as being smaller, more slightly built, and less dark in colour than the Negroes of Africa, and as having features less marked with the Negro characteristics, but as having woolly hair. Papuans of Dory worship, or rather consult, an idol called "Karwar," a figure rudely carved in wood and holding a shield, with which every house is provided. The idol, which is usually about eighteen inches high, is exceedingly disproportioned, the head being unusually large, the nose long and sharp at the point, and the mouth wide and well provided with teeth. The natives have also a number of "Fetishes," generally carved figures of reptiles, which are suspended from the roofs of the houses, and the posts are also ornamented with similar figures cut into the wood. Within the geographical limits of the Indian Archipelago, the Papuans only appear as inhabitants of the sea coast in New Guinea and the islands immediately adjacent. In other parts of this region they are found only among the mountain fastnesses, maintaining an unequal struggle with the brown races by whom they are surrounded. In some of the Spice Islands, the group nearest to New Guinea, "their extirpation is matter of history," as observed by Mr. Crawford. (History of the Indian Archipelago, Vol. i, p. 18.) In Ceram and Gillolo a few scattered remnants of the race still exist; but they hold little or no intercourse with their more civilized neighbours, flying into the thickets which afford them shelter and concealment on the first appearance of a stranger, experience having taught them that death or captivity will be their fate if they fall into the hands of their natural enemies. The characteristics of the mountain Papuans must therefore be sought in those islands where their

numerical strength permits them to lead a life more fitted for human beings than that of their hunted brethren. It is an error to suppose that these poor creatures disappear before civilization. Their chief destroyers are the wild and warlike hunting tribes of the brown race; and, excepting the case of the Moluccas, wherever European civilization has been introduced, the Papuans are more numerous than elsewhere. In the Philippines, for example, according to an intelligent modern traveller, their number in the year 1842 amounted to 25,000 souls. (M. Mallat, "Les Philippines," &c., Vol. i, p. 97, Paris, 1846.) The large island of Moysol or Mæsuai, which lies nearly midway between the north-western extreme of New Guinea and Ceram, is said to have been occupied exclusively by Papuans when this region was first visited by Europeans, and they still form the bulk of the inland population, but the villages of the coast are occupied by a mixed race, in which the Papuan element, however, prevails. The islands of Goram, Ceram-laut, Bo, Poppo, Gebu, Patani Hoek, and the south-eastern extremity of Gillolo, are also occupied by people of the mixed race, who are remarkable for their maritime activity, and for their friendly disposition towards European strangers. The woolly-haired tribes are more numerous in the Philippines than in any other group of the Indian Archipelago, with the exception of New Guinea. M. Mallat, as already stated, gives the amount of the "Negrito" population in 1842 as 25,000. This can only be considered as approximative, still it is probably not far from the true amount. The race, therefore, can scarcely be less numerous now than on the first arrival of the Spaniards more than three centuries ago. Indeed, their distribution among the islands of the group seems to have been much the same then as at the present day; for the island on which they were first seen was named by Magellan "Isla dos Negros," to distinguish it from the adjacent island Zebu, where his ships remained for some months. Negros still contains a large population of Papuans, while Zebu is altogether free from them, and no record exists of their having ever been found there. Samar and Leyte are similarly situated with Zebu. From a number of inquiries among Papuans who were marked with the raised cicatrices, it appears that those on the arm and breast, which are the largest and most prominent, were made in order to qualify them for admission to the privileges of manhood, by showing their capability of bearing pain. The Malayan term for crisped or woolly hair is "rambut pua-pua." Hence the term "pua-pua," or "papua," (crisped), has come to be applied to the entire race; and expresses their most striking pecu-

liarity. The features of the Papuans have a decided negro character: broad nose, thick and prominent lips, receding forehead and chin, and that turbid colour of what should be the white of the eye, which is apt to give the countenance a sinister expression. Their natural complexion is almost universally a chocolate colour, sometimes closely approaching to black, but certainly some shades lighter than the deep-black which is often met with among the negro tribes of Africa. The Papuans, when placed in circumstances favourable for the development of their powers, are physically superior to the races of South-eastern Asia. Some of the New Guinea tribes would bear a comparison, in point of stature and proportions, with the races of Europe, were it not for a deficiency about the lower extremities. Even the more diminutive mountain tribes are remarkable for energy and agility—qualities which have led to their being in great demand as slaves among their more civilized neighbours. With regard to mental capacity, also, they are certainly not inferior to the brown races; but their impatience of control while in an independent state, utterly precludes that organization which would enable them to stand their ground against encroachment; and they invariably fall under the influence of the Malays whenever the two races are brought into contact. The islands in which remnants of Papuan tribes may yet be found are Sumba or Sandalwood Island, Buru, the Xulla Islands, and the small eastern peninsula of Celebes, which terminates at Cape Taliabo. Sumba is a mountainous island, three hundred miles in circumference, lying to the south of Flores, from the coast of which it is distinctly visible in clear weather. The inhabitants of Savu possess a settlement near the south-west extreme of the island, and the Bugis traders of Ende have two or three small stations on the north coast which are occasionally visited by small European vessels for the purpose of obtaining horses; but the natives of Sumba all dwell in the uplands, where they cultivate maize, yams and other produce similar to that grown on Timor, and are said to use the plough, which is unknown in any other island to the eastward of Sumbawa.

The *Kei* group of ten islands adjoin the Arru Islands. Ke, Kei, or Ki, is prefixed to the names of all their villages. The great Kei is about the size of Tanakeka, an island, near Macassar. The men profess mahomedanism, but eat hog's flesh, and the islands produce Maratigo and Banyaro woods, well adapted for masts. In Dori, the Papuans are called Myfore. They are about 5 feet 3 inches high, few attain 5 feet 6 inches. They wear their crisped hair its full length, and generally uncared for, which gives them a

wild, scared appearance. The men, not the women, wear a comb. The Papuan women of Ke are not secluded, the children are merry, noisy and have the nigger grin, and amongst the men is a noisy confusion of tongues and excitement on every occasion. The Ki group form the northern of the south-easterly islands. The islands, are covered with luxuriant forests. The islands are occupied by two races, one of them the Papuan who make cocoanut oil, build boats and make wooden bowls, their boats are from small planked canoes to prahus of 20 to 30 tons burden. They build the skin first and fit on the knees and bends and ribs. Money is not used, but every transaction is in kind. The Papuan wears a waist cloth of cotton or bark. The other race are mahomedans who were driven out of Banda. They wear cotton clothing. They are probably a brown race, more allied to Malays, but their mixed descendants have great varieties of hair, colour and features, graduating between the Malay and Papuan tribes.

Ceram is the largest island of the Moluccas and, next to Celebes, of all the Archipelago. It is 162 miles long, but its greatest breadth is only 42 miles. The island is one long mountain chain that sets off transverse spurs, and some of the peaks are 5,000 or 6,000 feet in height. The people of Ceram approach nearer to the Papuan type than those of Gillolo. They are darker in colour, and a number of them have the frizzly Papuan hair; their features are harsh and prominent, and the women are far less engaging than those of the Malay race. The Papua, or Alfuro man, of Ceram, gathers his frizzly hair into a flat circular knot over the left temple, and place cylinders of wood, as thick as one's fingers and coloured red at the ends, in the lobes of the ears. They are very nearly in a state of nature, and go almost naked, but armlets and anklets of woven grass or of silver, with necklaces of beads or small fruits, complete their attire. The women have similar ornaments, but wear their hair loose. All are tall, with a dark-brown skin, and well-marked Papuan physiognomy. The Alfuro or Papuan race are the predominant type in the island of Ceram. Of twenty-eight words of the language of Ceram, nine of the words are Malay, two Javanese, and seventeen are common to these two languages.

In *Celebes*, the Trans-Javan or Timorian band, and the Moluccas, is a large and important class of Indonesians, who graduate between the Anam type, the Burman and the Negrito. The most prevalent head or that of the predominant is ovoid, but it is somewhat Burman or Indo-Burman in nose, eye and colour. The great island of Celebes may be considered the centre of a group of languages, which, although

agreeing with those heretofore described, in simplicity of grammatical structure, differs very widely from them in phonetic character, although spoken by the same race of men. Celebes is intersected by the equator, leaving a small portion of it in the northern and the mass in the southern hemisphere. Its greatest length is about 500 miles, but its greatest breadth does not exceed 100; and in some places it is hardly one-third of this width. Celebes may be considered to be the focus of an original and independent civilization which probably sprung up amongst the most advanced of the nations which occupy it, called by themselves Wugi, and by the Malays, and after them by Europeans, Bugi. In material civilization the Bugi are equal to the Malays.

Languages.—Mr. Crawford (Dictionary of the Malay language), considers that a certain connexion of more or less extent exists between most of the languages which prevail from Madagascar to Easter Island in the Pacific, and from Formosa, on the coast of China to New Zealand; thus, over 200 degrees of longitude and seventy of latitude, or over a fifth part of earth's surface. In this are the innumerable islands of the Indian Archipelago, from Sumatra to New Guinea, the great group of the Philippines, the Islands of the North and South Pacific, and Madagascar. It is inhabited by many different and distinct races of men, as the Malayan, the brown Polynesian, the Insular negro of several varieties, and the African of Madagascar. Of these, the state of civilization is so various that some are abject savages, while others have made a respectable progress in the useful arts, and even attained some knowledge of letters. He is of opinion that the leading race in the Archipelago is one and the same, but the languages are many, with more or less intermixture of some principal ones throughout. In Borneo there are at least 40 languages; in Celebes and its islands at least 10; in Flores 6; in Sumbawa 3; in Sumatra and its islands not fewer than 10; and even in civilized Java with its islands, 3. It is the same in the Philippine islands, and in Lucon, alone, there are three. The Indian Archipelago consists of the islands extending from Sumatra to the western shores of New Guinea, and respecting which our information is most complete. He says that no languages in it exist derived from a common stock, or standing to each other in the relation of sisterhood, as Italian, Spanish and French, do to each other; or as Gaelic does to Irish, or Armorican to Welsh, or Scotch to English. The only dialects that exist are those of the Malay and Javanese languages, but they consist of little more than differences in pronunciation, or the more or less frequent use of a few words. In

the Polynesian Islands alone, real dialects of a common tongue do exist, but there the number of words common to such dialects, and to the languages of the Archipelago, is so trifling that it refutes at once the notion of a common origin. In Malay, the most familiar words for the head, the shoulder, the face, a limb, a hair or pile, brother, house, elephant, the sun, the day, to speak, and to talk, are all Sanskrit. In Javanese, Sanskrit furnishes words for the head, the shoulders, the throat, the hand, the face, father, brother, son, daughter, woman, house, buffalo, elephant, with synonyms for the hog and dog, the sun, the moon, the sea, and a mountain. In the language of Bali, the name for the sun in most familiar use is Sanskrit, and a word of the same language is the only one in use for the numeral ten. It is on the same principle that Mr. Crawford accounts for the existence of a similar class of Malayan words in the Tagala of the Philippines although the whole number of Malayan words does not exceed one-fiftieth part of the language. Head, brain, hand, finger, elbow, hair, feather, child, sea, moon, rain, to speak, to die, to give, to love, are examples.

Some personal pronouns are found in the Polynesian dialects, where, in a vocabulary of five thousand words a hundred Malayan terms do not exist. A sentence of Malay can be constructed without the assistance of Javanese words, or of Javanese without the help of Malay words. These two languages can be written or spoken, without the least difficulty, without a word of Sanskrit or Arabic. The Malay and Javanese, although a large proportion of their words be in common, are distinct languages, and their Sanskrit and Arabic elements are extrinsic and unessential. When this test is applied to the Polynesian languages we find an opposite result. A sentence in the Maori and Tahitian can be written in words common to both, and without the help of one word of the Malayan which they contain, just as a sentence of Welsh or Irish can be constructed without the help of Latin, although of this language they contain, at least, as large a proportion of words as the Maori or Tahitian do of Malayan.

Mr. Crawford is of opinion that the Malay and Javanese languages furnish the stock of the wide-spread words which are common to so many tongues in the Archipelago and which have been chiefly derived from the languages of the two most civilized and adventurous nations of the Archipelago—the Malays and Javanese; and he uses the word Malayan for whatever is common to these two people.

Of the languages of Celebes, the next in importance to the Bugis is the Macassar. The

people who speak this tongue inhabit the same peninsula. They call themselves and their language Mankasara, and hence the Makasar or Mangkasar of the Malays, whence the English name. Besides Bugis and Macassar, the two principal languages, there are three other languages of Celebes written in the same character, or, at least, occasionally written in it; the Mandar, the Manado, and the Gorontalo. The Mandar is spoken by a people on that side of the south-western peninsula, which fronts Borneo.

The island of Sumbawa, the third in a direct line east of Java, about three times the extent of Bali or Lombok, and divided by a deep bay into two peninsulas, has three languages, the Sumbawa, the Bima, and the Tambora. The natives of Sumbawa are little inferior in cultivation to the most improved nations of Celebes. The Sumbawa and Bima languages are written in the Bugis character, but there exists in this island a singular and curious obsolete alphabet. It is ascribed to the Bima nation, but the characters do not generally correspond with the simple sounds of the Bima language as exhibited in the specimen given of it.

The large island of Flores, the fifth in a line east from Java, due south of Celebes, and of volcanic formation, affords the first example of a race of men seemingly intermediate between the Malay and Papuan, or Negro, but partaking far more of the physical form of the former than of the latter. The complexion is a good deal darker than that of the Malay, the nose flatter, the mouth wider, and the lips thicker. The hair is not lank as in the Malay; but buckles, without frizzling as in the Papuan. The stature is the same as that of the Malay, that is, short and squab. According to the statements made to Mr. Crawford by Bugis traders, themselves settlers in the island, Flores is inhabited by six different nations, speaking as many different languages; the Ende, the Mangarai, the Kio, the Roka, the Konga, and the Gale-teng, names derived from the principal places of their residence.

Timur is a word which means the east, and was probably imposed on this island by the Malays, to whose language it belongs, because this was the extreme limit of their ordinary commercial voyages to the south-east. Timur is about three times the extent of Jamaica. Its principal inhabitants are of the Malayan race, but it contains also Papuans or Negroes, and tribes of the intermediate race. The two languages of Timur are the Manatoto and the Timuri, the first spoken at the north-east end of the island, and the last used by many of the tribes as a common medium of intercourse. No alphabet has ever been invented in Timur; but judging by the specimens of its languages, the vowels are the same as those of the Malay and Javanese.

From Timur to New Guinea, there runs a long chain of islets, forming as it were, a wall or barrier to the south-eastern portion of the Archipelago. In these islets the inhabitants are of the same race with the Malays, and speak many languages. By far the most ample and authentic account of them has been given by Mr. Winsor Earl, who, after a longer experience of the countries in which they are spoken than any other European, makes the following observations. "In the south-eastern parts of the Indian Archipelago, where opportunities of social intercourse between the various petty tribes are of rare occurrence, every island, every detached group of villages, has its own peculiar dialect which is often unintelligible, even to the tribes in its immediate neighbourhood. In some of the larger islands, Timur, for example, these tribes are so numerous, and the country occupied by many of them so extensive, that it becomes impossible to form even an approximate estimate of their number." Of one language, the prevailing one, among several languages of the island of Kisa, one of the Sarawati group in the chain of islets already mentioned, Mr. Earl furnished a curious and instructive vocabulary of 330 words. The Kisa is an unwritten tongue, but its vowels are the same as those of the Malay and Javanese.

Spice Islands.—Sir Stamford Raffles furnished specimens of three of the languages of this furthest east portion, viz.: those of Ceram, correctly Serang, of Ternate, correctly Tarnati, and of Saparuwa, one of the Banda isles. Of the languages of Ceram, nine of the words are Malay, two Javanese, 17 are common to these two language. Ceram Laut is the great place to which the Bugis carry the Papuan slaves whom they steal from New Guinea.

The great group of the Philippines, although contiguous to the proper Indian Archipelago, differs materially in climate and the manners of its inhabitants. It extends over fifteen degrees from near latitude 5° to 20° N., and consists of many islands of which only Lucon and Mindanao are of great size. The bulk of the people are of the same tawny complexioned, lank-haired, short and squab race, as the principal inhabitants of the western portion of the Indian Archipelago. The focus of the aboriginal civilization of the Philippines, as might be expected, has been the main island of the group, Lucon. The principal languages of Lucon are the Tagala, the Pampanga, the Pangasinan, and the Ilocó, spoken at present by a population of 2,250,000; while the Bisaya has a wide currency among the southern islands of the group, Leyte, Zebu, Negros and Panay, containing 1,200,000 people. Mr. Crawford tells us that it does not appear, from a comparison of the phonetic character and grammatical struc-

ture of the Tagala, with those of Malay and Javanese, that there is any ground for fancying them to be one and the same language, or languages sprung from a common parent, and only diversified by the effects of time and distance, and that an examination of the Bisaya Dictionary gives similar results. The great islands of Mindanao, Palawang, and the Sulu group of islets, forming the southern limits of the Philippine Archipelago, contain many nations and tribes speaking many languages of which little has been published. Mr. Crawford, on the information given by Mr. Dalrymple, informs us that even in the little group of the Sulu islands, a great many different languages are spoken, and he gives a short specimen of 88 words of one of those most current. Sulu has for many years been the market where the Lanun and other pirates disposed of much of their plunder, and in former times itself was decidedly piratical. The mahomedan religion has made much progress in Mindanao and the Sulu islands, as has the Malay language, the usual channel through which it has at all times been propagated over the islands of the Indian Archipelago. Mr. Crawford remarks that whether the principal languages of the Philippines be separate and distinct tongues or mere dialects of a common language, is a question not easy to determine. Certainly, the phonetic character of the Tagala, the Bisaya, the Pampangan and Iloco are; sound for sound or letter for letter, the same. Words of the Malayan languages are to be found in the language of the aboriginal inhabitants of Formosa, or Taiwan; and as this large island about half as big as Ireland, stretches as far north as the 25° of latitude, this is the extreme limit in a northerly direction to which they have reached. The aborigines of Formosa are short in stature, of tawny complexions and lank hair. Although inhabiting a great and fertile island, affording to all appearance a fair opportunity of development, they never made any progress in civilization, and at present seem to live in a state of barbarism. They are thought by Mr. Crawford to belong to, or much to resemble, the brown-complexioned race of the Archipelago of whom the Malays are the type.

The islands of the Pacific extend from the east of New Guinea and the Philippines, to within two thousand five hundred miles of the western coast of America, and from about the 22° of north to the 47° of south latitude. The languages spoken over this vast area are, probably, nearly as numerous as the islands themselves. The language, with variations, is spoken by the same race of men from the Fiji group, west to Easter island eastward, and from the Sandwich islands north to the New Zealand islands south. It has been called the

Polynesian. The whole number of Malayan words in the Maori dialect of the Polynesian, as they are exhibited in the William's Dictionary, only amount to 85.—*John Crawford, Esq., F. S. NEGROS, or Buglos island, extends from lat. 9° 4' to lat. 9° 50'. Of the central group of the Philippines, consisting of Panag, Negros, Samar, Leyte, Masbate, Bohol, and Zebu, the two former are the only islands in which Negrito tribes exist to the present day, and even as regards Panag, the fact must be considered doubtful. Negros, however, contains a considerable Negrito population, the crest of the mountain range, which extends throughout the length of the island, a distance of one hundred and twenty miles, being almost exclusively occupied by scattered tribes.—*Mr. Earl, p. 141. See Aheta, Negrito, Negro.*

NEGUNDO, see Acer.

NEHAS, ARAB. Copper.

NEHEMIAH, is believed to have been born in Babylon.

NEHESH, HEB. Copper.

NEHOEMECA, or Nehoemaka, MALAY. Bryonia laciniosa.

NEHOR NEHU, a large sheep, or goat, or antelope, found in the very rugged mountains north of the Yaroo river, and in the neighbour-

hood of the salt mines or lakes. It is four feet high, has very large horns, sloping back, and four feet long, has a tail 15 inches long, is shaggy, and of various colours, sometimes black and red.

NEIRWALA, of D'Anville, is the capital of the Balhara sovereignty of the Arabian travellers of the eighth and ninth centuries.—*Tod's Rajasthan*, Vol. i, p. 497.

NEIBUHR, M. Carsten. In A. D., 1762, an expedition was organized by king Frederick V of Denmark, for the exploration of Arabia, but more particularly of the province of Yemen. It was under the charge of the learned M. Carsten Neibuhr, with whom were associated Professor Von Hanen as linguist; Professor Forskal and Dr. Cramer as naturalists, and M. Bauronfeind as draughtsman. They arrived in Yemen in the end of December 1762. Von Hanen died at Mokha on the 25th May 1763, Forskal died at Yereem on the 17th July following, M. Baurenfeind expired at sea, near the island of Socotra, on the 29th August, and Dr. Cramer at Bombay on the 11th February 1764.—*Playfair's Aden*.

NEILGHERRIES, a magnificent mass of mountains in the peninsula of India near the southern extremity of the Western Ghats, rising to an altitude of 8,500 feet at Dodabetta, where an observatory was established in 1845. Dr. Birch wrote a topographical report of the hills in *Mad. Lit. Trans.* 1838, Vol. viii, 86. The Neilgherries are the highest hills in the south of India, they lie to the west of Collegal. The surrounding rocks are of granite and gneiss, but the summits of the mountains are of greenstone. The Kunda range is extremely irregular in its outline. It forms the seaward flank of the Neilgherries with a very steep slope towards the Malabar Coast. It attains in its higher parts an elevation of 7,500 to 8,200 feet above the sea. The Kunda or Sispara ghaut or pass which leads to Calicut is 6,742 feet above the sea. Neilgheri, means blue mountain. The Neilgherries had been traversed by a party of Pioneers under Captain Bevan and Dr. Ford, in 1809, and were partially surveyed under the direction of Colonel Morrison, so far back as 1812. But they appear to have been almost unknown to Europeans till about the year 1819, when they were first ascended by

Whish and Kindersley, in pursuit of a band of smugglers. Their report led to Mr. Sullivan establishing himself there, and ultimately to their being selected as a convalescent station. The remains of two forts are still to be seen, each of which was used as a state prison, and was occupied by a small garrison in the time of Hyder Ali and Tippoo Sultan. The Baddagah, or agricultural inhabitants, have a distinct tradition of their having migrated thither

from Mysore towards the middle of the 17th century. Of the origin and history of the Toda, nothing certain is known. The hills are situated between L. 11° and 12° N., and L. 76° and 77° E., on the confines of the provinces of Mysore, Coimbatore, and Malabar. To Mysore, they are joined by a narrow neck of land, of much inferior height however. On all the other sides they are completely isolated. The sea is 40 miles distant at the nearest point on the west. The summit of the hills forms an undulating table land of considerable extent in the form of an irregular parallelogram, 40 miles long from E. to W., and with a medium breadth of about 15 from N. to S. The surface may be roughly estimated at 650 square miles, and presents several distinct ranges of undulations with peculiar features. That to the west called the Koondahs, rises abruptly from the plain, bordered by several precipices of great height, and accessible only at one or two points. The upper surface is intersected by narrow deep valleys, thickly dotted with wood, and presenting some most picturesque scenery. Several considerable streams take their rise here and unite to form the Bowany river, which, descending by a succession of beautiful falls into a most romantic gorge, forces its way through the southern edge of the tableland, where it makes an abrupt turn to the east, and flows along the whole southern aspect of the hills till it meets the Moyar descending in a similar manner, and with similar accompaniments of scenery from the northern face. A prolongation of the Koondahs to the north is called the Neddimulla range, and forms a narrow ridge, shooting up into sharp peaks, and bordered by lofty precipices on the west. On the inner side, the Koondahs sink into a lower range of tableland, formed by a succession of low rounded hills and valleys, less richly wooded and bounded to the E. by the great central range of Dodabet, running completely across from N. to S. This is the highest point of the hills, being 8,730 feet above the sea. On the west side of the range, immediately below the highest summit, is Ootacamund, situated in a basin surrounded by high hills on all sides. At the northern extremity of the range is Coonoor, from which a magnificent gorge descends to the plain of Coimbatore, giving a passage to the Coonoor ghaut, one of the principal roads. A corresponding fissure on the N., but much less deep and not so picturesque, contains the Segoor ghaut which gives access to the hills from Mysore and the north. After crossing the Dodabet range, the country sinks considerably and is covered with Buddagah villages and cultivation for some miles, when it again rises into long grassy ranges like the Koondahs, but without the lofty peaks which distinguish the latter. At the commence-

ment of the rise is situated Kotagherry, and a little to the N. a deep valley running E. and W. descends abruptly into the low country, and is known as the orange valley, from containing a number of wild orange-trees. It also contains a picturesque waterfall of some height. The descent from the tableland of Kotagherry, though less abrupt than that of the Koondahs, is sufficiently sudden to present a bold and imposing aspect when viewed from below. About the middle of the E. face, nearly opposite the Guzzelhutty pass, which ascends into Mysore, is the old Jackanairy Pass which for many years was the only practicable access to any part of them. The views on the Koondahs are bold and magnificent. Those towards and near Ootacamund, more pastoral; and in the vicinity of Kotagherry, richer and more agricultural. The want of rich tropical vegetation presented by some of the ghauts to the northward is conspicuous, and the absence of the deciduous plants and the consequent want of the rich variety of autumnal tints seen in the forests of Europe gives an air of monotony to the woods, which so richly clothe the upper portion of the table-land. The general elevation of the table-land differs a little in the three principal divisions. That of the Koondah range may be estimated at 7,600 feet. The central portion at 7,100 or 7,200, and the Kotagherry division at 6,000.

The great elevation of the Nelgiris, combined with their perfectly isolated position equally influenced by both monsoons, unite in producing one of the most perfectly temperate and equable climates in the world. The mean annual temperature of Ootacamund is 58°-68° The annual range is considerable, being equal in some years to 38°, the highest observed temperature in the shade being 77° and the lowest 39°. The mean daily range is 17°.

The following table presents a view of the

most important points of climate compared with similar phenomena in Great Britain :

TEMP. OF AIR IN SHADE.		SOLAR RADIATION.		QUANTITY OF RAIN.

								23

the end of March when the frost disappears ; the air becomes milder and there are generally a few heavy showers. April and May are mild pleasant months with frequent heavy showers and thunder-storms. In June the S. W. monsoon sets in ; in general 10 or 14 days later than on the Malabar Coast. At first the rain is pretty constant and heavy, but during the whole continuance of the monsoon, that is, till the middle or end of September, there are frequent intervals of most delightful weather. The temperature being peculiarly equable and the dampness very trifling. October is an uncertain month, being occasionally blustery and showery, occasionally very fine and dry according as the N. E. monsoon occurs early or late. November is showery and unpleasant, but after the occurrence of some heavy fogs in the early part of December, the frost sets in and the weather becomes dry, cold, and bracing. The seasons are subject to great fluctuations, almost as much so as in Europe. The climates of Kotagerry and Coonoor are considerably milder than that of Ootacamund, and there is also some difference in the seasons. The S. W. monsoon being comparatively light at both these stations, while the N. E. is heavier. The formation consists almost entirely of sienite in all its modifications, granite more rarely, covered in most places by a cap of lithomargic earth, in which the various constituents of the primitive rock can be distinctly traced in various stages of disintegration and decay. The latter in some places assumes the form of laterite or soapstone. The soil is of very various quality and composition. In the valleys and swamps it is generally of a deep black colour, and consists of disintegrated sienite (mostly hornblende) mixed with vegetable matter, very rich, and when thoroughly drained is highly productive. In the woods also there is a large admixture of vegetable matter and the soil is of great depth—on the sides of the hills again it is much thinner, more mixed with lithomargic earth, and consequently poorer. The soil is richer and more fitted for agricultural purposes towards the verge of the high ground, where the agricultural portion of the community (the Buddagah and Kothar) are exclusively located, and experience has taught them not to turn up the soil too deeply. Vegetables and fruit of every description are plentiful. The Buddagah cultivate barley, wheat, ragee, and a small species of millet in great quantities—a small grain called keerei-mow, (*Amarantus tristis*) poppies, garlic, onions and mustard—and without culture are wild oranges in one or two localities, the Brazil cherry, the hill gooseberry, strawberries, raspberries, brambleberries, and barberries. The *Orchis mascula* which produces the celebrated salep misree, is

plentiful in certain localities. Of wild animals, are the tiger and cheeta, the elephant, the bison (*Bibos cavifrons* of Hodgson) the sambar or black rusa (*Rusa aristotelis* of Cuvier) an undescribed species of wild goat, apparently the *Capra aegagrus*. The jungle sheep (*Cervus muntjak*), the bear (*Ursus labiatus*) the wild hog, jackalls and wild dogs, also otters which are numerous in the large rivers. Porcupines, martens, two species of monkeys, hares in considerable numbers. In the ghauts and slopes towards the low country, the woodcock, solitary and common snipe, jungle fowl, spur fowl, pea-fowl and quail. Hawks in great numbers and variety and a black eagle are also to be found. The black bird, the thrush, wren and lark are the same as their prototypes in Europe. A very small fish is found in great numbers in the Pykarra river, and the deep pools are inhabited by kaboose of a large size. Crabs are common. A small harmless green snake is very common. Cobras are not uncommon in Orange valley and a rather large description of boa. Fleas are very troublesome at certain seasons and appear to breed in the ground.

The Todawara or Todalu are the oldest of the inhabitants, but of their origin, history, &c., nothing whatever is known. Their costume and physiognomy are peculiar. Their language is partly derived from the Hala or ancient Canarese. Each Mund or village, has a separate, and somewhat larger house set apart, and sacred, as a dairy, into which women are not allowed to enter. They are entirely nomadic and subsist by the produce of their herds, receiving also a sort of ground-rent in kind from the Buddagah and Kota who acknowledge them as the lords of the soil. They are polyandric, the brothers of the family having only one wife in common: female infanticide prevails; they slaughter a number of buffaloes at funerals attended with some ceremonies. They appear to be decreasing in number.

The Buddagah, by far the most numerous race on the hills, are the descendants of Mysore soodras, who, sometime in the middle of the 17th century, quitted their original location in Mysore to avoid the oppression of the rajah. They are almost entirely employed in cultivation—but they keep large flocks and herds of cattle and readily act as coolies, cowkeepers, &c. They are a most industrious race. Their numbers are increasing, and their villages are populous and thriving.

The Kotha are a race with habits like the chucklers below. They are rather looked down upon by the Buddagah from their eating carrion, but they are equally industrious, and are the universal artisans of the hills, making and repairing ploughshares and other agricultural implements, as also the silver ornaments

worn by the Toda and Baddaga women and children.

The Erular and the Moola-Coorumar are almost in a state of nature, inhabiting the wildest recesses of the jungles on the slopes of the hills, where they erect wretched huts, surrounded by a few plantain trees and a little wretched cultivation. They avoid mankind, and are regarded as sorcerers by the other inhabitants, who attribute to their agency every piece of ill luck that befalls their cattle or themselves. In the year 1835, after a severe murrain had prevailed among the cattle, the Coorumars to the number of 50 or 60 were assembled to a feast, and in the height of their merriment were cruelly massacred by the Toda race, scarcely one escaping.

The experience of many years has undeniably proved the perfect adaptation of the climate to the sound European constitution and its great power of restoring to health those who have suffered from the various diseases produced by tropical climates. For confirmed liver-disease, and chronic dysentery, and for teething children, they are wholly unsuited. Little benefit is to be expected from a mere change to the Neilgherries without a prolonged residence there, and caution is required in guarding against peculiar effects of the climate. From the great elevation and consequent rarefaction of the air, heat is much more rapidly abstracted from the body at a corresponding temperature near the level of the sea. The power of the sun's rays or the difference between the temperature in the sun and in the shade is much greater than below, often amounting to nearly 30°: this is peculiarly remarkable early in the morning, and again after sunset when invalids or delicate persons are very subject to sudden chills, in the one case by coming into the house or shade, when heated by exercise in the open air, in the other by remaining outside after the sun has gone down. Allowance must also be made for the effects of diminished pressure of the atmosphere, increasing the quantity of blood circulated in the capillaries on the surface of the body, and more especially on the air cells of the lungs, by which the general circulation will be accelerated and the other effects of a powerful stimulus produced: to this cause may be attributed the malaise, head-ache, sleeplessness and other unpleasant sensations experienced by many delicate persons on their first ascent. Great attention is also requisite to clothing, diet, and exercise; and no invalid should omit to avail himself of the able medical advice to be had on the spot on his first arrival.

Ootacamund is picturesquely situated in the basin formed by the central chain of Dodabet, from which two considerable spurs run in a

semi-circular direction to the west, and completely enclose it on all sides except the W. N. W. The subordinate hills and interjacent vallies have each its house perched at the summit or sheltered in the nooks, and the terreplaine of the valley is advantageously occupied by a long narrow lake formed by an artificial dam which closes it to the W. and retains all the waters of the basin. The site has been admirably chosen, its central position giving it all advantages of climate while it is free from the suspicion of malaria which attaches to places nearer the edge of the ghauts, and it presents a great extent of level ground than almost any other point on the hills, the principal drive round the lake forming a circuit of from 6½ to 8 miles.

Kotagherry, 17 miles E. of Ootacamund, affords an agreeable relief at certain seasons when the cold at Ootacamund is too severe or during the prevalence of the S. W. monsoon. It is also generally preferred by those, who, from long residence in India or natural delicacy of constitution, are unpleasantly affected by the suddenness of the transition from the low country. This remark applies still more strongly to Coonoor, the climate of which is a shade milder than Kotagherry.—*Dr. Buist; British Almanac for 1836 and 1838; Daniel's Meteorological Essays; Dr. Benza, in the Madras Journal of Literature and Science, No. 13; Harkness' account of a singular Aboriginal race on the Neilgherries, London, 1832; Topographical Report on the Neilgherries, by Dr. Birch, M.D., Madras Journal of Literature and Science, No. 20; Baikie's Observations on the Neilgherries, edited by W. H. Smoutt, Esq., Calcutta, 1834, &c., &c.* See India, Khtar, Buddagar, Kurumbar and Thodawar.

NEILGHERRY BOXWOOD, Syn. of *Sarcococca trinerva*.

NEILGHERRY BROWN MUNGOOS, *Hepstes fuscus, Waterh., Bl.*

NEILGHERRY BURROWS, see Cairn.

NEILGHERRY GRASS. This is a species of lobelia, which probably came from Java. the *Lobelia succulenta* of Blume, a Java plant. Wight, writing on the lobelias says: "There is a small caespitose species much cultivated in pots, by amateurs, under the strange name of Neilgherry grass.—*Mason*.

NEILGHERRY NETTLE.

Urtica heterophylla, Rox. Herpah or Serpah, BRO-TIA.
Girardinia leschenaultii.
Hoaroo, Surat of Assam. Theng Mah, CHINESE.

This is the most widely diffused of the large Indian Nettles being found in South Concan, along the Malabar coast; the Mysore, the Neilgherries, the valleys of the Himalaya, in Assam and Bumah. It is an annual plant, the sting of it produces intense pain, the bark abounds in fine, white, glossy silk like fibres,

but these probably differ with the locality in which the plant is grown. Dr. Wight describes those of the Neilgherries, as a fine soft flax-like fibre, and fitted to compete with flax in the manufacture of even very fine textile fabrics. The Toda extract it by boiling the plant, and use it as a material for making thread. Mr. Dickson passed it through his machine and liquid, which rendered it like a beautiful, soft, silky kind of flax. He calls it a wonderful fibre, of which the tow would be useful for mixing with wool, as has been done with China grass.—*Royle*.

NEILGHERRY STRIPED SQUIRREL, *Sciurus sublineatus*, *Waterh., Bly.*

NEILGHERRY TREE-MOUSE, *Mus nilagiricus*, *Jerdon*.

NEILGHERRY WILD GOAT, *Hemitragus hylocrius* *Jerd.*

NEILL, Sir James, an officer of the Madras Army, who rose in the Madras Fusilier regiment. He was the first to stem the tide of rebellion in 1857. A statue was erected to his memory in Ayr, his native place, and another in Madras.

NEILUNG, see Kunawer.

NEISWURTEL, *DAN.* *Helleborus niger*.

NEJD occupies nearly the centre of, and is the largest province in, Arabia, being, in its greatest limits, 640 miles in length from north to south, and 750 miles from east to west. On the east is the long strip of El Ilassa, or Hadjar, on the north that part of Arabia Deserta called Tauf, the Hijaz on the west, with a part of Yemen on the south, and the desert of Ahkaf on the south-east. The surface, as the name implies, is elevated, but it is diversified with mountains, valleys, and plains. Some writers consider the mountainous district Nejd Arad as a separate province. The existence of a fresh-water lake at El Asha, and of several in Nejd, as ascertained by Captain Sadleir, has established the fidelity of Strabo in this particular. There are others, but of small size, in Arabia Felix, in Tehameh and in Oman, and one called Salome in Ahkaf. The Anezi, according to Burchardt, are the most powerful Arab nation in the vicinity of Syria, and of their brethren in Nejd he added, they are the most considerable body of bedouins in the Arabian deserts.—*Vol. iii, p. 484, of Trans. of the Bombay Lit. Soc.; Niebuhr's Travels in Arabia, translated by Robert Heron, Vol. i, p. 297; Bulletin de la Société de Géographie de Paris, 1843, p. 101; Col. Chesney, p. 571, Euphrates and Tigris. NELLOO, SINGH. A generic term for any one of the *Acanthaceæ*. See *Acanthus*.

NELLORE, a town, also a district in the *Madras Presidency* near the Bay of Bengal, 170 miles long, 70 miles broad and with 935,600 inhabitants. Its chief towns are *Nellore, On-gole*; the *Pennar* is its only river, but it has the *Pulicat Marine lagoon*, from the waters of which much salt is made by evaporation. The language spoken throughout the district is *Telugu*, but several races continue migratory or unsettled. The *Yanadi* race in the *Nellore* district are estimated to number 20,000. Red, yellow; purple, brown and grey sandstones occur in the *Podelay, Panoor* and *Pedda Reddappully talooks*, and from *Pullaybootoo*, fine grained sandstones. *Nellore* is in lat. 14° 27' N., long. 79° 59' E., 12 miles W. of the sea-shore. The mean height of the village, 80 feet.

NELLU, TAM. Unhusked grain of *Oryza sativa, Linn.*

NELLY, TAM. A *Travancore* wood of a light brown colour. Used for building in general.—*Col. Frith.*

NELLY MARAM, TAM. *Embliea officinalis.*

NELU, TAM. A *Malabar* wood of a dark-red colour, and considered good for boat-work; it produces a small fruit which the natives eat in a raw state.—*Edge, Forests of Malabar and Canara.*

NELU, SINGH. The *Honey plant*, grows on *Horton plains, Ceylon*; the flowers emit a fragrant aroma resembling that of new honey. It flowers once in eight years, and bees then cluster on the blossoms.—*Sim's Ceylon.*

NELUMBALY, TEL. *Nerium tomentosum.*

NELUMBIACEÆ, Lindl. The sacred-bean tribe of plants consisting of 1 species of the genus *Nelumbium*. They are herbaceous plants, with very large leaves and flowers, inhabiting stagnant and quiet waters in *North America, West Indies, the Caspian region, India, Persia, China, and Egypt*. Writing regarding a *Nelumbium* of *China*, Mr. *Fortune* says no flower could be more beautiful or more majestic than the *Nelumbium* was at this season; looking down from a bridge, the eye rested on thousands of these flowers, some of which were white, others red, and all were rising out of the water and

standing above the beautiful clear green foliage. The leaves themselves, as they lay upon the smooth surface of the lake, or stood erect upon long foot-stalks, were scarcely less beautiful than the flowers, and both harmonized well together. Gold, silver, and other kinds of fishes were seen swimming swiftly to and fro, and apparently enjoying themselves under the shade of the broad leaves. At another place he says, he once observed in the garden of a mandarin at *Ningpo* a very beautiful variety of the *Nelumbium*, *N. vittatum*, different from the red and white kinds of *Nelumbium*, its flowers being finely striped. It was evidently extremely rare in that part of *China*. They are abundant in all parts of the province of *Kiang-nan*, at *Shanghai, Soochow* and *Nanking*, where the ponds and lakes are often frozen up and the thermometer frequently sinks to within a few degrees of zero. During the spring and summer months the plants form and perfect their leaves, flowers, and fruit: in autumn, all the parts which are visible above water gradually decay, and nothing is left in a living state except the large roots, which remain buried deep in the mud, and they continue in a dormant state until the warmth of spring again calls vegetable life into action. The *Lien-wha Nelumbium* is cultivated very extensively in *China* for the sake of its roots, which are esteemed an excellent vegetable and are much used by all classes of the community. The roots attain their largest size at the period when the leaves die off; and are dug up and brought to market during the winter months in the north of *China*. The stalls of the green grocers are always loaded with them at that season of the year. Although in high repute amongst the natives, being served up with many of their dishes and forming part of others, they are not generally liked by foreigners. An excellent description of arrowroot is made from them, which is considered equal in quality to that which *England* imports from the *West Indies*. The seeds are also held in high estimation; they are commonly roasted before being served up to table.—*Voigt, p. 9; Fortune, pp. 350-52.*

NELUMBIUM, a genus of plants belonging to the natural order *Nelumbiaceæ* or *Sacred bean*. The blue lotus grows in *Kashmir* and *Persia*.

Of this plant, there are two varieties (α) rubrum, the Rakto-padmo of Bengal, with rose-coloured flowers, and (β) album, the shwet-padmo with white flowers. The lotus grows throughout the East Indies, also in Persia, Tibet, China and Japan. The leaves and flowers of the plants spring from beneath the waters, and in Kashmir the broad leaves form a verdant carpet, over which the water-hens run. In the hot weather, the stalks are very commonly eaten by the poorer classes and boiled in their curries, and the seeds are strung together like beads, and are eaten raw, roasted or boiled. The flowers are a favourite offering at the Burmese pagodas. The fruit is as large as the closed hand forming an exact hemisphere, on the flat surface of which about twenty-four seeds are imbedded, which, when ripe, are black and hard. The stalks are, in Hindi, called Kanwal kukri, Kanwal gatha, nalru bheng. The long fine filaments contained within the cells of the stem are drawn out, and the thread spun from the filament, is used as the wicks of the lamps in pagodas, the seeds and roots are used by natives as food, either raw, roasted or boiled, and also as a cold remedy in cholera and indigestion, demulcent, said also to be diuretic and cooling. It is highly venerated by the hindoos but it is the more immediate attribute of Vishnoo, from being the prime of aquatic vegetables, and he a personification of water. It is also peculiarly sacred to Lakshmi, the wife of Vishnoo, who is sometimes called Kamala, or lotus-like: it is moreover an emblem of female beauty. This plant is the true lotus of the Egyptians, and the Nymphæa nilofer of Sir William Jones, nilofer being its Arabic name. The new blown flowers of the rose-coloured lotus have an agreeable fragrance; those of the white and yellow have less odour. There is a variety which is blue, a native of China, Cashmir and Persia. Its flowers are used by hindoos in their religious ceremonies. Every morning at Cashmir, vast numbers of these flowers, which had served in the hindoo rites flow down the river. Its boiled roots are eaten as a pot-herb by the natives; in Lahore, they are called Pe, in Cashmir Nadroo. In China, the nelumbium covers extensive marshes in the eastern and northern provinces, otherwise unsightly and barren. The root is two or three feet long, and pierced longitudinally with several holes; when boiled it is of a yellowish colour and sweetish taste not unlike turnip. Taro is used less than the nelumbium, and so are the water-caltrops and water-chest-

nuts.—*Malcolm's Travels in South-eastern Asia*, Vol. i, p. 183; *Powell's Hand-book*, Vol. i, p. 329; *Ains. Mat. Med.*, pp. 162-251; *Honigberger*, p. 315; *William's Middle Kingdom*, Vol. xi, p. 44; *Emil. Schlagentweit, L.L.D.; Buddhism in Tibet*, London, 1863, p. 66; *Voigt; Roxburgh; Mason; Smith*, p. 139.

NELUMBO NUCIFERA, Gaert. Syn. of Nelumbium speciosum, Willd. See Dyes.

NEMALI SIKHA, or Mayura sikhi, TEL. Actinopteris radiata, Adiantum melanocaulon, *Ind. Ind.*

NIMAR was literally a desert, when taken over by the British Government in 1818, its lands waste and its few people miserable and hopeless. In 1864, its people were well off.

NEMELAY, TEL. Pavo cristatus.

NEMESIA FLORIBUNDA, one of the Scrophulariaceæ plants which may be cultivated from seed in any rich light soil, the colour of the flowers is purple.—*Riddell*.

NEMI, a name of Krishna, he is called Arishta-Nemi, 'the black Nemi,' from his complexion. Krishna, before his own deification, worshipped his great ancestor Budha; and his temple at Dwarica rose over the ancient shrine of the latter, which yet stands. In an inscription from the cave of Gaya, their characters are conjoined; "Heri who is Budha." According to western mythology, Apollo and Mercury exchanged symbols, the caduceus for the lyre; so likewise in India, their characters intermingle; and even the Saiva sectarian propitiates Heri as the mediator and disposer of the 'divine spark' (jote) to its re-union with the 'parent flame': thus, like Mercury, he may be said to be the conveyer of the souls of the dead. Accordingly, in funeral lamentation, his name only is invoked, and Heri-bol! Heri-bol! is emphatically pronounced by those conveying the corpse to its final abode. The vahan (qu. the Saxon van) or celestial car of Krishna, in which the souls (ansa) of the just are conveyed to Surya-Mandal, the 'mansion of the sun,' is painted like himself, blue; (indicative of space) Nem-nath and Sham-nath have the same personal epithets, derived from their dark complexions, the first being familiarly called Arishta Nemi, 'the black Nemi,' the other Sham and Krishna, both also meaning 'dark-coloured,' and when this is not only confirmed by tradition, but the shrine of Budha is yet preserved within that of Krishna at Dwarica, we have no reason to question that his faith prior to his own deification, was that of Budha.

NEMICHTHYS SCOLOPACEA, *Richardson*. A fish of the Archipelago, one of the Ophidiæ, scaleless with sharp-pointed teeth. *Adams*, 103.

NEMINATH, a deified saint of the Jains.

It was to counteract a fervour towards women that the jains of Western India set up their image of Neminath, a fact communicated in confidence to Colonel Tod by one of the sect.—*Tr. of Hind.*, Vol. ii, p. 45.

NEMI-TIRTHA, a ghaut, sacred to the memory of Choitunya for his having halted and bathed here in the course of his wanderings.—*Tr. of Hind.*, Vol. i, p. 8.

Pharaoh's chicken, "	Pitri-gedda, TAM.
White-scavenger vulture, "	Manju tiridi, TEL.
Kal-murgh, HIND.	Tella borawa, "
	Sind'ho, of the Wagree.

This bird, one of the *Neophroninae*, inhabits Europe, Africa and Asia, is common in the peninsula, and in Central and Northern India, but is not known in Bengal. A single pair has been known to stray beyond its ordinary haunt so far as Britain. Its chief food is refuse of all kinds. This bird is evidently the 'Kite' of Major A. Cunningham's 'Ladak,' p. 205). He writes—"the eagle (cha-nak, or the 'black bird') and the kite (cha-kote, or the white bird) are common enough, and so is the large raven." A second species of this genus, the *N. pileatus*, inhabits Africa only.

NEOZA and Chilgoza, also Neor, HIND. *Pinus gerardiana*, Gerard's pine.

NEPAL. This kingdom is in Mid-Himalaya, between the snowy range and the valley of the Ganges. It is separated from Tibet by the Himalaya mountains and bounded on the south by the British territory. The mythological history of Nepal like that of Kashmir, commences with the desiccation of the valley, for ages full of water by a muni, called Nai muni, whence the name of the country Naipala, whose descendants swayed the country 500 years. The first authentic history is B.C. 844? years. Then the Kerrat tribe of eastern mountaineers B.C. 646. Then the Surya vansa race of rulers B.C. 178. The Ahir, or original sovereigns began in A.D. 43. The Neverit dynasty was restored in A.D. 470. It was one of this dynasty, Rag-hoba deva, who in A.D. 380, introduced the use of the Samvat era into Nepal. In the Newar year 731, A.D. 1600, Jaya Eksha Mall (or Jye Kushi Mull) divided Patan, Khatmandoo, Banepa and Bhatgaon between his daughter and three sons, and one of the Bhatgaon race, in A.D. 1721, Ranjet Matla formed an alliance with Gurkha which ended in his own subversion and finally in that of all Nepal. The Gurkhali dynasty descended from the Udayapur Rajputs, occupied Kemaon and Noa kot for six or eight centuries prior to their conquest of Nepal in A.D. 1768.

Nepal lies between Kumaon on the west, and Sikhim on the east, at the foot of the Himalaya range, between the Himalaya and the Terai. It is 500 miles long; east to west 90 to 160 miles broad with an area of 54,500 square miles. The surface generally consists of valleys varying from 3,000 to 6,000 feet above the Bengal plains, the capital of Katmandoo is in an oval-shaped valley, 12 miles long from north to south, and from east to west 10 miles, long. 27° 42' N., lat. 85° 18' E., and 4,628 feet above the sea. Bhynturee, is in lat. 29° 35' N., long. 79° 30' E., and 5,615 feet. The slope to south and the valley is drained by the Ghogra, Gunduk, and Coosy. The geological formation of the hilly tract consists of limestone, hornstone, and conglomerate.

Vegetable productions occur of most remarkable stateliness, beauty, and variety. The climate resembles that of southern Europe. The valley is bounded on the north and south by stupendous mountains. To the east and west by others less lofty, the western end defined principally by a low steep ridge, called Naga Arjoon, which passes close behind Sambhoo Nath, and is backed by a more considerable one named Dhoahouk. To the eastward the most remarkable hills are those of Ranichouk and Mahabut, but they do not reach the elevation of Phalchouk (the highest on the south), or of Sheopoori, which is by far the highest mountain. The bottom of the valley is uneven, intersected by deep ravines, and dotted throughout with little hills. The country is diversified by several inhabited valleys. The hills rise towards the culminating ridge of the Himalaya, consist of limestone, hornstone, and conglomerate. Owing to its elevation, Nepal enjoys a climate resembling that of South Europe. Snow lies on the mountain-chain which surrounds the capital, in winter, and occasionally falls in the valley. The whole region is well-watered. The Nepal kingdom extends for 500 miles along the Himalaya, from the western extremity of Sikkim to the eastern border of Kumaon, from which it is separated by the river Kali. Its capital, Kathmandhu, is 4,000 feet above the sea, and about thirty miles from the plains of India. The position of the axis of the Himalaya at this part of the range, has not been traced; but two giant masses project from the axis towards the Indian plain, the culminating peaks of which form a conspicuous feature from Kathmandhu and even from the Gangetic plain so that their elevation has been correctly determined,—that of Dhawalgiri being 27,600 feet, and that of Gossainthan 24,700 feet. By these masses, the whole of Nepaul is divided into three great river basins, that of the Karnali or Gogra to the westward, that of the Gandak in the centre and that of the Kosi or Aran to the eastward. Sheopore on the water-shed between the Ghndak and the Kosi, is upwards of 10,000 feet. Nepaul lies betwixt the 27th and 37th parallels of latitude, separated from Tibet by the Hamalaya mountains and bounded on the south by the British territory. The mythological history of Nepaul like that of Kashmir, commences with the desiccation of the valley, for ages full of water, by a muni, called Nai muni, (whence the name of the country Naipala,) whose descendants swayed the country 500 years. Nepaul occupies a tract of country about seven hundred and fifty miles in length, and sixty to one hundred and seventy in breadth, situated between 26° 31' and 30° N. lat. It is bounded on the north by a part of Tibet,

from which it is separated by the Himalaya chain; on the east, by Bootan and the little state of Sikkim, from which it is separated by the river Teesta; on the south, by the British Indian province of Tirhoot, from which it is divided by the Terai, an immense forest, the eastern part of which is called the Moray district; and on the west, by the kingdom of Oude. The divisions of Nepaul are Jumla, Goorkha, Nepaul, Muckwanpore, and Morung. The principal rivers which traverse the territory are the Kalee and Surgoo, which, meeting at a place called Pramadee, form the Goggra and Gunduk. The Gunduk is supposed to rise in the Himalaya, and flows into the Ganges near Patna. The upper part of the river is called Saligramee, from the fossil ammonites, called saligram, which are found in it, and which the hindooes hold in veneration. To the extreme west of Nepaul, lies Almorah, a hill station, wrested from the Nepaulese in the wars of 1815-16; to the extreme east is Darjeling, another hill station, used by the Supreme Government of India as a sanatorium for invalids. The principal British cities and military stations which border on the Nepaul territory along the line of the Ganges, are, Berhampore (contiguous to the Morung district), Monghyr, Patna, Dinapore, Ghazeepore, Benares, Allahabad, Cawnpore, Lucknow, Futtighur, and Bareilly; the last-named town lying opposite to a Nepaulese fort called Doti, and a few miles from the hill station of Almorah. The Terai, or Turry, or Turyanee, is a long strip or belt of low level land. The word probably, signifies low or marshy lands, but it is sometimes applied to the flats lying below the hills in the interior of Nepaul, as well as to the level tract bordering immediately on the British frontier. It abounds with large and lofty forest trees, the chief of which are the Sal and the Bechiacori pine. Some of the Sal spars reach the length of seventy to eighty feet, and are generally considered unequalled for strength and durability. In this respect, however, they must yield to the teak, for there is this peculiarity in Saul, that it is seen to warp soon after having been employed in bulk for many years, rising into large fissures longitudinally, and falling a prey to the white ants. Small quantities of gold-dust are found in the Gunduk, which runs through the Terai, and Cassia lignea likewise produced in the jungle. It is named Singh Rowla, and is much used in Hindostan in spicery: the bark of the root does not differ widely from cinnamon, for which it has often been mistaken, but the bark of the trunk and branches possess little of the cinnamon flavour.

Enormous timber trees are found in the Terai. In addition to the Sal, and the Bechiacouri pine, are to be found the Sissoo, the Setti-saul,

the Phullamical, an iron wood, the Kalikset, a sort of black wood, the Sajk, the Burra, the Sunni and the Moolta. Besides these, there is a small quantity of ebony. These woods constitute in a great measure the commercial wealth of Nepaul. Wood merchants congregate at the southernmost point of the forest near the river Gunduk, because of the facility presented by that river of floating the timber to Calcutta.

Beyond the Terai, and still bearing its name, is a range of hills of about the same width, at the northern base of which commences the Nepaul valley, nearly oval in shape, about twelve miles from north to south, and nine miles from east to west. Its circuit has been roughly estimated by the inhabitants at twenty-five coss, or from forty to fifty miles. The range of mountains to the north of the valley is stupendous; the ranges to the east and west are much less lofty, the immediate head of the valley to the westward being defined principally by a low, steep ridge covered with brushwood. At the foot of the northern range, situated upon the eastern bank of a small river called the Bishenmuttee, in lat. $27^{\circ} 42' N.$; long. $85^{\circ} E.$, stands the city of Khatmandoo, the capital of Nepaul. It is not the largest of the towns in the valley, but it is the residence of the rajah, or ruler of Nepaul. In length, Khatmandoo may measure about a mile; its breadth is inconsiderable, nowhere exceeding half and seldom extending beyond a quarter of a mile. The town is distinguished in ancient books, as Gorgoolputten: the Newar call it Yindes, whilst among the Parbutia, or mountaineers, it is styled Kultiipoor, an appellation which seems to proceed from the same source with Khatmandoo, and derived, it is believed, from its numerous wooden temples, which are among the most striking objects in the city. These edifices are not confined to the body of the town, but are scattered over its environs, particularly along the sides of a quadrangular tank, or reservoir of water. The houses are of brick and tile, with pitched or painted roofs. On the street side they have frequently enclosed wooden balconies of open carved work, and of a singular fashion; the front piece, instead of rising perpendicularly, projecting in a sloping direction towards the eaves of the roof. They are of two, three, and four stories, and almost without a single exception are of a mean and poor appearance. The streets are exceedingly narrow, and very filthy.

The city of Patun is of the next importance. It occupies a rising spot of ground, situated about two miles S. by E. of Khatmandoo, and close to the confluence of the Munnohra, Tookcha and Bhagurutty rivers. The figure ascribed to it, is that of the Chucro, or wheel of Narain. Patun is called Yellodes by the Ne-

war; and it is likewise occasionally distinguished from Deo Patun, by the appellations of Lallit-Patun and Lall-Patun. It is a neater town than Khatmandoo.

Bhatjong is perhaps still more superior to Khatmandoo, for though the least considerable of the three towns in point of size, yet its buildings in general have a more striking appearance; and its streets if not much wider, are at all events much cleaner than those of the metropolis, a distinction which it owes to its admirable brick pavement. Bhatjong lies E. by S. of Khatmandoo, at a distance of nearly eight road miles. Its ancient name was Dhurmapatun, and it is called by the Newar, Khopodes; by whom it is also described to resemble in figure the Dumroo, or guitar of Mahadeo. It is the favorite residence of the brahmins of Nepaul, containing many more families of that order, than Khatmandoo and Patun together.

Kirthipoor occupies the summit of a low hill, about three miles west of Patun. It was at one time the seat of an independent prince; and its reduction cost the Goorkhali prince so much trouble, that in resentment of the resistance made by the inhabitants, he barbarously caused all the males, whom he captured in it, to be deprived of their noses.

Chobar is also situated on an eminence, which with that of Kirthipoor, forms a kind of saddle hill.

Nepaul contains every variety of climate. The fourth of it lies in the hot plains of the Ganges, and the remaining three parts lie on the slope of the Himalaya from the elevation of five thousand feet up to the limit of perpetual snow. It is alleged to contain from forty-three thousand to fifty thousand square miles, and to have two million inhabitants. It may be called the Switzerland of India; but its area is equal to that of three Switzerlands, while the amount of its population is no more than one-third part as great. The height of Nepaul above the level of the sea is about four thousand feet. The thermometer notwithstanding this height, ranges to 87° its usual height about noon varies from 81° to 84° . A little after sunrise, it stands between 50° and 54° , but it is occasionally as low as 47° . At nine in the morning, it fluctuates from 62° to 66° . The mean temperature in March is 67° . The seasons are pretty nearly the same as those of Upper Hindostan. The rains commence a little earlier, say in the month of May, and set in from the S. E. quarter; they are usually very abundant, and break up towards the middle of October. In the west of Nepal are the Gurang and Magar tribes, small, with features of an extreme Mongolian type, full of martial ardour and energy. They are known as the Goorkha soldiers. They have considerable in-

tellectual ability. The lands of Nepal proper are cultivated almost without exception by Newar who arrange themselves into several castes and orders, and their peasantry into first, second, third and fourth classes. The Parbattia tribe, called Dherwara, cultivate the western lands at Nurkale, &c. Amongst the Nepalese, the hindoo distinction prevails of brahmans and khetri with their various sub-divisions, viz.: of Newar, confined almost to the valley of Nepal: the Dherwar and Margi, the husbandmen and fishermen of the western districts; and the Bhotiah who occupy generally Kachar, though some families are planted in the lower lands. The Bhama are said to be separatists from the Newar, who shave their heads like Bhotiah. To the eastward of Nepal, some districts are occupied by Limbu, Naggankote and others. The great aboriginal stock of the inhabitants of the mountains east of the river Kali, as in Nepal, is Mongol, the martial classes of Nepal are the Khas, Magor and Gurung, each comprising a very numerous clan or race variously sub-divided. The Elthariah, who speak the Khas language, are descendants more or less pure of Rajputs and other Khetri. The Chepang, Haigu and Kusundu are three tribes residing amongst the other inhabitants of the valley. In Nepal is a perfect maze of dialects. Beginning from the Singhaleela range we find Limbu or Kiranta which goes west as far as the Dudkoosi river, in longitude $86^{\circ} 44'$. Sherwill found the Gurung in the higher parts of Singhaleela, closely connected with whom are the Murmi. Along the lower hills are the Magar, who extend to the west as far as Palpa. Somewhere about here we should apparently place the Brahmu, Chepang, Hayu or Vayu, and Kusumbha. In Central Nepal are the Newar, Pahri, and Brahmu, a dialect of Magar, also the Darahi or Dorhi, Danwar and Paksya. The Tharu live in the Terai, between Chumparum and the Khatmandoo valley, as far west as the river Gandak. These last four are classed among Indo-Germanic languages. The rest are Turanian, with more or less infusion of Hindi. The Parbattia or Paharia, a dialect of Hindi is spoken all over Nepal and is the court language. West of this again comes the Palpa, then the Thaksya, Sunwar, and Sarpa, the dialects of Kumaon and Gurhwal, which carry us on to the Milchan of Kunawar, the Hundisi, and Tibarskad north of it. Dr. Hunter gives the Nepal races as under:—

Nepal, East to West.—Serpa; Sunwar; Gurung; Murmi; Magar; Khaksya; Pakhya; Newar; Limbu.

Kiranti Group, East Nepal—Kiranti; Rodong; Rungchenbung; Chhingtangya; Nachhereng; Waling; Yakua; Chourasya; Kulungya; Thulungya; Babingya; Lohorong;

Limbichhong; Balali; Sang-pang; Dumi; Khaling; Dungmali.

Broken tribes of Nepal.—Darhi: Denwar; Pahri; Chepang; Brahmu; Vayu; Kuswar; Kusunda; Tharu.

The martial classes of Nepal are, the Khas, Magar and Gurung, each comprising a very numerous clan or race, variously ramified and sub-divided. It has been calculated that there are in Nepal no less than thirty thousand Dakhriah, or soldiers off the roll by rotation, belonging to the above three tribes. Their energy of character, love of enterprise, and freedom from the shackles of caste, are conspicuous, and in the opinion of competent judges, they are by far the best soldiers in India; their gallant spirit and unadulterated military habits might be relied on for fidelity.

The Newar compose the army, engross all situations of trust, whether civil or military, and are confined almost to the valley of Nepal. The Dherwar and Mhargi are the husbandmen and fishers of the western districts; and the Bhootia, though some families of them are planted in the lower lands, occupy, generally speaking, such parts of the Kachar as are included in the Nepal territories. The Bhama are a sort of separatists from the Newar, supposed to amount to five thousand; they shave their heads like the Bhootia, observe many of the religious rites, as well as civil costume of the latter, in a dialect of whose language they are said to preserve their sacred writings. To the eastward of Nepal some districts are inhabited by Limboo, Naggunkot and others. The Newar are divided into several castes or orders, most of which derive their origin, like those among the more ancient hindoos, from a primitive classification, according to trades and occupations. The peasantry of the Parbattia, or hill-people, are divided into four classes, denominated Awal, Doom, Seoom and Charam, literally first, second, third and fourth. The Awal peasants possess five ploughs and upwards; the Doom have from one to five; the Seoom are those who, without being proprietors of ploughs, are considered to be at the head of a few or more labourers; and the lands of Nepal proper are cultivated, almost without exception, by Newar; those to the westward, as Noorkale, &c., by the Parbatty tribe, called Dherwara. The ryots or peasantry are distinguished also into Koohrya and Perja. The former are those settled in hereditary proprietary, or other rent-free lands, and are not liable to be called on by government for any services, except the repair of roads, and attendance in the army upon particular occasions. The Perja, who occupy lands actually belonging to the prince, though perhaps in the immediate possession of jagheerdars, are, on the contrary, obliged to

perform various services, both at the call of the jagheerdar and of the prince. The great aboriginal stock of the inhabitants of the mountains, east of the river Kali, as in Nepal, is Mongol. The fact is inscribed, in characters so plain, upon their faces, forms, and languages, that we may well dispense with the superfluous and vain attempt to trace it historically in the meagre chronicles of barbarians. Lassa and Digurchee, in Thibet, two large cities, are great fur depôts; they are only forty marches from Khatmandoo. Beautiful dresses made of furs are brought by the native merchants from these cities; a fur cloak with thick silk lining, can be had for one hundred and fifty Moree rupees, in British money little more than ten pounds.

The mountainous parts of Nepal are rich in mines of iron and copper. The copper is of a very superior kind, and before the opening of a trade between Great Britain and India, was preferred for consumption in the territories of the king of Oude to that exported from Britain. Lead mines, yielding also a proportion of silver, are to be found in Moulkote, and it is supposed that there are gold mines to the north, though as yet no traces of gold have been discovered excepting in the beds of the torrent which rush through Kachar to the eastward.

Katmandoo is situated at the junction of the Bhagmutty and Bishmutty, and contains a population of 30,000 inhabitants. A tradition is current in Nepal that the valley of Katmandoo was at some former period a lake, and it is difficult to say in which character it would have appeared the most beautiful. The valley of Nepal is almost unrivalled in its fertility, supporting as it does in comfort and plenty a population of 400,000 inhabitants, being 300 persons to the square mile. Throughout its whole length and breadth not a stone is to be found: it is well-watered; its temperature is delightful, the thermometer in the hottest month seldom reaches 75°, in the coldest never falls below 30°. In phonology the Nepal languages have a strong resemblance to each other and to the Abor. The Lepcha is more Tibetan in its terminals than the others, having about 70 per cent. of consonants, *m* forming no less than 14. *So-Khain*, "anything," becomes *tham*. The Serpa resembles the spoken Tibetan, having about 34 per cent. of nearly the same consonants. The other languages are more vocalic. All possess a considerable portion of nasals, with the exception of Sunwar and Magar. In Sunwar, Gurung, and Newar, *m* is absent or rare. Newari is the most vocalic of the whole, *ng* and *n* being almost the only consonantal terminals. In thus possessing labial finals, the Nepal group is more consonantal than the east Gangetic languages, including Abor. In their

phoregetic elements Serpa and Lepcha resemble spoken Tibetan.

The Gurung and Magar tribes are small, with features of an extreme Mongolian type, full of martial ardour and energy. They are known as the Goorkha soldiers. They have considerable intellectual ability. The Newar have Tibetan features with a fair and ruddy complexion. The language of the Magar, Gurung and Newar is chiefly Tibetan. Further east are the Keranti, Murmi and others.

The *Khas* or dominant race, according to Manu, are outcaste military tribes.

The Goorka race ruling in Nepal, claim to be Rajputs, but Mr. Hodgson says they are bastard brahmans, descendants of brahman immigrants and women of the hills, said to be of mixed origin, but brave and fierce, and by the Chinese called Ku-ru Ka-li. Not only are they brave and skilful soldiers, but they are wonderfully advanced in the art of fabricating the implements of war: they cast their own ordnance, manufacture their own muskets, shot, powder, and cartridge-boxes; in fact, every instrument or weapon used in civilized warfare often clumsily enough, but capable of being used, with effect. The Goorka conquerors of Nepal now compose the army; they have grants of land called jaghires, on which they live when not actually on service. They are a handsome and independant race, priding themselves upon not being able to do anything but fight; and have a free and sometimes noble carriage like the Tryolese. The Goorka and Bhutani, on the east, and the Lahuli and Kanawari on the west, dwelling amongst the valleys of the Himalaya, are according to Cunningham, mixed races, between the Bhot family of Tibet and the hindoo race of the south. In feature and figure, the true Goorka are always remarkable, from their broad Chinese or Tartar-like physiognomy, the small eyes, flat nose and meagre whiskers, as well as the stout square make and sturdy limbs. The Goorka, in every description of costume, and in all degree of raggedness, are to be seen mingled with inhabitants of Kumaon, Sirmor, and Gurwhal. In 1792, the Goorka race mastered the whole of the valley of Nepal, and the hill country from Sikhim to the Gogra and a party of them crossed the Himalaya, and appeared suddenly before Teeshoo Loomboo. The Llama and priests hastily evacuated their convents, and fled to Lhassa, and the place was plundered by the Goorka, who retired immediately with their booty. The Tibetans applied to China for aid, and an army was collected for the punishment of this act of unprovoked outrage. The Goorka submitted unconditionally to the Chinese commander, who imposed a tribute and triennial mission to

Pekin, besides restitution of all the booty taken at Teeshoo Loomboo, and he took hostages for the performance of these stipulations. The rajah of Sikkim was at the same time taken under Chinese protection. Checked towards the east by these events, the Goorka extended their dominion westward, subjugating Kumaon, Sirinugur, and all the hill country to the Sutlej. When Lord Hastings commenced his administration, their dominion extended as far as the river Teesta to the east, and westward to the Sutlej, thus occupying the whole of the strong country in the mountainous tract which stretches on the northern borders of India, between that and the highlands of Tartary. They had acquired these territories during the preceding 50 years, from many disunited hill chiefs whom they dispossessed, exterminating the families as each raja fell before them. The early intercourse of the British Government with Nepal was exclusively of a commercial nature. British political relations with it date from the invasion of the valley by the Goorka race under rajah Pirthee Narain. In 1767, the Newar rajah of Katmandoo, being hard-pressed by the Goorka, applied for assistance to the British Government. Aid was granted, and Captain Kinloch was despatched with a small force in the middle of the rainy season. He was, however, compelled by the deadly climate of the Terai to retire. The Goorka chief, meeting but a feeble resistance, overran Nepal, and extinguished the Newar dynasty, and was eventually recognized by the British Government as rajah of Nepal. For several years previous to 1792, the Goorka power had been extending their conquests in the direction of Tibet. They had advanced as far as Digarchi, the Llama of which place was spiritual father to the emperor of China. Incensed by the plunder of the sacred temples of Digarchi, the emperor of China despatched a large army to punish the Nepal rajah and the Goorkas concluded an ignominious treaty with the Chinese within a few miles of their capital. War between the Goorka and the British was formally declared on 1st November 1814. An arduous campaign, in which the Goorkas fought most bravely and with much success, left the British in possession of the hills west of the Kalee, and the Goorkas disposed to treat for peace. Negotiations were however, twice broken off by the Goorkas refusing to comply with the demand for the cession of the Terai, and hostilities were therefore vigorously pushed by the British Government till the 4th March 1816, when the Nepaulese commissioners delivered to Sir David Ochterlony the treaty of Segowlee duly signed and executed. The hill lands east of the Nu-

chee and Teesta rivers ceded under this treaty, were made over to Sikkim.

The murder of Guggun Singh, a favourite of the maharani and the massacre of thirty-one of the most influential chiefs in 1846, paved the way for the rise of Jung Bahadoor to the office of prime minister, and he was created a maharajah by the maharajah of Nepal, and invested with the perpetual sovereignty of two provinces. He effected the marriage of a son and two daughters into the royal family of Nepal. During the mutiny of 1857, and the subsequent campaigns, Jung Bahadur rendered assistance to the British in the re-occupation of Goruckpore, the recapture of Lucknow, and the subsequent capture of the rebels who infested the Terai. In consideration of these services he was created a Knight of the Grand Cross of the Bath, and under a treaty concluded on 1st November 1860, the tract of territory on the Oudh frontier, which had been ceded to the British Government in 1816, was restored to Nepal. The Nepaulese usually estimate the population of Nepal at 5,200,000 or 5,600,000, but it is probably not more than 2,000,000. The city of Katmandoo contains from 30,000 to 35,000 inhabitants. The area of the kingdom is about 54,000 square miles. Its revenue is unknown, but is supposed to be about 43 lakhs. The Goorkas pay no tribute to the British Government, but every five years a mission is sent from Katmandoo with presents to Pekin. Previous to the Nepal war in 1814 the Goorkas had extended their conquests westwards as far as the Sutlej. By the 5th Article of the Treaty of 1815, the Nepaulese renounced all claim to the countries west of the Kali, and the British were left in possession of the whole tract of hills from the Gogra to the Sutlej. Kumaon and the Dehra Doon were annexed to the British dominions, and the rest of the territory, with the exception of Subathoo, Raengurh, Sundoch, and a few other military posts, was restored to the hill rajahs from whom it had been conquered by the Nepaulese. In Nepal they use the bark of *Photina dubia* or *Mespilus bengalensis* for dyeing scarlet. Nepal is said to contain 1,940,000 inhabitants, of which 500,000 are buddhists. The Nepaulese were defeated by Sir David Ochterlony on the 28th February 1816, and the Nepal war ended on the 12th March 1816. Nepal ceded Kumaon by the convention of Almora on the 27th April 1815.—*Sir John Shore, Lond. As. Trans., Vol. ii, p. 30; Thomas', Prinsep, p. 270; San. Com. Report; Smith's Five Years at Nepal, Vol. i, p. 63.* See Buddha, India, Inscriptions, Katmandu, Khas, Krat, Lepcha, Limbu, Newar, Sanskrit, *Shawl-goat, Tope.

NEPAL CHILLY, *Capsicum frutescens*, Linn., also *Capsicum minimum*.

NEPETA MALIBARICA.

NEPAL HORSE-SHOE BAT, see *Cheirop-tera*.

NEPAL PAPER PLANT, see *Daphne canabina*, also *Thymeleæ*.

NEPAL-WOOD SHREW, *Sorex nemorivagus*, *Hodg*.

NEPALA, SANS. *Nepalam*, SINGH. Croton seed.

NEPALAM, TEL. *Jatropha curcas*, L.—*R.* iii, 686.

NEPALA VEMU, TEL. The exact translation of this name is "bitter croton." The SANS. syn. is *Jwarantaka*, which in *W.*, who renders it *Medicago esculenta*, is *Jwarapah*, p. 356, lit., "fever removing." The only plant answering this description is *Croton cascarilla* of S. America. The name would indicate the existence of a plant with similar properties in India. Some kinds of *Phyllanthus* have bitter roots, but are only used as diuretics. *Croton* and *Jatropha* possess drastic but not antifebrile properties.

NEPALEÆ, HOON-LING, THIB. Syn. of *Picrorrhiza*.

NEPALUM, TEL. *Croton tiglium*.

NEPENTHACEÆ, *Lincll*. The pitcher-plant tribe of one genus and six species. The pitcher-plant grows on grassy hills about Amwee, near the Jyntea hills and crawls along the ground.—*Hooker, Him. Jour.*, Vol. xi, p. 315.

NEPENTHES DISTILLATORIA.

N. indica, *Jam.* | *N. phyllamphora*.
Chu-long-tzo, CHIN.

The natives of Amboyna believe that rain will fall if they empty the pitcher. *N. ampullacea*, *Jack.*, and *N. rafflesiana*, *Jack.*, grow in Singapore. One species grows in Ceylon; several species occur in Borneo. The Dutch call this plant *Kannekens kruyd*, or the can-fruit, from its singular form.—*Pennant's Hindoostan*, Vol. i, p. 236; *Bennet*.

NEPENTHES of Homer (*Odys.* iv, l. 221) supposed by some to have been hemp, *Cannabis sativa*. It has also been supposed that opium was the *Nepenthe* of Homer.—*Powell's Hand-book*, Vol. i, p. 321.

NEPHELIUM LITCHI.

NEPETA RUDERALIS, *Badranyboya*, PANJAB, *Powell's Hand-book*, Vol. i, p. 366.

NEPHELIUM, a genus of plants of the natural order Sapindaceæ. Under the Canarese and Mahratta names *Andgere* and *Yaroo*, Dr. Gibson mentions a tree growing in Canara and Sunda, above the ghaut chiefly at the Nilcoond and southern jungles. Wood said to be serviceable in house-building. Mr. Thwaites notices in Ceylon, *Nephelium bifoliatum*, *Thw.*, a moderate-sized tree on the lower Badulla road from Kandy, at no great elevation which flowers in April: *Nephelium eximium*, a large tree, of the central province, at an elevation of 1,000 to 2,000 feet, flowers in May and fruits in July, and *Nephelium erectum*, *Thw.*, also of the central province, up to an elevation of 3,000 feet. Three species of the genus are celebrated for their fruits, viz., *N. litchi*, *Don.*, the litchi of south eastern Asia: *N. longanum*, the longan of China; and *N. lappaceum*, the rambutan of the Malay peninsula. Dr. Mason mentions a small inferior Tenasserim fruit as the red *nephelium*, eaten by the natives only, though belonging to the same genus which produces the famous lichi, and bearing its fruit in bunches like that. One of the indigenous *Nephelium* trees, a wild rambutan of Tenasserim, bears a fruit whose subacid is very agreeable to the palate, and much resembles that of the rambutan so famous at Malacca. Malays say it is the wild rambutan, and the tree certainly belongs to the same genus, the species known are *N. lappaceum*, lichi; longan, rimosum, rubrum, verticillatum and variable.—*Mason; Thw. En. Pl. Zeyl.*, Vol. i, p. 57; *Voigt*.

NEPHELIUM LAPPACEUM, *Linn.*, *Mant.*

Rambut; Rambutan, MALAY.

The rambutan fruit is produced in bunches terminally; the pulp, which surrounds a seed of the size and flavour of a cob-nut, is transparent, and of a delicate sweetish acid flavour; it is in appearance not much unlike the fruit of the arbutus, but larger, of a brighter red, and covered with coarser hair or soft spines, from whence it derives its name. The part eaten is a gelatinous and almost transparent pulp surrounding the kernel, of rich and pleasant acid.—*Low's Sarawak*, p. 73; *Marsden's History of Sumatra*, p. 101.

NEPHELIUM LITCHI, *W. & A.*

Dimocarpus lichi, *Lour.* | *Euphoria lichi*, *Desf.*
Scytalia lichi, *Roxb.*

Tan-li: Lichi, CHIN. | Kaleng ken: Lichi, MALAY.

This tree, a native of China, is an evergreen, and grows to a large size. The fruit is of a dark-brown colour, and contains a glutinous yellow sweet soft of pulp; in British India it is not much prized—perhaps from its inferior quality to the Chinese fruit, which is much esteemed. The fruit ripens in March and

April. The tree grows in all parts of China. The sun-dried fruits are largely exported from Fuh-kien and Canton provinces being in demand as a marriage present or dessert at feasts.—*Riddell, Smith.*

NEPHELIUM LONGAN, *Camb.*

Euphoria longana, Lam. | *Dimocarpus longan*, Roxb.
Scytalia longan, Lour. |
 Lung-yen, CHIN. | Poovuttu marum, TAM.

A tree of the peninsula of India, the Khassia hills, the Malay peninsula, Cochin-China and China. A moderate-sized tree, having a straight trunk and fine globular head. It occurs in Coimbatore, but is rare in the Bombay presidency, being confined to their Race or green-wood jungles. In China, it grows in Fuh-kien, Kwang-tun and Kwang-si. It is more easily grown than the litchi. The fruit is globular, it is not equal to the Litchi. The wood is white, hard, and close grained.—*Drs. Wight and Gibson; Voigt, Smith, p. 155.*

NEPHRITE, jade, or axe-stone, the Yashm or Sang-i-yashm, so much valued in China, is found in Central Asia, New Zealand and Western America. See Jade.

NEPHRODIUM FILIX MAS, see Filix mas.—*Honigberger.*

NEPOTISM, see Polyandry.

NEPTUNUS PELAGICUS, and, N. sanguinolentus, species of Crabs.

NEPU, TEL. Fire.

NEP YAN, BURMESE. Plantain, *Musa paradisiaca*.

NER, HIND. *Skimmia lauricola*.

NERA, or Nerar, TEL. ? of the Nalla Mallai, the *Syzigium jambolana*.

NERA, HIND. *Rhododendron anthopogon*.

NERA, MALAY. Palm wine.

NERADI, TEL. *Syzigium jambolanum*, called Neradee in Kurnool, and is a very useful wood, of a light sepia colour, of medium hardness, and used generally as planks.

NERAMEDHA, see Kali.

NERAND GAUM, a town and river in Nagpore.

NERASI, TEL. *Eleodendron roxburghii*, W. & A.

NERASO, URIA. In Ganjam and Gumsur, a tree with an extreme height of 25 feet, and a circumference of $2\frac{1}{2}$ feet. Height from the ground to the intersection of the first branch, 8 feet. It is tolerably common and burnt for firewood. Plough-shares are sometimes made of the wood. The bark is used medicinally for wounds.—*Captain Macdonald.*

NERBUDDA, a river of Central India, which rises in the dominions of the rajah of Rewah at Amarkuntak, a jungly table-land in lat. $22^{\circ} 39'$, long. $81^{\circ} 49'$ from 3,500 to 5,000 feet above the sea. It runs nearly due west with occasional bends, to the Gulf of Cambay,

which it enters below the town of Baroach by a wide estuary, after a course of 801 miles. It receives the Herrun, Samarsee, 60 miles; Sukthia, 70 miles; and about 60,000 square miles are drained. The river, notwithstanding the great width of its bed in some parts of its upper course, is scarcely anywhere continuously navigable for any considerable distance, in consequence of the innumerable basaltic rocks scattered over its channel. It is regarded as the boundary between Hindustan and the Deccan. Its ancient name as found in the Puranas is Rewa; and it bears a high reputation for sanctity. Local devotees sometimes place it above the Ganges; and there is a saying that, whereas it is necessary to bathe in the Ganges to obtain forgiveness of sins, the same object is attained by mere contemplation of the Narbada. The source is at Amarkantak, a massive flat-topped hill, forming the eastern terminus of that long mountain range which runs right across the middle of India from west to east. South of the Himalaya there is no place of equal celebrity so isolated on every side from habitation and civilisation. The river bubbles up gently in a very small tank in one of the undulating glades on the summit of the mountain. But soon the waters are reinforced by the countless springs which abound in those trap-rock formations, and after a course of some three miles from the source, the abrupt edge of the Amarkantak plateau is reached. There it tumbles over the ledge of a black basaltic cliff with a sheer descent of seventy feet, a glistening sheet of water against the intensely dark rock. These, the first, and perhaps the loveliest, of all the many falls of the Narbada are called Kapila-dhara. A short distance from the stream is another fall of lesser height called Dudhdhara, or the 'Stream of milk,' the myth being that once the river here ran with that liquid. Thus far the river's course constantly interrupted by rocks and islands, has been frequently tortuous. But below Ramnagar for several miles down to Mandla it flows in a comparatively straight line with an unbroken expanse of blue waters, between banks adorned with lofty trees. These pools or reaches (called "doh" by the natives) in many of the rivers of the Central Provinces are reckoned as gems in the landscape. The doh or pool of the Narbada, between Ramnagar and Mandla, is quite the finest of them all. The banks for a considerable distance between Mundleysir and Chiculdah are from forty to seventy feet high, and consist, independent of a thin upper layer of rich vegetable mould, of two distinct strata of alluvium, the upper which is very light coloured contains a great quantity of indurated marl, and is strongly impregnated with muriate of soda or common

salt, which the natives extract by lixiviation and subsequent evaporation by the sun in shallow compartments near the banks, and they sell it to the poorer classes, particularly the Bheels, in the neighbourhood. This stratum is usually from thirty to forty feet thick. The one on which it reposes, and from which it is divided by a strongly marked horizontal line, and a difference of colour (this last being of a redder hue) contains a very large proportion of carbonate of soda in general, but slightly contaminated by the muriate. This bed rarely exceeds ten or fifteen feet thick, and rests immediately on the basalt forming the bed of the river. In the dry season, both these salts form a thick efflorescence on the surface of the bank, and this alone is collected by the natives. That from the lower bed forms an article of export for the use of the washermen, &c., &c., but the soda itself is not extracted like the common salt, nor is its value but in the above way known. The bed of the Narbada, consisting for a considerable portion of its course of basaltic rocks gives rise to numerous shallows and small falls. Of these, the principal are, one at Deyree, where the river is much contracted, a second at Semadarah, a little below Mhysir, and a third at the Hurn Pahl, or Deer's Leap below Chicul-dah, whence, till its entrance into Guzerat, the stream finds its way contracted to within half its usual breadth between two hilly ranges, its course being much impeded, so as to render navigation impracticable, by large masses and elevated ridges of the rock. Passing higher up the stream from Mundleysir, the northern bank, after about thirty miles becomes rocky and precipitous and consists of gently inclined beds chiefly of greenstone slate, containing interposed mica in small grains. But the island of Mundatta and part of the opposite bank appear mostly to consist of hornstone slate of a reddish or greenish grey and sometimes porphyritic. Above this, for a considerable distance is, on each bank, a very wild woody tract, resembling that already noticed below Chicul-dah, excepting that the river is in general deep and less obstructed by rocks. This part consists of a succession of low hills and deep ravines, and water-courses is covered with high thick forests, and is scarcely capable of being travelled in most parts for seven or eight miles from the river by any but foot-passengers. Iron ore abounds, but the country being almost desolate, it is only smelted at Kantcoole and Chundgurb, for the supply of the Indore and neighbouring markets. It is of a good quality, but from the imperfect mode of working the metal is little valued, excepting for common purposes. The hilly tract below Chicul-dah is better populated, chiefly by wild Bheel tribes, and nearer Broach on the southern bank are the Rajpeeply

hills inhabited by the coolie tribe. In these hills are situated the several cornelian mines. From Burwae to Chicul-dah, the whole valley from the Satpoora to the Vindya mountains, is nearly level, well-watered, cultivated and inhabited. At Jubbulpoor and in the neighbourhood of Saugur, fossil mammalia, shells and silicified palms have been recently discovered. Fossil shells have also been found in some of the trap hills, which have broken up the sandstones near the sources of the Taptee. This river is separated from the Narbada by a range of basaltic mountains; and having the same direction as the Narbada, its whole course appears to be in the basaltic formation.—*Central Provinces Gazetteer*; Dr. Copland, Vol. i, of the *Bombay Literary Transactions Jour. of Asiatic Soc.*, Vol. xiii, pp. 516-517. See N. W. corner of Map.

NEREDI-CHETTU, TEL. *Calyptanthus caryophyllifolia*. Neredi-pandoo, TEL. Its fruit.—*Willd.*; *Swartz*.

NEREDU, TEL. *Eugenia jambolana*, Lam., R. ii, 484, *Syzygium jam.* W. & A.

NEREMJENA, near Patun Sangee in Nagpoor.

NEREOCYSTIS LUTKEANA, one of the algae, forms dense forests in Norfolk Bay and all about Sitcha. Its stem resembles whipcord and is often 300 feet long and terminates in a large air vessel, 6 or 7 feet long, and crowned with a bunch of dichotomous leaves, each 30 or 40 feet in length. The sea otter when fish-fishing rests on the colossal air vessels of this giant sea weed, and its stems furnish fishing tackle.—*Hartwig*.

There are two varieties of this shrub, one with white flowers, the other with red, it grows wild, but is cultivated in every garden of the East Indies. In the Dekhan, the double red and white grow wild on the banks of rivers, bearing both white and red flowers; the root is poisonous. There are two other varieties very commonly met with bearing double flowers both red and white, and by budding the red colour on the opposite one in several parts of the same stalk, a very pretty appearance may be given to the shrub. The yellow congener is called the Exile—introduced from America. Grows easily from cuttings. The whole plant is impregnated with a dangerous principle which has not as yet been insulated, though many attempts have been made to procure it. Its activity and volatility are very great; it is even a popular belief that the vapour of the flowers in a close apartment will prove poisonous. Amongst hindoos, its flowers are sacred to Siva. The single white is called in Hindi sufaid-kurpud, the single rose-colored lal-kurpud and the beautiful large double rose variety is called pudma-kurpud. The root, the bark and the leaves are officinal, and are poisonous. The root contains a yellow poisonous resin, tannic, acid, wax, and sugar, but no alcoholoid or volatile poison. The bark and flowers contain the same poisonous resin which is most abundant in the liber or inner bark, it is very soluble in carbonate of soda, and though not volatile is carried over mechanically when the plant is distilled with water. The root is frequently resorted to, for the purpose of

self-destruction by the women of India when tormented with jealousy. The root of the hill-plant is much more violent than that of the garden, and in the hills is considered poisonous. Jealous women so frequently have recourse to it that, it is proverbial among the females of the hills, when quarrelling, to bid each other go and eat of the root of Kaner. In a case of poisoning by common oleander (*Nerium odorum*), a man about 35 years old swallowed an ounce of the expressed juice, and immediately fell senseless on the floor. He did not recover, even by vigorous treatment, from a state of collapse, under 40 hours, and during that time had constant spasmodic seizures of the whole body. The stalks are said to be used as hookah tubes. The powder of the dried leaves is given in colic and used as an emetic. A wash is made from the bark which is used in itch and for destroying vermin. Externally the leaves and bark have been used (and sometimes even internally) as a remedy in herpes and itch. The rasped wood is employed as rat's-bane. The wood itself is used by some eastern nations as the best material for gunpowder charcoal.—*Powell's Hand-book*, Vol. i, p. 360; *Eng. Cyc.*; *Drs. Riddell*; *Irvine*, p. 186; *Ainslie's Mat. Med.*, p. 70; *Hornberger*, pp. 316, 326; *O'Shaughnessy*, p. 445; *Mason*.

NERIUM PISCIDIUM, *Roxb.*

Eschaltum piscidium, *Wight*. | *Echalat* of Sylhet.

This is common in the Khassya and Sylhet mountains, where it forms an extensive perennial climber. Its bark contains a large quantity of fibre, which the natives use for the same purposes as hemp. Dr. Roxburgh, in steeping some of the young shoots in a fish pond, in order to facilitate the removal of the bark and to clean the fibres, found that many, if not all the fishes, were killed: hence the specific name which he applied. Dr. Wight formed the plant into a new genus, *Echaltum*. The whole family of "Apocynaceæ," termed "dogbanes, to which this belongs, are truly so.—*Royle, Fib. Pl.*, p. 302; *Roxb.*, Vol. ii, p. 7; *O'Shaughnessy*, p. 445; *Voigt*, p. 525

Net-making or the art in which the fabric is required to be transparent, but in which the fibres are decussated and retained in their places by knots, that the interstices may retain their form and size, and prevent objects from escaping, seems to have been known in the earliest ages in Egypt, and is practised with the greatest skill throughout the E. Indies in great variety, from a few to fifty fathoms in length. Those from Singapore are made with cotton, and others with the fibre which is very similar to, if not identical with, that forming the so called China grass. Nets are woven also of hempen thread, and boiled in a solution of gam-

bier (*Uncaria gambier*) to preserve them from rotting. The smacks which swarm along the Malay coast go out in pairs, partly that the crews may afford mutual relief and protection, but chiefly to join in dragging the net fastened to their boats. In the shallows of rivers, rows of heavy poles are driven down, and nets secured to them, which are examined and changed at every tide. Those who attend these nets, moreover, attach scoops or drag-nets to their boats, so loaded that they will sink and gather the sole, ray, and other fish feeding near the bottom. Lifting nets, 20 feet square, are suspended from poles elevated and depressed by a hawser worked by a windlass on shore; the nets are baited with the whites of eggs spread on the meshes. There are, also, Casting nets, and Siene nets. The Rani fibre, Trap fibre, cotton and hemp are all employed in net-making.—*Royle, Arts, &c., of India*, p. 505. See *Fisheries*.
NETAR, HIND. Low land.

NETTLE. This name is applied to plants which when touched impart a stinging sensation. They are classed by botanists under the natural order *Urticaceæ* of *Endlicher*, which comprises the genera *Anipalis*, *Antiaris*, *Artocarpus*, *Batis*, *Boehmeria*, *Broussonetia*, *Cannabis*, *Conoccephalus*, *Dorstenia*, *Epicarpurus*, *Ficus*, *Lepurandra*, *Morus*, *Parietaria*, *Pouzolzia*, *Procris*, *Trophis*, and *Urtica*. Of the species of the genus *Urtica*, of which there are known about twenty, many sting, as also do those of *Boehmeria*; *Urtica* and *Boehmeria* furnish useful fibres, and the *Broussonetia papyrifera*, a paper-like bark. See *Urticaceæ*.

NETTLE FIBRE, see *Decaschistia crotonifolia*.

NETTE PALE, TAM. The country gooseberry tree, the fruit is one of the most powerful acids of India. The tree grows to about twelve inches in diameter, its wood is not of any use.—*Edye, Mal. and Can.*

NETTAPUS COROMANDELIANUS, *Gmel*.

lin. The white-bodied goose teal or cotton teal of British India, Ceylon, Burmah and Malayana, is a pretty little goslet, it is unwary and familiar, frequents weedy and grassy tanks, flies with rapidity, and utters a cackling call. It breeds in holes of old trees; ruined houses, temples, chimneys, and lays eight or ten small white eggs. It is the *Bernicea girra* of Gray and *Dendrocygnus affinis* of Jerdon, and is 13 or 14 inches long.

NETU, also Neru, TEL. Water.

NEUERA ELIA, a mountain summit in Ceylon, taking its name from Nuwara, SINGH., an imperial residence, and elia, light. It was first visited by English officers in 1826, and by 1829, Sir Edward Barnes had opened it as a sanitarium. It is 6,222 feet above the sea, and, on its north, mountains rise 2,000 feet higher still. Its temperature ranges from 36° to 81°, with a mean daily variance of 11°, the average at noon being 62°, and the highest observation of the unexposed thermometer 70°. The quantity of rain falling has perceptibly decreased of late years, probably owing to the extensive clearing of the surrounding forests, to prepare them for coffee planting. Its highest peak is Pedu-ru-talla-galla, 8,280 feet in elevation which derives its name from the plants which grow there amongst the rocks (galla) and are substituted for the ("talla") leaves in making mats (peduru). It is a favourite place of resort from the commencement of January to the middle of May. At that time the rainy season commences, and visitors rapidly disappear.—*Baker's Rifle*, pp. 32-33; *Tennent's Ceylon*.

NEUR, HIND., of Kotgarh, *Cupressus torulosa*, twisted cypress.

NEUROPTERA (from *νῆρον*, a nerve, and *πτερόν*, a wing), one of the orders into which the Insects class is divided. It may be illustrated by the Libellula or dragon-fly; Ephemerella or May-fly, and Phryganea or alder-fly. The following are E. Indian genera and species:—

ORDER Neuroptera.

Sec. Necromorphostica.

Sub-Sec. Planipennes.

Ascalaphus tessellatus, Westwood, East Indies. Expansion of wings, 2½ inches, black.

A. segmentator, Westwood, East Indies. Expansion 3 inches, yellow.

A. canifrons, Westwood, East Indies. Expansion 1½ inches, brown.

A. dentifer, Westwood, East Indies.

A. javanus?—? Java.

A. angulatus, Westwood, Assam. Expansion 3 inches.

A. obscurus?—? East Indies, Expansion 2½ inches.

Myrmeleon singulare, Westwood, East Indies. Expansion 4 inches, buff coloured.

Chauliodes subfasciatus, Westwood, Sylhet. Expansion 1-5-6ths. inches, blackish.

Nemoptera filipponis, Westwood, Central India. Expansion nearly 1 inch, dull fulvous.

Mantispa nodosa, Westwood, Assam. Expansion nearly 2 inches.

NEVERIT, see Nepal.

NEWAL, HIND. *Herpestes griseus*, Geoff., Bly.

NEWALA, HIND. *Vitis indica*.

NEWAR, a race who occupy the great central and fertile valley of Nepaul. They use well-built houses. The native Achar is selected as their priests. They eat beef and drink alcoholic liquors. They burn their dead. On the 11th August, the Newar farmer distributes mashed rice to the frogs. The Newar are the cultivating peasantry, have Tibetan features with a fair and ruddy complexion. The language of the Magar, Gurung and Newar is chiefly Tibetan. Further east are the Karanti, Murmi and others. The Newar are divided into several castes or orders, most of which derive their origin, like those among the more ancient hindoos, from a primitive classification, according to trades and occupations. The Newar are more skilful artisans than the Ghorka, but their talent does not lie in the same direction. The Newar excel also in bell-making; it is the trade of the land; they are all bell-makers from their youth, and proofs of their skill are exhibited hanging at the corners of pagodas, swinging from the roofs of houses, surmounting dagobas, in fact, the device upon a Nepalese banner should be a bell. In jewellery they are no less expert, and are elaborate workmen in all metals. A coarse paper is manufactured by them from the bark of a tree, which is first reduced to a pulp and then spread over a sheet and dried. They are as excellent agriculturists as tradesmen, and the rich soil of the valley is not allowed by the industrious peasants to lie fallow a moment longer than is necessary. There are not, however, many Newar employed as Nepaul soldiers, and the army is chiefly composed of Muggur, Gurung, and Krat. The Newar women, are lady-like in their appearance, when compared with some of the Bhotia tribe. In an account of Nepaul in 1803, Colonel Kirkpatrick observes that "though the Newar have round and rather flat faces, small eyes, and low spreading noses, they bear no resemblance to Chinese features;" but there is a great similarity of the mass of the lower orders to the Chinese. Their imperturbable good humour, unaffected simplicity, their picturesque dwellings and sturdy limbs, plainly prove them a hill race. This class of the inhabitants of Nepaul are a cheerful, happy race.—*Elephant's Journey*,

pp. 73, 74, 134; *Colonel Kirkpatrick's Account of Nepal*. See India, Nepal, Saurashtra.

NEWARA, HIND. *Herpestes griseus*, also *malaccensis*, *F. Cuv.*, *Bly*.

NEWBERRY, see Leedes.

NEWBOLD, Captain T. D., an infantry officer of the Madras Presidency, known for his continuous contributions on the geology and history of parts of Southern Asia. Capt. Newbold rose in the 12th M. N. I., was a distinguished geologist, and most accomplished orientalist and scholar, Assistant to the Resident at Hyderabad. *Ob.* 1850. Wrote on the Beryl mine in Coimbatore, in *Edn. New Phil. Jl.*, Vol. xx, 241; Valley of Sondoor, *Mad. Lit. Trans.* 1838, Vol. viii, part 1, 128; Temperature of the springs, wells, and rivers in India and Egypt, *Phil. Trans.* and re-published *Edn. NEW CALEDONIA, see India.

NEWEL FRUIT, *Calyptanthus caryophyllifolia*.

NEW GUINEA or Papua, a great island on the eastern border of the Eastern Archipelago. Its north coast is generally high; towards the sea, there is low land, but a little way inland, a chain of mountains extends parallel to the coast and elevated in some places 4,000 or 5,000 feet above the sea. It is the great seat of the Papuan race,

and is 1,500 miles in extreme length, or nearly double that of Borneo; but its superficial area is probably less than that of the latter island (200,000 square geographical miles), as there is every reason to believe that the south coast of New Guinea, immediately opposite to the gulf of Carpentaria in Australia, forms a deep indentation similar to the Great Bay on the north coast, there being a space of two degrees and a half of longitude in which the land has not yet been seen. Of this unexplored space, 118 miles, or four-fifths of the whole, were taken possession of by proclamation, in the name of the king of Holland, in the year 1828. As the commanders of Her Majesty's ships employed in the Surveying service are said to have general instructions not to interfere with coasts claimed by foreign powers, unless the interests of navigation absolutely require it, this in some degree accounts for the fact that so large a space of coast, within 600 miles of a European settlement that has been established more than three centuries, remains still unknown to civilized nations. The names by which the island is known to Europeans and Asiatics, New Guinea and Tanna Papua, both distinctly refer to the leading peculiarity of the race by which the coasts are inhabited. The most striking geographical feature of the great eastern peninsula consists in a back-bone of lofty mountains, which apparently extends throughout its length. Their practice of standing up to paddle their canoes is repeatedly noticed by Lieutenants Kolff and Modera, and it seems to be general throughout the coasts of New Guinea. The brown-coloured natives of the Archipelago all sit, or "squat," while paddling their canoes, excepting the Baju Laut, or Sea Gypsies, who stand like the Papuans, and give as a reason for assuming this posture, the superior facilities it affords them of seeing turtle, and of chasing them when discovered. The trade with New Guinea and the Eastern Islands, (commonly called the Bugis Trade,) and the Trepang fishery on the north coast of Australia, is carried on chiefly in vessels called Padewahkan. These leave Macassar and the other ports of Celebes, for the Eastern Islands during the westerly monsoon, returning with the south-east trade wind. The northern part of this island, that is to say, the portion lying to the N. W. of the range of mountains already alluded to, partakes of the rugged and broken character of the volcanic islands of the Indian Archipelago, but the south-western part is low and undulating, and we may conclude that it bears considerable resemblance to the northern coasts of Australia, since the several Dutch navigators who explored the gulf of Carpentaria, and who are in the habit of coasting this part of New Guinea on their way to Australia, considered them as being portions of the same continent.

and they were thus delineated in our maps until Cook passed through Torres Strait and decided the question as to their insularity. A very interesting account of the S. W. coast of New Guinea, is given in Modera's "Narrative of the voyage of the Dutch Corvette 'Triton' in the year 1828," when this coast was explored with a view to forming a settlement: and contains information which bears upon this point. Its S. W. part is known to native traders as Papua-kowiyee and Papua-Onen: it is inhabited by the most treacherous and blood-thirsty tribes, and up to the present time traders continue to be murdered there. The Papuan races of Mysol, Salwatty, Waigiu, and some parts of the adjacent coast, have become peaceable. On the S. W. coast, however, and in the large island of Jobi, the Papuan race are in a very barbarous condition and take every opportunity to rob and murder. The race in the interior of Dori are called Arfak, they are savages. The Papuans of Dori hang the skulls of the Arfak under the caves of their houses, which are built in the water, on posts, and led up to by rude wooden bridges. There is a large council chamber at Dori, supported on larger posts, on each of which is a rude carving of a naked man or woman with other revolting carvings near. The people of Dori resemble those of the Ke and Aru islands, many of them are very handsome, tall, well-made, with well cut features and aquiline noses. Their colour is a deep brown, often approaching to black, and their frizzly hair is combed up into a mop-like form by means of a long six-pronged fork. The language spoken at Dori is not understood by the Papuans at Humboldt Bay. The Dori people are great carvers and painters. Their food is roots and vegetables with fish and game as a luxury. The Arfak or hillmen of N. Guinea are generally black but some are brown like the Malay. Their hair, though more or less frizzly, is sometimes short and matted, instead of being long, loose and woolly. Mr. Earl describes the features of the N. Guinea Papuans as of a decidedly negro character:—broad flat noses, thick lips, receding foreheads and chins, and that turbid colour of what should be the white of the eye which gives a peculiarly sinister expression. Their complexion is usually a deep chocolate colour sometimes closely approaching to black, but certainly a few shades lighter than the deep black that is often met with among the negro tribes of Africa. The many Papuan tribes in N. Guinea, are generally in a state of warfare with each other and return from their warlike expeditions with heads. They are superstitious and worship a wooden deity called Karwar, 18 inches high, whom they consult on all occasions. A widow remains in the family of her deceased

husband. The negroes of N. Guinea are in various states of civilization. Some of the rudest dwell in miserable huts and seek a bare subsistence by the chase or the spontaneous productions of the forest. There are, however, other negro tribes living on the coasts who have made some advance in civilization. These dwell by whole tribes in huge barn-like houses raised on posts, like those of the wild inhabitants of Borneo, but ruder. Their beard is crisp. The forehead is high and narrow; eyes large, dark-brown, or black: nose flat and broad: mouth large, lips thick and teeth good: few have regular features, and most are apathetic. The ordinary men wear a waist cloth made of the bark of a tree, called "mar," which is wrapped round the waist and passed between the legs. Women wear a short sarong to the knee, generally of blue cloth. Men and women tattoo their bodies on occasions, by pricking the skin with a fish bone and rubbing in lamp black. The Dori people are a seafaring people and are expert swimmers and divers. Their prahus have outriggers and are excavated from the trunk of a single tree. Their food consists of millet, obi, maize, a little rice, fish and hog's flesh and fruits. Sago is imported in small quantities. Theft is considered a grave offence: they are chaste and marry one wife. The dresses of the chiefs, among the natives of Dori consist of the saluer, or short drawers of the Malays, and the kahya, or loose coat of calico, with a handkerchief tied round the head. The common men, and the chiefs themselves, when not in the presence of strangers, wear only a chawat, or waist cloth of the bark of the fig, or of the paper mulberry tree, beaten out like the bark cloth of the Polynesians. The Papuans inhabit the shore, the Arfak dwell in the mountains and interior. Both these main classes are divided into different tribes, who are generally in a state of hostility with each other. The Papuans of Dori resemble those of Mysol which is called Long Island in the English charts, and lies about ten miles to the east of Dori. In general they are short in stature, the most 5 $\frac{1}{2}$, very few 5 $\frac{1}{2}$ feet high, but muscular and well-made. Their colour is dark-brown, inclining to black in some. Two Albino children were seen there (of the same mother) with white skin, rather passing to yellow, with some brown spots on the back and with white crisped hair and blue or green eyes. The Papuans of Dori are generally affected with skin-diseases, in some the skin looks as if it were covered with scales (ichthyosis.) The hair is black and crisped. It has a reddish tint at the outer ends. They usually wear the hair the full length to which it will grow, which makes their head, from a distance, appear twice its actual size. In general they bestow little

care upon it, so that it has a disorderly appearance, and gives them a wild aspect. There are some, however, whose hair, whether through art or naturally, is smooth and even, as if it had been clipped. The men wear a comb in their hair, consisting of a piece of bamboo having 3 or 4 long points on the under side, like a fork, running into a point above and generally carved. This comb, which is stuck in obliquely at the side, has a small strip of coloured cotton fastened at the top which hangs out like a streamer. The women do not wear this ornament. The beard is strongly crisped but short, the hairs of the beard are sometimes pulled out. Most Papuans have a high but small forehead, large dark-brown or black eyes, flat broad noses, large mouths with thick lips and good teeth; many, however, have thin crooked noses and thin lips, which gave them a European physiognomy. They pierce the ears, and wear some ornaments in them, or their tobacco, which they roll in pandan leaves and of which they are great consumers. The appearance of the Papuans is lazy and stupid; most of them are very ugly, only a very few have regular features and a lively aspect. The dress of the chiefs is the before-mentioned kabaya, breeches and handkerchief, which they have some difficulty in fastening on their stiff crisped hair. The rest of the men are wholly naked, with the exception of a chawat or waist cloth. This, which is composed of the bark of a kind of fig tree beat out, is called by them mar, and is wrapped round the middle, drawn through between the legs and fastened behind. The women wear a short sarong, generally of blue cotton, which hangs to the knees, or a kind of breeches with very short legs. The body is otherwise entirely uncovered. Some however wear the sarong to above the bosom. The children of both sexes go entirely naked until the age of puberty. All wear rings on the arms composed of fish bones, shells, copper, silver, twisted rattans or rushes. These last, of the breadth of two fingers and usually red-coloured, are put on the arm at an early age, and adhere tightly to the skin as the limb grows. The men mostly wear a similar band of rattan on the wrist of the left hand, but much broader and which sits loose on the wrist, in order to prevent the skin being stripped off by the hard string in shooting with the bow. They tattoo themselves on different parts of the body after the death of one of their relations, for instance, on the cheeks and under the eyes after the death of the father; on the breast for the grandfather; on the shoulders and arms for the mother, and on the back for a brother. The women also tattoo, but chiefly after the death of one of their female relations. The figures appear to be chosen at will; mostly

like those on two-crossed klewang, or two curls running into each other. This tattooing is performed by young girls, by pricking the skin with a fish-bone and rubbing in soot. Large scars are seen on some, as if they had been burned. The number of such scars on one person are sometimes as many as ten, and are probably used as ornaments.

The weapons of the Papuan consist chiefly of bows and arrows, the spear, klewang, and parang, as well as the shield for protection. The bows are formed of bamboo or of a kind of very tough red wood; the string rests in two notches near the ends and is made of rattan. The bows which they use in war are 6 or 7 feet long, those for ordinary use are mostly 3 or 4 feet. The arrows are formed of reeds, a little shorter than the bows; they have very long tapering points of bamboo, fish bones, pointed bones or wood hardened in the fire; sometimes, but not generally, these points are of iron. Most of the points have sharp barbs, which generally produce incurable wounds, especially in the case of those who have no knowledge of the healing art, and leave the cure to nature. They do not apparently use poisoned arrows. The points are put into the arrows and fastened with thread, being often subsequently blackened. They generally have a great quantity of arrows in readiness for use. The spears, like the arrows, have barbed points and are generally 8 to 10 feet long, and frequently have, just below the point, a small bunch of cassowary feathers. The klewang and parang, which they make themselves, or purchase from ships, are of the usual form. The shield is of wood, four-sided, 5 to 6 feet high, 2 broad, somewhat bent out at the edge and furnished with a handle at the back. They are generally carved on the outside and ornamented with the figure of a Papuan in a sitting posture.

The flora of these countries is rich in Filices, Scitamineæ, Aroideæ with edible roots, Convolvulaceæ and Solanaceæ. The Gramineæ furnish *Saccharum*, *Milium*, *Oryza*, *Zea*, the beautiful *Phalaris arundinacea*. Amongst the fruit trees were seen *Carica papaya*, *Musa paradisiaca*, *Bromelia*, *Ananas*, *Citrus aurantium* in great quantity, *Canarium commune*, *Terminalia catappa* and *Myristica moschata*. Along the shore there are *Rhizophora*, *Myrobalanus*, *Mangium*, *Avicennia*, *Barringtonia*, *Elæocarpus*, *Xanthoxylum*, *Celastrineæ*, *Ficus*, *Ricinus*, *Artocarpus*, *Calamus*, *Flagellaria*, *Bambusa*, *Acacia*, and *Casuarina*. More than 150 kinds of insects, *Scarabei*, *Buprestides*, *Curculionides*, and also beautiful *Lepidopteres* and *Hemipteres*. This country is also rich in beautiful coloured *Arachnides*. Amongst the birds there are found *Psittacus galeritus*, *Phylotolaphus sulphureus*, *Psittacus aterrimus* and species of *Buceros*. Of

the birds of Paradise are the brown-feathered with beautiful white and orange-coloured feathers on the sides; the wholly black with long tail and large bent beak; a small yellow kind with orange-coloured breast; another kind red, with two pens projecting from the tail, with a small green coloured curled bunch of feathers at the ends. *Epimachus magnus*, a bird of the coasts of New Guinea, is the *Upupa magna*, *Gm.*, and *U. superba*, *Lath.* Its tail is 3 feet long, and its head-feathers are lustrous steel-blue. The mammiferous animals are few in number. Only some wild hogs, and a species of marsupial, *Perameles doryan*, about the size of a rat, with scanty reddish hair like bristles, an extended pointed snout, short tail, and a pocket on the belly in which it carries its young ones. At Dori the inhabitants were found by Lesson and Duperrey to be quiet and inoffensive. Not a single Malay, or Bugis, or Ceramense settlement exists on N. Guinea though several are scattered over the outlying islands; the principal being at Salwatty, a large island, forming the apparent north-west extremity of New Guinea, from which it is separated by a very narrow strait. The statement often found on maps that New Guinea is "inhabited by Papuans and Malays," is therefore incorrect. The whole northern peninsula of New Guinea, as well as the islands of Wagiu, Salwatty and Balauta, are exceedingly rugged and mountainous. There is a continued succession of jagged and angular ranges of hills, and everywhere behind them, ridge beyond ridge stretch far away into the interior. Over the whole country spreads an unvarying forest, of a somewhat stunted appearance, broken only by the very widely-scattered clearings of the natives on the lower slopes. Near Dori the loftier mountains retire a little backward, and seem to reach their greatest altitude in the Arfak range, which the officers of the Coquille ascertained to have an elevation of 9,500 feet. Dori harbour, or bay, is formed by a long, low promontory, curving round towards the Arfak range, which rises abruptly from the opposite side of the bay. Towards the extremity of this promontory is situated the village of Dori, and opposite, at about a mile, is the inhabited island of Mansinam, and a smaller one uninhabited. The inhabitants of Dori live always on the coast, or more properly in the sea, as they always build their houses at or below low water-mark, raised on posts, and reached by a rough and tottering causeway from the beach. The natives of the interior do not differ perceptibly in physical character, but have a distinct language, and are called "Arfaki" by the Dori people. Their houses are very similar, but are raised 12 or 15 feet high, on a perfect forest of thin poles, a few of which are put diagonally, and prevent

the whole from falling with the first wind. The people of Dori are fishers and traders, the Arfaki are agriculturists. The former catch turtle and tripang, which they sell for beads, knives and cloth, and purchase of the Arfaki their rice and yams, plantains and bread-fruits and numbers of tame cockatoos and lorries, which they sell again to the Ternate and Tidore traders. All these natives have the characters of the Papuan race very strongly marked; the flat forehead, heavy brows, and large nose, with the apex bent downwards; are almost universal, as well as the harsh curly hair, which often forms an enormous stiff mop, and is then highly esteemed. It has, in fact, a very grand and imposing effect. The colour of the skin varies greatly. In general it is a dirty black, or sooty colour, but varies to a fine brown which is often quite as light as that of the pure Malay races. In mental and moral characteristics the Papuans differ remarkably from the Malay races. They are much more impulsive, and do not conceal their emotions and passions. They are inquisitive, talk much and loudly, and laugh boisterously; reminding one of the negro character, as much as of the negro form and aspect. The natives of Dori are not to be trusted in anything where payment is concerned. If they do not actually steal, it is only from fear of consequences. They are, however, not a fair sample of the New Guinea tribes, having been too much in contact with the lowest class of mahomedan traders with whom they find it necessary to take every advantage in self-defence. They possess the rude artistic genius of so many of the Oceanic tribes, decorating their household utensils and the prows of their canoes with elaborate carving, and the posts of their council-house with obscene caryotides. The language of the Dori people resembles that of the Aru and Ke islands in containing a large number of monosyllabic words, as well as others excessively polysyllabic, offering a remarkable contrast to the striking dissyllabic character of the whole Malayan group of languages. The principal article of trade on the northern coast of New Guinea is a fragrant aromatic bark, called mussoey, which is carried to Java where the natives extract an oil of great reputed efficacy as a remedy for various disorders. This is obtained only at one locality, Wandammen, deep in the great bay. Besides this, tortoise-shell is an important article of trade, with a small quantity of beche-de-mer and sago.

Adi or *Ai* Island, near New Guinea, is the Pulo Adi of the Malays, Wessels Eylandt of the Dutch, and is in lat. 4° 19' S., long. 143° 47' E., (East Point). Pulo Adi is separated from the large island of which Cape Katemoun forms the S. W. extremity, by a straight 8 miles wide,

which seems to be full of dangers, and should only be ventured upon with the greatest caution.

Modera is about 25 miles in length lying to the N. N. E. of the great Ke, distant about 60 miles, and is the south-westernmost of a group of high islands which, until lately, were considered as forming a part of New Guinea. The inhabitants are Papuans, and as they do not bear a high character among their neighbours, they are rarely visited except by traders from Goram and Ceram Laut, who have found means to conciliate them. The sea is unfathomable at a short distance from the island, but there are several indifferent anchorages on the north side. No vessel should attempt to visit the island for purposes of trade without previously obtaining a pilot at Goram, who will also act as interpreter, the natives not being acquainted with the Malayan language. Wild nutmegs, trepang and tortoise-shell are to be obtained here, but not in sufficient quantities to tempt a European vessel to visit the island for purposes of trade, particularly as these articles can be obtained more readily at some of the adjacent ports of New Guinea. Red calico, parang or chopping knives, coarse cotton shawls and handkerchiefs, with iron, Java tobacco, muskets and gun-powder, are the principal articles in demand. The chief traffic is in slaves which are distributed among the neighbouring islands of the Archipelago, and are sometimes carried as far as Bali and Celebes. This probably accounts for the deficiency of other articles of export.

Aiou or Yowl, is a group of islands situated about 70 miles W. N. W. from the Cape of Good Hope, on the west coast of New Guinea, and 30 miles N. E. from the island of Waygion in the Gillolo passage. The group consists of circular low isles, 16 in number. The largest lies in about lat. $0^{\circ} 25' N.$, long. $131^{\circ} 0' E.$ The group is surrounded by an extensive coral reef, nearly a degree in circumference, the south-western portion of which is separated from the main reef by a narrow, but deep channel. *Aiou-Baba*, the largest of the group, lies on this detached portion of the reef and is about 7 miles round and 500 feet in elevation. The north-eastern or larger reef, which contains the islands of Abdon and Konibar, with several coral islets, is said to have an opening on the N. W. side which admits large vessels within the reef, but if this be the case, the harbour is not frequented, there being no temptation in the way of refreshments to induce large vessels to put in there. The inhabitants, who are Papuans, are few in number and occupy themselves almost exclusively in fishing and in catching turtle, with which the lagoons within the reef abound. The chief exports are tortoise-shell of good quality, which is obtained here in large quantities, and trepang. These

are purchased by Chinese and sometimes European traders from Ternate, in Moluccas, the ruler of which place assumes supreme authority over all those parts of the coast of New Guinea which his subjects have been in the habit of visiting for purposes of trade. The traders to *Aiou* all employ small vessels, which alone are adapted for going within the reef of *Aiou-Baba*, their chief resort. They bring red and white calicoes, thick brass wire, old clothes, glass beads, and all sorts of ornamental finery which the Negroes of New Guinea delight in as much as those of Africa. The natives are tolerably friendly to strangers, but must not be trusted too much, as they are inclined to be treacherous and revengeful, which is the case, indeed, with all the Papuan tribes. A vessel visiting these islands for purposes of trade should always be provided with a native of Ternate or Tidore to act as pilot and interpreter.

Ansus island is inhabited by Papuans. Their houses, built on posts, are placed entirely in the water. At very low water only is the beach partially uncovered. This beach consists of mud, in which the mangroves grow luxuriantly and completely obstruct a landing. The gardens, from this cause, are situated on the surrounding islands, principally on an island with a high beach lying opposite to the kampong. The *Ansus* Papuans wear their hair in tufts. Their appearance is good-natured, faces regular, eyes beautifully black, the mouth broad with beautiful regular teeth, and the forehead high but narrow. Many have thin lips and finely curved noses, which give them a more European physiognomy. The men are generally handsome and well-formed, stout, without being too thick, strong and muscular; the women very good-looking; and some children with very regular soft faces, and long pendant curling hair.

The *Arru* group of islands is situated on the northern verge of the Great Australian bank, and extends from N. to S. about 100 miles; but as the eastern side of the group has not been explored, its limits in that direction are uncertain. Some of the southern islands are of considerable extent, but those to the north, lying close to the edge of the bank, are rarely more than 5 or 6 miles in circumference. The land is low, being only a few feet above the level of the sea, except in spots where patches of rock rise to the height of 20 feet, but the lofty trees which cover the face of the country give to it the appearance of being much more elevated. Coral reefs extend from the shores of all the islands, and in the eastern parts of the group these are often of great extent. The islands are divided from each other by narrow channels, some of which are of great depth, and in one of these there is said to be a whirlpool of so formidable a description

that the natives will not venture to approach it even in their larger vessels. Upon the whole, it is evident that this group has not been left quite untouched by the convulsion which has shaken its neighbours, a circumstance that might naturally be expected from its position on the very edge of the bank, and in the close vicinity of the volcanic chain, the Great Ki Island being only 60 miles distant.

Brumer Island is on the south coast of New Guinea, the women are tattooed on the face, arms, and front of the body, but generally not on the back, in vertical stripes less than an inch apart, and connected by zigzag markings. On the face, these are more complicated, and on the forearm and wrist they are frequently so elaborate as to resemble lace-work. The men are more rarely tattooed, and then only with a few lines or stars, on the right breast. Sometimes, however, the markings consisted of a double series of large stars and dots stretching from the shoulder to the pit of the stomach. In the great Island of New Guinea, with its savage negro population, and with the same deficiencies, the presence of any kind of writing is not reasonably to be looked for.—*Earl's Papuan*, pp. 40, 71, 121, 131; *Mr. Logan, in Jour. Ind. Arch.*, p. 321; *Wallace, Vol. ii*, p. 62; *Crawford's Malay Gram. and Dic.*, Vol. i, p. 143; *Bikmore*, p. 204; *McGillivray's Voyage of the Rattlesnake*, Vol. i, p. 262; *Lubbock's Orig. of Civil.*, p. 44; *Notes of a Voyage to New Guinea*, by Alfred R. Wallace, Esq., F. R. G. S., in *Journal of the Royal Geographical Society*, Vol. xxx, pp. 172 to 174; *Horsburg, Wallace's Archipelago*, ii, 62, 180-200; *Journ. Ind. Arch.* June 1852, pp. 330-3. See Aheta, birds, India, Negrito, Negro races, Negros, Pitt Strait.

NEW HEBRIDES. In Tana, the colour of the native skins is a shiny black, and their bodies covered thinly with hair, or a kind of down. Some have black or brown crisp hair; but that of the greater number is twisted and tied up into an immense number of thin cords, the ends being frizzled out, about two inches from the extremity, where the colour is a sandy-red. The nose is generally rather flat, and the eyes of a chocolate colour; the ears of almost all being pierced, and flat rings of tortoise-shell and other trinkets hanging from them. They wear universally the wrapper, the end of it being, in many cases, tied up by a narrow band of some kind of plait, passing round the hips, and producing a much stronger effect of indecency, according to our notions, than the total absence of clothing would have done; the more so, that this strange garment serves as a pocket, wherein to deposit a pipe, piece of tobacco, or any such article that they may obtain by traffic. Several women were

seen fishing on the reefs which line the eastern side of the bay; and they were dressed in a petticoat reaching to the knees. The features of the men would not be disagreeable, but for the common custom of daubing their faces with black-lead, to which a thick plastering of red ochrous earth was generally added. The *Conus textilis*, *Linn.*, found at Aneiteum, of the New Hebrides, bites and injects a poisonous acrid fluid into the wound, occasioning the part to swell, and often endangering life.—*Captain Elphinstone Erskine, Islands of the Western Pacific*, p. 306.

NEW IRELAND. Captain Keppel mentions that the water, where he anchored, was so beautifully clear, that in forty fathoms deep the coral shells, and seaweed growing at the bottom could be distinctly seen, and give it all the appearance of a beautiful submarine garden.—*Keppel's Ind. Arch.*, Vol. ii, p. 208.

NEWSPAPER PRESS, the first English newspaper was published at Calcutta on the 29th January 1780. There are now several hundred newspapers printed in British India, in the European and many of the vernacular tongues.

NEW TESTAMENT, a sacred book of the christians.

NEWUJ, a river near Bhopalpoor in Rajgurrh.

NEW ZEALAND, in the South Pacific Ocean, between Australia and N. America, consists of two large and several small islands lying between L. $34\frac{1}{2}$ and $47\frac{1}{2}$ S., and L. $166\frac{1}{2}$ and $178\frac{3}{4}$ E., is 800 miles long from North to South and 120 miles broad, with an area of 99,969 English square miles=4,703 German square miles. It was discovered towards the close of the 18th century by Captain Cook, a British navigator. Its two chief Straits are named after Cook and Foveaux. The first human inhabitants of New Zealand were the ancestors of the Maori. Two races of human beings, a brown and a black-skinned, inhabit the islands scattered over the Pacific Ocean. The brown race occupy all the islands from the Sandwich group in the northern hemisphere to New Zealand in the southern, and from the Tonga group in the west to Easter Island in the east. The black race people occupy the islands extending from the Fijee to New Guinea both inclusive. Certain physical features distinguish each race. Those with brown complexions have generally lank hair and scanty beards, and speak essentially the same tongue, although divided into many dialects; while the black race, numbering several varieties of men and speaking several distinct languages, have frizzly but not woolly hair, and abundant beards. French naturalists call the islands which the black race occupy Melanesia, or the islands of black men, while

Polynesia is applied to the islands peopled by the brown race. Intermixture has occurred between the black and brown races at their points of junction; 300 miles across the trade wind, from the Fejee islands to the Tonga islands, being a voyage of no difficulty to a maritime people. The Polynesians, or brown-skinned race, have been again subdivided into Micronesians and Polynesians proper. The former occupy the Pelew, Caroline, Marianne, and Tarawa islands, and the latter the Sandwich, Navigators, Marquesas, Tonga, Society islands, the Dangerous Archipelago, Easter island, and New Zealand. The Micronesians are distinguished from the Polynesians proper by their low stature, their language, Mongolian conformation, and absence of the system of Tapu or Tabu. Between the Micronesians and the Polynesians proper there is as much difference as there is between Dutchmen and Englishmen. Ethnologists have clearly established that the Polynesians proper are sprung from the Malay family of the human race, and Mr. Hale, the best authority on the migrations of the Polynesians, is of opinion that the Samoa or Navigator's islands were first occupied, and that from them all the other Polynesian islands were peopled. For ages Malay fleets have habitually resorted to Australia, and at the present day 200 Malay proas according to Captain King, annually frequent the northern coasts of that continent to fish. For, although ignorant of the compass, the Polynesians have names for the cardinal points, and steer by the stars. It was this grand principle of selecting a course which brought the Malay fleet to Navigator's islands. From the Malay and Polynesian custom of giving new places similar names to those from which they came, evidence is furnished that the Malay route to Polynesia just given is the correct one. New South Wales and New Zealand derive their civilized names from a modification of this law. It will be observed that several places in the Indian Archipelago have analogous names to Samoa or Savii, the Polynesian name of the Navigator's islands, Sama in Malay signifies "like as," Samoa, "all together." Thus in close proximity to Timor, there is a small island called Samoa; the southern extremity of Timor is called Sammow, and there is a Sumbava, Sama, Java, and other names in the Archipelago resembling Samoa in sound. Even the birthplace of the Malays, Sumatra, the derivation of which term is unknown, cannot fail to strike both the eye and the ear. From the remains of some Hindoo and Jewish customs among the New Zealand branch of the Polynesian race, and the entire absence of anything like mahomedan customs, it is inferred that the Malay migration from the Indian Archipelago to Polynesia took place

after the hindoo influence began to prevail there, and before the arrival of the mahomedan traders and settlers from Arabia. Indian colonies were established in Java in the first century after Christ. According to Javanese annals, the first arrival of the hindoos in the Indian Archipelago from Western India occurred about A. D. 800, and the mahomedans tradition to the Archipelago began in A. D. 1278. The date of the last migration is probably correct, that of the hindoos being more distant is uncertain. From these two great events, it is inferred that the Malay ancestors of the Polynesians left the Indian Archipelago soon after the commencement of the christian era. No light is thrown on the origin of the New Zealanders from the name Maori which they call themselves. This word, rendered by linguists "native," is used in contra-distinction to pakeha, or stranger. But the Rev. Mr. Maunsell thinks the New Zealanders have sprung from different islands, in consequence of three lingual peculiarities. The Ngapuhi nation, living in the neighbourhood of the bay of islands, pronounce *h* as if it were *sh*, and Hongi is rendered by them Shongi. The Taranaki natives do not pronounce the *h* at all, but supply its place by a curious jerk in the voice; *hei* becomes *ei*, and *hohoro*, *orra* in their mouths. Some tribes in the Bay of Plenty do not give *Ng* the singular nasal sound of good Maori linguists, and in its place use *Na*. The physical form of the Polynesians, to whom the name of New Zealanders can now be given is as follows. In stature they almost equal Englishmen, and they are taller than the inhabitants of the temperate countries of the continent of Europe, the average height of the male sex being five feet six inches and a quarter. Chiefs by birth are not taller than free-born men, but they are taller and better developed than slaves. The tallest New Zealander seen was six feet five inches and a half. In bodily weight and girth of chest New Zealanders are equal to Englishmen; ten stone avoirdupois being their average weight without clothes. Their bodily shape is peculiar, and this peculiarity consists in having longer bodies and longer arms with shorter legs than Englishmen of similar stature. The lengthening of the arms occurs in the fore-arms, and the shortening of the legs in the bones below the knee, the leg bones of New Zealanders are indeed an inch and a half shorter than these bones are in Englishmen. Their long bodies are produced by the size of the spinal bones and the cartilages between these bones. The inferior extremities of New Zealanders are stout, but in consequence of the shortening below the knee, the calves of their legs look unusually high up; and in walking they turn in their toes, take shorter

steps, and move in narrower paths than Englishmen. The feet of the New Zealanders are short and broad, and the arch of the foot is often badly developed; their hands are small and tapering. The head-hair is abundant and generally black, but some have hair with a rusty-red tinge. This red tinge, which is likewise found in the head-hair of other Polynesian races, has been ascribed to the use of alkaline washes, but such is not the case among the New Zealanders. A few have lank head-hair, a few frizzly, but the majority have dark hair with a slight wave in it. The head-hair looks coarse, but when washed, oiled, and brushed, it assumes a raven darkness and a downy softness. Their beards and whiskers, since the custom of extracting the hair has fallen into disuse, are occasionally considerable; but on the trunk it is scanty, and they look with wonder at the hairy frames of Englishmen. Few New Zealanders become bald, although many are grey. Like all people living in a simple state, the New Zealanders have good teeth. The nose is short and broad, with an imperfect bridge, but there are some good noses, and many Rotorua natives possess a Jewish style of features. The skin is of an olive-brown colour, not unlike a seasoned filbert, but it has many shades, some New Zealanders being so fair that blushes can be detected on their faces, while others are so dark that the tattoo marks are seen with difficulty. The white parts of New Zealanders' eyes less clear than those parts are in Englishmen; the pupil is dark and large, the iris is brown, never blue, even half-castes rarely have blue eyes, although the progeny of half-castes and Europeans have blue eyes frequently. The mouth is coarse, the face broad, and the upper lip long. The forehead is high, narrow, retreating, and pyramidal; the skin is cool, and the circulation of the blood is slower than in Englishmen. The size and darkness of the eyes of New Zealanders give to their countenances an air of gravity. In youth the expression is generally open and happy; in middle age sleepy, morose, and thoughtful; while in the old this last expression almost amounts to sadness. From want of intellectual cultivation, there is not much individuality of features, and the soul's emotions are but slightly reflected in their faces. Travellers have perceived a peculiar and distinctive odour among different races of men. Chinese houses are redolent of musk, hindoo towns of garlic, and New Zealand huts are characterised by the smell of dried fish. The females are less handsome than the males, although the young are invariably pleasing. The women have very long eyelashes, and the habit girls have got of casting them, as if from lassitude, over the bright restless eyes,

throws into their faces an indescribable mildness, while their soft voices give a peculiar sweetness to their language. There is, indeed, a pathos about their voices when speaking, a plaintive pathos when allusions are made to persons dear to them, and an indifference and ease of manner unknown among many other races, which are alike charming to hear and pleasant to see. The New Zealanders are a mixed race, and may be divided into brown, reddish, and black. Out of a hundred persons eighty-seven have brown skins, with black, straight, and waving hair: ten have reddish-brown skins, with short frizzly, or long straight hair, having a rusty-red tinge in it; and three have black skins with dark frizzly hair, which does not, however, spread over the head as in negroes, but grows in tufts which if allowed to join, twist round each other and form spiral ringlets. Among some tribes the black and reddish men are more numerous than among others. Chiefs are generally brown-coloured, occasionally reddish, rarely black. Every tribe, however, comprises the three varieties, all speak the same language, and all arrived in New Zealand at the same time. Crozet accounted for this mixture of men, by supposing that New Zealand was formerly inhabited by a black race similar to the Australians, but there is not a tittle of evidence to support this opinion. Most races of men have endeavoured to improve the human body by disfiguring it, in which art the New Zealanders have out-stripped all others. First among the New Zealand list of disfigurements is tattooing, a Polynesian word signifying a repetition of taps, but which term is unknown in the language of the New Zealanders; moko being the general term for the tattooing on the face, and whakairo for that on the body. Tattooing is the most ancient personal disfigurement on record, and it is likewise the most universal. Dampier in 1691 brought to England the first tattooed south Sea islander, a man who was well-known in London as the painted prince, at which place he died of small-pox. The present generation of male New Zealanders tattoo their faces, hips, and thighs; and the women their lips, chins, eyelids, and occasionally straight lines, the offspring of each woman's fancy, are drawn on their bodies. Every line has a name, and among distant tribes the tattoo marks are alike, although the figures tattooed are not made up of the same number of lines. And among the New Zealanders it is a mark of rank to have the streaks of a fish carefully cut on their bodies. The New Zealanders dislike, as much as eastern nations glory in, hairy faces; and consequently the hair was eradicated from various parts of their bodies with the aid of shell pincers, beards on tattooed faces are not picturesque, and the proverb of "no wife

for the hairy man," made young men carefully pull out every indication of beard or whisker. Its tertiary strata contain remains of the giant bird the Moa, and the genus *Dinornis*, and *Palapteryx*. It has coal, gold, copper, iron, chrome ore and graphite. It is remarkable for its wingless birds, of the *Apteryx* species. Earthquakes are frequent, especially in the volcanic line between Tongariro and White Island, where on lake Tarawera, not a single month passes without at least one slight shock. The root of *Pteris esculenta*, formerly formed the chief aliment of the New Zealand natives. The Kauri (*Dammara australis*); the Kahikatea (*Podocarpus dacrydioides*) and the black birch, the Tawai (*Fagus fusca*) are the chief forests, but mixed with them are the following trees;

Podocarpus totara or totara.
" *spicata* or matai.
Dacrydium cupressinum or Rimu.
Phyllocladus trichomanoides or tanekaha,
Knightia excelsa or Rewarewa.
Elæocarpus hinau, the Hinau.
Edwardsia microphylla, the Kowai.
Dammara australis.
Dacrydium cupressinum or Rimu.
Podocarpus dacrydioides, and *P. ferruginea*.
Metrosideros robusta.
" *tomentosa*.
Vitex littoralis.
Hartighsea spectabilis.
Knightia excelsa.
Mira salicifolia.

Amongst the largest forest trees are *Metrosideros robusta* or Rata, the trunk of which frequently measures 40 feet in circumference; the Kahikatea (*Leptospermum*), Tawa (*Laurus*) Pukatea (*Laurelia*), Karika (*Corinocarpus*). The *Dammara australis* furnishes the best ships' masts, and spars, and its gum is largely exported, its timber to the value of £34,376 and its gum to £20,776. The oldest trunks attain a diameter of 15 feet, a height of 100 feet to the lowest branches and 150 to 180 feet to the crown, trees of 60 to 80 feet to the crown are probably 250 to 300 years old. The New Zealand flax or *Phormium tenax*, is a flag-like plant. The blossoms contain a sweet honey juice, and each plant will produce nearly half a pint. At the root of the leaves is a semi-liquid gum-like substance which serves for sealing wax and glue. Its relative tenacity is.

European hemp, 11.	New Zealand flax, 23.
" flax, 16.	Silk, 34.

The best part of the leaf furnishes the flax, by water steeping, drying, braked, singled, and combed.

The wingless birds *Apteryx australis* and *A. mantelli*, *A. owenii* and *A. maxima* occur. The *Dinornis giganteus* now extinct, was about 9½ feet high, and the *D. elephantopus*. The *Palapteryx ingens*, 6½ feet high. The people are known as Maori and are about 45,000, but

are rapidly diminishing in number. They are of the Melanesian or Papuan race.

Captain Elphinstone Erskine heard it asserted that there did not exist in 1845 many New Zealand males of twenty years of age who had not, in their childhood, tasted of human flesh. In New Zealand the natives produce a most brilliant blue-black dye from the bark of the Eno tree, which is in great abundance. Some of the borders of the native mats, of a most magnificent black, are dyed with this substance. It has been tried in New South Wales; but, although found well suited for flax, hemp, linen, or other vegetable productions, it could not be fixed on wools or animal matter. It is of great importance that chemical science should be applied to devise some means of fixing this valuable dye on wool. As the tree is so common, the bark could be had in any quantity at about £3 10s. a ton; and tweed manufacturers are in great want of a black dye for their check and other cloths.—*Captain Elphinstone Erskine Islands of the Western Pacific*, p. 275; *Thomson's Story of New Zealand*, Vol. i, pp. 51-78; *Humboldt's Dissertation on the language of Java*; *Latham*; *Pritchard*; *Williams*; *Von-Hochstetter's New Zealand*; *Ethnology and Physiology of the United States Exploring Expedition from 1838 to 1842*, by *Horatio Hale*, Philadelphia, 1840.

NGA-DJU, the name of the inhabitants on the Kahayan or Dyak river in Borneo.

NGANNAM, a name of Anam or Annam.

NGAN-TSOING-SHA, BURM. A bast of Arracan. See Linden.

NGARI, a territory which embraces the whole of the upper valley of the Sutlej, from the Manasarovara lake to the crest of the Porghal mountain. See Gnari, India, Nari, Shawl-goat.

NGA THIN-GYEE, BURM. *Ficus cordifolia*.

NGA YOUK THI, BURM. *Capsicum*.

NG-HYET-PRA, BURM. *Plantains*.

NGOO-BENG, BURM. In Tavoy, a strong wood used for posts and planking.—*Dr. Wallich*.

NGOO-THA, BURM. *Cassia* species.

NGU-SI, BURM. *Cassia lignea*.

NGY-SOUNG-THA, BURM. A Tenasserim wood of maximum girth 3½ cubits and maximum length 22 feet. Abundant all over the provinces. When seasoned it floats in water. It is a wood of no durability or strength; splits

readily, with a short grain, and is only fit for firewood.—*Captain Dance*.

NHAN,—? *Sesamum orientale*.

NHARUI. Lieutenant Pottinger states that the races occupying Baluchistan are divided into two great classes, severally known by the appellation of Belooch and Brahui, and that these again are sub-divided into an infinite number of tribes, who take their names from the chief under whom they serve, the district or country to which they belong, or the traditions whence they derive their descent. The Beloochee partakes considerably of the idiom of the Persian and at least one-half of its words are borrowed from that language, but greatly disguised under a corrupt and unaccountable pronunciation. The Brahuiki, on the contrary, is so dissimilar in its sound and formation, that he did not recollect to have marked in it a single expression in any way approaching to the idiom of the Persian. It contains a portion of ancient hindoo words. The contour of the people of these two classes is as unlike, in most instances, as their languages, provided they be descendants of a regular succession of ancestors of either; but the frequent inter-marriages which take place amongst them have tended in some degrees to blend together the peculiar characteristics of both, that in many families, and even whole tribes, they have ceased to exist. The Beloochee branch, in the first instance, from the original class of that name, into three principal tribes, called Nharooi, Rindi and Mughsee. The Nharooi, principally inhabit that portion of Beluchistan, which lies to the westward of the desert, and there are likewise khels of them at Nooshky and in Seistan. See Beluchistan, Kelat, India, Wooshky.

NHIATRANG BAY, on the coast of Cochin China, is large, there are a river and town of same name, where silk is manufactured.

NIALA NEMIKI, TEL. *Sypheotides auritus*, *Latham*.

NIALA, or Nialo, HIND. *Polygonum tortuosum*.

NIAMCHO, HIND. *Astragalus*, *sp.*

NICANOR, Lieutenant of Antigonus, (305, B. C.) seized the whole of Media, Parthia, Asia and all the countries as far as the Indus. See Afghanistan, Greek, Asia, Kabul.

NICATOR, see Greeks of Asia.

NICHI HAMA, see *Suhoyum*.

NICHNI, HIND. *Rhododendron anthopogon*.

NICHOLSON, Dr., Bombay Medical Service, wrote an account of the Kooree, or Eastern branch of the Indus, showing the probable changes of its course, and the manner in which the old channels have been blocked up, in Bom. Geo. Trans., Vol. vi, 111; Account of the Island of Perim, in Bom. As. Trans., Vol. i, 10. Of the submerged city of Balabhipura, in Lond. As. Trans., 1852.

NICHOLSON, JOHN, a Bengal military officer. He was a Deputy Commissioner in the Punjaub Civil Commission when he was suddenly called upon to assume a high military command in the attacking force. As a Civil Officer, his reputation was of the very highest, he was in every place where he could be of the least possible assistance, and he effectually supervised every official in his district. This extraordinary man had more influence with his subordinates than perhaps any native of Great Britain in the East has ever had. One class of natives actually termed themselves "The Nicholsanee Fakeers." A native speaking of him said, "The sounds of his horse's hoofs were heard from Attock to the Khyber." In an official report of the Punjaub Government, this sentence occurs, "Nature makes but few such men, and the Punjaub is happy to have had

one." Nicholson was employed in the Affghan war of 1838 to 1842, and fell at the re-taking of Delhi.—*Tr. of Hind.*, Vol. ii, p. 368.

NICIAS, see Greeks of Asia.

NICKEL, a brilliant white metal resembling silver: ductile and malleable, and capable of receiving a high polish. It is usually procured from speise, a compound of the metal with arsenic, found associated with cobalt in Germany. Alloyed with copper, it forms argentane or German silver; and is besides used in making mariner's compasses, and for other purposes. Nickel and cobalt, occur near Safragam, in Ceylon.—*Waterston; Faulkner.*

NICOBAR ISLANDS lie between 6° 50' and 9° 20' North latitude, and 92° 50' and 94° 10' East longitude. The group consists of nine smaller islands and some smaller ones. The most southern are called respectively Great and Little Nicobar. The island is more than 2 miles long and 8 across in the widest part. The Danes formed a settlement on this group in 1756, but abandoned it 12 years after. In 1864, Captain Steem Bille, the Commander of a Danish Corvette, having reported to his Government the present unhealthy state of these nominal possessions of the Danish crown, and the great expense which would attend any attempts to make them inhabited by Europeans, His Danish Majesty came to the determination of finally abandoning all right to the islands. The Officiating Superintendent of Marine, in his letter to Government, dated the 13th January states that Mr. Mackey speaks very favorably of the Nicobars as a field for colonization, and is of opinion, that if the jungle were cleared away, and other sanitary measures adopted, the Nicobars would become as healthy as Penang; an opinion in which the Officiating Superintendent adds, he has every reason to concur. The surface of these islands is hilly. At the southern harbour of Great Nicobar, the nearest hill on being measured was found to be 1,575 feet above the level of the sea. There were others in the interior, of a greater height. In Little Nicobar, some of the hills are supposed to be about 1,000 or 1,200 feet above the sea-level. The island of Bompoka rises abruptly from the beach to the height of 750 feet. Pulo Cobra is a small high island, bristling with cocoanut and betel-nut trees. Little is known of the interior of these islands. At Great and Little Nicobar "not a cleared spot is to be seen, except here and there a slip of land. A large quantity of coal was obtained from the natives of Little Nicobar, also on Trice Island, at low-water. Lignite or half-charred wood when burned emitted a strong sulphurous vapor. Coal was also found at Busch Island, at Pulo Condul, on the north-east side of Great Nicobar, and

at the southern bay of the same island. The coal, though collected in various parts of the Nicobars, seemed to be very much alike in their nature, though differing a little in appearance. They burn with little flame. They seem to bear both in appearance and chemical properties, a near resemblance to the pitch, or canal coal of the Little Tenasserim river. The amount of the whole population spread or scattered over the Nicobar Archipelago does not exceed the moderate number of 8,000 souls; of whom about 2,000 inhabit Car-nicobar. Theresa had a population of about 500 souls. The Nicobarians are strong and capable of carrying very heavy burdens, some of them carrying without any trouble 200 cocoanuts. The language used is polysyllabic, abounds in vowels, and its pronunciation is harsh and far from harmonious. The chief food is the pulp of the cocoanut, yams, plantains, papayas, fowls, and above all pigs, which abound in those islands. It is not uncommon to see round a single hut, 40, 50, or 60 of them. The quantity of pigs killed and eaten is almost incredible. The Nicobarians, though voracious, separate the grease from the flesh, and keep it separately for culinary purposes; they never eat, or rather devour any part but the flesh, and that for a single festival day. There was seen and counted 75 large pigs killed for satiating the wolf-like appetite of the inhabitants of an inconsiderable district of Theresa Island. In this respect, the Chinese could not be a match for the Nicobarians. The Nicobar Islands are called by the Malays, the Sambilang or Nine Islands. Eight or nine of them are of considerable size, the others, nine or ten in number, generally small. They extend N. N. W. and S. S. E. about 53 leagues; having several safe channels between them. They are unhealthy to Europeans, who are subject there to attacks of remittent fevers. Car Nicobar, is the most northern of the group. Its centre is covered with long grass. The names of the other islands are Batty, Malve, Chowry, Theresa, Bompoka, Katchae, Nancowry, Canmorta, Trincuttee, Tillangching, Sombreiro, Meroe, Little Nicobar Island and Great Nicobar Island. The people are described as having a dark skin, the sclerotic coat of the eye, yellow; flat faces, and scanty beards. Their chief aliment consisting in hogs, poultry and cocoanuts. They worship the Ividi or genii of the hills and woods, and their priests are called Malain. The specimens of the languages of Carnicobar and the Nicobar Islands offer dissimilarities. The Nicobar Islanders appear to have been an early colony of the Mon race in its pure or more west Chinese and less Indian condition. They are flatter faced and more oblique eyed than the Rakhoing and Mon, in this resembling

the more sequestered hill tribes of the Burman race. In some islands, they have been much mixed with Malay colonists. Nicobar phonology is allied to that of the Silong and Simang. The Nicobar people, probably migrated from Sumatra, but the interior of Great Nicobar island is occupied by a Negro race. Caloenas Nicobaricus, the Nicobar pigeon is of great size and splendour; its appearance and habits exhibit a near approach to the gallinaceous birds. It lives chiefly on the ground; runs with great swiftness, and flies up into a tree when disturbed. Its nest is of the rude platform construction usual among the pigeon family, one of them was built in a tree about ten feet from the ground and contained a single white egg. The Great and Little Andaman Islands and the Little Cocos, and their dependencies, and the Island of Nancowry, the Islands of Great Nicobar and Car Nicobar, with those lying near them, including Tillanchong, have been created into a Chief Commissionership.—*Selections from the Records of the Govt. of India, Home Dept., No. 25, pp. 66-67; Jour. Ind. Arch., Vol. iii., No. 5, 1849, page 272; Macgillivray's Voyage, Vol. i, page 244; Horsburgh, Latham.* See India, Malacca, Monsoons.

NICOLAIEFF, see Kherson.

NICOLO-DI-CONTI, or in Latin, De Comitibus, a Venetian of noble family, who, when a young man, resided as a merchant in the city of Damascus. In what year he started from thence in his travels to the East, is not precisely known; but it seems to have been about A.D. 1419. He passed through Persia, sailed along the coast of Malabar, visited some parts of the interior of Hindustan, and also the islands of Ceylon, Sumatra and Java. He afterwards went to the south of China; and on his return passed along the coasts of Ethiopia, sailed up the Red Sea, crossed the desert and reached Cairo, where he lost his wife and two children, and returned to Venice in 1444, after twenty-five years' absence: and as a penance for having apostatised to the mahomedan religion, the Pope Eugene IV., required him to relate his adventures to Poggio Bracciolini, the Pope's Secretary, and the original Latin appeared in the fourth book of Poggio's treatise, de Varietate Fortuni, libri quatuor, Paris, 1723. He visited Cambay, Vizianagur, Palgonda, St. Thomé, Ceylon, Sumatra, Tenasserim, Ava, Java, thence to Quilon, Cochin, Calicut, Socotra and homeward.—*Ind. in 15 Cent.*

NICOL PRISMS, see Gums and resins.

NICONOR, see Kabul.

NICOTIANA, a genus of plants belonging to the order Solanaceæ. Loudon has 14 species. Lindley 31, but the following are the better known, and all are recognised tobacco plants; *N. angustifolia, Ruiz & Pav., Chili.*

- N. bonariensis Lehm., Buenos Ayres.*
- N. fruticosa, L. the N., frutescens Cav., India.*
- N. glutinosa, L., of Peru. It is the N. militaris, L. Tabacum viridifolia, Mönch; Sairanthus glutinosus, G. Don.*
- N. multivalvis—? Columbia river.*
- N. nana—? Rocky mountains.*
- N. paniculata, Linn., N. viridiflora of Cav., Peru.*
- N. persica, Lind., Persia; Shiraz tobacco.*
- N. plumbaginifolia, Viv., the N. cerinthoides of Vittm., Rio Grande.*
- N. quadrivalvis, Pursh., N. America, Missouri river.*
- N. repanda—? Cuba, Havannah tobacco.*
- N. rotundifolia, Lindley., Swan river.*
- N. rustica, Linn., Europe, Asia, Africa, America, English tob., Godavery tob., Syrian tob.*
- N. tabacum, Linn., the N. havanensis of Lag., America.*

The genus *Nicotiana* contains about 14 species, most of them yielding tobacco for smoking, and many of them cultivated in the gardens of Europe. The name *Nicotiana* was given these plants after Jean Nicot, of Nîmes, in Lauguedoc, who was an agent of the king of France at Portugal, and there procured the seeds of the tobacco from a Dutchman who had procured them in Florida. Nicot sent them to France in 1560. Tobacco was the name used by the Caribbees for the pipe in which it was smoked, but this word was transferred by the Spaniards to the herb itself. Tobacco leaves when properly dried have a greenish yellow colour, a strong pleasant smell and acrid taste; taken into the stomach, by persons not habituated to its effects, violent vomiting, diarrhæa, and collapse are occasioned. *N. quadrivalvis* has capsules with four valves; it grows near the Missouri River, and is there smoked by the natives. *N. multivalvis* has capsules with many valves; it is cultivated by the Indians on the Columbia River for smoking. It is a fetid plant, and the calyx, the most fetid part, is selected by the Indians for smoking. *N. nana*, a small species of tobacco, is a native among the rocky mountains of North America, and is smoked by the Indians. *N. repanda* is a native of Cuba, and is said to furnish the tobacco for making the small cigars known as Queen's. The *Macuba* tobacco, which grows in Martinique is deemed the finest, and next to it in esteem is the Cuba tobacco. *Nicotiana macrophylla*, or Orinoco Tobacco, is a herbaceous plant, with ovate-acute leaves clasping the stem; throat of corolla inflated, segments short-pointed. The stem rising from 5 to 7 feet high. It is a native of America, and is frequently used for smoking, the milder Havannah cigars are said to be made from it. The Havannah, Persian, Manilla and Maryland tobaccos have been extensively introduced into the Peninsula of India. The English smoke more of the strongest tobacco than any nation in the world. *O'Shaughnessy, p. 471; Eng. Cyc.*

NICOTIANA PERSICA, Shiraz tobacco, is

a herbaceous plant, clothed with clammy down, with the leaves of the root oblong, those of the stem acuminate and sessile; corolla salver-shaped, with a long tube, and rather unequal segments. This tobacco is milder than that produced by the *N. tabacum*, and but a small quantity is consumed in England.—*Eng. Cyc.*

This plant is a native of Europe, Asia, Africa, and America, but grows on the coast of the Mediterranean, and thence finds its way into India, where it is highly valued. It has a herbaceous square stem; with petiolate ovate quite entire leaves; tube of corolla cylindrical, longer than the calyx; segments of the limbs roundish, obtuse. It was the first species that was introduced into England for growth from America. It grows very well in that climate, and in some places is almost naturalised. The tobaccos of Salonica and Latakia, which are much esteemed, appear to be the produce of *N. rustica*. From the extensive range of climate and difference of situation which this plant occupies, its characters suffer considerable change; hence a number of varieties have been described. Dr. Hooker writing of this species, says, to wind up the feast, we had pipes of excellent mild yellow Chinese tobacco called "Tseang," made from *Nicotiana rustica*, which is cultivated in East Tibet and, according to M. M. Huo and Gabet in West China. It resembles in flavour the finest Syrian tobacco, and is most agreeable when the smoke is passed through the nose. Under various names, it is cultivated at many other places in the Panjab, Multan, Hoshiarpur, Delhi, Hurriana, &c., also in the gangetic Doab, Gudd, &c., it appears to be this species that is grown to some extent in Cooch Bahar, Rungpur, and Assam, *Eng. Cyc.*; Dr. J. L. Stewart, M.D.; *Punjab Plants*; Hooker *Himm. Journal*.

This species is said to have been imported from England in the time of Akbar. It is a herbaceous plant, with acuminate oblong-lanceolate sessile leaves, lower ones decurrent; throat of corolla inflated, segments of the limb pointed. This plant is a native of the West Indies, where

it first became known to the Spaniards, and of Virginia, where the English first became acquainted with its properties. Of the various species it is that which is most commonly cultivated in gardens as an ornament. It is largely cultivated in Europe for the purpose of smoking. It is grown over all the plains of the E. Indies in the Himalaya up to 7,400 feet at least on the Chenab to 11,000 feet. The other species are however in some cases preferred. Schrank has described a large number of varieties of the common tobacco, varying in the size and form of their leaves, as well as the colour and form of their corollas. This species is the one most commonly employed for making tobacco and cigars. Mr. Royle mentions on the authority of the Persian works on *Materia Medica*, that it was introduced into India in A. H. 1014 (A. D. 1605) towards the end of the reign of Jelal-ud-din Akbar padshah. From India tobacco probably found its way to the Malayan peninsula and China, though Royle quotes the authority of Pallas, Loureiro and Rumphius, who think tobacco was used in China at a period anterior to the discovery of the New World. The common tobacco of India (*Nicotiana tabacum*) is much imported into Tibet, where it is called "Tumma," (probably a corruption of the Persian "Tumak'hu,") and is said to fetch the enormous price of 30s. per lb. at Lhasa, which is sixty times its value in India. Rice at Lhasa, when cheap sells at 2s. for 5 lbs.; it is all bought up for rations for the Chinese soldiery.—*Eng. Cyc.*; Drs. Mason, Hooker, *Him. Jour.*, Vol. iv, p. 232.

NICOTRIS, the queen mother of the king of Babylon; she counselled resistance against Cyrus, but after a siege of two years, Cyrus drained the Euphrates into the trenches which he had dug around the city, and his soldiers entered it, through the bed of the river, and opened the gates for the rest of his army, A.D. 504.

NIDAM PAINI, MALEAL. A Malabar tree which means long Paini. It grows to about two feet in diameter, and seventy feet high, and produces a sort of varnish which is used with wood oil for painting wood. The natives use the spars for rafting timber down the rivers, and for the yards of small vessels. It is a wood of little value being neither strong nor durable.—*Edye, Forests of Malabar and Canara*.

NIETNER, a resident in Ceylon, about A. D. 1850, who wrote on the coffee plant and its enemies. He stated that a fungus had done enormous damage in the Ceylon coffee plantations. When a coffee tree is attacked by the bug, it is deprived of its sap and its nourishment, whilst the fungus which never fails to attend on the bug prevents restoration by closing the stomates through which the tree breathes and respire. Bug, he tells us, existed on the estates to an incalculable extent,—none are believed to be quite free from it. Whole estates are seen black with bugs, i. e., with the fungus: and, he asks, “am I wrong in saying that if there was no bug in Ceylon, it would at a rough guess produce 50,000 cwts. of coffee more than it actually does.” The value of this quantity on the spot being about £125,000, this sum represents the aggregate of the annual loss by bug sustained by the Ceylon planters.

NIGAR. Richard Andree gives a very complete view of the spread of anthropophagy in the *Erganzungsblattern*. The motives of this hideous aberration are extremely varied. Besides mere sensual gratification and hunger brought on by the dearth of other animal food, the passions of revenge and hatred, as well as religious precepts and gloomy superstition, play an important part in historical times. Anthropophagy has been gradually disappearing, but in one single instance (that of the Bassuto peo-

ple) the habit had newly arisen, having been previously unknown. Anthropophagy has vanished with the people themselves from among the Iroquois and Algonkin; it has disappeared from among the people of the high plains of Anahuac, the Indians of Peru, and most Brazilian races. It is increasingly circumscribed in the Southern Ocean by the dying out of the cannibal race and the pressure of white settlers. The number of cannibals is still, however, very considerable. The following figures are, of course, only proximately correct, but they afford a stand point from which to take a census of the class:—The Batta of Sumatra, according to Friedman, may be reckoned at 200,000 souls; the cannibals of the Nigar Delta at 100,000; the Fan, according to Fleuriot de Langle, at 80,000; the cave-dwellers of the Bassuto country (about a tenth of the whole population), at 10,000; the Niam-Niam at about 500,000; the Miranha and Mesay, according to Marloy, at 2,000; other South America cannibals at 1,000; the Australian aborigines at 50,000; the Melanesians (without including New Guinea), 1,000,000. This calculation gives a total at the present of 1,943,000 human beings addicted to anthropophagy, a number in no degree exaggerated, but which actually represents the 690th part of the whole population of our planet, or 0.14 per cent. A native paper of British India in A. D. 1870, stated that a person has been transported for life by the Session Court at Jhansie, on a charge of eating dead human bodies stolen from graves. It is said that he had lived on this fare for a number of years.—*P. M. Gazette*. See Aghora, cannibals.

This is a native of the south of Europe, Egypt, Barbary, and the Caucasus and is extensively cultivated in India. The seeds, resembling coarse gunpowder, are triangular, slightly compressed, obtuse above with oblique bases, rugose, black externally, internally of a greenish white hue. The capsules are polyspermous, oblong, and pointed at the side. The seeds are of strong aromatic odour, and flavour resembling sassafras or cubebs. These properties are due to an essential oil, of which the seeds yield from 5 to 10 per cent. The nigella seeds have been long used in medicine, and were praised by Hippocrates as a tonic condiment. At present they are chiefly employed by the

native Hakim and Baida, as aromatic adjuncts to purgative or bitter remedies. In Bengal they are given to nurses, in the belief that they increase the secretion of milk, and facts tend to corroborate that opinion. In eruptions of the skin, the seeds reduced to powder and mixed with sesamum oil, are much used as an external application. The seed will seldom be prescribed in substance. The tincture is a useful, warm stimulant, and may be added conveniently to numerous draughts and mixtures intended for other purposes. The popular mode of giving the nigella to nurses is by mixing the powdered seed with curry, to which however it communicates a very heavy and disagreeable flavour. The price of the seed in the bazaars is from one to two annas the seer = 2 lbs. avoirdupois. The tincture of it is stimulant and diaphoretic. Dose, half a fluid drachm to two drachms. To prevent injury to furs, feathers, books, papers and clothes that are lodged in trunks, book cases, &c.; it is useful to place along with them small packets of camphor; or little cups of camphor dissolved in alcohol; packets of *Nigella sativa*, the "kala jira" of the bazaars: pieces of the roots of the *Aconitum ferox*, the dreadful "bish;" "Ati Singeea bish," or bishnak of the bazaars, may also be used, but its highly poisonous effects on animal life, require its use to be had recourse to with the greatest precaution. Cups of carbolic acid are useful. The oil from *N. sativa* seeds, is a clear and colourless but rather viscid oil. It is employed principally as a medicine. It is called jungle jeerah oil in Mysore.—*O'Shaugh.* p. 164; *Beng. Phar.*, p. 430.

NIGHT OF POWER amongst hindoos, the 7th night, of the 7th month, of the 77th year, of a man's age, is termed Bhimaratri, or Night of Power! and is considered the end of his natural life. After that, a hindoo is considered exempt from all instituted observances.—*Wils. Gloss.*

NIGHT-BLOWING CEREUS, or Night-flowering Cereus, Eng. *Cereus glandiflorus*.

NIGHTINGALE. Dr. J. D. Hooker, in his Himalayan Journal, twice notices "the Nightingale," as having been heard by him; but at a time of the year at which no real nightingale ever sings. The true nightingale regularly ceases to sing, somewhat abruptly, about the beginning of the month of June, and this alike whether it has young to tend in the wild state, or when confined in a cage; and captive nightingales re-commence their song, if in health and vigour, about January, and continue in full song for two months or more before their wild brethren arrive from their southern haunts. This bird never sings out of season. Dr. Hooker's "nightingale" refers to some other bird, and most probably to the Shama. "On the 4th October," he remarks, "I heard the nightingale for the first time in the season;" and when at Pemiongechi (a former capital of Sikhim), in January, he notices that "nightingales warble deliciously night and morning, which rather surprised us, as the minimum thermometer fell to 28°, and the ground next day was covered with hoar frost. These birds migrate hither in October and November, lingering in the Himalayan valleys till the cold of early spring drives them further south to the plains of India, whence they return north in March and April." But among the numerous collections of Sikhim birds examined, no specimen of a nightingale has ever occurred: nor is the bird enumerated in Mr. Hodgson's lists of the species inhabiting that region. The *Calliope camtschatkensis*, a delicate little bird much like a nightingale, but with a brilliant ruby-throat, which is not rare in the vicinity of Calcutta during the cold season, arrives "early in April, with the snowfleck, in the Lower Kolyma district" in Northern Siberia, as we are told by Von Wrangell; that is to say, before the last of them have left Bengal: but it is remarkable that this bird has never been seen in the very numerous collections from the Himalaya examined hitherto; though another and non-migratory species of the same genus (*C. pectoralis*), peculiar, so far as known to the Himalaya, is of common occurrence in such collections. It is, however, enumerated in Mr.

Hodgson's list of the birds of Nepal: the *C. camtschatkensis* does not seem to breed extensively on this side of the snow; although the Bengal birds may not have to find their way quite so far as to Northern Siberia to pass the summer. The nightingale of the English residents in Ceylon is the dayal-bird or dial-bird (*Copsychus saularis*). The more sombre plumage of the female which is seldom seen with the male, except during the breeding season has deceived many. The song of this species is rich and sweet, and it frequently imitates the notes of other birds. In habits familiar, it is a common tenant of the gardens, where it pours forth its welcome notes in the afternoon or early morning, and like its rival redbreast, sings a bar, and then waits a short time for another individual to reply.—*Blyth in Indian Field; Adams*.

NIJROW. The natives of Nijrow, who have assumed the name of Tajik, have become better mahomedans than they were in the time of Baber, and their valour and difficult country have generally been sufficient to preserve their independence. They are numerous and well armed, having all muskets. The Pashai families in the vicinity of Nijrow are a distinct community, but on a good understanding with their neighbours. Their largest village is Hishpi, and they are represented as extremely hospitable. Here, as in other valleys, are abundance of mines and caves.—*Masson's Journeys*, Vol. i, p. 222.

NIKAH, AR., HIND., PERS. Marriage, amongst mahomedans, Nikah namah, the marriage certificate. In Arabia, Egypt, and Persia the nikah is the principal marriage ceremony. In India, a marriage confined to the nikah, is deemed disreputable, or it is with some person of inferior rank. In the case of a spinster of equal rank, the shadi or rejoicings lasting for five days put all the religious ceremonial of the

nikah into the shade. The nikah engagement, though inferior to marriage, is still respectable. It is common where the condition of the parties is too unequal to admit of one more public. Nikah and Shadee are often in India used synonymously, as meaning the marriage or the marriage ceremonial of the mahomedans. The Nikah, however, is the form of words used by the Kazee in uniting the couple and the shadee or rejoicings, are all additional, and may be lengthened or curtailed at the will of the relatives. About Delhi, the ceremony of Nikah would appear to be styled "Burat." The Shadee ceremonial in India is generally used only where the bride is a spinster and of equal rank with the husband.—*Malcolm's Central India*, Vol. i, p. 368.

NIKAIA is identified by Genl. Cunningham, with Kabul. The town of that name on the Hydaspes, is identified with Mong.

NILE. The rains from the mountains to the south of Abyssinia, flowing through Meroë,

Ethiopia, and Nubia, reach Egypt in the middle of June, when the Nile begins to rise at Syene. The little plains which fringe its banks through the Thebaid to a greater or less width are first overflowed, and, during the months of August, September and October, the fields in the Delta become a sheet of water, leaving the villages on the raised mounds standing like so many islands in the ocean. Why there was most water in the Nile in the driest season of the year, was a subject of never-ceasing inquiry with the ancient travellers and writers on physics. Thales said that its waters were held back at its mouths by the Etesian winds, which blow from the north during the summer months; and Democritus of Abdera said that these winds carried heavy rain clouds to Ethiopia; whereas the north winds do not begin to blow till the Nile has risen. The Nile begins every year to rise about the middle of June, and continues rising 40 or 50 days; it then falls by degrees, till, in the end of May, next year, it is at the lowest. The causes of its rise are now well known. During the hot months of the year, rain falls every day in Habbesh or Abyssinia, and all that rain-water is collected into the Nile, which, from its entrance into Egypt till it reaches the sea, runs through a wide vale. It does not rise alike high through all Egypt. At Cairo the full height is at least 24 feet above its ordinary level. At Rosetta and Damietta it is only four feet. At Cairo, the Nile being confined to one channel, between high banks, must necessarily rise to a much greater height than nearer the sea, where it is divided into two streams, after running over so much barren ground, and forming so many lakes. The branch upon which Rosetta stands, is only 650 feet broad; and that by Damietta, not more than 100. As soon as the Nile begins to rise, all the canals intended to convey the waters through the country, are shut and cleaned. They are kept shut, however, till the river rise to a certain height which is indicated by the Nilometer in the isle of the Rodda. A shaikh attends for this purpose, by the mikkias, and gives notice, from time to time, of the rising of the river, to a number of poor persons who wait at Fostat for the information, and run instantly to publish it in the streets of Cairo. They return every day to Fostat, at a certain hour, to learn from the shaikh, how many inches the river has risen. And its rise is every day proclaimed in public, till it reaches the fixed height, at which the canals are permitted to be unlocked; the usual tax is then paid for the waters, to the sultan, and a good year expected. The canal at Cairo is first opened, and then, successively, all the other great canals down to the sea. Between the dyke of the canal of Cairo, and the Nile, a pillar of earth

is raised, nearly of the height to which the waters of the rivers are expected to rise. This pillar is called Anes, or the bride, and serves as a sort of Nilometer, for the use of the common people. When the waters enter the canal, this bride is carried away by the current. A like custom, which prevailed among the ancient Egyptians, has subjected them to the imputation of sacrificing every year a virgin to the Nile. Nukta signifies in Arabic, both a drop and the time of the sun's entering the sign of Cancer; at which season, the great rains fall in Abyssinia, which occasion the swelling of the Nile.—*Sharpe's History of Egypt, Vol. i, pp. 4, 401; Niebuhr's Travels, pp. 67-71.* See Iran, Siam, Vishnu.

NILESHWAR, see India.

NIL-GAI, or Nil-gao, HIND. Portax tragocamelus, is one of the largest and most magnificent of known antelopes being upwards of 4 feet high at the shoulder; it resides in the dense forests of India, is a vicious animal, of very uncertain temper, and even when domesticated is both violent and changeable.

The Toda dialect has special affinities with the Tamil, and the Badaga of the same hills have also some dialectic peculiarities. Further north the Koorg mountaineers have their own dialect, the Kodagu. The insular languages of the S. Indian province, or those of Ceylon, the Laccadives and the Maldives, also belong to the Dravidian family. The closely connected Tamil and Malayalam of the south, of which Todava and Kodagu may be considered as sub-dialects, the Telinga of the east, and the central Karnataka, appear to have exterminated or absorbed the numerous continental dialects, of the former existence of which the physical evidence of a multitude of distinct tribes having been scattered over southern India, in its barbarous era, leaves no doubt. That the Dravidian race did not bring with it into India the civilization which the present great southern nations possess, as the Arians certainly did theirs, appears to be little questionable when we consider the antique character and affinities of the dialects of the

Male, Orond, Khond, and Toda, the very archaic and barbarous character of many of the customs of the widely separated tribes which speak them, and, above all, the nature of the relationship of these dialects to those of the civilized nations, which is inconsistent with the hypothesis that the former originated in the metamorphosis of non-Dravidian dialects of rude aboriginal tribes, through the influence of the intrusive and dominant race. The known ethnic facts of all kinds lead us directly to the conclusion that the uncivilized Dravidian-speaking tribes are no other than genuine Dravidians who have, in great measure, escaped the culture which the more exposed tribes have received, and thus preserve a condition of the race certainly not more barbarous than that which characterized it when it first entered.—*Journ. Ind. Arch., No. IV, and April and May, 1853, p. 208.* See India, Neilgherries.

NILUVU PENDALAM, TEL. *Dioscorea alata*, i. e., upright or standing yam from its oblong tubers.—*L.*; *R.* iii, 797; *W. Ic.* 810; *Rheede* vii, 38.

NIMAR is the westernmost district of the Central Provinces of British India. On the east it marches with the Hoshangabad district, the Chhota Tawa, and its tributary the Gangapat to the north and the Guli to the south, marking its boundary almost from point to point; on the north it touches the territories of the ponwar of Dhar and of the maharaja Holkar; and on the west it is bounded throughout by the dominions of Holkar. On the south it meets the Khandesh collectorate of the Bombay presidency and the border of West Berar. The modern district has an area of about 3,340 square miles. Nimar has always been, as it still is, a border land. The aboriginal inhabitants even belong to two distinct divisions—the Bhil and Koli of Western India here meeting the Gond and Kurku of the Eastern Central Provinces. Hindoo sacred literature states that Mahishmati, the modern Maheswar, a city of Prant Nimar (now Holkar's), was the capital of the Haihaya kings. The Haihaya are said to have been expelled by the brahmans, who established the worship of Siva, in the form of the Linga Omkar on the island of Mandhata, in the river Narbada. We next read in Rajput poetry of the country being ruled by the Chauhan Rajputs who held A'sirgarh, though their capital was at Makavati (Garha Mandla.) They were supporters of the gods of the brahmans, and appear to have been at last overcome by the Pramara Rajputs who established the great buddhist kingdom of Malwa. A branch of this family called Tak held A'sirgarh from the beginning of the ninth to the close of the twelfth century of our era. Several times during this period the Tak of A'sir are mentioned by the poet Chand, as leaders in the hindoo armies battling in Northern India against the mahomedan invader. During this period the Jain religion—was paramount in Nimar, and numerous remains of finely-

carved temples, &c., yet remain at Wun, Barwani, and other places in Prant Nimar, and at Khandwa and near Mandhata in the modern district. Before the invasion of the mahomedans, the Chauhan again seem to have recovered A'sirgarh and the southern part of the district. In A. D. 1295, sultan Ala-ud-din, returning from his bold raid in the Deccan, took A'sir, and put all the Chauhan to the sword, excepting one, whose descendants were afterwards the rajas of Harauti. The present rana of Piplod in Nimar also claims descent from the A'sir Chauhan, and his pretensions are in great measure supported by his genealogy and family history. Northern Nimar about this time came into the possession of a raja of the Bhilala tribe, and his descendants are still to be found in the chief of Bhamgarh, Mandhata and Silani. The historian Ferishta relates a story of a shepherd-chief called A'sa, ruling over all Southern Nimar at the time of the invasion of the mahomedans, and building the masonry fort which was called after him A'sirgarh (from A'sa and ahir, a herdsman). The tale, however seems doubtful. In A. D. 1370, Malak Raja Faruki obtained Southern Nimar, then unconquered, from the Delhi emperor, and after establishing the mahomedan power in the Tapti valley, was succeeded by his son Nasir khan, who assumed independence established the Faruki dynasty of Khandesh, in A. D. 1399. He captured A'sirgarh (according to Ferishta from A'sa Ahir), and founded the cities of Burhanpur and Zainabad, in honour of the mahomedan shaikhs Burhan-ud-din and Zain-ud-din, on opposite banks of the river Tapti. The Faruki dynasty held Khandesh, with their capital at Burhanpur, during eleven generations, from A. D. 1399 to A. D. 1600. Their independence was, however, of a very modified sort, as they were throughout under the suzerainty of the more powerful kings either of Gujarat or Malwa, and whenever they ventured to throw off their vassalage, or attacked their neighbours, were quickly brought to their senses by a force which they in no case successfully resisted. In the later disputes, between the nizam and the peshwa, Nimar was often plundered by the latter, until, by the treaty of Munge Pattan, northern Nimar became the peshwa's in A. D. 1740. Baji Rao peshwa, however died the same year at Raver on the banks of the Narbada, which he was just about to cross on a second invasion of Hindustan. His cenotaph of variegated sand-stone is still to be seen at Raver. Eight years later his great rival A'sof Jah died at Burhanpur. The Pindhari in Nimar, had their chief camps in the dense wilds of Handia, between the Narbada and the Vindhyan range. Chitu, the most daring of

their leaders, usually frequented the jungles of Irwas and Limanpur, due north of Nimar. In 1817 the British troops attacked the Pindhari and drove them out of these haunts. Chitu himself, after fleeing to Pachmarhi and A'sirgarh, being again driven to the haunts he knew so well, was killed by a tiger in the Sita Ban jungle of Limanpur, a place still well known to British sportsmen as a sure find for tigers. The population of Nimar numbers 1,90,440 souls, of whom 34,805 are Bhil, Kurku, &c. There are scarcely any Gond in Nimar. The population of Nimar also consists of Dher, Mhang and other non-hindoos. 18,446 Europeans..... 402
Brahmins..... 6,983
Hindoo immigrants..... 1,18,508
Mahomedans..... 18,279

The best cultivators in Nimar are the Kunbi, Gujur, Mali and Rajput races. The language is a mixture of Hindi and Marathi, with a good many Persian words, and it is written in a peculiar current Devanagari character.—*Central Provinces Gazetteer.*

NIM, ARAB., BENG., HIND., MAHR., PERS. *Azadirachta indica*, and species of *Melia*.

Nim-ka-chal, HIND. *Margosa* bark. Bark of species of *Azadirachta* and *Melia*.

A tall straggling plant common in places in the Punjab Himalaya from the Sutlej to the Chenab, at from 3,000 to 9,000 feet. It is browsed by goats and sheep, and in Chumba the leaves are applied to itch. In some parts the red fruit is eaten. It was discovered in Nepal by Dr. Hamilton, and is stated by Dr. Royle to exist in Turanda, on the banks of the Sutlej, in more than 31° of north latitude. Dr. Royle has also met with it in valleys in Gurhwal, in a valley

near the town called Thankot. It has elliptical oblong leaflets, which are acuminate and serrated. The corymbs are trichotomous. It is as bitter as the quassia of South America. In general appearance and intense bitterness this tree is closely allied to the *Simarubæ*. The wood is light-coloured and very bitter, and although it has not as yet been subjected to experiment, we are led from analogy to entertain the most confident opinion of its proving a perfect substitute for the West Indian article. It rises to near the snow line of the Himalaya mountains. The wood has long been used for killing insects, and latterly recommended in fever by M. Macardieu.—*Don, Dechlamdeous Plants; Lindley, Flora Medica; in Eng. Cyc.; O'Shaughnessy, page 269; Ind. An., 106; Dr. J. L. Stewart.*

NIMAK, HIND. Salt.

Nimak-guman, coarse rock salt of the hill states.

Nimak-ustifrag, said to mean tartar emetic.

Nimak-kalri, the reh salt, a salt of soda.

Nimak-maniyari, HIND. Salt residue in glass-melting = to Kachlun.

Nimak-nali, fused salt in long pipes.

Nimak-safed, white salt.

Nimak-sambar, salt of Sambhur lake.

Nimak-shisha, crystal salt.

Nimak-shor, coarse salt educed in the process of making saltpetre.

Nimak-sinda, salt from Sindh.

Nimak-sonchal, black salt. See Kala nimak.

Nimak ka-tezab, sulphuric acid.

See Salt, Reh. Kalr.

NIMOOKA, BENG. Clypea hernandifolia.

NIMROD had two sons, one of whom, Yoktan, proceeded southwards about B. C. 4500 or 5000, and formed and founded there 13 principalities. Nimrod's name is connected with all the cities and towns as far as the highlands of Kurdistan and even Phrygia. — *Bunsen*, Vol. iv, p. 412.

NIMROUD, the mound wherein sculptures have been discovered at this ancient place is not far from the Tigris, and about four hours' distance from Mosul. Xenophon, in his account of the retreat of the 10,000, makes mention of a pyramid in a town called by him Larissa. It is most probable that the mound marks the site of that place, which the Turks generally believe to have been Nimrod's own city; and one or two of the better informed with whom Rich conversed at Mosul said it was Al Athur or Ashur, from which the whole country was denominated. The villagers of Deraweish still consider Nimrod as their founder. The village story-tellers have a book

they call the "Kisseh Nimrod," or Tales of Nimrod, with which they entertain the peasants on a winter night. Over the ruins at Nimroud, Mr. Layard discovered ancient tombs, of a race unknown and of which he could not assign any date. Many of the vases, necklaces, and ornaments have a resemblance to those of the Egyptian tombs. Two or three purely Assyrian cylinders were also discovered in the tombs. Mr. Layard considers that the mode of burial which is there evidenced, more nearly resembles that adopted by the early Persians. Cyrus and Darius were buried in Sarcophagi in troughs. Darius in one of Egyptian alabaster. The alabaster *πυλος* or tub, in which Darius was buried, is mentioned by Theophrastus. The Assyrians, like the early Persians may have buried their dead entire, and preserved the bodies in honey or wax. (Herod, lib. i, c. 140, Arian de Bello, Alex. Theoph. de Lapid, c. xv.) According to Ælian, when Xerxes opened the tomb of Belus, he found the body in a coffin filled, nearly to the brim, with oil. Mr. Layard infers that these tombs belonged to an intermediate people or race who occupied Assyria after the building of the most ancient palaces and before the foundation of the most recent. He (Nimrod) went out into Assyria and built Nineveh and Calah; the same is a great city. (Gen. x, 11, 12.) The ruins of Nimroud had been identified with Resen, of which Larissa was believed, first, by Bochart, to be a corruption, arising from the (presumed) use by the inhabitants of the country, of the common Semitic article "al" before the word. In the first place, the philological grounds are inadequate; and, if this were Resen, no room would be left for the site of Nineveh, a still greater city. A great dam was built by Nimrod, and in the autumn before the winter rains, the huge stones of which it was constructed, squared, and united by cramps of iron, are frequently visible above the surface of the stream. This dam is called by the Arabs, either Sukr-el-Nimroud, from the tradition, or El Awayee, from the noise caused by the breaking of the water over the stones. Large rafts are obliged to unload before crossing it, and accidents frequently happen to those who neglect this precaution. Diodorus Siculus states that the stones of the bridge built by Semiramis across the Euphrates were united by similar iron cramps, whilst the interstices were filled up with molten lead. The dams greatly impeded the fleets of the conqueror in their navigation of the rivers of Susiana and Mesopotamia, and he caused many of them to be removed. By Strabo they were believed to have been constructed to prevent the ascent of the rivers by hostile fleets, but their use is evident. Tavernier mentions in his travels,

(Vol. i, p. 226), this very dam, he says that his raft went over a cascade twenty-six feet high; but he must have greatly exaggerated.

Athur, the ruined city near the mouth of the upper Zab, now usually known by the name of Nimrud is called Ashur by the Arabic geographers, and in Athur we recognise the old name of Assyria, which Dio Cassius writes Atyria, remarking that the barbarians changed the Sigma into Tau. The Bors Nimrud and mound are supposed by travellers to represent the tower of Babel, but others conjecture it to be the remains of a temple of the ancient Borsippa which is mentioned as having been near Babylon, and where Alexander halted on his road to Ecbatana when warned by the Chaldeans not to enter Babylon from the east.—*Rich's Residence in Kurdistan*, Vol. ii, p. 131; *Layard's Nineveh*, Vols. i, ii, pp. 4, 5, 8, 220; *Muller's Lectures*, p. 233; *Strabo*, p. 1851, Ed. Ox., 1807. See Babel, Luristan, Mosul, Tigris.

NIMUK DULLA, or Nimuk-ka-dalla, HIND. Muriate of soda; Salt.

NINDI, HIND. *Vitex negundo*.

NINEVEH, built by Asshur, son of Shem, (see Genesis x, 11) who went forth from the land of Shinar, is not again mentioned in scripture until the time of Jonah when its population is supposed to have been half a million. Nahum foretold its destruction, and in B. C. 606, it fell before the combined forces of Cyaxares, king of Persia and Media, and of Nabopolassar who seems to have been the ruler of Babylon, or the Assyrian governor of the city. The walls of Nineveh are described to have been 60 miles in circumference, and 100 feet high with 1,500 bastions each 200 feet in height. Diodorus Siculus mentions that the city was destroyed partly by water and partly by fire, and so utter was the destruction that though, in 400 B. C. Xenophon must have passed within a few miles of its site, he makes no mention of it, and Lucian, a native of Samasata, near the Euphrates, living between A.D. 90 and 180, states that its site could not, then, be pointed out. Mr. Rich, however, in 1820, detected it, in the mounds opposite Mosul, and M. Batta, in 1843; and Mr. Layard in 1845 obtained numerous sculptures from it. When visited by Jonas, who was sent thither by Jeroboam, king of Israel, it was three days' journey in circumference; and Diodorus Siculus, who has given the dimensions of Nineveh, says, that it was four hundred and eighty stadia, or forty-seven miles, in circuit: that it was surrounded by a wall and towers; the former, one hundred feet in height, and so broad that three chariots might

drive on it abreast; and the latter two hundred feet high, and amounting in number to fifteen hundred. Above thirty generations elapsed between Ninus and Sardanapalus. But, with regard to Ninus and Semiramis, like all heroes of primitive history and early tradition, their names appear to have become conventional—all great deeds and national events being assigned to them. Originally, historic characters they have been to some extent invested with divine attributes. If there be no interpolation in the book of the Genesis, we have mention of Nineveh at least 1,500 years B. C. The down fall of the Ninyads, in the person of Sardanapalus, occurred B. C. 748. Nineveh, B. C. 606 fell before an alliance of the kings of Babylon and Media, Nabopolassar and Kyaxares. Nineveh, as the metropolis of the Assyrian empire, in B. C. 526, governed Babylon and Media. Nineveh, the city of Ninus, on the Tigris, opposite Mosul, was the capital of the Assyrian empire. The term assigned by Herodotus to the Assyrian dominion in Upper Asia, is 520 years. The Assyrian empire came to an end in B. C. 1273. The territory of Athur (from Asshur, Shem's son) was originally of small extent, and formed the second part of the kingdom usurped by the giant warrior, Gen. x, 11, 12, who built, or rather restored, the three cities, Rehoboth, Calah, and Resen, besides the capital, Nineveh. The ruins of the latter city are known from the descriptions of Rich, Layard Ainsworth, and earlier travellers. They are in Assyria proper, on the left bank of the Tigris, opposite Mosul, and the natives still call them by the original name. Two remarkable facts in Layard's latest work of Nineveh show that the national records of Assyria were written on square bricks, in characters so small as scarcely to be legible without a microscope; in fact, a microscope was found in the ruins of Nimroud. Nabopolassar, the father of Nebuchadnezzar, became the Assyrian satrap of Babylon, in the 123rd year of Nabonassar. Sardanapalus, king of Assyria, commanded him to march against the Medes who had revolted, but he allied himself with Cyaxares, and marched with him against Nineveh, and Babylon became independent on the destruction of Nineveh in B. C. 606. The Ninevites, in all their various monuments, have left us no trace of their ideas concerning the dead, while their neighbours, the Babylonians attached that care to the rites of sepulture which betokens strong belief in another life. The sepulchral urns obtained in Babylonia, contain the remains of the dead, with jars and utensils for food and water, made of baked clay, and with remains of date stones, the head of the dead reverently laid on a sun-dried brick as a pillow. Their ancient tombs, rare in Assyria and upper Babylonia,

are chiefly in Chaldea proper, and the Rev. G. Rawlinson (i, 107) suggests that the dead may have been conveyed to the sacred land of Chaldea, similarly as the Persians, even now, send their dead to Karbila and Meshid Ali, and as the hindoos from remote India, send the bones or the entire bodies to the Ganges at Benares. Chagda or Chackrada, near Sook-sagur, is an abyss said to have been made by the chariot wheel of Bhagiruth. The legend points to an antiquity which is not borne out by any old vestiges or ancient population. But the place is a great golgotha where the dead and dying are brought from a great way off to be burnt and consigned to the Ganges. The deceased is seldom conveyed by any of his relations, unless from a short distance, and poor people generally send forward their dead for incremation in charge of bearers who never betray the trust reposed in them. The arrow-headed character was that used on the sculptures of Nineveh and is still occasionally used in writing Arabic, as also is the Cufic or Kufic which had its origin in the town of Kufa, but the Nashk and Talik characters are now usually employed.—*Kinneir's Geographical Memoir*, p. 259; *Layard's Nineveh*, Vols. i and ii, pp. 18, 225; *Bunsen*, p. 494; *Vol. iii*, p. 605; *Euphrates and Tigris*, Col. Chesney, p. 119; *Curiosities of Science*, p. 42; *Tr. of Vol. i*, p. 18.

NING-PO lies in 29° 45' north latitude, and in 121° 22' east longitude; is situated on the banks of the river Tae-hae, and in the province of Che-keang; the town of Ning-po is about twelve miles distant from the sea, being in a westward direction from the cluster of the Chusan islands. Over the river, an extraordinary bridge is constructed, in a most ingenious manner. Ningpo was taken, 13th October 1841, by the British.—*Sir's China and the Chinese*, Vol. i, p. 195.

NINNI, see India.

NINUS. The first year of his reign was B.C. 1273, Semiramis seems to have reigned jointly with Ninus after his tenth year. Ninus established the Assyrian empire in its entire extent in his 17th year. Semiramis after him reigned as sole sovereign.

There are indeed sufficient grounds for the conjecture that there were two, if not more, distinct Assyrian dynasties, the first commencing with Ninus. The Bactrian and Indian expe-

ditions of Ninus, the wonderful works of Semiramis, and the effeminacy of Sardanapalus, are points in their several reigns.—*Layard's Nineveh*, Vols. i, ii, pp. 20, 217. See Hercules, Lud, Nineveh; Semiramis.

NIPA FRUTICANS.

Da-ni,	Cocos nypa, <i>Lour.</i>	
Water cocoanut,	Burm. Atap,	MALAY
	Eng.	

This lowly stemless palm grows very abundantly in Tenasserim, the Malay Peninsula and Eastern Archipelago. Thatch is made of the fringe of the leaves, doubled down and sewed on sticks or lathes of bamboo and used as thatch for the roofs. The pulpy kernels of the fruit (called buah atap) are preserved as a sweetmeat, but are entirely without flavour. It grows in the tidal waters and bears a large head of nuts. The nuts of a similar plant abound in the tertiary formations at the mouth of the Thames, buried deep in the salt and mud that now forms the island of Sheppy. The "nipa" and "sasa" of the Philippine islands possesses various useful purposes. The Nipa fruticans has affinities with the screw pines. The leaves, besides being used for thatch, mats, and baskets, when burnt they yield salt: toddy or palm wine is extracted from the spathe, convertible into syrup, sugar, vinegar, yeast and a strong spirit. The nipah palm in the nature of its flowers, approaches the screw pines; to the Mergui river, it is found in perfection, but only a few specimens occur as far north as Moulmain. It flourishes in brackish water, along with the mangrove, and its lower parts are inundated when the tide rises. Writing of this plant Dr. Hooker says, "Receding from the Megna the water becomes saltier, and Nipa fruticans appeared, throwing up pale yellow-green tufts of feathery leaves, from a short thick creeping stem, and bearing at the base of the leaves its great head of nuts, of which millions were floating on the waters, and vegetating in the mud. Marks of tigers were very frequent. The trunk never exceeds a man's height. It is the inhabitant of low marshy situations. Like other palms it yields a wine by the usual process, and in some parts of the Archipelago, particularly in the Philippines it is cultivated for its wine. Its principal use, however, is for the leaf, usually called Atap, the common term for thatch among the Malays, but specially applied to the leaves of this palm, because, among that people, it is almost the only material used for that purpose. The nipa leaf is also used for the fabrication of

coarse mats. The small, insipid pulpy kernels are sometimes preserved as sweetmeats. The tuba, or juice, is extracted from the tree whilst in its flowering state, in the same way as that of the cocoanut tree, and afterwards distilled by a similar process; but it is more spirituous, from six to six and a half jars, being sufficient to yield one of wine. The great difference remarked in the prices of the liquor, from the cocoanut and nipa trees arises out of the great number of uses to which the fruit of the cocoanut tree is applicable, and the increase of expense and labour requisite to obtain the juice, owing to the great height of the cocoanut plant, and the frequent dangers to which the gatherers are exposed in passing from one tree to another, which they do by sliding along a simple cane.—*Marsden's Hist. of Sumatra; Hooker's Him. Jour., Vols. i, ii, pp. 1, 355; Seeman; Royle's Fib. Plants, p. 35; Mason; Walton's State, pp. 119, 120.*

NIPHANDA of Ptolemy, probably the same as Ophiana.

NIPAL, see Nepal, Koh-i-safed, Oojein.

NIPHATES, the ancient name of the range of the prolongation of the Taurus. The Tigris and Euphrates rise from its opposite sides.

NIPON, The four large Japanese islands are Nipon, Kiu-siu, Jesso, and Sikoff, which together form a group not dissimilar in geographical configuration to Great Britain and Ireland. In the first island are situated Yedo and Miako the two capitals, the Tycoon, the temporal sovereign, resided in Yedo, and the Mikado or spiritual sovereign in Miako. The island of Nipon popularly called Japan, and known to the Chinese as Yang-hoo, or Jih-pun-kwo, is the largest, and its name signifies land of the rising sun. Kiu-siu or Ximo, the most southern of this group, in lat. $32^{\circ} 44'$ N. and long. $129^{\circ} 52' 7''$ E. has the harbour of Nangasaki on its western side, is a hundred and fifty miles north to south by two hundred and seventy east to west. Sikoff is about a hundred miles in length by sixty in breadth. The gross area of the empire is estimated at 265,500 square miles, and its population at 40 or 50 millions. Sagaleen island is a little smaller in extent than Nipon, and was formerly divided between the Chinese and Japanese, the former holding the northern and the latter the southern half. Its native population are the Kuriles, a very hairy, wild and untutored race. The chief town in the island of Jesso, is Matsmai: the second is Hakodadi. Matsmai is an imperial city, built upon undulating ground, and the hills near are covered with oaks, firs, cedars, poplars, the yew, the ash, cypress, birch, aspen and maple. Nipon, or Nifon, or Niphon, constitutes the main body and strength of the Japanese empire. Ila-da, a port in Nipon, is about 40 miles from Si-

moda, and is built on a plain, eighty miles from the metropolis, it contains about 8,000 people. The town is divided into wards separated by wooden gates. It contains nine buddhist and one sintu temple. Since the treaty of Kanagawa, by which the port was opened to the Americans, Simoda has been raised to the dignity of an imperial city. A hot spring flows from a rock at Simoda, stated to be sulphurous. The island contains the largest towns, and the manufactured articles produced in this island are considered the best.—*MacFarlane's Geo. & His. of Japan, p. 147.* See India, Japan.

NIPPULA VANNE KRANUGA, TEL. *Pongamia uliginosa* or *Butea superba*? The word means "fiery-red colour" and indicates a species with flaming bright flowers; also perhaps *Wagatea spicata*.

NIR, BENG., HIND., KARN., MALEAL. MAHR., TEL. Water.

NIRADA MOOTOO YENNAI, TAM. See Neradi mootoo oil.

NIRADHAR, Niratar, Niratari, HIND. *Cuscuta reflexa*, supposed to be a corruption of nila-tar green thread.

NIRAKARU, SANS., from Nir prop., and akaru, form.

NIRALLI or Nakkena, TEL. *Canthium didymum*, Gaertn.

NIRAM, HIND. Ballast.

NIRANGI, CAN. *Poinciana elata*.

NIRANKOT or Haidarabad, the ancient Patala.

NIRARLAY, TAM. *Eugenia jambolana*, Lam., Roeb.

NIRARUGA, TEL. *Paspalum scrobiculatum*, L.— β Kora, P. kora, R. 1, 279.

NIRA, or Sainda, DUK., GUZ. Toddy.

NIRBISI, HINDI. *Curcuma zedoaria*, Roeb., a syn. of *C. aromatica*, *Salisbury*; also *Kyllingia monocephala*. Bara Nirbisi is the *Scirpus glomeratus*. Nirbisi, means the antidote, and is sometimes said to be the root of a species of aconite, but is generally supposed identical with jadwar or zadwar, the zedoaria of old writers. In Sirmoor the root of *Delphinium pauciflorum* is also called Nirbisi.

NIRCHA, HIND. *Corchorus capsularis*.

NIR CODUMBA, TAM. *Nauclea parviflora*.

NIREPUTI, TAM. *Rostellaria procumbens*, Nees.

NIRGAL also Nirgali, HIND. *Arundinaria falcata*, a hill bamboo.

NIRGUBI, TEL. *Asteracantha longifolia*.

NIR GUBI VERU, TEL. Root of *Barleria longifolia*.

NIRGANDA, DUK. *Vitex trifolia*, Linn., also *Vitex negundo*. Leaves of *Vitex negundo* are useful in acute rheumatism and intermittent fever and special diseases, also said to relieve headache and catarrh also after confine-

ment. The fruit is acid, its action is similar to that of the *Vitex trifolia*, but less powerful.—*Powell's Hand-book*, Vol. i, p. 364.

NIRGUN, see Satnami.

NIRGUNA. In Hindu metaphysics there are three Guna, Satya-guna or property of truth, the source of purity and wisdom—the Rajo-guna, or property of foulness, the source of passion and error, and the Tamo-guna or property of darkness, the source of inertness and ignorance. Deity, abstractedly, is Nirguna, or without any of the three properties.—*Wilson*.

NIRGUNDI, BENG. *Vitex negundo*.

NIRIJA, or Bira, TEL. *Elæodendron roxburghii*, *W. and A.*, 492—*W. Ill.*, 71—*Nerija dichotoma*, *R.* i, 646. The name Bira is very doubtful, it was only found at Palamanair. The root of this tree is much prized as a cure for snake-poison, apparently not without some reason.—*Br.*, 502; *O'Sh.*, 271.

Niru tamara, TEL. *Pontedra hastata*, *L.*—*R.* ii, 121; *Cor.*, 111. This name rests on Roxb.'s authority alone.

Niru tota kara, TEL. *Amarantus*, *sp.* The common cultivated species, requires plentiful watering.

Niru tumiki, or Niti tumiki and Eru tumiki, TEL. *Diospyros*, *sp.* Ebenaceous tree frequenting water? *Sk.* syn. is *Dirgha patraka*.

Niru talavapu, TEL. *Desmodium natans*, Willd.—*W. and A.*, 835—*Mimosa nat.*, *R.* ii, 553; *Cor.* 119. Nir tavili means touching the water refering to the floating habit characteristic of this plant.

Niru vanga, TEL. *Solanum melongena*, *L.*—*S. longum*, *R.* i, 567.—*Rheede*, x, 74. This well known variety is under culture at all seasons and requires much water, hence the name.

Niru veniki, TEL. *Ottelia alisnoides*, *Pers.*, also *Damasonium indicum*, *R.* ii, 216; *Cor.* 185; *Rheede*, xi, 46. This name does not seem to be right, the plant is called Gurrapu dekkka.

NIRULLI, TEL. *Allium cepa*, *L.*—*R.* ii, 142, *Br.* 502.

NIRVALA, MALRAT. *Croton tiglium*, also *Cratava nurvala*, *Ham.*

NIRVALUM, TAM. *Croton tiglium*. Nirvalum yennai, TAM. Croton oil: Napaulah oil.

NIRWANA or Nirvana, or Nighan, in buddhism, final emancipation, a buddhist idea of annihilation, of the spirit's extinction, but Bunsen asserts it to mean the absence of desire in this life; inward peace. M. St. Hilaire, M. Eugene Burnouf and Prof. Max Muller, identify the Nirvana of Buddha with absolute annihilation, the pure not being, in which there is no absorption in the higher life of the uncreated essence, no consciousness of peace and freedom from evil, but the loss of being and consciousness at once. This doctrine is shadowed forth in the despair of Job and Jeremiah; in the deep melancholy of Ecclesiastes; in the choruses of Sophocles, the Apologia of Plato and in the soliloquy of Hamlet, yet this has nowhere led to suicide, as the path to Nirvana, but to fasting, prayer, almsgiving, and self-sacrifice. But the doctrine was offered to people who held to the belief of a natural immortality and metempsychosis, to whom death brought no sure deliverance, but might lead to ills greater than in this world, new forms of human or brute life more miserable than what they had passed through. The life of self-sacrifice of its founder, his voluntary acceptance of poverty, his proclamation of a universal brotherhood, and his making war on the caste system, are remarkable features of his career. But after him brahmanism rose triumphant and drove buddhism into other lands, and the region of Sakya Muni's birth and labours became a place of pilgrimage to peoples from distant countries. The Nirvana of Sakya Muni, according to the Raj-guru of Assam occurred in the 18th year of Ajatra Satru, and 196 years before Chandragupta, the contemporary of Alexander which may agree thus 348 + 196 = 544.—*Bunsen, God in Hist.*, Vol. i, p. 5. See Buddha, Chinese, Inscriptions.

NIRVANA, HEBREW, signifying satisfied or prosperous.

NIRVANEE, SANS. From Nirvanu, liberation.

NIRWAR, see Kush.

NISHA, HIND. See Kush.

NISÆA, the Nisaia of Ptolemy called also Nisa and Nisæa, a city on the upper Oxus, was the chief town of the district, in northern Parthia, famous for its breed of horses, bordering on Hyrkania and Margiana. The fourth settlement of the Arians was in Nisaya (Northern Parthia.) It (v. verse 8.) says "the fifth best land is Nisaya; there Ahriman created unbelief." This is the Nisaia of Ptolemy, famous for its breed of horses, commonly called Nisæ, the renowned district of Northern Parthia, bordering on Hyrkania and Margiana. The city of Nisæ is situated on the Upper Oxus. The term "unbelief" signifies the apostacy from pure fire worship. Here, therefore, the first schism took place.—*Bunsen*, Vol. iii. See Arians.

NISAETUS BONELLI, *Temm.* The Crestless hawk eagle.

<i>Aquila intermedia</i> , <i>Bonelli.</i>	<i>Nisaetus niveus</i> , <i>Jerd.</i>
M'hor-angah, HIND.	Rajali, TAM.
M'hor-angi, "	Kundeli, small TEL.

This eagle is about 27 inches long and is found throughout India, in the hilly and jungly districts. It preys on game birds and peafowl, ducks, herons and waterfowl.

NISAETUS NEPALENSIS, *Hodg.*, also *N. pulcher*, *Hodg.*, Syns. of *Limnaetus nipalensis*, *Hodg.*

NISAETUS OVIVORUS, *Jerd.*, Syn. of *Neopus malaiensis*, *Reinwardt.*

NISAETUS PALLIDUS, *Hodg.* Syn. of *Limnaetus nivæus*, *Temm.*

NISARNA, HIND. To blossom, the blossoming of sugar-cane is thought very unlucky.

NISHADA of the Sanscrit writers, a race who seem to have been the occupants of India prior to and opponents of the Aryans and especially to the wild and barbarous forest and mountainous tribes. It is a term applied in the Vedas to the ancient aborigines of India, and Professor Max Muller proposes to apply the words Nishada languages to all the non-Arian tongues.—*Wils.* See India, Siva.

NISHAPOUR, at one time the greatest and richest city of Khorasan, is seated in a plain, formerly irrigated by about twelve thousand aqueducts, most of which have been suffered to fall to decay, and are now destitute of water. This city was founded by Taimuras, and destroyed by Alexander the Great. It was, after the lapse of many years, re-built by Sapor the First; and the statue of that prince was to be seen at Nishapour; until it was overturned, and broken in pieces, by the Arabs. The town and district of Nishapour, are situated about sixty miles to the south-west of Mushed. On the death of Nadir Shah, it was seized by Ab-

bas Kuli Khan, a chief of the Turkish tribe of a Byat. The name is a compound of Ni reed and Shahpoor, and the term Ni, which denotes the produce of the plain in which it stands, was given to distinguish it from the city of Shahpoor in Fars, which was also founded by Shahpoor the First. The fruits of Nishapur are uncommonly fine, particularly melons; its mountains are cultivated to the very summit. In these mountains, the Ferozah, or Turquoise stone, is found. General Ferrier says he suffered many disappointments at Nishapur, but it was from thence only he could visit the turquoise-mines in the neighbourhood. The mines are near the village of Madene, about thirty-two English miles from Nishapur; the road to it is for the first five miles across a plain of great extent. Salt abounds in this locality, and the principal mine, Dooletaly, is about six miles from Madene. This is an enormous rock, covered on its exterior surface with a thin layer of red clay. The mines are the property of the Government, who lease them to the highest bidder. At present the rent is only 150 tomanus yearly. A good workman can extract about 800 lbs. a day. The salt is beautifully white and of a fine grain. The turquoises are divided into two classes, according to the positions in which they are found. The first, called sangi, or stony, are those which are incrustated in the matrix and which must be removed by a blow of the pick or hammer; the second are found in washing the alluvial deposits, and are called khaki, or earthy: the former are of a deep blue; the latter, though larger from being paler and spotted with white, are of less value. These are seen as if incrustated or glued in the matrix to the number of from twenty-five to thirty, and more or less near one another. Each of these stones is enveloped in a thin calcareous covering, white on the side adhering next to the turquoise, but brown on that next to the matrix. Mr. Fraser mentions that on the 24th of January, about five in the morning, he set off to visit the turquoise mines, about nine fursungs to the westward of Nishapur. Part of these are but pits dug in grey earth like that of the Khurooch mine, and may possibly be also the remains of some former working. The gem is also found in small veins variously dispersed through the body of the rock; a man who was working here offered him the produce of his day's labour in an old shoe, consisting of pieces of various sorts and sizes. He ascended to a considerable height to where, in a cleft of the hill, is situated the mine called Abdool Rezakee, from having been discovered, or formerly worked, by a person of that name. The chief excavation is under a great overhanging rock, of the same nature as

that of the Madan-e-siah and others, and from this mine were obtained the finest and largest stones of any. In this mine the turquoise matter did not appear to run so much in veins; but this might be accidental, for we were told that the greater part of the gem is found in this manner.—*Fraser's Journey into Khorasan*, pp. 407-413; *Kinneir's Geographical Memoir*, p. 185; *Malcolm's History of Persia*, Vol. ii, pp. 218, 220; *Ferrier's Journ.*, pp. 105, 106, 107.

NISHAN, HIND. Sign, flag, or standard, synonymous with a company of soldiers.

NISHA-PATEE, SANS., from nisha, night, and patee, lord.

NISHASHTA, PERS. Starch. Nishast-i-gandum, Gluten of wheat.

NISHINDA, or Nisinda, BENG. Vitex negundo, and Vitex trifolia, *Linn.*

NISHIKRAMANA, SANS. A going forth, from nir, prep., and krum, to step.

NISIBIS, a fort situated between the Tigris and Euphrates, the possession of which was continually contested by the Romans and Persians. It was taken after Shahpoor had subdued Armenia. Persian authors term this fort Nisibyn and Nisibi.—*Malcolm's History of Persia*, Vol. i, p. 97. See Mesopotamia.

NISINDA, also Nisindha, also Seduari, HIND. Vitex negundo and V. trifolia.

NISOMALI, SANS. Polygonum aviculare.

NISO-CHAKA, SANS. Alangium decapetalum, *Lam.*

NISOT, BENG., HIND. Ipomœa turpethum.

NISR, HEB. Eagle.

NISSAB, AR. (lit. alms) the repeating an attribute of the deity a certain number of times.

NISUNG. In this town, the Tartar husbandmen have a custom similar to those of the Scotch farmers, who plait the first corn cut three-fold, and fix it over the chimney-piece till next harvest, when it is renewed. The Tartars use three ears of barley, which they paste outside, above the door. At Nisung there was not a house in the village but was ornamented in this way. The Tartars are called by the Kunawar inhabitants of the lowest parts, Zhad, Bhottea or Bootuntec, and their country is often named Bhot and Bootunt; the Tartars are very different in appearance and manners from the inhabitants of the Lower Kunawar; all those of Basihur were formerly under the Chinese. The Tartars of Kunawar are not so stout as those farther to the eastward, and have less of the Chinese features. The others are muscular, well-made, and tall; Gerard saw few under five feet ten, and many were six feet or more; their strong athletic forms were remarkably contrasted with the puny diminutive figures of his attendants, several of whom were inhabi-

tants of the plains. Their countenance is ruddy, and they have small oblong eyes, high cheek bones, thin eye brows, and very few have either mustachios or beards, which they admire much. Many of them, especially from twelve to eighteen years old, are extremely handsome, of a very prepossessing appearance, and fine specimens of Tartar youth.—*Capt. Gerard's Account of Kunawur*, pp. 3 to 102.

NITA, TAM. Aloe fibre.

NITAM-PALA, TAM. A Malabar tree that grows to about twelve or fifteen feet long and fifteen inches in diameter: it is not of much consideration; it produces a small fruit which is used by the natives medicinally.—*Eclye, M. C.*

NIT BIRALU, NEPAUL. *Viverra zibetha*, Linn.

NITI, a pass of Kumaon, in lat. $30^{\circ} 57' N.$, lon. $79^{\circ} 54' E.$; the crest is 16,814; village of Niti, 11,464 feet. It is open from the end of June to October. Niti is considered the best pass between Kumaon and Tibet, and is one of the principal channels of trade between Chinese Tartary and Hindoostan.

NITKI, RUS. Thread.

NITO, a cloth used by the wild natives in Mindoro.

NITI GANNERU, or Bagga patti, TEL. *Linnophila racemosa*, Benth. Any aquatic plant with long, narrow, oleander-like leaves.

NITI TUMIKI, or Niru tumiki and Eru tumiki, TEL. *Diospyros*, sp. So called by the Konda Doralu.

NITRARIA TRIDENTA, a plant of Tunis, the true Lotus of the lotophagi, and Nitraria scoberi, the berry of which is the chief luxury of the tribes of the Caspian desert, might be introduced into India.

NITRAS POTASSÆ, Nitre.

NITRATE DE SOUDE, FR. Nitrate of soda.

NITRATE OF LIME is recommended as a probable chemical antidote for the salts of the "reh." It has been known that the best remedy for reh is the saline efflorescence of old mortar on walls, or which appear on ground containing carbonate of lime and animal matter. In this substance, nitrate of lime is found, and this salt would act by producing the insoluble carbonate of lime, and the sparingly soluble sulphate of lime, and the deliquescent nitrate of soda, instead of the efflorescent sulphate and carbonate of soda, which are the principal constituents of reh. This is prepared by distilling shora or saltpetre with kahi safed, and neutralizing the acid liquor that passes over with chunam. The natives, in some parts, have long been accustomed to employ "chikna kullur," or earth which looks damp; this earth is found where animal remains are deposited, and usually contains nitrate of lime. The reh is composed principally of sulphate of

soda and chloride of sodium, with, in some places, carbonate of soda: the sulphate and carbonate of soda are very efflorescent salts, and melt partly in their water of crystallization at a temperature of about 98° , while they are rather sparingly soluble when the temperature falls below 60° . Hence, during the hot weather the reh melts and percolates the ground to some considerable depth; but as the weather becomes cooler, crystals form in this soil and form a capillary net-work, upon which it travels till it arrives at the surface, where the salt gives off its water of crystallization, and falls into a dry powder by efflorescence. If to a solution of these salts, nitrate of lime is added, no change is produced by it on the chloride of sodium, but the sulphate and carbonate of soda are converted into nitrate of soda, a deliquescent salt, while the lime is changed either into the insoluble carbonate of lime, or the sparingly soluble sulphate of lime, neither of which are efflorescent, or in any way injurious to vegetation.—*Powell's Hand-book; Econ. Prod., Punjab*, pp. 95, 112.

NITRATE OF SILVER. This salt is now made at Lahore for photographic purposes and called kastak, a corruption of caustic.

NITRATE OF POTASH, Nitre.

NITRATE OF SODA.

Nitrate do Soud, FR. | Wurfel saltpetre, GER.

This salt occurs in Bellary and Hyderabad, where it forms a natural efflorescence. Its chief use is as a substitute for saltpetre for the manufacture of nitric and other acids and chemical substances. It is too deliquescent for making gunpowder, though it answers well for some descriptions of fireworks. It is found in immense quantities in deposits in South America, particularly in the districts of Atacama and Tarapaca in Peru. See Alkaline minerals and Soda.

NITRE.

Siau-shih,	CHIN.	Shora,	HIND
Nitrate of potash,	ENG.	Nitro,	IT., SP.
Saltpetre,		Nitrum,	LAT.
Saltpetre,	FR.	Nitras potassæ,	"
Nitre,		Salitre,	SP.
Nitrate de potase,		Buti-uppu,	TAM.
Salpeter,	GER.	Petli-uppu,	TEL.
Saures Kali,	GER.		

Nitre, or Saltpetre, must early have been known, as both the Indians and Chinese have long been acquainted with the making of fireworks, and the former have an easy process for making nitric acid, in which they have been followed by Geber and other Arabian authors. The names neter in the Old Testament, and nitrum in ancient authors, were applied to carbonate of soda, but they were also used in a generic sense. Nitre is found effloresced on the soil in many parts of India, where there is no animal matter, and being washed out, a fresh crop is formed after a few

years. The soil is sandy, with mica interspersed, which will continue to yield a supply of potash, while the nitric acid must be furnished by the combination of the oxygen of the atmosphere with its nitrogen, probably, as suggested by Liebig, by the oxidation of the ammonia which he has proved is always present in the atmosphere. Mr. Stevenson (Prinsep's Journ., ii, p. 23) has detailed the process, and shown that the saline earth contains salts soluble in water, sulphate of soda, muriate of soda, nitrates of lime and of potash. The nitrate of lime is easily converted into that of potash by lixiviating the saline soil over a filter of woodashes, which contains carbonate of potash (the carbonic acid combines with the lime, and the nitric acid with the potash), a carbonate of lime is precipitated, and the nitrate of potash in solution is evaporated and put aside to crystallize. The salt obtained contains from 45 to 70 per cent. of pure nitrate of potash. It is re-dissolved and crystallized, but still contains impurities, which are termed so much per cent. of refraction. The ordinary kinds are called rough or crude saltpetre, and the purer East India "refined." In Europe nitre is prepared artificially in nitre-beds or nitre-walls, and in ditches covered by sheds, where urine is added to different mixtures of earth with refuse vegetables, various animal substances, and calcareous matter, &c. The whole is exposed to the action of the air. The nitrogen, combining with the oxygen, forms nitrates, and the foregoing processes being adopted, similar results are obtained. Nitre is manufactured in many districts of the South and East of Asia.—*Smith; Royle*. See Saltpetre.

NITRIC ACID.

Maulabker,	AR.	Acidum nitricum	
Sterk water,	DUT.	purum,	LAT.
Aqua-fortis,	ENG.	Spiritus nitrici glauberi, "	
Acide nitrique,	FR.	Arak-i-shora,	PERS.
Salpeter saure,	GER.	Aqua forte,	PORT.
Suriakhar-ka-tel,	HIND.	Vedi-lunu-rasa,	SINGH.
Shore ka tezab,		Petluppu dravagum,	TAM.
Acidum nitricum,	LAT.	Petluppu drava-kam,	TEL.
Aqua fortis,			

This was known to Geber, and probably also to the hindoos. In combination with potash, soda, and lime or ammonia, it is found, effloresced on the soil in some countries; also in some minerals; likewise in some vegetables, as in the officinal Pareira root, in the state of nitrate of potash. When manufacturers make nitric acid they employ only half the quantity of sulphuric acid and use nitrate of soda instead of nitrate of potash, because it is cheaper. The acid obtained is of a brownish colour, fumes, and is called nitric acid of commerce. When pure, it is colourless, but as met with in commerce, it is yellowish, owing to its containing nitrous acid in solution; besides which it is often highly diluted, and mixed with sulphuric and muriatic acids. It

is exceedingly corrosive, and its taste is sour and acid. Nitric acid is employed in a great variety of chemical processes; in metallurgy and assaying, for etching on iron and copper, in dyeing and in medicine. Nitric acid, is made in Lahore, by acting on pure nitrate of soda with a quantity of sulphuric acid. This sort is used for the purification of silver, and the formation of the nitrate. A less pure kind is made by the action of Kahi (impure sulphate of iron) on nitre, but this is rather a mixture of nitric and hydrochloric acids, and will dissolve gold leaf.—*Royle; Faulkner; Powell*.

NITRO, Ir. Salitre, Sr. Saltpetre.

NITRO-MURIATIC ACID.

Acidum nitro-muriaticum.	Acidum nitro-hydrochloricum.
	Aqua regia.

Eau regale, FR. | Königswasser, GER.

This acid is made by mixing nitric acid with muriatic, and has probably been known since the discovery of these acids. The Arabs must have been acquainted with it, as they had a solvent for gold. Nitro-hydrochloric acid is of a golden yellow colour with the suffocating odour of chlorine, and the irritant corrosive properties of the strong acids. The manufacturers mix gradually in a cooled vessel, and where the fumes can easily escape. Nitric acid 1 part, muriatic acid 2 parts (both by measure). They keep the mixture in a well-closed bottle in a cool, dark place. The resulting acid is not a mere mixture of the two acids, for both become decomposed. It is distinguished by the property of dissolving gold.—*Royle*

NITRON, Potasse nitras, Saltpetre.

NITURI or Katou niruri, Phyllanthus multiflorus.

NITYAMALLE or Adavi nitaya mallee, Hibiscus hirtus, L.

NITYANANDA, SANS., from nitya, constant, and ananda, joy. See Chaitunya.

NIU-JU also Niu-nai, CHIN. Milk.

NIU, HIND. Alnus, sp.

NIUMA, HIND. Brassica rapa.

NIUNKAR, HIND. Brassica, sp.

NIURTSI, HIND. Artemisia sacrorum.

NIUSKAR, HIND. Brassica, sp.; Kharnub nubti, HIND., is Ceratonia siliqua.

NIVARI DHANYAMU, TEL. Oryza, sp.

NIVERTTI, see Nibutti.

NIVESAM, TAM. Nivesanam, TEL. a ground of 2,400 feet square of ground.

NIYAL, HIND., of Kangra. A weasel.

NIYAZBO, HIND. Ocymum basilicum.

NIYAMA, SANS. A resolution.

NIZAM, the title of the mahomedan ruler of the kingdom of Hyderabad in the Dekhan, a sovereign, with a British resident at his court. The country of the Nizam is now

smaller than it was in the middle of the 18th century. By the treaty with the British Government of 1759, he ceded Masulipatam and other districts; by the treaty of 1766, the Northern Circars, and by the death of its jagheerदार in 1788, the Guntoor Circar. The authority of the founder of the State of Hyderabad at one time extended from the Nerbudda to Trichinopoly and from Masulipatam to Beejapoor. Orme makes it still larger—"in a line nearly north and south from Berhampoor to Cape Comorin, and eastward from that line to the sea." The area of the country the Nizam now holds is computed to be 95,337 square miles. It lies between the 15th and 21st degrees of north latitude, and the 75 and 82 degrees of longitude, forming a lateral square of more than 450 miles each way. This tract is traversed by the Krishna with its feeders, the Beema and Tumhoo-dra, the Wurda and its tributaries, and the Godavery with its tributary streams of the Doodna, Manjera, and Pranheeta. This country of the Nizam, called Hyderabad after the capital, is three times larger than either Mysore or Gwalior—the next two large powers with whom the British have subsidiary treaties, ten times larger than Holkar's country, Indore, and almost as large as both Nepal and Cashmere together—the two independent powers in alliance with the British. The modern Dekhan comprises most of Telingana, part of Gondwana, and that large portion of Maharashtra which is above the western range of ghauts, and which extends from the Nerbudda to the Krishna. Hyderabad in the Dekhan is commonly used in contradistinction to Hyderabad in Sind. This country of the Nizam consists of elevated tableland, never less than 1,800 feet above the level of the sea, and it has always been populated: for it long formed a large part of Telingana.

Assuming the title of Asoph Jah, Nizam-ul-Mulk crossed the Nerbudda at the head of 12,000 men. The fort of Asseerghur was given up to him by Jalib Khan for a sum of money. Soon after, in the month of October 1723, he took an opportunity, on pretence of going on a hunting excursion, to depart for his vice-royalty in the Dekhan; and from that time, although he always professed obedience to the emperor, even when waging war against him, Nizam-ul-Mulk became wholly independent; and the countries south of the Nerbudda, the conquest of which had engaged the Mogul princes in much more than a century of wars, were torn for ever from the throne of Delhi. After the battle of Shukurkhara, Nizam-ul-Mulk had fixed his eye on Hyderabad—the ancient capital of the Kootub Shahce kings—as fitted for the seat of government of the independent sovereignty which he himself had

founded; and it was very desirable for this purpose to remove the Maharatta collectors from that quarter on any terms.

One of the traditions of the Nizam's ancestry is that the family is of Tartar origin, and claims descent from Baha-ud-Deen—a person much celebrated for his devotional zeal as well as for the austerity of his life. He took the appellation of Khajeh Nakshbund, and was the founder of the order of Nakshbundee Dervises which still prevail in India, Turkey and Tartary. His descendants to this day generally prefix the word Khajeh to their names, and distinguish themselves by the appellation of Nakshbundee. Khajeh is a term of honour usually applied to persons who are eminent either for their sanctity or learning. The literal meaning of Nakshbund is fixing an impression; and the term was figuratively adopted by Baha-ud-Deen. Nizam-ul-Mulk was the Pugri buddul Bhae, or 'turban-exchanged brother,' of the Hara prince. When Asoph Jah, Nizam-ul-Mulk died in A. D. 1748, he was 104 years old. He left five sons; Ghazi-ud-Deen, Nazir Jung, Salabat-Jung, Nizam Ali and Basalat Jung, of whom, the second son Nazir Jung succeeded. For centuries an intermittent war had raged between the great Moguls at Delhi, and the mussulman princes of the Dekhan. Every disaffected chieftain in the court of the Mogul, every rebellious prince and every statesman under a cloud, sought to make his way to the Dekhan, where he might at least find a refuge from his enemies if not the means of revenge. At last the Moguls established a grand army in the Dekhan, which became famous in the reigns of Shah Jehan and Aurungzeb. That army became the school of all the great Mogul warriors of the time; of men who not only achieved the conquest of the country but who were subsequently nominated to high military command as subahdars and nabobs; and who subsequently established their real independence in their own provinces, and left the Mogul power at Delhi to fall in pieces before the destroying hands of Mahrattas and Affghans. Foremost amongst these men was the ancestor of the Nizam of the Dekhan. His first title was Asoph Jah, but he is better known by his second title of Nizam-ul-Mulk, or 'Regulator of the State.' The life of this man extended over the extraordinary period of an hundred and four years, and the events with which it was crowded would fill volumes. He was born in 1645, about the time when Shah Jehan was carrying on the conquest of the Dekhan, and when, as we may say, Charles I. was still waging war against his Parliament. He was a youth when the sons of Shah Jehan were waging that terrible war against each other which ended in

the succession of Aurungzeb. Up to his middle age he himself was engaged in the wars both against the Mahrattas and against the musulman kings of the Dekhan; and when Aurungzeb finally brought the conquest of the Dekhan to a close about 1688, Asoph Jah was forty-three-years of age. The first subadar, or viceroy of the Dekhan, was however Zu-ul-fikar Khan, a son of the vizier of Aurungzeb; and he was succeeded by Daoud Khan, the same who besieged Fort St. George in Governor Pitt's time. After the death of Aurungzeb in 1707, the power of the Great Mogul began to decline. Asoph Jah, though fast verging on three score years and ten, was deeply engaged in all the intrigues of the period. This resulted in his obtaining the government of the Dekhan under the name of the Nizam-ul-Mulk; and in his making himself virtually independent of the Great Mogul, his government was not limited by the Kistna, but extended southward to the frontiers of Tanjore; and it would seem that he nominated the nabobs of the Carnatic at will. The aged warrior and statesmen at last sunk into his grave in 1749, aged 104 years. The Nizams down to our own time have been:-

Asoph Jah,	ob. 1749	Nizam Ali,	ob. 1803
Nazir Jung,	1750	Secunder Jah,	" 1829
Mozuffir Jung,	1751	Nasir-oo-Dowlah "	1857
Salabut Jung,	1762	Ufzool-oo-Dowlah,	1868

Nazir Jung was feebly supported by the British; Mozuffir Jung and Salabut Jung were strongly supported by the French. On the death of Asoph Jah, 1749, the British were mere merchants, who had only recently regained possession of their settlement at Madras, after two years' occupation by the French. On the imprisonment and death of Salabut Jung in 1762, the English had gained the complete ascendancy over the French, had captured Pondicherry, and established their own nabob Mohammed Ali on the throne of the Carnatic. All the three immediate successors of Asoph Jah died a violent death. Nazir Jung was shot through the heart by a rebellious noble. Within a year Mozuffir Jung shared his fate. Salabut Jung ruled the Dekhan for ten years, during the greater part of which he had a French army near his capital, nominally as his allies; but who really were regarded with all the jealousy and hatred which were subsequently displayed by Native courts towards the British subsidiary forces. The overthrow of the French in the Carnatic was accompanied by the withdrawal of all French interest from the Dekhan, and laid Salabut Jung open to the intrigues of his brother Nizam Ali, to which he fell a victim about 1762. Nizam Ali, in the beginning of his reign, came into conflict with the British respecting the Northern Circars. The great Mogul at that time was the wretched fugitive Shah Alum II, who had already become little more than a

pensioner of the British. Clive obtained from him a grant of the Northern Circars, which then formed part of the territories of the Nizam. In return the Nizam invaded the Carnatic and in a treaty, the British agreed to pay a rent for the possession of the coveted territory; many years afterwards the British occupation of the Northern Circars was a sore point with the Nizam. The two great events which brought Nizam Ali and the British into contact and collision, were the wars against Mysore and the wars against the Mahrattas. It was the Marquis of Wellesley who established the relations between the Nizam and the British on their present basis; and who initiated that political status of subsidiary alliances which has continued with but little alteration down to the present day. By this system a native sovereign was led to agree to receive a British Resident at his Court, and to receive and maintain a British subsidiary force within his dominions. This system was carried out with the Nizam of the Dekhan in 1798 and 1800. It was also tried on the sultan of Mysore; but Tippoo flamed up at the idea of becoming a pensioned prince, and the result was his own overthrow and the establishment of a dependent rajah in his room. Then it was tried on the Peshwa of the Mahrattas, and would also have been tried on Sindiah and Holkar, had not Wellesley been re-called and Cornwallis sent out in his room. This system was subsequently extended to the whole of the Native States, and belongs to the general history of India. By this arrangement Nizam Ali was compelled to give up his French force, and to become really dependent on the British power. He died however in 1803, very shortly after the change.—*Tod's Rajasthan*, Vol. ii, p. 509; *Rennell's Memoir*, p. 22; *The Nizam, his History and relation with the British Government*, by Henry George Briggs, Secy., Bom. Municipality.

NIZAMI, a celebrated Persian poet who died in A. H. 576 or A. D. 1180, he compiled his *Sekander Nameh* or "History of Alexander," from Jewish, Christian and Pehlavi records; by which we may suppose him to mean Hebrew, Greek or Latin, and old Persian manuscripts.—*Ouseley's Travels*, Vol. ii, p. 362.

NIZAMUT ADAWLUT, see Prinsep.

NIZAM UT TUARIKH, a historical work by Baizavi on the Asian monarchies, a general History of the Ghaznavide rulers.

NIZAM UD DIN AOIA, is a spot near Delhi where visitors used to witness some excellent feats performed by a number of swimmers who jump into a large reservoir from a dome about fifty or sixty feet above the surface of the water.—*Tour in India by French*, p. 11.

N'MO-N'MA, a salutation in Western India, between brahmins.

NOAH, the Nuh of the Arabs. See Kush or Cush, Raja Taringini, Persian kings.

NOALEE-LYENG, BURM. In Tavoy, a close-grained, strong, heavy wood; useful for handles.—*Dr. Wallich.*

NOBLE CHAMOMILE, ENG. *Anthemis nobilis*, *Linn.*

NOBLE HORSE-SHOE BAT, see *Cheiroptera*.

NOBLE OPAL, see *Opal*.

NOBUT, a kettle drum; the use of this amongst the Malays, is confined to royalty, and even then they are used only on occasions of state. In the regulations for the government of Malacca in the 11th Annal it is laid down that when it is necessary for the Laksmana to be in attendance the Nobuts ought to be present, the term, "to confer Nobuts," means to give one the government of a country with the rights of royalty. The nobut-khanah or saloon for the martial or royal band is usually placed over an arched gateway. Amongst the mahomedan rulers of British India, the right to the Nobut is granted to their nobles.—*Jour. Ind. Arch., No. 8, Vol. v, Act 1851.*

NOCE-MOSCADA, Ir. Nutmegs.

NOCTILIONIDÆ, a family of mammals, of the sub-order *Cheiroptera*, as under:

Fam. Noctilionidæ.

Sub-fam. Taphozoinæ.

Taphozous longimanus, *Hard., Blyth.*

T. brevimanus, *Blyth.* *T. fulvidus*, *Blyth.*

T. cantori,

The long-armed bat of all India.

Taphozous melanopogon, *Temm., Horsf.* The black-bearded bat of Canara, Malayana.

Taphozous saccolaimus, *Temm., Blyth.*

T. crassus, *Blyth.* | *T. pulcher*, *Elliot.*

The white-bellied bat of Madras, Malayana.

Taphozous bicolor, *Temm.* *E. Indies?*

Taphozous emballonura, from Java.

Sub-fam. Noctilioninæ.

Vespertilio plicatus, *N. dilatatus*, *Horsf.*

Buch., Bly. *N. tenuis*,

N. bengalensis, *Geoff.* | *N. plicatus*, *Jerdon.*

Cheiromeles torquatus, of Java. The wrinkled lip-bat of Madras, Calcutta. See *Mammals*.

NOCTILINEALABIATA, see *Cheiroptera*.

NOCTILINEA MALACCENSIS, see *Cheiroptera*.

NOCTURNÆ, a tribe of birds as under:

Tribe II.—Nocturnæ.

Fam. Strigidæ.

Sub-fam. *Atheninæ*, 2 gen., 9 sp., viz., 1 *Ninox* *scutatus*; 8 *Athene*.

Sub-fam. *Syrniinæ*, 1 gen., 3 sp., viz., 3 *Syrnium*, *Indrani*, *Sinense* and *Nivicolum*.

Sub-fam. *Striginæ*, 3 gen., 3 sp., viz., 1 *Phodilus*, *badius*; 2 *Glaux* *flammea* and *Javanica*.

See *Birds*.

NOCTULINIA LASIURA, *Hodgson.* Syn. of *Lasiurus pearsoni*, *Hors., Bl.*, also *Murina* *suillus*, *Jerd.*

NODDING CLERODENDRON, ENG. *Clerodendron nutans*.

NODDING-FLOWERED ALPINIA, ENG. *Alpinia nutans*, *Roscoe.*

NOELHA-TAHLI-MARM, TAM. *Antidesma bunias*, *A. alexiteria*, *Nocha-tali pattay*, the bark; *Noelha tali pallum*, the fruit.

NOEL-VALLI and Panni-Valli, *Dalbergia scandens*.

NOERALA MARA, CAN. *Syzygium jambolanum*.

NOFR-ATMOO, one of the gods of ancient Egypt; he bore the lotus on his head.

NOGAI, a Tartar race settled in the city of Bokhara, who migrated from Russia.

NOGAON, a town in Central India. See *Nowgaon*.

NOHLÆ-TALI, *Antidesma alixaterium*.

NOIR DE CORDONNIER, FR. Blacking.

NOIR DE FUMÉE, FR. Lamp black.

NOISETTES or Aveilenes, FR. Hazel nut.

NOIX, FR. Walnuts.

NOIX D'ACAJOU, FR. The nut of *Anacardium occidentale*, *Linn.*, cashew-nut.

NOIX DE GALLES, FR. Galls.

NOIX VOMIQUE, FR. *Nux vomica*.

NOIYAYIKA, SANS. A follower of the Nyaya philosophy.

NOKI, HIND. From nok a point, the pointed-shaped peach.

NOKI-TAMAKU, the pointed-leaved variety of tobacco.

NOLAI TALAI MARAM, TAM. *Antidesma bunias*, *Spr., Syst. Veg.*

NOLANACEÆ, *Lindl.*, an order of plants, comprising 1 genus and 4 species of *Nolana*. *Nolana grandiflora* is a trailing annual with white, yellow and blue flowers, easily raised from seed, in any garden soil.—*Riddell.*

NOLE-COLE, or knol khol, a vegetable, must be sown exactly as cabbage, brocoli, &c. It comes in early and remains in season until April. If watered during the hot weather and taken care of, it will, when the rains commence, throw out sprouts, and form other knole-cole on the old stalk, which may either be used or slipped off and planted: they will not be so fine as those raised from seed, yet are fit for use.—*Jaffrey.*

NOLIKA or Loluga, TEL. *Pterospermum heynianum*, *Wall.*

NOLI ME TANGERE, *Impatiens balsamina*.

NOLI TALI MARAM, MALAYAL, TAM. *Antidesma alexiteria*, *Linn.*, *A. bunias*.—*Spr. Syst. Veg.*

NOMADE, a term by which are designated the shepherd tribes of Central and Southern Asia, who migrate from place to place at seasons of the year, to obtain forage for their flocks. The Persian word 'numud', or 'felt,' of

which the tents of the wandering tribes of Central Asia have always been and still are composed, have supplied the root to the word *νομαδικος*. The nomad tribes of Turkoiman, are the representatives of a family which has existed from times anterior to history, and exist at the present time in the immense steppes of Tartary. The Turkoman, out of whom the Turks of the towns and cities of Southern and Western Asia sprung, were, apparently, those of the Persian frontier, the ancestors of the present Yamud, Goklan, Tekke, and Ersan tribes, who lie along the frontier of Persia from the Caspian to the south-western feeders of the Oxus. Except on the valley of the Attruk, where they have developed an imperfect agriculture, more akin to gardening than to farming, they are nomades, with no towns, with more tents than houses, and with pre-eminently predatory habits, as the Persians of Khorasan and Asternabad know to their cost. Unrivalled riders, with a breed of horses that will endure any hardship they are infamous for their forays; and, as they have a great robbing-ground to the south where the occupants are other than Turk, they are more incorrigible plunderers than even the central Kirghiz and Usbek. When settled in more favourable localities they are slow to lay aside their original habits. So far as they are mixed in blood, it is the Persian element that has mixed. Such are the Turkomans. A true picture of Iliyat nomad life is expressed in Isaiah xl, 11, "He shall feed his flock like a shepherd: he shall gather the lambs with his arm, and carry them in his bosom, and shall gently lead those that are with young." As the Iliyat move along, the women are seen with their spinning-wheels on their shoulders, some twisting woollen yarn, others bent forward, and advancing slowly with their children astride on their backs, clasping their little arms around their mother's neck, and twisting their little legs round her waist: the smaller ones are usually tied up in a bag behind the back, while infant babies, together with their clumsy cradles, are hoisted on the heads or shoulders of their fond mothers, sinking under the weight. An Iliyat tribe whom Baron de Bode met, belonged to a Lur stem, which was transplanted into Fars by Aga-Muhammed Khan, the uncle of the late Fath-Ali-Shah, from Luristan Kuchuk. After his death, many returned to their primitive encampments in the Zagros chain, but some remained behind. The word Iliat or Ilat, is derived from Eol, "a tribe." It is also expressed by Zem or Zim, which Ibn Haukal explains by the equivalent Arabic, Kabilah. Many of the nomades met with by Vigne were of a sickly complexion, attributed to the pernicious alkaline quality of the water. The diseases to which they were most subject

were fevers, cutaneous and nervous disorders, and especially blindness. The Dhangar or shepherd race of the peninsula of India are its sole nomade people, but their movements are restricted to the forest and open tracts. The nomades of S. Asia, on the contrary move for some hundred miles to the warm and arid lands. Residents of British India who have witnessed a large Banjara camp migrating, will have seen a true picture of the nomade life of Central Asia. Turanian, Nomadic or Allophyllan are names applied by Pritchard to all languages not belonging to the Arian or Semitic, and which comprise all languages spoken in Asia or Europe not included by him under the Arian and Semitic families, with the exception perhaps of the Chinese and its dialects: These are,—

Tungus, Mongol,	Turki, Samoiède,	Finn.
--------------------	---------------------	-------

The writers on this class of tongues are Rask, Klaproth, Schott, Castren, and Muller. But Muller admits that the characteristic marks of union, ascertained for this great variety of languages are as yet very vague and general, if compared with the definite ties of relationship which severally unite the Semitic and Arian. The Turanian languages occupy by far the largest portion of the earth, viz., all but India, Arabia, Asia Minor and Europe, but except agglutination there is not a single positive principle, which can be proved to pervade them all. It has points of affinity with the languages of Africa and America and even with the Chinese.—*Essay on the Origin of Language*, by F. W. Farrar, A.M., London, 1860; *Latham, Nationalities of Europe*, Vol. ii, p. 70-1; *Baron C. A. De Bode's Travels in Luristan and Arabistan*, pp. 118-19-255; *Onsley's Travels*, Vol. i, p. 307; *Vigne's A personal Narrative*, p. 83.

NOMORCHI, LEPCH. Decaisnea.

NOMRI, HIND. A fox, see Lumri, Noomri.

NOMURDI, a tribe in the hill tract on the western side of the Indus. In Rennell's time they were very troublesome to the villagers and travellers. The Ayin Acbaree names this tribes' strength about the year 1560, as 7,000 infantry, and 300 horsemen. This being a part of the tract named Indo-Scythia by the ancients, a doubt arises, whether they may not be the descendants of the Scythian Nomades, if the Scythians; on the borders of mount Imaus, did really call themselves by that name, and that it was not a term applied to them by the Greeks alone.—*Rennell's Memoir*, p. 185.

NONA, MALAY. Anona reticulata, Bullock's heart.

NONCHA, HIND. Portulaca oleracea.

NONEA ROSEA, one of the Boraginæ, a plant of no great beauty, may be raised in common garden soil.—*Riddell*.

NONGOLIAH, URIA. *Conocarpus latifolia*, Roeb., *W. & A., W. Ic.*

NONGYA-CHOR, BENG. *Felis tigris*, Linn.

NONNUS, see Yavana.

NONPAREIL, see Capers.

NOOCHIE OIL, ANGLO-TAM. Oil of *Vitex negundo*.

NOOLSHIMA, NEPAL. *Ehretia serrata*, Roeb.

NOOGA-GASS, SINGH. *Ficus laccifera*, Roeb.

NOOLI-TUDDA, TEL. *Helicteres isora*, Linn.

NOOMRI, DUK. *Vulpes bengalensis*, Shaw, the fox.

NOOMRI, Loomri or Looka, all of which mean fox, a sub-division of the Baluch race. These are the Nomadies of Rennell.—*Tod's Rajasthan, Vol. i, p. 62.*

NOONA BARK, of *Morinda umbellata*, yields the Noona dye famous in Tanjore, where the plant is grown in large quantities, the colour is red but not so bright as that extracted from the Imboora, which is exported to Madura and with it the famous Madura turbands are dyed.—*M.C.C.*

NOONBORA, BENG. *Ionidium suffruticosum*.

NOON-DAB, HIND. From Noon or loon, salt, and dabna, to dip, bespatter, or sprinkle, a custom among the Rajput races, of dipping the hand in the salt; the Noon-dab, is the most sacred pledge of good faith. It has had recourse to, to increase the solemnity of an occasion and to banish all suspicion of treachery, as well as to extinguish ancient feuds, and reconcile chiefs who had never met but in hostility.—*Tod's Rajasthan, Vol. ii, p. 409.* See Munwar-piala.

NOONIAREE, Looniaree or Noononea, URIA. A common tree of Ganjam and Gumsur, of extreme height 36 feet, circumference 4 feet, and height from the ground to the intersection of the first branch 7 feet. Used for firewood and ploughshares. The bark is employed medicinally.—*Captain Macdonald.*

NOONYA, BENG., HIND. *Portulaca oleracea*, and *Atrana scandens*.

NOORPOOR, see Kohistan.

NOORZYE, see Affghan.

NOOS, see Adam.

NOOSHKY, is on the borders of the Scistan desert. See Kelat, Nushki.

NOOTKANEE, see Khyber.

NOPHEE, HEB. Emerald. The Nophek of the Old Testament, translated emerald, seems to have been a carbuncle or *avopax*, but under this term, the ancients included all gems of a red colour, such as hyacinths, rubies, garnets. At present the carbuncle is a gem manufactured from the garnet. The carbuncle, in Hebrew, Barakat, signifying flashing stone, or lightning stone, was supposed to fall from the clouds amid flashes of lightning. Carbuncles of superior brilliancy are called "males," and those of superior colour, females.

NORAY COONGILLIUM, see Dammar.

NORD CAPER WHALE, or Nord kapper whale, variety of *Balena mysticetus*.

NORFOLK ISLAND PINE, *Araucaria excelsa*, grows also in New Caledonia, Botany Island, Isle of Pines; it is a majestic tree growing to the height of from 60 to 228 feet, with a circumference of 30 feet. Its wood is useful for carpenters' in-door-work but is too heavy for naval purposes as spars.

NORFOLK ISLAND GRASS TREE, *Freyinetia baueriana*, belongs to the Pandaneæ or Screw pines. Its stem is marked by rings, like those of the cabbage where the old leaves have fallen off, and it lies on the ground, or climbs like ivy round the trees. The branches are crowned with crests of broad sedge-like leaves, from the centre of which the flowers arise, the petals of which are a bright scarlet, and the sepals green, and, when they fall off, clusters of three or four oblong pulpy fruit, four inches in length, and as much in circumference, appear.—*Keppel's Ind. Arch., Vol. ii, p. 284.*

NORIMON, an oblong box, used in Japan as the palanquins in India, carried by means of poles passed through iron loops on either side. There are many kinds of norimon. The Governor has one kind, the priests another, the doctors a third, and, with decisive marks which distinguish the "norimon" of the great from the "kako" of the humble. The norimon in Japan, is what the palkee is in India and chairs in China. They always look as if one side of a pair of flat square scales (such as are seen near stone quarries, or on wharfs) had been run on a pole, and if for a big man, are covered with curtains, if a common hack norimon, it is left in its original naked ugliness and discomfort. The occupant must sit cross-legged, and even then, can hardly raise his head.—*Hodgson's Nagasaki, p. 202; Frere's Antipodes, p. 431.*

NORMAN, CHARLES, General, c. n., was Acting Adjutant-General of the Bengal army: when serving before Delhi, both pen and sword were ever in his hand, and to those who knew him then and fought beside him, his name will be inseparably connected with Metcalfe's ruined home, and that intrenched position on the heights commanding Delhi where Hindu Rao once lived. In the amalgamation it was his plan of establishing a Staff Corps that was followed, and the immediate pressure was removed, but the real difficulties of the situation were increased ten-fold, and after six years of, for an army, demoralization and anxiety, only in 1867 was some conclusion come to, but even then leaving the whole of the officers utterly disassociated. In practically endeavouring to obliterate all former service, claims and regimental pride, the government pursued an un-

wise policy, calculated to estrange the army.
—*Thurlow*, pp. 26, 27-28.

NORMAN FRENCH, see Hindoo.

NORNE of Tavoy, *Castanea martabanica*.

NOSHADAR, HIND. Hydrochlorate of Ammonia, Sal-ammoniac.

NORTH ARCOT, a revenue district of the Madras presidency, embracing a portion of the country with peoples speaking the Telugu and Tamil. It is rich in iron, ore and minerals. Kurse Mungalum near Vellore has a stone called Muddy Sagapoo Culloo, a brown steatitic sandstone. Baulapilly near Arcot has grey Chert for paving porcelain mills. Chumbaukum-droog, has a quartzose rock suited for paving porcelain mills. Ennore grit, is a nodular, bluish gritty limestone from the bed of the Pulicat Marine Lagoon. Trichoor has a brownish sandstone. Muddoor, Arnee, bluish grey sandstone suited for grindstones. Triputtty and Kurumbady, yellow red and purplish sandstones.

NORTHCOTE, Sir STAFFORD H., an enlightened statesman, for many years Secretary of State for India. He gave every support to the progress of railways, canals, channels of irrigation and sanitation.

NORTH CANARA, a Bombay revenue district in the country on the sea coast of the western side of the peninsula of India. With the exception of the transfer of North Canara from Madras to Bombay and the addition of Sindh to Bombay on the conquest of that province, these presidencies have retained very nearly their original limits, including the provinces conquered from the Peshwa and Guikwar between 1800 and 1818.

NORTHERN CIRCARS. This Madras district comprises a narrow tract of land extending (between 16° and 20° N. latitude) from the sea coast on the eastern side of the peninsula to the eastern ghauts by which it is separated from the great table-land. It is a tolerably level district, with occasional spurs from the ghauts approaching the sea coast; has little or no natural wood, except towards the ghauts, the sides of which are in some places clad with thick jungle of bamboos and forest trees, and, with the exception of large groves of palm trees, has but little wood throughout it. This district is perhaps hardly separable from the Carnatic by its physical features alone, but the difference of latitude, causing a change in climate and a greater variation of temperature, perhaps authorise its separation. It has a small body of native soldiers in the towns of Waltair, Berhampore, Sumbulpore, Vizagapatam, Vizianagram, Cuttack and Samulcottah.

NORTHERN INDIA, a term by which, in British India, the provinces about Oudh and Delhi are designated.

NORTHERN LAPLANDERS, see India.

NORTHERN MEDIA, Northern parthia, see Arians.

NORTHERN SPERM WHALE, *Catodon macrocephalus*.

NORTH MALABAR, see Kummaler.

NORTH SEA, see India.

NOR-WESTERS, occur in lower Bengal in March and April, accompanying most refreshing falls of rain. The season of the north-westers, is, above all others, that which requires the most attention and care by voyagers on the Ganges. Should one of those squalls approach, and no creek or inlet offer for shelter, when in the wide rivers, there is much danger.—*Rennell's Memoir*, p. 361.

NORTH-WEST PROVINCES of INDIA, a provincial subordinate government of British India, including the Doab or Mesopotamia of the Ganges and the Jumna. The provinces lie along the middle and upper course of the Ganges, and extend to the skirts of the Himalaya. These provinces are between L. 30° 7' and 23° 51' N., and L. 77° 4' and 84° 40' E. They are bounded on the north by the snowy range, the Himalaya, Kumaon, Oudh and the Nepalese Terai; on the south by the Saugor district of the Central Provinces, and the Native States of Bundelkand and Rewah; on the west by the river Tonse, until its junction with the Jumna, thence by the Jumna till the 28th degree of latitude; on the south-west by the Native States of Gwalior, Dholpore and Bhurtpore; and on the east and south-east by the Sarun, Shahabad, Behar and Palamow districts of Lower Bengal. The North-western Provinces contain 36 districts, of which 35 are grouped into 7 commissionerships. The "non-regulation" portions are Kumaon and Gurhwal to the extreme north, Jhansie to the south-west, and Ajmere; which is separated from the western boundary by several intervening Native States. This last division from its isolated position, requires distinct demarcation. It lies to the west, extending between L. 22° 16', and 27° 45' N., L. 71° 45' and 77° 22' E. It is bounded on the east by the Rajpoot States of Kishengurh and Jeypoor, on the north and west by Jodhpore, and on the south by the territory of Odeypoor. The Ajmere division comprises Ajmere proper and Mairwarra. The Mairwarra tract belongs in unequal portions to the British Government, to Mewar or Odeypoor, and to Marwar or Jodhpore. The Mewar possessions consisting of three Pergunnahs, and the Marwar of two, were made over to the direct management of the British in 1822-23. Benares is the most thickly peopled district. The density stands at 797, or, including the military and railway, 803, per square mile. Looking at its 30 millions of people according to creed, nearly 26 millions are hindoos and 4½ mahomedans. Mahomedans form about

NORTH-WEST PROVINCES.

a sixth of the whole population, there being only 100 to every 600 hindoos. They are most numerous in Meerut and Rohilkund, where they comprise nearly a fifth of the population; more than half of the entire number of the mahomedans in the North-west Provinces, viz., 2,197,202 out of 4,243,207, reside in those northern districts. The numbers of the different creeds are :

<i>Christian</i> —30,501.	<i>Mahomedan</i> —4,105,200.
European ... 21,831	Not classified ... 2,207,576
Mixed ... 3,968	Sheikhs ... 1,140,203
Native ... 4,702	Pathans ... 515,426
	Syuds ... 170,248
	Moguls ... 41,748
Buddhist & Jain ... 75,629	<i>Hindoo</i> —25,071,819.
Parsee ... 120	Brahmins ... 3,451,692
Sikh ... 1,425	Kshatryas ... 2,827,768
Other religious sects ... 195,977	Vaisyas ... 1,091,250
	Soodras ... 18,304,309

The aborigines are returned as 313,215, and seem to be mixed up with the other sects. The numbers of men and boys exceed those of the women and girls.

The intense desire of all the hindoos of India, on religious grounds, is for a son. The boy is reared with care not shown to the girl. The girl is exposed to chances productive of greater female mortality, being married the moment she attains the age of puberty, bearing children at 12 and 13, subject to a sedentary and listless life in the zenana, or one of hardship in the fields, and treated oppressively as a widow. Two-thirds of the population are engaged in agricultural pursuits. The avocations are :

Soldiers ... 20,454	Bards and acrobats ... 3,733
Priests ... 176,701	Servants ... 1,113,987
Pundits ... 40,344	Water-carriers ... 154,622

NORTH-WEST PROVINCES.

In 1865, the North-west Provinces had 361 to the square mile, excluding Kumaon: the mass of the population are cultivators of the soil. By the revenue settlement of 1833, the Government rent was fixed for 30 years. Its chief towns are Agra, Cawnpore, Allahabad, Benares and Delhi.

The non-regulation portions are Kumaon and Garhwal to the extreme north, Jhansie to the south-west, and Ajmere, which is separated from the western boundary to several intervening native states. This last division from its isolated position requires distinct demarcation. It lies to the west, extending between lat. 22° 15' and 27° 45' N.; long. 71° 45' and 77° 22' E. It is bounded on the east by the Rajpoot States of Kishenghur and Jeypoor; on the north by Jodhpur and on the south by the territory of Oudeypur. The Ajmir division comprises Ajmir proper and Mairwarra. The Mairwar tract belongs in equal portions to the British Government, to Mewar or Oudeypur and to Marwar or Jodhpur. The first attempt to take a census of the N. W. Provinces was made on the night of the 31st December 1852, and the next attempt was made on the 10th January 1865. Benarese is the most thickly-peopled district, its density being 797 to the square mile, or, including the military and the railway bodies, 803. The most thinly-populated districts are in the Kumaon division, where the density averages 58 to the mile. Large tracts of Gurhwal are thickly populated where the situation is favourable, the cultivation may often be seen stretching high up the hills, terrace after terrace. Of the districts in the plains, excluding the Terai, Lullutpur in the Jhansi division is the most sparsely populated, the average to the square mile being only 127 persons. Ajmere with its population of 160 to the mile comes next, and in density approaches very near to Switzerland, which it slightly exceeds. Of the remaining districts, twenty-nine in number, five an average density of between 200 and 300 persons to the mile; three between 300 and 400; eleven between 400 and 500; seven between 500 and 600; two between 600 and 700, and one about 800. The extremes of density in the sub-divisions into which the districts of the N. W. Provinces are divided, vary from 6,773 to the square mile in the Dehat Amanat of Benares, which comprise the city of that name, to 37 to the square mile in Agoree, Roberts-gunj, in the Mirzapur district. The population of the N. W. provinces is equal to that of Great Britain and Ireland and equal to that of the Madras presidency. Its mahomedan population is a sixth part of the hindoo. Christians are in 1,000 of the population :

NORTH-WESTERN HIMALAYA. When the British conquered the Panjab, or valley of the five rivers, they found a traffic already in existence between Central Asia and the Punjab. For ages past, the hardy Toorki trader had brought his churrus, pushum and turquoises from beyond the Karakorom passes and had taken back opium, dyed cloths and trinkets. Yarkand was under its native sovereigns, and Cashmere and India were ruled by mahomedan potentates. The intervening territory of Ladak was mildly governed by a Thibetan chief owing a nominal fealty to L'hassa. All was well. Subsequently Cabul took Cashmere, a revolution passed over East Toorkistan and the Chinese became its rulers. After that Cashmere, and subsequently Ladak itself, came, under the Sikh sway; but the trade of centuries could not die out in a day. The heaviest imposts were laid on the traffic. The trade with China was fostered and had displaced to a great extent the traffic with India. The Russian fairs began to attract traders. The trade with India would have been entirely ruined, but that the British had approached the furthest confines of North India, British officers appeared at distant places like Ladak, and the trade began to revive. Gradually the line of traffic began to turn east and to pass into the Punjab by Kooloo. The difficulties in the old routes are very great. On every high pass in the interior of the great Himalaya there are spots marked by bleaching bones, where hundreds, attempting to cross late in the season, have been overtaken by a storm and buried beneath the snows. Beyond Khoksur there is the old road, not one mile of which is free from the most serious obstructions and dangers. From Koolloo to Bajoura, south, the road is excellent. The Bajoura pass rivals the Rotang pass in its difficulties. The ascent from the north, especially, is dangerously steep and abrupt, and in some parts nearly impassable. The dāk route from Simla to Kangra, Dhurmalla, Dalhousie, Jummoo and Cashmere, which passes through Mandi, is the very worst of all made or unmade hill roads. After passing along the beautiful roads in the valley of the Sutlej, by Belaspoor and Suket, the road beyond Mandi becomes impassable. The continuation pierces the Kangra valley, runs through the tea dens at Holta. From Kangra the road passes either to Noorpoor, Puthankote, and thence to Umritsur on the west, or on the south through Harpoor to Jullunder and Loodiana. Another road south-east from Koolloo (at Bajoura) unites it to Simla: after Ladak and Srinugger, Koolloo is the place of largest traffic for the trade of Central Asia.

The other main course of traffic that the British Government has been opening up, is the great Thibet road. Proceeding north and north-

east from Simla up the Sutlej valley, 32 out of 52 miles had been opened out in 1865, and two bridges, 140 and 120 feet span respectively, completed. The desert country in which the work has been carried on, may be conceived from the fact that a thousand mules were constantly coming up from and going down into the plains for the food of the working parties. The gradient is a very easy one, and the road, so far completed, is hailed with satisfaction by the natives. The annual snows, however, have broken up some portions, and indeed all hill roads must be constantly supervised and annually repaired. But it is stated that this road is to terminate at Chine, near which British territory ends. The great road from L'hassa via Gartok to Ladak passes not far off, when the Koolloo and Chine routes are all opened out; we may expect a great annual Simla Fair to rival the vast gatherings of Russia. —*Friend of India*, April 20, 1865.

NORTON, JOHN BRUCE, Barrister at Law, for nearly thirty years practising at the Madras Bar, held successively the offices of Counsel for Paupers, Clerk of the Crown, Government Pleader, Law Professor in the University of Madras in Equity, Public Prosecutor and Advocate General. He was a Senator of the Madras University and Member of the Legislative Council for Madras. He devoted much of his time to promote education, and was long the President of Patcheappah's Institution; was a Member of the Torture Commission, and of the Commission on the Administration of Justice and the author of

Norton's Law of Evidence, which attained a 7th Edition.

Norton's Topics of Jurisprudence.

Norton's Educational Speeches.

Norton's Inaugural Lecture on the Study of the Law.

Norton's Madras and its requirements.

Norton's Administration of Justice in India.

Norton's Leading Cases on Hindoo Law.

Norton's 'Nemesis,' and 'Memories of Newton.'

Norton's Rebellion in India, and how to avoid another. He was appointed

Clerk of the Crown on the 16th June 1845.

Counsel for Paupers in 1847.

Government Pleader on the 1st February 1853.

Professor of Law on the 29th May 1855.

Clerk of the Crown and Crown Prosecutor on the 15th August 1862.

Advocate General on the 2nd June 1863.

NOSCHIATUR, Rus. Sal ammoniac.

NOSE-RUBBING, as a salutation, exists in China, New Zealand and amongst the Lapland alps.—*Max. Muller, Chips*.

NOSHERA, a town on the left bank of the Cabul river, the scene of a great battle between

the Sikhs under Ranjit Singh and the Affghans under Azim Khan, who however, himself, held back from the battle and ultimately fled, and the Affghans were defeated with great slaughter.

NOSHI, Rus. Knives.

NOSH-I-JAN, PERS. A Persian congratulatory salutation, meaning, may it be a drink of life to you.

NOSHIZAD, see Saurashtra.

NOSOWOI TABAK, Rus. Snuff.

NOSTOE EDULE is used in China as food; Gelidium corneum enters, it is said by some, into the formation of the edible swallows' nests of the Japanese islands. Agar-agar moss is shipped from Singapore to the extent of 13,000 tons a-year. Irish moss, Iceland moss, Ceylon moss, and some others, are also of some importance. Iodine and kelp are prepared to a considerable extent from sea weeds; one species, the *Fucus tenax*, furnishes large supplies of glue to the Canton market, and the orchilla weed is of great importance to the dyer. In Siberia, *Nostoe pruniforme* is used.

NOSTRADAMUS gives the following extract from a MS. poem on the virtues of gems, written by Pierre de Boniface in the fourteenth century: "The diamond renders a man invincible; the agate of India or Crete, eloquent and prudent; the amethyst resists intoxication; the cornelian appeases anger; the hyacinth provokes sleep."—*Milner's Seven Churches of Asia*, p. 127; *Simmonds*.

NOTACANTHI, a family of fishes, the genus *Notacanthus* has five species.

NOTELÆA LONGIFOLIA, the "Iron-wood" of Norfolk Island, is used in all wheelwright's work, and is very hard and durable. It is also used for cabinet work, and, when French-polished, it is not excelled by any of the fancy woods—*Keppel's Ind. Arch.*, Vol. ii, p. 283.

NOTOPTERIDÆ, a family of fishes, comprising five species of the genus *Notopterus*.

NOTATION. The decimal system of notation has been shown by Woepcke to have entered Europe from India, through the Arabs. Mr. Burnell supposes the cypher represents the large couly used by Indian astronomers, in the decimal places in the very ancient method of calculation by couries.

NOU, or Nagoo marum, TAM. *Pterocarpus* species.

NOUKA, BENG. *Pontedra vaginalis*, Linn.

NOUKA-KHANDA, SANS., from nouka, a boat, and khanda, a part.

NOURĀTRI. Amongst the Rajputs, on the Nouratri festival, the sword is worshipped, and with them, this imposing rite is sacred to the god of war. The festival commences on the first of the month Asoj. It is essentially a martial rite and, confined to the Rajput, who,

on the departure of the monsoon found himself at liberty to indulge his passion whether for rapine or revenge, both which were necessarily suspended during the rains. Arguing from the order of the passions, we may presume that the first objects of emblematic worship were connected with war, and we accordingly find the highest reverence paid to arms by every nation of antiquity. The Scythic warrior of Central Asia, the intrepid Gete, admitted no meaner representative of the god of battle than his own scimitar. He worshipped it, he swore by it; it was buried with him, in order that he might appear before the martial divinity in the other world as became his worshipper on earth, for the Gete of Transoxiana, from the earliest ages, not only believed in the soul's immortality, and in the doctrine of rewards and punishments hereafter, but, according to the father of history, he was a monotheist; of which fact he has left a memorable proof, the punishment of the celebrated Anacharsis, who, on his return from a visit to Thales and his brother philosophers of Greece, attempted to introduce into the land of the Saccæ (Sakatai) the corrupted polytheism of Athens.

The Nouratri or festival of nine nights, occupying the period from the first to the ninth of the moonlight half of Asoj, is consecrated to the family-goddess, or to Doorga, the consort of Siva. On the 1st of Asoj amongst the Rajput chiefs, the rana of Mewar after fasting, ablu-tion, and prayer, on the part of the prince and his household, the double-edged khanda is removed from the hall of arms (awad-sala), and having received the homage (pooja) of the court, it is carried in procession to the Kishen-pol (gate of Kishen), where it is delivered to the Raj-Jogi, the Mahants, and band of Jogis assembled in front of the temple of Devi 'the goddess,' adjoining the portal of Kishen. By these, the monastic militant adorers of Heri, the god of battle, the brand emblematic of the divinity is placed on the altar before the image of his divine consort. At three in the afternoon the nakarra, or grand kettle-drums, proclaim from the tripolia the signal for the assemblage of the chiefs with their retainers; and the rana and his cavalcade proceed direct to the stables, when a buffalo is sacrificed in honour of the war-horse. Thence the procession moves to the temple of Devi, where the Raja krishen (Godi), has preceded. Upon this, the rana seats himself close to the Raj-Jogi, presents two pieces of silver and a cocoa-nut, performs homage to the sword (karga), and returns. On the 2nd of Asoj, in similar state he proceeds to the Chougan, their Champ de Mars, where a buffalo is sacrificed; and on the same day another buffalo victim is felled by the nervous arm of a Rajput, near the Torun-pol, or trium-

phal-gate. In the evening the rana goes to the temple of Amba Mata, the universal mother, when several goats and buffaloes bleed to the goddess.

On the 3rd, they repeat the procession to the Chougan, when another buffalo is offered, and in the afternoon five buffaloes and two rams are sacrificed to Harsid Mata.

On the 4th, as on every one of the nine days, the first visit is to the Champ de Mars: the day opens with the slaughter of a buffalo. The rana proceeds to the temple of Devi, when he worships the sword and the standard of the Raj Jogi, to whom, as the high-priest of Siva, the god of war, he pays homage and makes offering of sugar, and a garland of roses. A buffalo having been previously fixed to a stake near the temple, the rana sacrifices him with his own hand, by piercing him from his travelling throne (raised on men's shoulders and surrounded by his vassals) with an arrow. Colonel Tod writing in the early part of the 19th century of the reigning rana of his day, says that in the days of his strength, he seldom failed almost to bury the feather in the flank of the victim; but on the last occasion, his enfeebled arm made him exclaim with Pirthi-Raj, when, captive and blind, he was brought forth to amuse the Tatar despot, "I draw not the bow as in the days of yore." On the 5th, after the usual sacrifice at the Chougan, and an elephant-fight, the procession marches to the temple of Asapurna (Hope); a buffalo and a ram are offered to the goddess adored by all the Rajputs, and the tutelary divinity of the Chohan tribe. On this day, the lives of some victims are spared at the intercession of the Nuggur-Set'h, or chief-magistrate, and those of his faith, the Jains. On the 6th, the rana visits the Chougan, but makes no sacrifice. In the afternoon, prayers and victims to Devi, and in the evening the rana visits Bikhari Nath, the chief of the Kanfara Jogi, or split-ear ascetics. The 7th—After the daily routine at the Chougan, and sacrifices to Devi (the goddess of destruction), the chief equeyry is commanded to adorn the steeds with their new caparisons, and lead them to be bathed in the lake. At night, the sacred fire (hom) is kindled, and a buffalo and a ram are sacrificed to Devi; the Jogis are called up and feasted on boiled-rice and sweetmeats. On the conclusion of this day, the rana and his chieftains visited the hermitage of Sukria Baba, an anchorite of the Jogi sect. 8th—There is the homa, or fire-sacrifice in the palace. In the afternoon, the prince, with a select cavalcade, proceeds to the village of Sameena, beyond the city-walls, and visits a celebrated Gosaen. 9th—There is no morning procession. The horses from the royal stables, as well as those of the chieftains,

are taken to the lake and bathed by their grooms, and on return from purification they are caparisoned in their new housings, led forth, and receive the homage of their riders, and the rana bestows a largess on the master of the horse, the equeyries and grooms. At three in the afternoon, the nakarras having thrice sounded, the whole state insignia, under a select band, proceed to Mount Matachil, and bring home the sword. When its arrival in the court of the palace is announced, the rana advances and receives it with due homage from the hands of the Raj-jogi, who is presented with a kelat; while the mahant, who has performed all the austerities during the nine days, has his patera filled with gold and silver coin. The whole of the Jogis are regaled, and presents are made to their chiefs. The elephants and horses again receive homage, and the sword, the shield, and spear, are worshipped within the palace. At three in the morning the prince takes repose. The 10th, or Dussera, is a festival universally known in India and respected by all classes, although entirely military, being commemorative of the day on which the deified Rama commenced his expedition to Lanka for the redemption of Seeta; the "tenth of Asoj" is consequently deemed by the Rajput a fortunate day for warlike enterprise. The day commences with a visit from the prince or chieftain to his spiritual guide. Tents and carpets are prepared at the Chougan or Matachil mount, where the artillery is sent; and in the afternoon, the Rana, his chiefs and their retainers, repair to the field of Mars, worship the kajjri tree, liberate the niltach or jay, as sacred to Rama, and return amidst a discharge of guns. On the 11th, in the morning, the rana, with all the state insignia, the kettledrums sounding in the rear, proceeds towards the Matachil mount, and takes the muster of his troops, amidst discharges of cannon, tilting, and display of horsemanship. And while every chief or vassal is at liberty to leave his ranks, and "witch the world with noble horsemanship," there is nothing tumultuous, nothing offensive in their mirth. The steeds purchased since the last festival are named, and as the cavalcade returns, their grooms repeat the appellation of each as the word is passed by the master of the horse; as Baj Raj, 'the royal steed;' Hymor, 'the chief of horses;' Manika, 'the gem;' Bajra, 'the thunderbolt,' &c., &c. On returning to the palace, gifts are presented by the rana to his chiefs. The Chohan chief of Kotario claims the apparel which his prince wears on this day in token of the fidelity of his ancestor to the minor Oody Sing in Akbar's wars. To others, a fillet or balabund for the turban is presented; but all such compliments are regulated by precedent or immediate merit. Thus terminates

the nouratri festival sacred to the god of war, which in every point of view is analogous to the autumnal festival of the Scythic warlike nations, when these princes took the muster of their armies, and performed the same rites to the great celestial luminary. If we look westward from the central land of earliest civilization to Dacia, Thracia, Pannonia, the seats of the Thyssagetæ or the western Getes, we find the same form of adoration addressed to the emblem of Mars, as mentioned by Xenophon in his memorable retreat, and practised by Alaric and his Goths, centuries afterwards, in the Acropolis of Athens. If we transport ourselves to the shores of Scandinavia, amongst the Cimbri and Getes of Jutland, to the Ultima Thule, wherever the name of Gete prevails, we shall find the same adoration was paid by the Getic warrior to his sword.—*Tod's Rajasthan, Vol. i, pp. 582, 585, 588; Forbes' Ras Mala Hindoo Annals, Vol. ii, p.*

NOWREEA, also known by the name of "Marwaree," have clan correspondents in all parts of India. The Marwarce of Jeypoor regulate the exchange operations of almost all natives in India. About A. D. 1750, a few enterprising traders having heard of the rising importance of Umritsur, and stimulated with the hopes of gain, emigrated from Futtelipoor, Chooroo, Ajmere and Ramghur, and opened a few small shops in Umritsur. By A. D. 1850, the few traders expanded into about 70 large Firms, forming the most influential and notable of the mercantile classes of the city. For wealth, for respectability, none can vie with them. It also happens that their bazaar is one of the most improving, the widest, the best drained, and most prominently situated. They manage their concerns well. Their dealings are entirely wholesale. They seldom appear in law courts. Fraudulent insolvencies are unknown. Pecuniary disputes are adjusted before the elders of their people, and while the elders do their part with much apparent equity, the disputants betray none of the litigant spirit so rife among the retail dealers. An average of six lakhs per month has been quoted as the value of their monthly invoices. Native and foreign merchandize, pushmeena, piece goods, spices, metals, drugs—in these they have nearly the sole monopoly. The dealings of the Nowrcea with the retail dealers are conducted in ready money. Credit to a small extent, is sometimes given to old-established shops. They dabble a little in usury, and sometimes get bitten.—*Indian Field.*

NOW-ROZ. This celebrated festival of the ancient and modern Persians originated in the time of Jamshid. It falls generally on the 21st of March, is coeval with the vernal equinox, and with the Mukhr Saccarant of the hindoo.

This day is observed by the modern Persian, Arab, Turk, Parsee, and several other Asiatic nations, for the computation of the solar year, and for state purposes, such as the collection of the revenue and the arrangement of the agricultural operations of the year. In Persia, the festival is kept up for several days with unusual pomp by all the inhabitants; but in India, among the Parsees, it is simply a day of rejoicing.

The Nowroz or New year's day, amongst the mahomedans, is the day on which the sun enters the sign Aries. On the Noroza, or festival of the new year, the great Mogul used to slay a camel with his own hand, which is distributed and eaten by the court favourites. The great Akbar hazarded his popularity and his power, by the introduction of a custom appertaining to the Celtic races of Europe and the Goths of Asia; and degraded those whom the chances of war had made his vassals, by conduct loathsome to the keenly-cherished feelings of the Rajput. There is no doubt that many of the noblest of the race were dishonoured on the 'Noroza;' and the chivalrous Pirthi Raj was only preserved from being of the number by the high courage and virtue of his wife, a princess of Mewar, and daughter of the founder of the Suktawut. On one of these celebrations of the Khooshroz, the monarch of the Moguls was struck with the beauty of the daughter of Mewar, and he singled her out from amidst the united fair. On retiring from the fair, she found herself entangled amidst the labyrinth of apartments by which egress was purposely ordained, when Akbar stood before her: but instead of acquiescence, she drew a poniard from her corset, and held it to his breast, dictating, and making him repeat, the oath of renunciation of the infamy to all her race. The anecdote is accompanied in the original description with many dramatic circumstances. The guardian goddess of Mewar, the terrific 'Mata,' appears on her tiger in the subterranean passage of this palace of pollution, to strengthen her mind by a solemn denunciation, and her hand with a weapon to protect her honour. Rae Sing, the elder brother of the princely bard, had not been so fortunate; his wife wanted either courage or virtue to withstand the regal tempter, and she returned to their dwelling in the desert despoiled of her chastity, but loaded with jewels; or, as Pirthi Raj express it: "she returned to her abode, tramping to the tinkling sound of the ornaments of gold and gems on her person; but where, my brother, is the moustache on thy lip?"—*The Parsees; Tod's Rajasthan, Vol. i, pp. 72 & 345.*

NOUSHERWAN flourished about the middle of the sixth century of the christian era. He was contemporary with the Roman emperors

Justinian and Justin, and in his time the fables of Bed pai were translated into Pehlevi. His reign commenced in A. D. 531; and lasted till A. D. 579, and towards the close of it, Mahomed was born in Arabia. Nousherwan invaded Sind or its borders. Various Persian authors, quoted by Sir John Malcolm, assert that this monarch carried his arms into Ferghana on the north, and India on the east; and as they are supported in the first assertion by Chinese records, there seems no reason to distrust them in the second. Sir Henry Pottinger (though without stating his authority) gives a minute and probable account of Nousherwan's march along the sea-coast of Mekran to Sind, and, as Ballabi was close to Sind, we may easily believe him to have destroyed that city. Perhaps the current story of the descent of the ranas of Mewar from Nousherwan may have some connection with their being driven into their present seats by that monarch. Nousherwan was the twentieth of the Sassanian dynasty, was surnamed "the just," and was distinguished for equity, wisdom and munificence. He erected many colleges, caravansaries, and other buildings of public benefit, and gave great encouragement to learning and philosophy.—*Pottinger's Travels, Beluchistan and Sind*, p. 386; *Elphinstone's History of India*, Vol. i, p. 401. See Nowsherwan.

NOUSERHWANI, a tribe in Beluchistan. See Kelat.

NOVA, TAM. A Palghat wood of a white colour, used for shafts, cart-poles, &c.—*Colonel Frith*.

NOVA, or NUVU TEL. *Sesamum orientale*.

NOWABATFEE, see Cotton manufactures.

NOWBUT, an instrument of music sounding at the gate of a great man at certain intervals.

NOW-CHOW, a small seaport, on the south coast of China, in lat. 20° 52' N., long. 110° 36' E.

NOWGONG, a town near the centre of Assam. The boundaries of the Nowgong district are formed on the east by the Dhuunseeree and Deeyong rivers, and an undefined, unexplored tract of country occupied by Angami Nagas; on the west, by the Mongah of Desh Cummooreah in the Kamroop district; the Burrunipooteer on the north; and on the south by Jynteeah, and the Tytingah river in northern Cachar, and a high range of mountains separating Now-Gong from Muneepoor. Within this boundary the number of square miles in the whole district amounts to 8,712.—*Butler's Travels of Assam*, p. 230. See Mikir.

NOWI MALTREE, URIA. Hiptage mad-dablota.

NOWLADDI, CAN., of Mysore. This wood polishes well, is used for house-building and furniture.—*Captain Puckle's, Cat. Br.*, 1862.

NOWOOLOO or Nuvulu, TEL. Gingelly seed; *Sesamum orientale*.

NOW-ROZ, New year's day. See Nouroz.

NOWSAGUR also Nowsadur, Guz. *Sal ammoniac*.

NOWSARI, in Guzerat, the city of the Parsee priests, whence numbers are sent every year to Bombay, to minister to the Parsee population of that city.—*Parsees*, p. 24. See Kissa-i-sanjan.

NOWSHADUR, PERS. Nowsadur, SANS. Nowsagur also Nowsadur, Guz., HIND. *Sal ammoniac*.

NOWSHERWAN. The king Kesra Anowshirwan reigned in Persia from A.D. 531 to A.D. 579. See India, Mahratta Governments in India, Nusherwan.

NOWUL-ERAGU, TEL. *Vitex arborea*.

NOWULGURH contains four thousand houses, environed by a shahr-pannah or curtain. It is on a more ancient site called Roleani, whose old castle in ruins is to the south-east, and the new one midway between it and the town, built by Nowul Sing in S. 1802, or A.D. 1746.—*Toul's Rajasthan*, Vol. ii, p. 426.

NOYAKOT VALLEY, in Nepal is about eighteen miles distant from Katmandu.—*Elephant's Journey*, p. 160.

NOYA-LUTA, BENG. *Brachypterum scandens*.

NOYEL, a river that rises in the Animallay hills in Coimbatore and joins the Cauvery near Caroor. It rises on the eastern slope of W. Ghauts, lat. 10° 59', lon. 76° 44', and runs east into the Cauvery. Its length is 95 miles.

NOZES D'ACAJU, PORT. Cashew nuts.

NOZ-MOSCADA, PORT. Nutmegs.

NREE-MEDHA, SANS., from nree, a man, and medha, flesh, a human sacrifice.

NRISINGHA, SANS., from nree, a man, and singha, a lion. The man-lion avatar.

NUBARI, BENG., HIND. *Cicca disticha*, Linn. See Nubi.

NUBIASWAT, SANS., from nubhas, the sky.

NUBI, BENG. *Cicca disticha*, Linn.

NUBIA, the Hebrews may have used the word Ophir to designate any gold-producing country, but, however this may be, undoubtedly, Berenice on the shores of the Red Sea was one Ophir. Even while the gold of Ethiopia may have only been picked up by the unsettled tribes of the desert, it had yet been a source of great wealth to Ethiopia; but when Ethiopia was conquered by the Egyptians and its mines were worked by Egyptian skill, the produce seemed boundless. The gold was found in quartz veins within a slaty rock, at various spots in the Nubian desert, between Derr on the Nile and Souakin on the coast. They were said to bring in each year, the improb-

able sum of thirty-two millions of minæ, seventy millions sterling, (Diod Sic, lib. i, 49) as was recorded in the hieroglyphics under the figure of the king in the Menmonium, who is there offering the produce to Amun-ra. To these mines criminals and prisoners taken in war were sent in chains, to work under a guard of soldiers; and such was their unhappy state, banished from the light of heaven, and robbed of everything that makes life valuable, that the Egyptian priests represented this as the punishment of the wicked souls in the next world. No other known mines were so rich. From the word Noub, gold, the country received the name of Nubia, or the land of gold, and gold was shipped from the port afterwards by the Ptolemies, named the Golden Berenice. Gold was henceforth more abundant in Egypt than in any other country in the world; and every natural product must have been dearer. Under these circumstances, while they may have imported iron and copper from Cyprus, oil and silver from Greece, with a few other articles, from Arabia and Palestine, they could have exported very little beyond gold. The gold mines helped the people's industry in performing their great works in building and in war; but after a time it undermined that industry, and made the country an easier and richer prey for its neighbours.—*Sharpe's History of Egypt*, Vol. i, p. 89; *Diod, Siculus*.

NUBRA, the north-western district of Ladak, on the Shayok river, in the north-west Himalaya, is in lat. 35° 36' N., and long. 77° 78' E. The Sassar pass is 17,753 feet above the sea. The Nubra, Pangong and Rodok districts, in the basin of the Shayok river, and its affluents, lie on the S. flank of the Kuenlun from Balti to Nari, and have Ladak as their southern boundary. With the exception of Nari, this is the most lofty and sterile part of Tibet, the axis of the Kuenlun being probably upwards of 18,500 feet, the valleys 16 or 17,000 feet and numerous peaks rise 20 or 23,000 feet. The Karakorum pass is 18,300, the salt Pangong lakes 13,400 feet. The villages of lower Nubra are not numerous, but some of them possess very extensive cultivation. From Kashmir eastwards, all the easily accessible portions of the Himalaya are occupied by Aryan hindoo as far as the eastern border of Kumaon and the Kali river separating Kumaon from Nepal—the Tibetans being here confined to the valleys about and beyond the snow. People of Tibetan blood have migrated into Nepal, throughout its whole length, and have formed mixed tribes whose appearance and language is more Tibetan than Indian, but whose religion and manners are hindoo. East of Nepal, in Sikim and Bhutan the hindoo element almost

disappears, and the Thibetans are altogether dominant. Eastward of Kashmir, are the Bhot race in Bulti and Ladak. Bulti includes Hasora, Rongdo, Rong-yul, Shagar, Skardo, Bulti, Parkuta, Tolti, Kartaksho, Kiris, Khaybalu and Chorbat. Ladak or the Botpa, includes Spiti, Zangskar, Purik, Suru, Hembako (Dras,) Ladak proper or Le, Nubra, Rong, Rupshu and Hanle. The language of the Bhotiahs of Tibet, the Bhutiah or Thibetan, is also that of Bhutan, and is a connecting link between the polysyllabic and monosyllabic languages. Garhwal is to a large extent Bhot.—*Dr. Thomson's Travels in Western Himalaya and Tibet*, p. 199; *Hooker and Thomson's Fl. Indica*, p. 22. See Hot springs, India, Maryul or Lowland, Kailas or Gangri range.

NUBRA NIRA, see Ladak.

NUBRA-TSHO, see Glacier.

NUBSIR, a river near Bura Bhumoree in Holkar's territory.

NUBTEE, ARAB. *Ceratonia siliqua*, W.

NUCH, HIND. *Fraxinus xanthoxylloides*, the Crab ash, also *Juniperus communis*.

NUCH, TAM. *Vitex negundo*, Linn., Roxb.

NUCIFRAGA, the Nutcracker genus of birds, comprising *N. caryocatactes* and *N. hemispila*, described and figured in Mr. Gould's 'Century of Birds from the Himalayan Mountains.' *Nucifraga caryocatactes* of the pine forests of Europe and Siberia is replaced by *N. hemispila* in those of the Himalaya generally, and by *N. multimaculata* about Kashmir.—*Eng. Cyc.*

NUCKA or Nakka, TEL. A fox.

NUCK-CHILINI, HIND. *Epicarpurus orientalis*, properly *nakhilini*.

NUCK-TEL, also Mitti-ka-tel, Guz., HIND., Naphtha.

NUCLEOBRANCHIATA, see Carinaria, Molluscs.

NUDDEA, a rich district, to the north of Barasat. Its chief town is Krishnaghur. Much of Nuddea's frame rests upon its being an ancient seat of learning, which has exercised a great influence upon the politics, morals and manners of the Bengalees. The community is for the most part composed of brahmins who devote their lives to study for many years. There are Vaishnavas who possess a respectable body of literature. The very shop-keepers and sweetmeat-vendors are imbued with a tincture of learning. In proof of the great antiquity of Nuddea, the brahmins show their great tutelary goddess called *Para-maee*, a little piece of rough black stone painted with red ochre, and placed beneath the boughs of an aged banian tree. Nuddea town is on the Bhagarathi river, it has more than fifty tole or seminaries. Choitunya's father resided in Nuddea; at the age of 44, Choitunya appears to have had a divine call, and he em-

braced a life of mendicity. The Gosae, his followers, perform the ceremonials of marriage and other rites among themselves. They will also, contrary to the usual custom of the hindoos, dissolve a marriage with as much facility, on an application from the parties. The Gosae observe none of the hindoo festivals except those of Krishna; but the anniversaries of the deaths of their founders are observed as such. They do not, says Mr. Ward, reject the mythology, or the ceremonies of the hindoos, but they believe that those of Huree (Krishna) only, are necessary. On the nights of their festivals the initiating incantation may be heard resounding through the stillness of the night: Huree, Krishna; Huree, Krishna; Krishna, Krishna; Huree, Huree; Huree, Ram; Huree, Ram; Ram, Ram, Huree, Huree.—*Col. Myth. Hind., p. 240; Tr. of Hind., Vol. i, pp. 38, 39.* See Chaitanya, Chaitun.

NUDDI KA SHAIKRA, DUK. Caboose.

NUDELN, GER. Vermicelli.

NUDERH, see Sikhs.

NUECES D'ACAJU, SR. Cashew-nuts.

NUFFELL, TAM. A Tinnevely wood a red colour; specific gravity 0.717. Used for building in general.—*Col. Frith.*

NUFIL (pl. Nuffen), a voluntary act of devotion.

NUGAR-MOTHA, *Cyperus pertennis*. Very common at Ajmeer: the root has a pleasant smell: used in hair mesalihs: also considered astringent and to check diarrhoea: one tola is given.—*Gen. Med. Top., p. 147.*

NUGDI, also Chandi, GUZ. Silver.

NUGGAR, see Chalukya.

NUGGER, a revenue division of Mysore under a Commissioner, its principal civil town is Shemogah. See Bednore, Bednor, Coffee, Corundum, Tea.

NUGHZ, or Nagaz, see Kabul.

NUGU BENDA, or Tutturu benda, TEL. *Abutilon indicum*, *G. Don.*; *A. asiaticum*, *W. and A.*; *Sida indica*, *R. iii, 179*; *S. populifolia*, *R. iii, 179*; *Rheede*, vi, 65. These species seem to be identical.

NUGU CHIKKUDU, TEL. *Dolichos glutinosus*, *R. iii, 312*; *W. and A.* Nugu meaning rough, hairy, pubescent; this name is more appropriate to *D. tomentosa*, which however differs but little from the other.

NUGU DOSA, or Kuturu budama, TEL. *Bryonia scabrella*, *L.*

NUH, or Noah, a Hebrew patriarch. See Kohistan, Nepal.

NUH HASEL, see Koh-i-nokreh.

NUKA, HIND. Land on the ridges or banks left by the dry course of a running river.

NULTURA, HINDI. *Arundo karka*, *Royle*.

NULU, TEL. Thread.

NULU-CHAMPOO, SANS. From *nulu*, the name of a king; and *champoo*, a particular kind of composition in which the same subject is maintained in all the varieties of prose and verse.

NULU-DANGA, SANS. From *nala*, a reed, and *danga*, a place.

NULU TEGA, or *Antaravalli*, TEL. *Cassyta filiformis*, *L.*—*R.* ii, 314—*Rheede*, vii, 44. The syn. in *Sk.* is *Akasa valle*, which name it still retains in Bengal.—*Voigt*.

NUMAZ, HIND., PERS. Prayer.

Fujur ki numaz, morning prayer.

Zohur ki numaz, mid-day prayer.

Usser ki numaz, afternoon prayer.

Mughrib ki numaz, sunset prayer.

Aysha ki numaz, evening prayer.

Numaz ishraq, at 7½ A.M.

Numaz chashit, at 9 A.M.

Numaz tulnuijoor, after 12 P.M.

Numaz turaweel, after 8 A.M., a particular form of prayer not of divine command.

Numaz-i-junaza, the funeral service.

Numaz gah or Eedgah, place of public prayer.

Numaz kurna, praying, one of the points of the mohammedan religion.

NUMBER. This English word has been added to all the languages of India. The number seven is used frequently in scripture, not to signify a definite, but a large and sufficient quantity: hence, *Daubuz* states its Hebrew etymology to signify fulness and perfection; and *Philo* and *Cyprian* call it the completing number. "The barren hath borne seven," said *Hannah* in her song, meaning a great number. The victims under the Jewish law, bled by sevens; the golden candlestick had seven branches, bearing seven golden lamps; the mercy-seat was sprinkled seven times with the blood of the atonement; and to sacrifice by sevens, was a characteristic of great solemnity in patriarchal times. The key to this rite, says *Horsley*, is the institution of the Sabbath, the observance of the seventh day being the sacrament of the ancient church. The numbering by seven was doubtless taken from the phases of the moon. The number ten is often used in scripture to denote frequency and abundance: and is evidently taken from the ten fingers on the hands. "Thou hast changed my wages ten times;" i. e., frequently changed them: *Gen.*,

xxxi, 7, 41. "Those men have tempted me now these ten times:" *Num.*, xiv, 22. "These ten times have ye reproached me:" *Job*, xix, 3. "He found them ten times better than all the magicians:" *Dan.*, i, 20. The ten days are again interpreted, as indicating the shortness of the persecution, in the same sense as they are employed by *Terence*: "Decem dierum vix mi est familia," I have enjoyed my family but a short time. There is in India a very remarkable use of seventy-four, in epistolary correspondence. It is an almost universal practice in India to write this number on the 'outside of letters; it being intended to convey the meaning that nobody is to read the letter but the person to whom it is addressed. The practice was originally hindoo, but has been adopted by the mahomedans, when correctly written, it represents an integral number of 74, and a fractional number of 10.—*Tod's Rajasthan*; *Elliot's Supp.*; *Milner's Seven Churches of Asia*, pp. 23, 205; *Heaut. Act.* 5, S. iv.; *Prolegem. ad Ignat.* See *Seven*; *Seventy-four*.

NUMEERI, TEL. *Terminalia paniculata*. *W. & A.*

NUMENIUS, a genus of birds of the family *Scolopacidae*. *Numenius arquata*, the common curlew of Europe, North Africa, Asia to Japan, Malasia: very common in India. *Numenius phaeopus*, the Whimbrel of Europe, Asia, North Africa: common in India, along sea-coasts and estuaries.

NUMGEA, see *Kunawer*.

NUMIDA MELÆAGRIS, see *Payo japonensis*.

NUMIDA PTILORHYNA: the Guinea fowl is believed to be descended from the *Numida ptilorhyna* of the hot arid parts of East Africa, but it has become wild in Jamaica and St. Domingo, and has become small with black legs. The Guinea fowl is the Bohemian of the barn-yard. They are hardy, and prolific and are valuable in gardens, as they rarely scratch the ground, are eager in their search for insects, and, with a scraping motion of their bill, gather the seeds of grasses.—*Darwin*.

NUMMULITE.

Shudna udsee, ARAB.

Official with the natives. They are lentil-shaped greyish pebbles, of various sizes, consisting of carbonate of lime and iron with a nucleus of calcareous crystals. The hakims administer them in eye-diseases and ulcers.—*Royle, Hombergger*.

NUMOOCHÉE-SOODANA, SANS. A proper name joined to stood, to kill.

NUMRI or Lumri, the people of Luz, a dependency of Kelat. The clan can send about 1,600 fighting men. They are mahomedans.

NUMUCHISADANA, see *Indra*.

NUMUK CHUSHEE, HIND. A mahomedan ceremony.

NUMUSKARA, SANS. A reverential mode of obeisance, from *namas*, a bow, and *kri*, to make.

NUN. Buddhism, which had assumed a distinct form in the middle of the third century *n. c.* became powerful during the Greek connexion with India. Hindoo women embracing buddhism became prominent. They not only began to frequent places of public worship, but came forward to join the clerical body and were admitted as nuns. Maha Prajapati was the first female admitted to the order. The daughter of Asoka, Sanghamitta, also entered the church, taking the usual vow of celibacy. She went to Ceylon to ordain the princesses in compliance with the request of her brother Mahendra, who had been sent there to propagate the religion, he being of opinion that a male priest could not ordain a female. Gautama had five hundred women admitted into the order. The nuns were, however, restricted in their liberty in holding communication with male priests. Women of rank, such as Maha Maya, the mother of Gautama and Misaka, were moving freely in society, while other classes of females not only moved from place to place but carried on discussions with men and took part in secessions. There are several notices of educated females. Visakha, a most celebrated buddhist lady, resided in Sakita, or Ayodhya. Nevertheless Buddha's personal opinion as to females leading the religious life was: "Be careful; do not permit females to enter upon my law and become Samarans." He said, "What is named woman is sin," *i. e.*, that she is not nice but sin; and "it is better for a priest to embrace the flame than to approach a woman, however exalted her rank." Mendicants and novices were not permitted to look at a woman. Priests were not allowed to visit widows, grown up virgins, or women whose husbands were abroad. If a woman had a fall and required to be lifted up by the hand, no buddha would help her, because it was considered sinful to touch a woman, whether she lived or died. The Patimokhan forbids not only "the contact with the person of a woman," but "impure conversation with a woman," sitting on the same seat with her, reclining with her on the same place, being alone with a woman, accompanying her on a journey, and preaching more than five or six sentences to a woman except in the presence of a man who understood what was said. And yet according to Hinao, Buddha accepted the invitation of Ambasali, the celebrated courtesan of Vaisali, "who took her seat on one side of him." The buddhist women were clad in robes. The king of Kosala presented to each of his five hundred wives "a splendid robe." The Bhilsa monument shows the buddhist female drapery—"a long flowing vest resembling that which

we see in Grecian sculpture. Fa Hian, who came here in *A. D.* 399 says that "the females were kept down and ordered to follow certain precepts." He cites the instance of brothers marrying non-uterine sisters in the case of the sons of one of the kings of Potala settled near the hermitage of Kapila. As to caste, he says, that although the principle in the selection of the chief of religion was the moral merit, inasmuch as Sakya was a Kshatriya, and his successor a Vaisya, and his successor a Sudra, yet the son of the king of Kapila by the daughter of a slave was not admitted into the church. When he entered, the cry was, "The son of a slave dares to enter and be seated here." In the drawings of the excavated temples of Ajanta "there are groups of women in various attitudes, particularly in the one of performing tapasya or religion on the Asan siddha;" and also "of a female worshipper of Buddha" surrounded by a group, and a brahmin among them whom she is teaching. There are, at present, in buddhist Tibet, many nuns.—*Calcutta Review*, No. 109, pp. 45, 46, 47, 48.

NUN, HIND. Salt.

NUNA, HIND. Soda.

NUNA, TEL. Salt.

NUNA. Most of the traders of the snow valleys have some members of their families residing at Daba or Gyani on the Nuna-khar lake. The great body of the hillmen are Rajputs. There are a few villages of brahmins, their residences are respectable, and occupy the more elevated portion of the village site.

NUNA MARAM ELLY, TAM. Leaves of *Morinda umbellata*.

NUNDAN SAR, see Kashmir.

NUNDEE-BRIKHYA, BENG. *Cedrela toona*.

NUNDIUVUTHIEN, *Tabernaemontana coronaria*.

NUNDIDROOG, a fortified hill in Mysore. See Tea.

NUNE, TEL. Oil, vegetable or animal.

NUNE BIRA, or Neli bira, **TEL.** *Luffa pentandra*, *R.*

NUNE GACHCHA, TEL. *Cassalpinia digyna*, *Rottl., W. and A.* 871.

NUNE PAPATA, or Papata, **TEL.** *Pavetta indica*, *L.*

NUNJU, also Nunjunda maram, **TAM.** *Balanites ægyptiaca*, also *Gardenia turgida*?

NUNNARI, TAM. *Hemidesmus indicus*, *R. Brown.* Nunnari vayr, **TAM.**, the root of *Hemidesmus indicus*, Sarsaparilla.

NUNRE, or Noonre, **HIND.** Canes of the Bhur grass.

NUPUTKI, BENG. The Heart-pea. *Cardiospermum halicacabum*, *Lin.*

NUQARA, AR., a kettle drum.

NUQARCHÉE, AR., a drummer.

NUQDAY KA-JORA, or Chooreean, Wrist ornaments of silver, bracelets.

NUQEEB-UL-FUQRA, a Mohurruin fuqeer.

NUQLEE SHAH, a Mohurruin fuqeer.

NUQSHBUNDEEA, a class of mahomedan fuqeers or devotees. Nuqshibundee, a Mohurruin fuqeer.

NUR, MALAY. Cocos nucifera, L. Cocoa-nut-palm.

NURALAM, HIND. Eryngium planum.

NURANG KALUNG, TAM. Dioscorea pentaphylla.

NURBUDDAH, a river of the Central Provinces of British India. See Coal, Central provinces, Inscriptions, Narbuddah, Nerbuddah.

NURCHIA?—Corchorus olitorius.

NURDUL, BENG. Panicum interruptum.

NUREE, BENG. Cicca disticha.

NUREH, AR., PERS. Quick-lime, also a depilatory made of yellow arsenic, (1 oz.) pounded and mixed with quick-lime (4 oz.) till the compound assume a uniform yellowish tinge. It is applied to the skin in a paste made with warm water, and must be washed off after a minute or two, as it burns as well as stains. This admirable invention is ascribed by western authors to the ingenious Soliman, who could not endure to see the state of Bilkis of Sheba's bare legs.—*Burton's Scinde*, Vol. i, p. 278.

NUREH, PERS. Quick-lime.

NURENI KALANGU, MALEAL. Dioscorea pentaphylla, Linn.

NURGIL, see Jallalabad.

NURGUNDI, BENG. Vitex negundo.

NURI, BENG. Cicca disticha, Linn.

NURALAM, HIND. Arum sp.

NUR JAHAN, literally light of the world, was the daughter of a Persian of some rank. She was born under circumstances of great privation, whilst her father was journeying towards India. She was married to Sher, an Affghan, by whom she had a daughter. Her husband was killed in some quarrel; and she was then married by the emperor Jehangir who gave her brother Asof Khan and her father high employ. Her husband associated her name with his own on the coins. After the death of Khusrü, the emperor's son, who took a dislike to Shah Jehan, the second son, and made efforts to have Shahriar raised to the throne, her husband was taken prisoner by Mahabbut, and in her efforts to release the emperor she was defeated. After Jehangir's death she was pensioned on 25 lacs a year. The father of Nur Jahan is known in history by the names of Mirza Ghiyas Beg and Khaja-Aiyass. The name given him throughout by De Laet (Ethaman Doulet) is obviously a corruption of the title which Jahangir bestowed upon him, I'timad-ud-Doulah, or the "trust of

the empire." His splendid mausoleum lies near Agra, close to the railway.—*Calcutta Review*, January 1871.

NURMA, or Chanderi cotton. See Cotton.

NUR-MANJEE, TAM. A Travancore wood of a bamboo colour; used for light work.—*Col. Frith*.

NURMANSHEER, see Kirman.

NUR-MARITHY, a Travancore wood of a brown colour, specific gravity 0.615; used for building common houses.—*Col. Frith*.

NUR-MINAK, MALAY. Coconut oil.

NURMUDA, SANS., from narma, sport or entertainment, and da, to give.

NURMUK, see Kelat.

NUR NOTSJIL, MALEAL. Clerodendron inerme.

NUR PUNGELION, TAM. Bignonia spathacea.

NURPUR: this town derives its name from the celebrated Nur Jahan, the wife of the emperor Jehangir. Its original name was Dahmari, or Dahmala, or as Abul Fazl writes, Dahmahri, although he mentions no fort. The people pronounce the name as if written Dahmeri. It is also called Pat'haniya. Nurpur, at the entrance of the western Himalaya, where they rise from the plain of the Punjab, contains about 15,000 people, principally Kashmirians, engaged in the shawl trade. It is in the great road through which Kashmir, Chenab and Ladak are attainable.—*Cunningham's Ancient Geog. of India*, p. 143. See Shawlgoat.

NURREY-PITHEEN-KEERAY, TAM. Rothia trifoliata.

NURRRIALA, SINGH. Squill.

NURRI VUNGAYUM, also Nurri vunjyum, TAM. Squill. Scilla indica, Roeb.

NURSEEA, a hindoo deity.

NURSOO, alias Narsinga, fourth avatar of Vishnu.

NURTIUNG. The Nurtiung Stonehenge in the Jyntea hills is no doubt in part religious, as the grove suggests, and also designed for cremation, the bodies being burnt on the altars. In the Khassia these upright stones are generally raised simply as memorials of great events, or of men whose ashes are not necessarily though frequently, buried or deposited in hollow stone sarcophagi near them, and sometimes in an urn placed inside a sarcophagus, or under horizontal slabs. The usual arrangement is a row of five, seven, or more erect oblong blocks with round heads (the highest being placed in the middle), on which are often wooden discs and cones: more rarely pyramids are built. Broad slabs for seats are also common by the wayside. Mr. (afterwards Colonel) Yule, who first drew attention to these monuments, mentions one thirty-two feet by fifteen, and two

in thickness; and states that the sarcophagi (which, however, are rare) formed of four slabs, resemble a drawing in Bell's *Circassia* and descriptions in Irby and Mangles' *Travels in Syria*. He adds that many villages derive their names from these stones, "mau" signifying stone: thus "maismai" is the stone of oath, because, as his native informant said, "there

war between Churra and Maismai, and when they made peace, they swore to it, and placed a stone as a witness; forcibly recalling the stone Jacob set up for a pillar, and other passages in the Old Testament. "Mamloo" is the stone of salt, eating salt from a sword's point, being the Khassia form of oath; "mau-fong" is the grassy stone, &c. Analogous combinations occur in the south of England and in Brittany, &c., where similar structures are found. Thus maen, man, or men is the Druidical name for a stone, whence Penmaen-mawr, for the hill of the big stone. Maen-hayr, for the standing stones, of Brittany and Dolmen, the table stone of a cromlech.—*Hooker's Him. Jour.*, Vol. ii, pp. 320-321; *Notes on the Khassia mountains and people*, by Lieutenant H. Yule, *Bengal Engineers*. See Burial customs, Cairn, Khassya.

NURU, SANS. Man, from nrce, to do right.

NUR UD DIN, a Kurd tribe.

NURU-SINGHA, SANS. From nara, man, and singha, excellent.

NURWUR. Through the mediation of Major J. Stewart, Acting Resident at Sindia's court in December 1818, the pergunnah of Parone and six villages were granted to Madho Sing of Nurwur under the guarantee of the British Government. The rajah had been deprived of his hereditary possessions by Dowlat Rao Sindia, and he took to plundering in Sindia's territories. The object of the settlement was to put a stop to his outrages. In 1857, Man Sing, the ruling rajah, joined the rebels during the mutinies, but surrendered in 1859, on condition of a free pardon and a suitable maintenance being granted to him. His former possessions were consequently restored to him under guarantee.

NUR-ZYE, an Affghan tribe, a clan of the Durani.

NUSA KAMBANGAN, or the Floating island, is about twenty miles long, but in the centre not more than three broad. The water between it and Java being very shallow, there is no channel yet known for vessels to pass out from the harbour to the eastward.

NUSHKI, a western sub-division of Baluchistan. The Zigger Minghal and Raskshani, who inhabit Nushki, have no proper towns or villages, but reside in tents, though not migratory. Their river, the Kaiser, is useless for irrigation and is lost amongst the

sands. They cultivate wheat at the skirts of the hill ranges supporting the plateau of Saharawan. Snow seldom falls. The Zigger Minghal at one time occupied the Dasht-i-Giran near Kelat, but their increasing numbers compelled them to migrate into Nushki, dispossessing the Rakshani, of whom two tomans or clans still reside at Nushki. They have a much valued breed of horses called Tarji. Their flocks are very numerous. The original seats of the Eusofzye were about Garra and Nushky, the last of which places is on the borders of Dusht-i-Loot, or Great Salt Desert, and now held by the Beloches under Kelat-i-Nuscer. The Eusofzye were expelled from Garra and Nushky, about the end of the thirteenth or beginning of the fourteenth century of the christian era, and soon after settled in the neighbourhood of Kabul. Ulugh Beg, whose power was, at that time, strengthened by the accession of many Moguls, to rid himself of his troublesome allies, began by fomenting dissensions between the Eusofzye and Guggeani (for the Khukkye had now broken into independent clans), and he soon after attacked them at the head of that tribe and his own army. He was defeated at first; but having cut off all the chiefs of the tribe at a banquet, during an insidious peace which he had the art to conclude with them, he plundered the Eusofzye of all their possessions and drove them out of Kabul. The Eusofzye, reduced to extreme distress, took the way to the neighbourhood of Peshawar. That country was then in a very different state from that in which it is at present. The tribes who now possess it, were then in Khorasan, and the plain of Peshawar, with several of the neighbouring countries, were possessed by tribes which have since either entirely disappeared, or have changed their seats. Lughmaun was in the hands of the Turkoolani, who are now in Bajour; the tribes of Khyber and the Bungush had already occupied their present lands, but all the lower part of the valley of Kabul, all the plain of Peshawar, with part of Bajour, Chuch, Huzareh, and the countries east of them as far as the Hydaspes, belonged to the Affghan tribe of Dilazak, which is now almost extirpated. The country between the Dilazak and the range of the Hindoo Coosh, on both sides of the Indus, formed the kingdom of Swat, which was inhabited by a distinct nation, and ruled by sultan Oveiss, whose ancestors had long reigned over that country. On the first arrival of the Eusofzye, they threw themselves on the generosity of the Dilazak, who assigned them the Doabeh for their residence. Living among a conquered people, like Spartans among Helots, and enjoying entire independence on all around, every Eusofzye is

filled with the idea of his own dignity and importance. Their pride appears in the seclusion of their women, in the gravity of their manners, and in the high terms in which they speak of themselves and their tribe, not allowing even the Doorani to be their equals. *Elphinstone's Kingdom of Cabul*, pp. 330, 331, 334, 348. See Baluchistan.

NUT or Nut'h, in India, a wandering tribe, who are dancers, actors, athleteæ. They resemble the gypsies in habits. The nut called also Sirki bash (dwellers under mats) met with in the Dekhan are not distinguishable from Dher. The Bazeegur and Nut, jugglers and tumblers, may be considered as the gipsies of Hindustan; both are wandering tribes, and have each a language understood only by themselves: they live principally by juggling, fortune-telling (by palmistry and other means), and are alike addicted to thieving. The gypsies are governed by their king, the Nut'h by their nardar bouthah. They appear to be equally indifferent on the subject of religion, and in no respect particular in their food, or the manner by which it is obtained. According to a list furnished by Captain Richardson, the languages adopted by these people would appear to possess a very strong affinity to each other. The Bazeegur are sub-divided into seven castes, viz., the Charee, At'hyec'a, Bynsa, Purbuttee, Kalkoor, Dorkinee, and Gungwar: but the difference seems only in name, for they live together, and intermarry as one people: they say they are descended from four brothers of the same family. They profess the mahomedan rite of circumcision; they regard Tan-Sin as their tutelar deity; consequently they look up to him for success and safety in all their

professional exploits. These consist of playing on various instruments, singing, dancing, tumbling, &c. The two latter accomplishments are peculiar to the women of this sect. The notions of religion and a future state, among this vagrant race, are principally derived from their songs, which are beautifully simple.—*Cole. Myth. Hind.*, p. 313. See Himalaya.

Dr. Hassall says there are three species of *Myristica*, which furnish nutmegs. The best description is from *Myristica fragrans*, a tree from twenty to twenty-five feet high, somewhat similar in appearance to a pear tree. The fruit is smooth externally pear-shaped, and about the size of an ordinary peach. It consists, first of an outer fleshy covering, called the pericarp, which, when mature separates into nearly equal longitudinal

parts, or valves, secondly, of the aril, or mace, which, when, recent, is of a bright scarlet colour, and thirdly, of the seed proper, or nutmeg. This is enclosed in a shell, which is made of two coats, the outer is hard, and smooth, the inner, thin, closely invests the seed sending off prolongations which enter the substance of the seed and which being coloured, impart the marbled or mottled appearance characteristic of nutmeg. Nutmegs are cultivated in the Molucca islands, and especially in those called the Banda, or Nutmeg islands. The tree is also grown in Java, Sumatra, Penang, Singapore, Southern India, Bengal, Bourbon, Island of Madagascar, and certain of the West India islands. The first kind of nutmegs met with in commerce, called the true, round, cultivated, or female nutmeg, is the product of *Myristica fragrans*. The nutmegs are characterised by their full and rounded form and delicate and aromatic flavour; they are occasionally imported in the shell. There is also a small variety, not larger than a pea, which has been described under the name of the royal nutmeg.

Three varieties of true nutmeg are distinguished by dealers, which are thus described in Pereira's *Materia Medica*:—

Penang nutmegs are unlined or brown nutmegs, and fetch the highest price. They are sometimes limed in Britain for exportation, as on the Continent the limed sort is preferred. According to Newbold, the average amount annually raised at Penang about A.D. 1836 was 400 piculs (of 136½ lbs. each).

Dutch or Batavian nutmegs are limed nutmegs. In London they scarcely fetch so high a price as the Penang sort.

Singapore nutmegs are a rougher, unlined, narrow sort, of somewhat less value than the Dutch kind. According to Mr. Oxley, 4,085,361 nutmegs were produced at Singapore in 1848, or about 252 piculs (of 133½ lbs. each); but the greater number of the trees had not come into full bearing, and it was estimated that the amount would in 1849, be 500 piculs. The second kind of nutmeg is called the false, long, wild, or male nutmeg, and is the produce chiefly of *Myristica malabarica*. The seeds of *Myristica fatua*, are about half as long again as the true or round nutmeg; they are paler, and less aromatic. The wild nutmeg obtained from the *Myristica malabarica* has scarcely any flavour or odour; and, according to Rheede, is of the size and figure of a date. "The Turkish and Jewish merchants," writes Rheede, "mix these nutmegs with the true long ones, and the mace with good mace, selling them together. They also extract from these inferior articles an oil, with which they adulterate that of a more

genuine quality." The importance of this spice, requires that the opinions of various writers should be given. In the Banda islands, three crops or harvests of nutmegs are obtained in the year, the principal gathering is in July or August; the second in November; and the third in March or April. The fruit is gathered by means of a barb attached to a long stick; the mace is separated from the nut and separately cured. On account of their liability to the attacks of an insect known as the nutmeg insect, considerable care is required in drying them. They should be dried in their shells, as they are then secure from the insect. They are placed on hurdles, and smoke-dried over a slow wood fire for about two months. In the Banda islands, they are first dried in the sun for a few days. When the operation of drying is complete, the nuts rattle in their shells; these are cracked with mallets, and the damaged, shrivelled, or worm-eaten nuts removed. To prevent the attacks of the insect, the nuts are frequently limed. The Dutch lime them by dipping them into a thick mixture of lime and water, but this process is considered to injure their flavour. Others lime them by rubbing them with recently prepared, well-sifted lime. This process is sometimes practised in London. For the English market, however, the brown or unlined nutmegs are preferred. The quantities of nutmegs entered for Home consumption in the United Kingdom, and the amount of duty received thereon were as under:

1840..	lbs. 118,664	1840..	£. 25,041 s. 9

In 1842, the duties were fixed at 3s. 6d. per lb. on those from a foreign, and at 2s. 6d. per lb. on those from a British possession. The duty on wild nutmegs in the shell was then also fixed at 3d. without regard to origin. The duty now is 1s. per lb.; on wild nutmegs in the shell, 3d. per lb., not in the shell, 5d. per lb. Wholesale price, 1s. 9d. to 4s. It appears from Dr. Hassall's inquiries; 1st, That nutmegs, as they reach the consumer are not in general deprived of their essential oil; a result contrary to the opinion commonly entertained on this point; 2nd, That, as met with in the English markets, they are seldom limed. Crawford says the species of the genus *Myristica* are numerous and wide-spread, for some are found in all the islands of the Archipelago, in several parts of Hindustan, in the Indoo-

Chinese countries, in the Philippines, in Australia, and in tropical America. As a spice, however, the *M. moschata* or *aromatica*, is the only one of which the nut or mace is of any value and of this the geographical limits are comparatively narrow, being comprehended between the 126th and 135th degrees of east longitude, and the 3rd degree of north, and the 7th of south latitude. It is, or has been, found wild in the proper Moluccas, in Gilolo, Ceram, Amboyna, Boeroe, Damma, the north and south sides of the western peninsula of New Guinea, and in all its adjacent islands. It certainly does not exist in its wild state in any of the islands west of these, nor in any of the Philippines. Wherever the soil and climate are suitable for its growth the aromatic nutmeg is raised with great facility. It is even transported to remote parts, and the seed is disseminated by two species of pigeon, *Columba perspicillata* and *zena*, which prey on the nutmeg as the wood-pigeons on the acorn, feed on the mace and drop the nut.

In its native country the nutmeg tree comes into full bearing in its ninth year, and lives to seventy-five. In shape and size, the ripe fruit resembles a nectarine. When ripe, the fleshy outer substance bursts, the nutmeg in its black shining shell is seen through the interstices of its reticulated crimson envelope, the mace, which amounts to about one-fifth part of the weight of the whole dried fruit. These two articles, the nut and mace, constitute the spices which for so many ages have been in request among the nations of Europe and Asia, although never used as a condiment by the inhabitants of the countries that produce it. The British after the unsuccessful efforts of two centuries, succeeded at length in participating in the nutmeg trade, in consequence of having occupied the Spice Islands in 1796. In 1798 the nutmeg was introduced into Bencoolen and Penang, and in 1819 into Singapore, and at these places it was once largely cultivated, but certainly under the disadvantage of growing as a not already acclimated exotic. In countries native and congenial to it, the nutmeg is reared with great ease, requiring little care beyond shelter from the sun and weeding. At the Madras Exhibition of 1855, fine samples of nutmegs were sent by General Cullen from his gardens, Vellei Malay near Oodagherry, south of Travancore, 1,800 feet above the sea. Two sorts of nutmegs were exhibited by C. S. Vernede, Esq., Commercial Agent to the Cochin government; first sort, averaging 70 to the pound, and the second sort, 100 to the pound; the former are particularly fine. In some instances the nutmegs had been coated with chunam to preserve them. Wild or spurious nutmeg, was

also forwarded from the Bulabooden Hills, Mysore, and from Canara; it is much used as a substitute for the true spice, but is almost wholly devoid of aroma and of no interest. The nutmeg tree has been found growing wild in Assam, lat, 27° 30', and probably it would succeed in higher latitudes in America. It is already cultivated in several of the West India Islands, but with less success. The appearance of the rich brown shell of the nutmeg covered with the red fibres of the mace is very beautiful in the fresh fruit. These fibres being removed, the shells are dried in the sun or by a moderate fire until they split, revealing the aromatic kernel or nutmeg. Nutmeg plantations are formed in alluvial ground, or in virgin forest land in level situations. Declivities are unfavourable on account of the slight hold these trees take on the soil, and the consequent danger of their being uprooted during the heavy rains which occur in tropical countries. Their culture in Bencoolen, which represents the ordinary mode of treatment has been minutely described by Dr. Lumsdaine, in a paper originally communicated to the Agricultural Society of Sumatra, in 1820, and afterwards republished in Silliman's American Journal of Science and Arts.

Cultivation.—In originating a nutmeg plantation it is necessary to select ripe and sound nuts, and set them at the distance of a foot apart in a rich soil, covering them lightly with mould. They must then be watered every other day, weeded occasionally, and shielded from a scorching sun. In from one to two months the young seedlings may be expected to appear; and when about 4 feet high, the healthiest and most luxuriant are to be removed at the commencement of the rainy season to the plantation previously cleared and prepared for that purpose, and set at the distance of 80 feet from each other, care being taken to protect them from the heat and from violent winds. The plants are set in rows, and between these the plough is employed to clear the intermediate spaces of weeds and grasses. The plants continue to require watering every other day in sultry weather; and in nearly all cases the soil requires to be enriched with annual supplies of manure, which are laid on during the rains, and which are made more stimulating as the tree increases in age. After the fifth year the trees no longer require to be shielded from the sun; in the seventh year they begin to bear fruit; and from that time to the fifteenth year they generally increase in fruitfulness, being then in their highest perfection. During the progressive growth of the plantation, the beds of the trees are regularly weeded, and the roots kept covered with the mould, for these have a constant tendency to seek the

surface: the growth of lateral branches is alone encouraged, and all suckers or dead and unproductive branches are removed by the pruning-knife, so as to thin the trees considerably, and admit of the descent of the night-dews, which contribute much to their well-being, especially during dry and sultry weather. The conclusion of the principal harvest is the time chosen for these prunings. As the trees advance in age, the coarser vegetation and creepers are alone removed from the intervals between the trees, and the more harmless grasses are allowed to remain, giving the plantation a park-like appearance. The use of the plough is then discontinued. Nutmeg-trees are of two kinds in the same plantation, flower-bearing, and fruit-bearing. The productive plants are in the proportion of about two-thirds to the whole plantation. It is impossible to discover the difference in the sexes of the plants until the period of flowering. Between the appearance of the blossom and the ripening of the fruit, a period of 7 months generally elapses; but when once a tree has begun bearing, it continues to produce fruit all the year round, but more plentifully in some months than in others. The months of September, October, November and December, are the period of the great harvest: those of April, May and June, of the smaller harvest. In the Moluccas these trees continue prolific for 70 or 80 years; and the annual produce, taking one tree with another, amounts to about five pounds of nutmegs and a pound and a quarter of mace of each tree. When the fruit is ripe, which is indicated by the bursting open of the fleshy portion, and the appearance of the kernel, it is gathered in by means of long hooked sticks. The first step, after removing the outer integument, is cautiously to strip off the mace, and flatten it by hand in single layers placed on mats and dried for 3 or 4 days in the sun. In damp and rainy weather the heat of a charcoal fire is employed, but with care that no smoke or heat blacken the surface of the mace. In drying, the red tint of the mace changes to orange, its substance becomes horny and brittle, and its strongly aromatic odour and taste are preserved. When well cured, it is made up in tight packages in a dry situation; but is exposed to the sun about once a fortnight to preserve its dryness, and thus to keep it from insects which attack it if it becomes damp. The nuts being liberated from their macy envelope, are conveyed to the drying house and placed on a raised stage or frame-work, which admits the heat from a smouldering fire beneath it, to pass freely among them. The heat is kept below 140° Fahr., because too great a heat dries up the kernels, while too long continued heat produces fermentation, which increases their volume so

greatly as to fill up the whole cavity of the shell, and thus prevent them from rattling, which is the criterion of due preparation. The drying-house is a brick building of suitable size, and the stage is placed at an elevation of 10 feet having 3 divisions in it for the produce of different months. The nuts are turned every second or third day, that they may all partake equally of the heat, and such as have undergone the smoking process for the period of two complete months, and rattle freely in the shell, are cracked with wooden mallets, and the worm-eaten and shrivelled ones thrown out. The sound nutmegs are rubbed over with recently prepared well sifted dry lime, and packed tightly in chests, the seams of which have been made impervious to air and water. Another and a more common method is to dip them in a mixture of salt-water and lime, and then to spread them out for 4 or 5 days in the shade to dry. But the quantity of moisture imbibed during this process, appears to increase the liability to early decay and to the attacks of insects. The surest way of preserving the kernel would be to export it in the shell; this is done in sending nutmegs to China; but it does not answer in Europe, on account of the heavy allowance for shells, which is one-third of the weight. The general qualities of the nutmeg and mace are the same: their agreeable aromatic odour and pungent taste are well-known, the peculiar flavour of the mace, however, being quite distinct from that of the nut. They contain, according to Bonastre, fat oil 31.6 per cent., volatile oil 6.0, starch 24, gum 1.2, free acid 0.8, lignine 54. Not more than 4.5 per cent. volatile oil is usually obtained in the distillations at Apothecaries' Hall. The fixed oil, called nutmeg butter or expressed oil of nutmeg, is prepared in Holland: the nutmegs are beaten into a paste, which is enclosed in a bag, steamed and pressed between hot plates. It is imported in oblong cakes, wrapped in flag-leaves or leaves of the banana, and weighing about three quarters of a pound. It is of an orange or reddish brown colour, and of a fragrant odour. It is liable to much adulteration, and so also is the volatile oil, with which turpentine is frequently mixed. The article called expressed oil of mace is obtained from the nutmeg, and should bear its name. Nutmeg butter, according to Playfair, consists of three fatty substances, two of which are soluble in alcohol, and the third almost insoluble in that fluid: the third substance has been termed Myristine, and from this myristic acid is prepared. Nutmegs are sometimes passed off as fresh, after the volatile oil has been abstracted from them. Such nutmegs are very light, and when pierced with a hot needle, do not give an oily coating to it. The best nut-

megs are small, but heavy, weighing on an average 90 grains each. There is a large and inferior kind of nutmeg, longer and heavier than the above, weighing as much as 110 grains. This is the produce of another variety, and sometimes of a distinct species of nutmeg, and is said to be more liable to produce narcotic symptoms than the true nutmeg. Nutmegs and mace are decidedly stimulant, and in small quantities wholesome. When used in abundance they produce, by increasing the circulation, narcotic effects. According to Mr. Simmonds, the nutmeg tree, *Myristica moschata*, *M. officinalis*, or *M. aromatica*, is of a larger growth than the clove, attaining a height of thirty feet, and has its leaves broader in proportion to their length; the upper surface of these is of a bright green, the under of a greyish colour. It is a dioecious plant, having male or barren pale yellow flowers upon one tree, and female or fertile flowers upon another. The fruit is drupaceous, and opens by two valves when ripe, displaying the beautiful reticulated scarlet arillus, which constitutes mace. Within this is a hard, dark-brown, and glossy shell, covering the kernel, which is the nutmeg of the shops. The kernels of *M. tomentosa* are also used as aromatics, under the name of wild or male nutmegs. Lindley describes two other species, *M. fatua*, a native of Surinam, with greenish white flowers, and *M. sebifera* or *Viola sebifera*, a native of Guiana, with yellowish green flowers. By expression, nutmegs are made to yield a concrete oil, called *Adeps myristicæ*, or sometimes erroneously oil of mace. A volatile oil is also procured by distillation. Nutmegs and mace are used medicinally as aromatic stimulants and condiments. In large doses they have narcotic effects. The fleshy part of the fruit is used as a preserve. Dr. Oxley, as the result of twenty years' experience at Singapore, observes that the nutmeg tree, like many of its class, has a strong tendency to become monœcious, and planters in general are well pleased at this habit, thinking they secure a double advantage by having the male and female flowers on the same plant. This is, however, delusive, and being against the order of nature, the produce of such trees is invariably inferior, showing itself in the production of double nuts and other deformities. It is best, therefore, to have only female trees, with a due proportion of males. The female flowers, which are merely composed of a tripartite calyx and no corolla, when produced by a tree in full vigor are perfectly urceolate, slightly tinged with green at the base, and well-filled by the ovary, whereas the female flowers of weakly trees are entirely yellow, imperfectly urceolate, and approach more to the stamiferous flowers of the male. The shape of the fruit varies consider-

ably, being spherical, oblong, and egg-shaped, but the nearer they approach sphericity of figure, the more highly are they prized. There is also a great variety in the foliage of different trees, from elliptic, oblong and ovate, to almost purely lanceolate-shaped leaves. This difference seems to indicate in some measure the character of the produce; trees with large oblong leaves appearing to have the largest and most spherical fruit, and those with small lanceolate leaves being in general more prolific bearers, but of inferior quality. Whilst its congener the clove has been spread over Asia, Africa, and the West Indies, the nutmeg refuses to flourish out of the Malayan Archipelago, except as an exotic, all attempts to introduce it largely into other tropical countries having decidedly failed. The island of Ternate, which is in about the same latitude as Singapore, is said to have been the spot where it was truly indigenous, but no doubt the tree is to be found on most of the Moluccas. At present the place of its origin is unproductive of the spice, having been robbed of its rich heritage by the policy of the Dutch, who at an early period removed the plantations to the Banda isles for better surveillance, where they still remain and flourish. But although care was formerly taken to extirpate the tree on the Moluccas, the mace-feeding pigeons have frustrated the machinations of man, and spread it widely through the Archipelago of islands extending from the Moluccas to New Guinea. Its circle of growth extends westward as far as Pinang, or Prince of Wales' Island, where, although an exotic, it has been cultivated as a mercantile speculation with success for many years. Westward of Pinang there are no plantations, looking at the subject in a mercantile point of view. The tree is to be found, indeed, in Ceylon, and the West Coast of India, but to grow it as a speculation out of its indigenous limits, is as likely to prove successful as the cultivation of apples and pears in Bengal. In the Banda Isles, where the tree may be considered as indigenous, no further attention is paid to its cultivation than setting out the plants in parks; under the shade of large forest trees, with long horizontal branches, called "Canari" by the natives. There it attains a height of 50 feet and upwards, whereas from 20 to 30 feet may be taken as a fair average of the trees in the Straits Settlements. A nutmeg plantation, well laid out and brought up to perfection, is one of the most pleasing and agreeable properties that can be possessed. Yielding returns, more or less daily, throughout the year, there is increasing interest, besides the usual stimulus to all agriculturists of a crop time, when his produce increases to double and quadruple the ordinary routine. Trees having arrived at fifteen years' growth, there is no incerti-

tude or fear of total failure of crop, only in relative amount of produce, and this, as will be seen, is greatly in the planter's own power to command. The first requisite for the planter is choice of location. The nutmeg tree, aided by manure, will grow in almost any soil where water does not lodge, but it makes a vast difference in the degree of success, whether, the soil be originally good, or poor and improved by art. The tree does not thrive in white or sandy soils, but prefers the deep red and friable soils formed by the decomposition of granite rocks and tinged with iron, and the deeper the tinge the better. He thinks that iron in the soil is almost necessary for the full development of the plant. If under the before-mentioned soil there be a rubble of iron-stone at four or five feet from the surface (a very common formation in Singapore), forming a natural drainage, the planter has obtained all that he can desire in the ground, and needs only patience and perseverance to secure success. The form of the ground ought to be undulating, to permit the running off of all superfluous water, as there is no one thing more injurious to the plant than water lodging around its roots, although, in order to thrive well, it requires an atmosphere of the most humid sort, and rain almost daily. Besides the form of the ground, situation is highly desirable particularly as regards exposure. A spot selected for a nutmeg plantation cannot be too well-sheltered, as high winds are most destructive to the tree, independently of the loss occasioned by the blowing off of fruit and flower. Whilst the planter is clearing the ground, he may advantageously at the same time be establishing nurseries; for these the ground ought to be well-trenched and mixed with a small quantity of thoroughly decomposed manure and burned earth, making up the earth afterwards into beds of about three feet wide, with paths between them for the convenience of weeding and cleaning the young plants, and really good plants, the produce of well-selected seed, will be a great saving of time and expense but in the selection of seed the most perfectly ripe and spherical nuts are best. Oval long nuts are to be rejected, particularly any of a pale colour at one end. The seed ought to be put in the ground within twenty-four hours after being gathered, setting it about two inches deep in the beds already prepared, and at the distance of twelve to eighteen inches apart, the whole nursery to be well-shaded both on top and sides, the earth kept moist and clear of weeds, and well smoked by burning wet grass or weeds in it once a week, to drive away a very small moth-like insect that is apt to infest young plants laying its eggs on the leaf, when they become covered with yellow spots, and perished if not attended to speedily. Washing the leaves with a decoction of

the Tuba root is a good remedy but where only a few plants are affected, if the spots be numerous, it is preferable to pluck up the plant altogether, rather than run the risk of the insect becoming more numerous, to the total destruction of the nursery. The nuts germinate in from a month to six weeks, and even later, and for many months after germination the seed is attached to the young plant, and may be removed apparently as sound as when planted, owing to the great disproportion in size between the ovule and albumen, the former of which is alone necessary to form the plant. The plant may be kept in nursery with advantage for nearly two years. Should they grow rapidly, and the interspaces become too small for them, every second plant had better be removed to a fresh nursery, and set out at a distance of a couple of feet from each other. When transplanted either in this way or for their ultimate position in the plantation, care should be taken to remove them with a good ball of earth, secured by the skin of the plantain, which prevents the ball of earth falling to pieces. The nurseries being established, the ground cleared and ready, the next proceeding is to lay out and dig holes about 26 or 30 feet apart, and the quincunx order has many advantages. The holes should be at least six feet in diameter, and about four feet deep, and when refilled the surface soil is to be used, and not that which is taken out of the hole. Each hole should be filled up about one foot higher than the surrounding ground, to allow for the setting of the soil and the sinking of the tree, which, planted at this height, will in a few years be found below the level. Over each hole thus filled up, a shed, made of atap leaves or other shelter, closed on two sides, east and west, and proportioned to the size of the plant, is to be erected. It is not a bad plan to leave an open space in the centre of the top of each shed, about twelve inches wide, by which the young plant can obtain the benefit of the dew and gentle rains, which more than compensates for the few rays of sun that can only fall upon it whilst that body is vertical. After the sheds have been completed, each hole should have added to it a couple of baskets of well-decomposed manure, and an equal quantity of burned earth, when all is ready for the reception of the plant, which having been set out, if the weather be dry will require watering for ten days or a fortnight after, in fact until it takes the soil. The planter having set out all his trees must not deem his labours completed, they are only commencing. To arrive thus far is simple and easy, but to patiently watch and tend the trees for ten years after, requires all the enthusiasm already mentioned. About three months after planting out, the young trees

will receive great benefit if a small quantity of liquid fish manure be given them. In the first six years they ought to be trenched round three times, enlarging the circle each time, the trenches being dug close to the extremities of the roots, which generally correspond to the ends of the branches, and each new trench commencing where the old one terminated. They must of course greatly increase in size as the circle extends, requiring a proportionate quantity of manure, but the depth ought never to be less than two feet. The object of trenching is to loosen the soil and permit the roots to spread, otherwise the tree spindles instead of becoming broad and umbrageous. Manure is beyond all other considerations the most important to the welfare of the estate; it is that which gives quantity and quality of produce, and without it a plantation cannot be carried on. The want of it would limit the cultivation in the Straits' Settlements, and will arrest many a planter, who having got his plantation to look well up to the eighth year with very little manure, thinks he can go on in the same manner. The nutmeg tree likes well all sorts of manures, but that which is best suited for it seems to be well-rotted stable and cow-yard manure, mixed with vegetable matter, and when the tree is in bearing the outer covering of the nut itself is about one of the very best things to be thrown into the dung-pit. Dead animals buried not too near the roots, also blood, fish, and oil cakes are beneficial. Guano is of no use. All obnoxious grasses must be carefully kept from between the trees, and the harmless grasses rather encouraged, as they keep the surface cool. The trunk of the tree ought to be carefully washed with soap and water once a year to keep it clear of moss. Parasitical plants of the genus *Loranthus* are very apt to attach themselves to the branches, and if not removed do great injury. The insect enemies of the tree are not very numerous, but it has a few white ants among the number. They seldom attack a vigorous plant, it is upon the first symptoms of weakness or decay that they commence their operations. Their nests may be dislodged from the roots of the plant by a dose of solution of pig dung, to which they have a great aversion. There are several species of insects which lay their eggs on the leaves, and unless carefully watched and removed, they commit great havoc amongst the trees. For this purpose it is necessary to wash the leaves with a decoction of Tuba root, and syringe them by means of a bamboo with lime and water, of the consistence of whitewash; this adheres to the leaves, and will remain even after several heavy showers. Another nuisance is the nest of the large red ant; these collect and glue the leaves together,

forming a cavity for the deposition of their larvæ. The best mode of destroying them is to hang a portion of some animal substance, such as the entrails of a fowl, fish, &c., to the end of a pole thrust through and protruding from the branches; the ants will run along the pole and collect in immense quantities around the bait, when, by a lighted faggot, they can be burned by thousands. This repeated once or twice a day for a week or so, will soon rid the tree of the invaders. In general one man for every one hundred trees will be found sufficient to care for the plantation, provided there be some four or five thousand trees. The nutmeg planter is under the necessity of keeping up nurseries throughout the whole of his operations for the re-placement of bad plants and redundant males. Of the latter ten per cent. seems to be about the best proportion to keep, but completely dioecious trees are preferable. No person can boast to get a plantation completely filled up and in perfect order much sooner than fifteen years. Of the first batch planted, not more than one-half will turn out perfect females, not taking into account monoecious trees, already condemned. The tree shows flower about the seventh year, but the longer it is before doing so, the better and stronger will it be. The best trees do not show flower before the ninth year, and one such is worth a score of the others. Dr. Oxley has seen several trees yield more than 10,000 nuts each in one year, whereas he does not believe that there is a plantation in the Straits that averages 1,000 from every tree. The experiment of grafting the trees, which at first view presents so many advantages, both in securing the finest quality of nut and the certainty of the sex, has still to be tried in this cultivation. The advantage gained would be worth any trouble, the quality of some nuts being so far above that of others it would make a difference beyond present calculation; in short, 1,000 such picked trees would yield something equivalent to £4,000 a year, for £4 per tree would be a low estimate for such plants. An acre of land contains on an average 92 trees, and it is calculated an outlay of 300 dollars is required upon every acre to bring the tree to maturity; but as not more than one-half of the trees generally turn out females, and as many others are destroyed by accident and diseases to which this plant is very liable, it makes the cost of each tree, by the time it yields fruit, about 8 dollars. The nutmeg tree begins to bear when about eight years old, but it gives no return for several years longer; and therefore to the expense of cultivation must be added the interest of the capital sunk. The plant being indigenous in the Moluccas, the expense of cultivation there is greatly less. As the fruit is brought in by

the gatherers, the mace is carefully removed, pressed together and flattened on a board, exposed to the sun for three or four days, it is then dry enough to be put by in the spice-house until required for exportation, when it is to be screwed into boxes, and becomes the mace of commerce. The average proportion of mace yielded in Singapore is one pound for every 433 nuts. The nutmeg itself requires more care in its curing, it being necessary to have it well and carefully dried ere the outer black shell be broken. For this purpose the usual practice is to subject it for a couple of months to the smoke of slow fires kept up underneath, whilst the nuts are spread on a grating about eight or ten feet above. Care should be taken not to dry the nuts by too great a heat, as they shrivel and lose their full and marketable appearance. It is therefore desirable to keep the nuts, when first collected, for eight or ten days out of the drying-house, exposing them at first for an hour or so to the morning sun, and increasing the exposure daily until they shake in the shell. The nuts ought never to be cracked until required for exportation, or they will be attacked and destroyed by a small weasel-like insect, the larvæ of which is deposited in the ovule, and, becoming the perfect insect, eats its way out, leaving the nut bored through and through, and worthless as a marketable commodity. Liming the nuts prevents this to a certain extent, but limed nuts are not those best liked in the English market, whereas they are preferred in that condition in the United States, and on the Continent of Europe. When the nuts are to be limed, it is simply necessary to have them well-rubbed over between the hands with powdered lime. By the Dutch mode of preparation, they are steeped in a mixture of lime and water for several weeks. This no doubt will preserve them, but it must also have a prejudicial effect on the flavour of the spice. After the nuts are thoroughly dried, which requires from six weeks to two months' smoking, they cannot be too soon sent to market. But it is otherwise with the mace; that commodity, when fresh, not being in esteem in the London market, seeing that they desire it of a golden colour, which it only assumes after a few months; whereas, at first, when fresh it is blood-red, now red blades are looked upon with suspicion, and are highly injurious to the sale of the article. The nutmeg tree was sent from Bencoolen to Singapore, in the latter end of 1819. Sir Stamford Raffles shipped to the care of the resident commandant, Major Farquhar, 100 nutmeg plants, 25 larger ditto, and 1,000 nutmeg seeds, which were committed to the charge of Mr. Brooks, a European gardener, who was specially engaged by the East India Company to look after their embryo

spice plantations here. If a plantation be attended to from the commencement and the trees be in a good locality, the planter will undoubtedly obtain an average of 10 lbs. of spice from each tree from the fifteenth year; this, at an average price of 2s. 6d. per lb., is 25s. per annum, and he can have about seventy such trees in an acre. The total number of nutmeg trees in Singapore in 1848 was 55,925, of which 14,914 only were in bearing. The produce of that year was 4,085,361 nutmegs, or 23,600 lbs. in weight. Plants were likewise sent to Ceylon and Cape Comorin. It does not appear that the climates of these two localities suit the nutmeg tree, as it requires rain, or at least a very damp climate throughout the year. The East India Company's spice plantations in Pinang were sold in 1824, and the trees were dispersed over the island. In 1843 there were 3,046 acres cultivated with spice trees in Pinang and Province Wellesley, containing 233,995 nutmeg, and 80,418 clove trees, besides 77,671 trees in nurseries ready to be planted out; and by a similar statement from Singapore, which is however not so complete, that 743 acres were cultivated, containing 43,544 nutmeg trees. The consumption of these spices in Great Britain was, on an average of four years ending 1841, nutmegs, 121,000 lbs.; mace, 18,000 lbs.; cloves, 92,000 lbs.

In the Pinang papers for 1857, the *Gazette* gives the following statistics: The subjoined table of the exports of Nutmegs and Mace from Pinang during the last ten official years shows a startling rate of increase. The exports in 1855, 1856, 4624 piculs of nutmegs and 1340 of mace—exceed the total produce of the Bandas in 1855, which Dr. Oxley states at 4,032 piculs of nutmeg and 1,008 of mace.

Exports of Nutmegs and Mace during 10 years.

109 piculs of imported mace were re-shipped in 1847. 40,000 lbs. of mace were imported into the United Kingdom from India in 1848. The extremely limited consumption of nutmegs and mace, and of the latter especially, over the world, as compared with other tropical exportable produce, which has checked and perhaps ever will continue to check any permanently large progressive increase of these spices. The Dutch confined the cultivation of the nutmeg, when they got possession of the Moluccas from the Portuguese, in the end of 1598, to three distant islands. Lonthoir or great Banda, Banda Neira, and Pulo Aye. The first of these presents a ridge of hills of various heights from one extremity to the other, the sides of which are cut into ravines through which descend a few small streams, the only ones on the island. The island is crescent-shaped, is 9 miles long and 2½ miles across where widest. The highest hill on Banda-Neira, in lat. 4° 30' S., and long. 128° 18' E. of Paris does not exceed 800 feet, and the south side is perfectly flat. Gunong Api is a single island or cone of volcanic matter rising from a rocky base and separate from great Banda by a narrow channel. It has the appearance of a heap of cinders and two-thirds of it are perfectly black and bare of all vegetation, while a constant smoke rises from the crater. Pulo Aye, according to Martin, and the S. side of great Banda yield the best nutmegs. Neira is 2½ miles long and about 3½ miles across where widest. Pulo Aye is nearly cir-

cular and is about 1½ miles in diameter. Gunong Api, is so named from the terrible volcano of which it consists. Lonthoir is commonly called the 'high land,' other islands are Rosingain, Pulo Aye and Pinang. The island of Rosingain has been little inhabited since the extirpation of spice trees by the Company in 1632, and the cultivation of the nutmeg is exclusively confined to Banda, Lonthoir and Pulo Aye. Gunong Api is unfortunate on account of its frequent eruptions and its insalubrity. It lies near to Banda and Lonthoir. Earthquakes are frequent and ordinarily precede or follow the eruptions. The strongest eruptions were in the following years:—1598, 1615, 1632, 1691, 1711, 1749, 1798, 1820. That of 1691 was a terrible one. The intervals betwixt these periods of eruption are therefore consecutively 17, 17, 59, 20, 38, 49, 22, and the general average of these intervals is 31 years and a little more than a month. The most fatal earthquakes took place in 1629, 1683, 1686, 1743 and 1816. The intervals therefore are 54, 3, 57, 73 years respectively. Thence it appears that these convulsions arose from there having been no vent for the lava. The Banda soil is stony. By the above average of eruptions and dating back to 1820, an eruption was expected somewhere about 1857. Mr. Mun for 1750 rated the total produce of the islands at 250,000 lbs. of nutmegs besides mace. The Dutch author Stavorinus acquaints us that the annual average produce during the early part of the 18th century was 700,000 lbs. (Dutch) of nutmegs, and 180,000 lbs. (do.) of mace. But he adds, that in the year 1778 a hurricane destroyed all the trees excepting 8,000 which last number yielded an annual produce of 30,000 lbs. of nutmegs with the usual proportion of mace. Allowing 10 per cent. of trees for males, which is a very small proportion when trees have not from the first been regularly and systematically planted the productive ones will have thus yielded 4½ lbs. per tree of nutmegs. But of these 8,000 were all bearing or female trees the rate per tree would be 8½ lbs. nutmegs. Mr. Martin estimated the produce previously to the above year (perhaps the year immediately preceding it) at, for Europe 250,000 lbs. nutmegs; for India 100,000 lbs. and mace 80,000 lbs., which would admit of a total produce of about 350,000 lbs. nuts, the best sorts only being sent to Europe. This quantity of 700,000 lbs. has reference to the beginning of the eighteenth century. The English market was not then so particular as to quality as it afterwards became so that probably Nos. 1, 2 and 3 were sent to Europe about this period. If the 8,000 trees yielded 30,000 lbs., then there were 168,000 trees in the early part of the above century. But the

rate of bearing here brought forward does not quite tally with subsequent reported averages. In Dutch official records, Puly Aye afforded the best nutmegs and yielded annually from 45,000 trees the quantity of 130,000 lbs. or $3\frac{1}{2}$ lbs. (Dutch it is supposed) per tree of nuts. Major Thom states that the cultivation of the nutmeg was confined to Lonthoir or the Great Banda, Neira and Pulo Aye, which last island he takes to be $1\frac{1}{2}$ mile in diameter. He also allots to its area 45,459 trees, which on a rough calculation would give about 37 trees to an acre, for more could hardly without great crowding have been planted on the area. Indeed, with advertance to irregularities and breaks in the surface, the trees may have been still more closely packed. He states the average produce in 1810 to have been for all the islands, 300,000 lbs. of nutmegs, 85,000 lbs. of mace. The produce has ever been subject to great fluctuations, owing to various causes, the most prominent of which were the eruptions of volcanoes and earthquakes. We have seen that in 1772 a hurricane nearly annihilated the plantations—and in 1811 a severe storm destroyed much fruit. Eruptions of the volcano and devastating earthquakes have occurred at no very wide intervals—high winds frequently diminish the crops greatly. Sulphureous vapours sometimes blast the trees. Some of the hills even are more or less incrustated with nutmeg. The nutmeg decrease in size and weight as the tree advances in age after a varying period. The Dutch derive their nutmegs and mace for exportation from the Bandas, Celebes, Palembang and Bencoolen in Sumatra and Java, but scantily from the latter island, and perhaps a few other but insignificant localities. But the proportion of the Moluccas or Banda produce to that of these or other places, and which last is termed free, is nearly as 100 to 11. The mercantile monopoly nuts and mace are sent to Europe and the inferior sorts are crushed and the oil is converted into nutmeg-soap, an article which has not yet perhaps been appreciated in England, but might possibly be converted to some useful purpose. The cultivation of the nutmeg in Java is free, and about A. D. 1830 ago the number of trees then planted out was about 40,000. In 1816, which was eight years before Bencoolen was given up to the Dutch, it was reported officially by Lumsdaine that there were then at that station 26,049 bearing trees. The estimate for 1825 was an addition to these of 15,000 trees, making the total to be 41,049, and for the succeeding years the expected produce was rated at 128,000 lbs. of nutmegs, besides mace.

The highest produce in nutmegs of any one year from 1825 to 1845 both inclusive, was 8,158 piculs, or lbs. English 1,101,303, and the

lowest 1,171 piculs or 158,085 lbs. English, reckoning 135 English lbs. per Dutch picul. The average of the ten years ending in 1845 was 4,636 Dutch piculs or 626,386 $\frac{1}{2}$ lbs. English per annum, being 73,614 lbs. at least less than the average of the Dutch writer Stavorinus for the middle or earlier part of the 17th century. Of late years, all the nutmegs of a fair merchantable quality have been sent direct to Holland—and the inferior sorts have been converted into nutmeg soap. It is not clearly shown however where the line lies which cuts off these inferior nuts. The medium sorts chiefly go to China and to the Eastern Archipelago.

The returns obtained for 1844-5 showed then in Penang and Province Wellesley upwards of fifty plantations having from 200 bearing female trees up to 12,000 besides 390 nutmeg gardens varying in their contents from 10 up to 200 bearing trees. The total of bearing female trees was upwards of 70,000. But a large increase has taken place since that year.

Consumption.—It would be difficult to exhibit correctly the average consumption of nutmegs and mace in the various quarters of the world. There are in fact but very partial data for a computation of it.

Crawfurd averages the produce at 65 ozs. avoirdupois of nuts and mace together per tree, which, deducting $\frac{1}{4}$ for mace, will leave nearly 3 lbs. of nutmegs for each bearing tree. The weight of a given quantity of nutmegs in the shell to the same when freed from it is as 73 to 50 nearly. The mace may be assumed to be about three and three-fifths of the whole. The Dutch used to allow 12 $\frac{1}{2}$ per cent. loss in curing the nutmegs and mace, and the loss afterwards by waste and accident at one-third of the whole, which last, however, appears to be a very high estimate if confined to curing and transporting. Out of 1,000 nutmegs the produce of any single tree, there will be only about 500, which will be of value.

Dr. Oxley (*Journal Ind. Arch.*, Vol. xi, p. 657), observes that good trees yield 10 lbs. of spice after the 15th year. This doubtless included mace, and if so the produce in nutmegs would be after a deduction of $\frac{1}{4}$ for mace, 8 $\frac{1}{2}$ lbs. per female tree.

Mr. Crawfurd has stated the cost of cultivating nutmegs in the Bandas, is at 8 dollars the picul. If it had been found practicable by the Dutch to raise the nutmeg at so low a figure, all competition with them would have been at an end. It is likely that when foreigners first resorted to these islands they obtained only the nutmegs which the woods afforded, as no cultivation had begun until a period long subsequent to their advent. It may be premised that the Moluccas possess no other produce in such quantity of suffi-

cient consequence to attract trade, and that the nation which holds them must tack on to the cost of raising the tree that of protecting these islands.

Martin acquaints us that when he was Resident at Amboyna there were 2,160 slaves in the nutmeg plantation.

Statistics of Nutmegs.—In the beginning of the 19th century nutmeg-planting was introduced into Pinang, a number of spice plants having been imported from Amboyna by the East India Company. The Government after some time, sold their gardens in which they had planted the clove and nutmeg trees, but the cultivation would appear to have made little progress at first, as in 1810 we find that there were only about 13,000 trees on the island, a few hundreds being all that were in bearing. In 1818 the number of bearing trees had increased to 6,900. In 1843 there were 75,402 trees in bearing, and 111,289 not in bearing, besides males and 52,510 nurseries. The number of bearing trees in Province Wellesley in 1843 was 10,500, not bearing 7,307, besides males, and a number in the nursery. The total number of nuts produced by the Pinang and Province Wellesley trees in 1842 were 18,560,281, and 42,866 lbs. of mace. Nutmeg trees were first introduced into Singapore in 1818. In 1843 the total number of trees were estimated at 43,544, of which 5,317 were in bearing, the produce being stated at 842,328 nuts. In 1848, according to the table given by Dr. Oxley, the total number of trees planted out was estimated at 55,925, of which the numbers in bearing were 14,914 and the produce 4,085,361 nuts besides mace, which is estimated at about 1 lb. for every 433 nutmegs. During the occupation of Bencoolen by the English, the nutmeg and clove were introduced from the Moluccas, and in 1819 the number of nutmeg trees were stated at 109,429, regarding their present number we have no information. The average quantity of nutmegs annually sold by the Dutch East India Company in Europe during the 18th century has been estimated at 250,000 lbs., besides about 100,000 lbs. sold in India. Of mace the average quantity sold in Europe was reckoned at 90,000 lbs. per annum and 10,000 lbs. in India. The trade although so jealously guarded by the Dutch, was never been a very profitable one to them, the expenses being heavy. In 1779 the charges at Banda amounted to f. 146,170 and the revenues derived from the duties on imports, &c., to f. 9,350, leaving an excess on the charges of f. 136,820 to be deducted from the profit on the spices; and the large quantities of species frequently burned in Holland, on which heavy charges for freight, &c., must have been incurred, must have also formed a serious deduction from

the gross profit derived from those sold. In 1814, when in possession of the English the number of nutmeg trees planted out were estimated at 570,500, of which 480,000 were in bearing including 65,000 monœcious trees. The produce of the Moluccas has been reckoned at from 6 to 7 hundred thousand lbs. per annum, of which one-half goes to Europe, and about one-fourth that quantity of mace. The imports into Java from the Eastern Archipelago in 1843, consisted of nutmegs 740·33 piculs, and of mace 218·06 piculs, and the exports consisted of nutmegs 2,133·29 piculs, and of mace 486·63 piculs. The amount of nutmegs exported from Java during the 10 years ending in 1834 averaged yearly about 352,226 lbs., and during the eleven years during 1845 about 664,060 lbs. yearly. The quantity of mace exported during the first period averaged 94,304 lbs. yearly, and during the last 169,460 lbs. yearly. The produce of the Straits' Settlements in 1842 was reckoned at nutmegs 147,034 lbs., and mace 44,822 lbs., thus being more than equal to the whole consumption of Great Britain. The rest of Europe it has been estimated takes about 280,000 lbs. of nutmegs, and 33,000 lbs. of mace, India about 216,000 lbs. of nutmegs and 30,000 lbs. of mace, and China about 15,000 lbs. nutmegs and about 2,000 lbs. of mace. As these quantities, however, would leave a surplus production of nutmegs alone, above 250,000 lbs., it is probable they are now considerably under the real amounts. In ten years from 1832 to 1842, the exports of nutmegs and mace from Pinang were trebled, and from the very great extension in the cultivation which is constantly going on, it is probable that the same result at least will take place in the ten years succeeding to the above period, viz: from 1842 to 1852. During these ten years from 1832 to 1842, the price of nutmegs in Pinang fell from 10 and 12 dollars per thousand, to from 4 to 5 dollars per thousand.

The nutmeg is a beautiful tree, pretty in form, foliage, blossom and bearing, rising to a height of 25 to 30 feet, occasionally 50 feet. The fruit to within a few days of ripening might, had it a pink check, be readily mistaken for the peach. When the nut inside is ripe, the fruit splits down the centre and remains half-open, disclosing the bright crimson mace that enwraps the nut. In a few days, if not gathered in, the fruit opens wider and the nut with the mace around it, drops to the ground leaving the fruity husk still hanging to the tree, till it withers away and falls off. When the nuts are collected, the mace is carefully removed and placed in the sun to dry. Beneath the mace is a thin hard shell containing the nutmeg which is not broken until the nuts are prepared for shipment. A good tree yields 600 nuts yearly, or about

8 lbs. weight. A wild nutmeg grows in Damma, Ambuyna, Ceram, Obi, New Guinea, Gillolo, of an elliptical shape, an inch or 1½ inch long. *M. officinalis*, Mart., is used in Brazil. *Acrodictidium camara*, Schomb., yields a fruit known as the Camara also Ackani nutmeg of Guiana; the clove nutmeg and the Brazil nutmeg. The calabash nutmeg is from the *Moreodora myristica*. In the Archipelago a species of *myristica* called Dungan and another *M. spuria* are substituted. *M. tomentosa*, Hooker and Thomson, is the nutmeg tree of Penang, *M. malabarica*, Lam., and *M. attenuata*, Wall., are indigenous to the forests of the Concan and Malabar. *M. amygdalina*, Wall., a native of Martaban and Moulemein, is supposed to be identical with *M. attenuata*. It is *M. malabarica* that yields the Malabar nutmegs of commerce.

Butter of *Myristica moschata*,

NUTMEG, MALE.

Kayphul, Guz., HIND.

A native of the Moluccas, and frequently to be met with in some of the woods of Southern India. It is covered with a hard shell, provided with a pale arillus. It is one and a half to two inches long, elliptical, the parenchyme devoid of marbling. Its odour is weak, and flavour disagreeable. Its properties are analogous to that of the true nutmeg, but the oil is so inferior in proportion, that it is but of little commercial value. It is thought that it might, however, be greatly improved by cultivation. They are procurable in most Indian bazaars.—*Faulkner*.

NUTMEG OIL.

Jajphul-ka-tel, HIND. | Jagikarra nuna, TEL.
Jadikai enne, TAM.

The nutmeg contains a fixed or solid oil, and

a volatile oil both of which are used for medicinal purposes. Of the former there are two varieties; the English, which is the best, occurs in pieces of about ¾ lb. in weight, wrapped in leaves of the banana, it has a uniform reddish colour inside, and the Dutch imported from the Moluccas chiefly, in larger pieces, wrapped in leaves or paper, and of a lighter colour.—*Waterston*; *Faulkner*.

NUTMEG PIGEON, see *Columbidae*.

NUTMEG TREE, Eng. *Myristica moschata*.

NUTMEG, WILD, Eng. *Pyrrhosia horsfieldii*, Blume.

NUT'NA, also Nut'h, the nose-jewel, even to mention this is considered a breach of delicacy. Colonel Tod states that, as a token of the full confidence reposed in him, he was told that, "Should you even send to the queen's apartment and demand her necklace or nutna, it shall be granted."—*Tod's Rajasthan*, Vol. i, p. 431.

NUT OIL, Oils of *Corylus coturna* or *Juglans regia*.

NUTSA, a tribe, in lat. 21° 20' N., and long. 99° E. with Lawa and Shans on the north.

NUTS, ACHEEN, are the betel nut, boiled, of very inferior quality, chiefly used by the lower classes in the South of India and are in no demand at Madras: sold from 35 to 50 Rs. a candy.

NUTS, COLUMBO, are raw betel nuts: sold everywhere and are chiefly used by the Kayala mahomedans.

NUTSI RAGUM, TAM. *Cuminum cyminum*.

NUTTALLIA GRANDIFLORA, a pretty plant, when in blossom, resembling the poppy; they should be grown in a light rich soil of vegetable mould, the colour of the flowers is pink, purple, red and purple.—*Ridgell*.

NUTTI CHURI, TAM. *Spermacoce hispida*, L.

NUTTY, TAM. The swim or sound in the bellies of fish, the swimming bladder. That of Madras is obtained from the Codoovahi min and Koorakathalay min. It is sold at 8 Rupees per maund of 8 viss, or 160 Rupees per candy. This is bought by merchants and exported to China where it is used to polish silk and crockery ware.

Kuchla, DUK.	Yetti coltay, TAM.
Poison nut, Dogbano, ENG.	Mustig henza Musadi vittu TEL.
Noix vomique, FR.	

The Nux vomica is the nut of *Strychnos nux vomica*. Its wood was supposed by Dr. Christian to be often substituted for *Lignum colubrinum*, snake wood. Its bark is often sold in Calcutta as that of the Rohuma tree, *Soyimida febrifuga*. *Nux vomica* was early used as a medicine by the hindoos; by whom its properties must have been investigated long before it could be known to foreign nations. It is the Izarakee of Persian works on *Materia Medica*, but there is doubt respecting its name in *Avicenna*. *Khanuk-al-kulb*, dog-killer, and *Faloos mahée*, fish-scale, are other Arabic names. But under the name of *Jouz-al-Kue* or *Emetic nut*, Dr. Royle obtained the fruit of a *Rubiacæous* shrub. Dr. Pereira thinks that the *Nux mehil* of Serapion is *Nux vomica*; but in Persian works this name is applied to a *Datura*. The plant is a moderate-sized tree, with a short crooked trunk. Branches irregular, the young ones long and flexuose, with smooth dark-green bark. Wood white, close-grained, and bitter. Leaves opposite, with short petioles, oval, smooth and shining, 3 to 5-nerved, differing in size. Flowers small, greenish-white, in terminal corymbs. Calyx 5-toothed. Corol funnel-shaped; limb 5 cleft, valvate. Stamens 5; filaments short, inserted over the bottom of the divisions of the calyx: anthers oblong, half exserted. Ovary 2-celled, with many ovules in each cell, attached to the thickened centre of the partition. Style equal to the corol in length. Stigma capitate. Berry round, smooth, about the size of an orange, covered with a smooth somewhat hard fragile shell, of a rich orange colour when ripe, filled with a soft white gelatinous pulp, in which are immersed the seeds attached to a central placenta. Seeds peltate or shield-like, slightly hollowed on one side, convex on the other, about $\frac{1}{4}$ of an inch in diameter, and about 2 lines in thickness, thickly covered with silky ash-coloured hairs attached to a fibrous testa, which envelopes the kernel composed of horny bitter albumen, of the form of the seed and of the embryo imbedded in a hollow in its circumference. It is a native of the Indian Archipelago and of the forests of the Peninsula of India,

as well as of the southern parts of the Bengal Presidency, as near Midnapore.—*Esenb. and Eberm.*, 209; *St. and Ch.*, xi, 52.; *Roxb. Corom.*, i, t. 4

NYAMDAL, HIND. *Taxus baccata*.

NYAN, TIBETAN. *Ovis ammon*, is found in Ladak, only in the most inaccessible places, near the snow limit.

NYAN, BURM. *Desmodium*, species.

NYA-PEE or Gna-pee, BURM. The Balachang of the Malays, a compound of several kinds of small fish. Putrescent fish, in some shape or other is a condiment among all the races from the mountains of Sylhet to the isles of the Archipelago.

NYAR, a river near Chandpoor in the Almora district.

NYAR, a river near the Cossyah hills.

NYASA, a form of ejaculation made with a short and mystic prayer to the heart, the head, the crown of the head, and the eye, as Om! Sirase Namah! Om! salutation to the head, with the addition of the Kavacha, the armour or syllable Phat, and the Astra, the weapon or syllable Hum. The entire mantra, the prayer or incantation, is then, Om Sirase Namah, Hum, Phat. The Nyasa ceremony is

performed at the time of worship (pooja,) and consists of a number of curious, minute, and almost undefinable motions of the hands and fingers, (while the person repeats prayers,) such as touching the eyes, ears, shoulders, mouth, nose, head, breast, &c., doubling and twisting the hands, fingers, &c.—*Him. Th., Vol. ii, p. 53.*

NYASA, SANS. A deposit, from nee, prep. and us, to throw.

NYAYA, SANS. Justice; from nee, prep. and ay, to move.

NYAYA, the philosophy of the hindoos, a syllogism. This school of philosophy, or logical system of Gautam, corresponds with the dialectic school of Xenophanes. It is one of the six orthodox schools of the hindoos, the other two being the Mimams of Jeimuni, and the Mimams or Vedant of Vyasa. Of the philosophical schools it will be sufficient here to remark, that the first, Nyayu, seems analogous to the Peripatetic; the second, sometimes called Vaisishica or Vaiseshka to the Ionic; the two Mimamsa, of which the second is often distinguished by the name of Vedanta to the Platonic; the first Sanchya to the Italic, and the second, or Patanjala, to the Stoic philosophy; so that Gautama corresponds with Aristotle, Kanada with Thales, Jaimini with Socrates, Vyasa with Plato, Kapila with Pythagoras, and Patanjali with Zeno; but an accurate comparison between the Grecian and Indian schools would require a considerable volume. The original works of those philosophers are very succinct; but like all the other shastras, they are explained, or obscured by Upadarsana, or commentaries, without end. It results, from this analysis, of hindoo literature, that the Veda, Upaveda, Vedanga, Purana, Dharma, and Darshana, are the six great shastras, in which all knowledge, divine and human, is supposed to be comprehended. The word shastra, derived from a root signifying to ordain, means generally an ordinance, and particularly a sacred ordinance, delivered by inspiration: properly, therefore, the word is applied only to sacred literature. The sudras, or fourth class of hindoos, are not permitted to study the six proper shastras beforementioned; but an ample field remains for them in the study of profane literature, comprised in a multitude of popular books, which correspond with the several shastras. All the tracts on medicine must, indeed, be studied by the Vaidyas, or hereditary physicians, who have often more learning, with far less pride, than any of the brahmans; they are usually poets, grammarians, rhetoricians, moralists; and may be esteemed, in general, the most virtuous and amiable of the hindoos. See Veda, Vidya.

NYAU, BURM. *Morinda exserta.*

NYAU HWEE, BURM. *Morinda, sp.*

This is a tall shrub with rough scabrous leaves, well-known for the delicious though evanescent perfume of its flowers. The tubes of their corollas, called in Hindooi (Dundee), are of a fine rich yellow colour and are employed alone or in conjunction with Parasam flowers (*Butea frondosa*), in preparing a beautiful though transient bright yellow-dye, much sought after by the mahomedans for dyeing their turbans, and used for dyeing silks especially, it produces a good yellow colour, and compounds with reds, into a pleasing series of flame salmon and orange colours. The flowers called Dunda poo, *TEL.*, are used for giving a scent to cloths. Buchanan mentions the product as the powder scattered at the Holi feast. In Ajmeer, the tubes of the corolla are used, under the name of 'kesru,' to dye buff or orange colour. This plant is very abundant, wild, at the foot of the Vindhya range, where the green tough stalks are used to make large grain baskets of. The tree of mourning, is sometimes called night-blooming flower, and is as great a favorite in India as in the Southern States of America. Its delicate orange and white blossoms pour the most delicious fragrance on the evening air, and then fall in showers, bedewing the earth's cold bosom with sweetness. Its flower is held sacred to Siva.—*Drs. O'Shaughnessy, p. 436; J. L. Stewart; Ains. Mat. Med., p. 148; Irvine; Gen. Med. Top., p. 172; Mason; Rhode's MSS.; Beddome and Macdonald; Powell's Hand-book, Vol. i, p. 448.*

NYCTICORAX GARDENI, the Night Heron of Europe, Asia; Africa, North America? or a species at least barely separable, is very common in India. The *Nycticorax*, genus of birds, is of the order *Grallatores*, as under:

Sub-fam.—*Ardeinæ*, 1 gen., 7 sub-gen., 19 sp., viz: 4 *Ardea*, 6 *Herodias*, 1 *Butorides*, 1 *Ardeola*, 1 *Nycticorax*, 1 *Tigrisoma*, 1 *Botaurus*, 4 *Ardetta*.

NYCTINOMUS BENGALENSIS, Geoff. *N. dilatatus*, Horsf., and *N. tenuis*, Horsf., are syns. of *Nyctinomus plicatus*, Jerdon.

NYCTERIBIA, a singular parasitic creature which appears to have neither head, antennæ, eyes, nor mouth. It moves by rolling itself rapidly along rotating like a wheel on the extremities of its spokes, or like the clown in a pantomime, hurling himself forward on hands and feet alternately. It was first discovered only on a few European bats. Joinville figured one which he found on the large roussette or flying-fox, and says he had seen another on a bat of the same family. Dr. Templeton observed them in Ceylon in great abundance on the figure of the *Scotophilus Coromandelicus*.—*Tennent's Sketches of Nat. His. of Ceylon*, p. 20.

NYCULA, see *Pandu*, Polyandry.

NYEE, TAM., TEL. Ghee.

NYMPHÆA, a genus of plants, the type of the natural order *Nymphaeaceæ*. There are upwards of 20 species of this genus described. They have all large floating leaves, with white, red, or blue flowers, which appear at the surface of the water. Griffith says there are two different species of water lily in the Tenasserim Province. The *Nymphaeaceæ* or water-lily tribe, are all floating plants and dispersed through most warm parts of the world. Their stems are bitter and astringent and contain a considerable quantity of *fæcula*, which may be used as food. *Nymphaea alba*, the common white water-lily, is a native of ditches, ponds, and lakes throughout Europe, and is abundant in Great Britain. The flowers are white, and ac-

cording to Linnæus, open themselves in the morning at seven o'clock, and close them at four o'clock in the evening. The roots of the white water-lily contain an astringent principle, which renders them useful in dyeing. They also contain starch, and on this account swine feed on them, although other animals reject them. A variety of this plant occasionally met with called *Alba minor*, has smaller flowers and leaves than the species. It is found in tanks in India, and grown as the rest of the species. The *Nymphaea nelumbo* is considered, on account of its beautiful appearance, a sacred plant, and pleasing to the gods. The images of idols were often depicted sitting on its large leaves. The genera and species are as under:

Euryale ferox, Salisb., North India, Bengal.

Nymphaea pubescens, L., British India.

" *rubra*, Roxb.

" " var. *rosea*, Roxb., Bengal.

NYMPHÆA EDULIS, DC.

Nymphaea esculenta, Roxb. | *Castalia edulis*, Salisb.
Chota sundhi, BENG. Kalharamu, TEL.
Kotika, TEL.

The eatable water lily has pellate broad oval entire leaves, with the under surface pubescent. It is a native of the East Indies, in wet fenny districts. Its flowers are small, and white or reddish. Like all the species it has large pear-shaped roots, which contain an abundance of starch, and they are consequently used as articles of diet, as also are the seeds of a species nearly allied to this, the *N. rubra*, which has deep-red flowers. Its flowers also are held in veneration by the hindoos. The *Tukhm-i-nilofar* of Sirsa are the capsules and seeds of *Nymphaea edulis*, which are eaten or else mixed with flour and made into cakes; they are also curried. The *Bekh-i-nilofar* of Srinagar and Kashmir is the root of the edible lotus.—*Eng. Cyc.*; Roxb.; Riddell; Voigt; Powell. See *Kaul doda*, &c.

NYMPHÆA CÆRULEA, the blue water-lily, has peltate, nearly entire, leaves without dots, glabrous on both surface, and 2-lobed at the base, the lobes free; the anther with an appendage at the apex; the stigmas 16-rayed. This plant is a native of Lower Egypt in rice-grounds and canals about Rosetta, Damietta, and Cairo. The flowers are very fragrant, and from its frequent representation in the sculptures of Egypt, it appears to have been regarded as a sacred plant by the ancient Egyptians.—*Eng. Cyc.*

NYMPHÆA NELUMBO, Linn. Syn. of *Nelumbium speciosum*, Willd.

NYPHÆA PUBESCENS, Willd.

Koi, Kumul,	HIND.	Kaki-kaluwa,	
Bhambar; bhambal,	"	Alli-kalung.	
Sarang: Kuwal-gotta,	"		

A native of Africa of all the E. Indies and Java. It was venerated by the Egyptians and is held sacred by the hindooes, being regarded as an emblem of fertility. It has large white flowers with sepals. Has peltate leaves, sharply serrated; the under surface is pilose at the nerves, and pubescent between them, red at the margins: the root is large, tuberous and eatable; like that of the Tawmaray, (*Nelumbium speciosum*), the root can only be found in dry weather, in the beds of the tanks; it is pleasant to the taste, and is made by the natives into curries and other dishes. The seeds were dried by the ancient Egyptians, and made into bread. Dr. Buist gave a highly interesting account of the breathing of the Lotus, but Lotus is a name applied to various plants by the ancients. The Lotus of the Lotophagi was the *Zizyphus lotus*; that of Homer and Dioscorides, a species of Lotus, or *Trifolium*; the Lotus of Hippocrates is the *Celtis australis*; and the Italian Lotus is the *Diospyros lotus*. The halved-dried flowers, consisting of numerous yellowish thin petals, are considered by native writers to be a dry and cold astringent remedy, used in fever and cholera, bilious affections and piles, also in diarrhoea and eruptions of the mouth. The root is mucilaginous and demulcent, and is used in piles. The fruit called Napa bij or Kumud bij, is used similarly, is considered by natives cool and used as an antidote for poisons also in skin-diseases and leprosy.—*Eng. Cyc.*; *Irvine, Gen. Med. Top.*, p. 198; *Powell's Handbook*, Vol. i, p. 330; *Ainslie's Materia Indica*, p. 248.

NYPHÆA PYGMIA, a diminutive water-lily, the flower of which is no larger than a half-crown; grows on the Khassia hills, in China and Siberia, a remarkable fact in the geographical distribution of plants.—*Hooker's Him. Journ.*, Vol. ii, p. 312.

NYUNG-YUWE, see Shan.

O is the fifteenth letter and fourth vowel of the English language, in which it has several sounds;—long as in *tone, grown, old*; short as in *lot, not, lodge, rot*: a sound as of the Italian or German *u*, or the French *ou*, as in *move, do, boot*; a similar but shorter sound as in *wolf, boot, foot*, and a longer sound as in *form, mortal*. In Sanskrit *o*, like *e*, is always long, but in the Southern dialects, there is a still more prolated quantity of it.

OADHAL, ASSAM. *Sterculia villosa*, a native of the mountainous countries to the eastward of Bengal. Trunk straight, the bark is smooth, but fibrous bags are made of it. Its fibres are made into cords by the natives of the eastern frontier of Bengal, to bind wild elephants with. The rope is made most readily; the bark, or rather all the layers, can be stripped off from the bottom to the top of the tree with the greatest facility, and fine pliable ropes may be made from the inner layers of bark, whilst the outer yield coarse ropes. The rope is very strong and very lasting—wet doing it little injury.

OADAL, a creeper in Kemaon, with fine strong fibres.

OAK, Eng.

Bealut,	ARAB.	Quercia,	Ir.
Eeg,	DAN.	Quercus,	LAT.
Eik,	DUT.	Dab,	POL.
Chene,	FR.	Roble,	PORT., SP.

Drus,	GR.	Bubb,	RUS.
Balanis,	"	Ek,	SW.

In the tract of country from Asia Minor, along the north of Persia to China and Japan, also in the Tenasserim provinces, several oaks occur, but, in the presence of other valuable timber trees, their woods do not attract the same attention as that of English oak. An oak is mentioned in the Holy Scriptures, but it is not identical with the British oak, being either the evergreen oak (*Quercus ilex*), or a species nearly resembling it. Near Shechem there stood also a tree of the same genus which probably was remarkable for its size, being called in Genesis, xxxv, 4, "The oak which was by Shechem." In the war of 1812-13 and 14, the natives of the peninsula and the French both frequently fed on the acorns in the woods of Portugal and Spain. In Morocco and Algiers the acorns of *Quercus ballota* are sold in the public markets, and the acorns "balut" of some of the oaks are met with in all the Indian bazars. The genus of *Quercus* embraces about 150 species. Several species are indigenous in the Tenasserim provinces, and on the moun-

tains of South-Eastern Asia. Wallich found seven different species of oak *Quercus fenestrata*, *turbinata*, *velutina*, *Amherstianus*, *Tirbbæ*, growing in Burmah and on the Tenasserim Coast, and all affording useful timber, though inferior to the English oak. No oak nor chestnut ascends above 9,000 feet in the interior of Sikkim, where they are replaced by a species of hazel (*Corylus*); in the North Himalaya, on the other hand, an oak (*Quercus semecarpifolia*, see vol. i, p. 187) is amongst the most alpine trees, and the nut is a different species, more resembling the European. On the outer Sikkim ranges oaks (*Q. annulata*?) ascend to 10,000 feet, and there is no hazel. It is not generally known that oaks are often very tropical plants; not only abounding at low elevations in the mountains, but descending in abundance to the level of the sea. Though little known in Ceylon, the Peninsula of India, tropical Africa, or South America, they abound in the hot valleys of the Eastern Himalaya, East Bengal, Malay Peninsula, and Indian islands; where perhaps more species grow than in any other part of the world. Such facts as this disturb our preconceived notions of the geographical distribution of the most familiar tribes of plants, and throw great doubt on the conclusions which fossil plants are supposed to indicate. In Borneo, the trees which are abundant, and produce excellent timber, amount to upwards of sixty species, many of the other kinds not useful as timber trees, are, or might be valuable, for making charcoal, pot-ash, pearl-ash, &c. Several kinds of oaks are found in the forests, but being of quick growth and soft wood, their timber is not esteemed. Ebony is abundant in many parts of the island, particularly on the west coast, but it is said to be inferior to that from the Mauritius, although it has been found a very profitable export to China. In the neighbourhood of the Lundu river, in the Sarawak territory, are large forests of it. There are three species of oak in the Sutej valley, *Quercus incana*, "ban." Common heavy oak, *Q. semicarpifolia*, "kar-su," *Q. dilatata*, "morhu," which are next in importance to the pines. Vast forests of them occur in various places, as on the east side of Hattu, on the upper track between Muttiana and Nagkanda, in Mandi, Sukhet, &c. The trees are of great size, 80 to 100 feet in height, they prefer dry situations, and are not generally convenient to the river. The logs do not float the first and second years, being in this respect like the black wood of Malabar. Oak wood

has been well reported of by General Cautley at Marri.—*St. John's Forest Trees of Britain*, Vol. i, p. 51; *McCulloch's Commercial Dictionary*, p. 854; *Drs. Faulkner; Mason; Wight; Hooker, Him. Jour.*, Vol. ii, p. 336; *Low's Sarawak*, pp. 59-61. See Acorns, Japan, Quercus, Tree.

OAK GALLS are produced on different species of oak by the female of the Cynips, or Dipolepis, piercing the buds of *Q. imbecilla* and depositing its eggs. Dr. Falconer, when travelling in the Punjab, was informed that galls were produced on the Balloot oak, *Q. ballota*. East India Galls of commerce are Bussorah Galls, re-exported from Bombay. Mecca Galls are also Bussorah Galls. The Himalayan oak (*Quercus incana*), Chil, (*Pinus longifolia*), and small rhus (*R. continus*), are employed for tanning.—*Cleghorn's Panjab Report*, pp. 41, 191; *Royle*.

OAK-AN, BURM. A tree of Moulmein. This wood is made into canoes.—*Cal. Cat. Ex.*, 1862.

OAK-LEAVED POLYPOD, *Polypodium quercifolium*.

OAKUM.

Pakal, MALAY. | **Pamakal, MALAY.**
Old hempen ropes pulled loose, and used in the caulking of sailing vessels. Oakum in China is made of the baru, a gossamer-like substance found at the base of the petioles of the *Arenca saccharifera*.—*Faulkner*.

OAN-NAIH, BURM. A tree of Moulmein, used for house-building purposes.—*Cal. Cat. Ex.* 1862.

OANT, HIND. In Central India, accommodation bills. These are termed, on the faces of the bills, "chelaun" or current, in opposition to "Rokra," or ready money bills. The person who accepts these from the drawers, enters the amount against him in his books at interest.—*Malcolm's Central India*, Vol. ii, p. 90.

OARACTA, see Kishm island.

OASIS, a fertile portion of land in the deserts of Africa and Arabia. Hugh Murray derives this word from the Egyptian, and quoting Strabo and Abulfeda makes it synonymous with Auasis and Hyasis, but it is believed to be a mere corruption of the Arabic word wady. The "wady" is, generally speaking, a rocky valley bisected by the bed of a mountain torrent, dry during the hot season. In such places the Bedouins love to encamp, because they find forage and drink, water being always procurable by digging. M. Langles suggested the derivation of Oasis from the Arabic, and Dr. Wait, in a series of interesting etymologies suggests vasi from vas, to inhabit. Vasi and oasis or vasis are almost identical. Sir W. Ouseley gives nearly the same signification of Wadi as appears in Johnson's edition of Richardson,

viz., a valley, a desert, a channel of a river, river; wadi-ul-kabir, 'the great river,' corrupted into Guadalquivir, which example is also given in d'Herbelot and by Thompson, who traces the word water through all the languages of Europe. The Saxon wæter, the Greek hudor, the Islandic udr; the Slavonic wod, (whence woder and oder, 'a river'): all appear derivable from the Arabic wad, 'a river'—or the Sanscrit wah; the word bas (classically vas) is applied to one of these habitable spots. The word bustee, a hamlet, is from vāsna, to inhabit; vasi, an inhabitant; or vas, a habitation, perhaps derivable from wah, indispensable to an oasis.—*Burton's Pilgrimage to Mecca*, Vol. i, p. 219; *Asiatic Journal*, May 1830; *Tod's Rajasthan*, Vol. ii, p. 294. See Wadi gehennem.

OATH.

Kasm, AR., HIND., PERS.

Oath, a religious affirmation, an appeal to witness of the Supreme God. The British nation have, in England and Ireland, the custom of kissing the book, pronouncing the words "so help me God." The French custom raises the hand as in Gen., xiv, 22; Deut. xxxii, 40; Jeremiah, v, 7, forbids swearing by idols, and in II Kings xi, 2, and I Sam. i, 26, the soul (or life) of the exalted man is invoked. The Greeks and Romans swore by their tutelary gods and the mediæval christians by their guardian saints. The oath administered to the person who erects the boundary pillars, if a hindoo, is the gunga-jul, or the chour or raw hide of the cow, or swearing by his son. The leaves of the tulsi and water are swallowed after an oath. If a musulman the Koran, or the placing his hands on his son's head. To a hindoo the chour, and swearing by his own child, are the most binding. In the "Book of the Oath," which a Burmese witness places on his head in swearing, one of the numerous and tremendous imprecations which it contains is, "All such as do not speak truth. . . . if they travel by water whether in ships or boats, may they sink, or may they be bitten or devoured by crocodiles."—*History of the Punjab*, Vol. i, p. 151; *Yule*, p. 24. See Jaffri oaths.

OATS.

Havre,	DAN.	Avena sativa, L.	LAT.
Haver,	DUT.	Owies,	POL.
Common oat,	ENG.	Avea,	PORT.
Avoline,	FR.	Ovyoss: owes,	RUS.
Hafer,	GER.	Avena,	SP.
Bromion: bromos,	GR.	Hafer,	SW.
Vena, avena,	IT.		

The oat (*σπῆραι* of Dioscorides) was known to the Greeks. The oat is distinguished among cereal grains by its loose panicle. A native probably of the Persian region. Several varieties are cultivated in Europe. The grains of oat when deprived of their integuments form groats; when these are crushed, emben and prepared groats.

When the grain is kiln-dried, stripped of its husk and delicate outer skin, and then coarsely ground, it constitutes the oatmeal of Scotland. The husk, with some adhering starch from the seed, is sold under the inconsistent name of seeds. Oats according to Vogel, consist of 34 of husk and 66 per cent. of meal, and oatmeal, in 100 parts, 59 of starch, 43 of albuminous matter. Bitter extractive and sugar, 8.25, gum, 2.5 with 23.95 of Lignin and moisture. Dr. Christison finds as much as 72 per cent. of starch, and that it consists therefore of nearly five-sixths of real nutriment. Groats and oatmeal are nutrient and demulcent. When boiled with water (3 oz. to 1 pint, boiled down to $\frac{1}{2}$ a pint), gruel is formed, which is so useful as diet for the sick. Oatmeal, when of thicker consistence, forms porridge, and may be employed for making poultices. Oats are in demand for horses. The following is a fair estimate of the comparative production:—

England, Acres	2,500,000	Produce	12,500,000
Ireland, „	2,300,000	„	11,500,000
Scotland, „	1,300,000	„	6,500,000

It is the hardiest of all the cereal grains cultivated in Britain, of which there are about 40 species known to botanists. Oats were introduced into Patna and Monghyr, but the cultivation is not carried on to any great extent.—*Royle; Hassell; Cat. Ex., 1862, Nees von E., p. 28.*

OB, a serpent: for Obi-women, Obion, Oboth, and Oub, see Serpent.

OBAL, HIND. *Fagopyrum emarginatum*, *Meisn.*

OBAN, the principal gold coin of Japan, worth about £4 2s.—*Simmond's Dict.*

OBAR, HIND. Kotaha, land dependant on rain for irrigation same as Barani.

OBARA, HIND. Houbara macqueenii, one of the bustards.

OBAIRIA, hard, rather fine, generally close-grained, heavy Ceylon wood, presenting, however, many open cells.

OBEH, see Kalmuck, Jews.

OBELISKS, see Maha deva.

OBIRA, or Kakesa and Tella pidusa, TEL. *Streptium asperum*, R. iii, 90; *Cor.* 140. Perhaps Obera or Obhera would be a more correct orthography.

OBLATIONS, Jeremiah, xlv, 17, says, 'To pour out drink-offerings to the queen of heaven.' The hindooes pour out water to the sun three times a day; and the moon at the time of worshipping this planet. Amongst hindooes, kula means a family, a race, a tribe. Properly the got of a hindoo is his tribe, and kula is the race. But kula, among the Rajputs means a tribe; and corresponds to the Affghan kheil. Amongst the hindooes there are three kinds of devata or deities to whom worship is given, the Gramma Devata or village-god; the Kula Devata, the

race, household or family-god; and the Ista Devata, the patron or personal deity of individuals. Adhi-devata is the primitive deity, Sthana-devata, local deity. The Aryan hindoo does not recognize the village gods of Southern India, but the non-hindoo Turanian races largely worship them, and even many of those Turanian races who have been converted to hinduism, worship them. They are mostly shapeless pieces of wood or stone smeared with vermilion, and mostly represent evil sprits or devils. These are the Amma, Anmun and Amoor of the eastern and southern parts of the peninsula, and the Satwai, Bhairo, Massoba, Chamanda, Asra, Ai and Marryai of the northern and western parts of the peninsula, all of whom are recognized as causing harm to individuals. In health, they are neglected, but when sickness occurs, either to individuals, or as an epidemic, these spirits of evil are worshipped with much solemnity and bloody sacrifices are made to them of goats and sheep and bullocks and buffaloes. Gotra or Kula mean a family and existed amongst Kshatrya and Vaisya as well as Brahmans. The Gotra depend on a real or imaginary community of blood and then correspond to what we call families. No hindoo house is supposed to be without its tutelary divinity, but the notion attached to this character is now very far from precise. The deity who is the object of hereditary or family-worship, the Kula-devata, is always Sivá, or Vishnu, or Durga, or other principal personage of the hindoo mythology, but the Griha devata or household god rarely bears any distinct appellation. In Bengal, the domestic god is sometimes the Saligram, sometimes the tulasi plant, sometimes a basket with a little rice in it, and sometimes a water jar, to any of which a brief adoration is daily addressed, most usually by the females of the family: occasionally, small images of Lakshmi or Chandi fulfil the office, or should a snake appear, it is worshipped as the guardian of the dwelling. In general, in former times, the household deities were regarded as the unseen spirits of ill; the ghosts and goblins who hovered about every spot, and claimed some particular sites as their own. At the close of all ceremonies, offerings were made to them in the open air, to keep them in good humour, by scattering a little rice with a short formula. Thus at the end of the daily ceremony, the house-holder is enjoined by Menu—3.90 "to throw up his oblation (bali) in the open air to all the gods, to those who walk by day and those who walk by night." In this light the household gods correspond better with the genii locorum than with the lares or penates of antiquity.—*Wilson's Hind. Th.*

OBLON, Sr. Hops.

OBOS, see Jüllundhur.

OBSIDIAN, a black mineral: it will scratch a paste, but not a pure gem.

OBST, GER. Fruit.

OBUL, HIND. *Rumex acutus*.

OBUN, a river in the Banda district.

OBY and Irish, rivers of Siberia.

OCCHUS of Pliny, the Akantheon aria of Theophrastes, supposed to be the Alhagi maurorum of Tournefort.

OCEAN.

Bahr, Bahr mahit, Darya, Kala-pani,	AR. HIND.	Darya, Samudra, Samandr,	PERS. SANS., TEL. TAM.
---	--------------	--------------------------------	---------------------------------

The south and east of Asia is girt by the ocean, portions of which are known as the Red Sea, the Persian Gulf or Bahr-i-Oman, the Arabian Sea, or N. Indian Ocean, the South Indian Ocean, the Bengal Bay and the Pacific Ocean. Edrisi says, "The Ocean Sea is called the Dark Sea, because it is dark, and is almost always in commotion with violent winds, and covered by thick fogs." To the ocean near land the Arabs give the name of Bahr-ul-Khazr, or Green Sea; the natives of India, generally style the Great Ocean as the Kala pani or Black Water. The Indian and Pacific Oceans are studded with islands in a state of formation by polypi and corallines. In the Indian Ocean, the tide follows the moon to the west with a somewhat northerly course. Dr. Buist, on the authority of Mr. Laidly, stated the evaporation at Calcutta to be "about fifteen feet annually, and that between the Cape and Calcutta, it averages in October and November, nearly three-fourths of an inch daily; between 10° and 20° in the Bay of Bengal, it was found to exceed an inch daily. Supposing this to be double the average throughout the year, we should, have eighteen feet of evaporation annually." All the heat received by the intertropical seas from the sun annually would not be sufficient to convert into vapour a layer of water from them sixteen feet deep. It is the observations as to the rate of evaporation on shore that have led to such extravagant estimates as to the rate at sea. The mean annual fall of rain on the entire surface of the earth is estimated at about five feet. The rivers of India are fed by the monsoons, which have to do their work of distributing their moisture in about three months. Thus we obtain 0.065 inches as the average daily rate of effective evaporation from the warm waters of the N. Indian ocean. If it were all rained down upon India, it would give it a drainage which would require rivers having sixteen times the capacity of the Mississippi to discharge. Nevertheless, the evaporation from the North Indian ocean required for such a flood is only one-sixteenth of an inch daily throughout the year. The total amount of

evaporation that annually takes place in the trade wind region generally at sea, according to Maury's estimate does not exceed four feet, Sir John Herschel gives to the winds the entire right of setting the ocean streams in motion; Lieutenant Maury holds the universal circulation of the sea to be caused by nothing else than the difference in its specific gravity, and Dr. Carpenter (or rather Professor Buff) would bring about a general interchange of polar and equatorial water by the aid of sunshine and frost alone. The water of the Indian Ocean is warmer than that of any other sea, therefore it may be inferred that the evaporation from it is also greater. The north Indian Ocean contains about 4,500,000 square miles, while its Asiatic water-shed contains an area of 2,500,000. Supposing all the rivers of this water-shed to discharge annually into the sea four times as much water as the Mississippi discharges into the Gulf of Mexico, we shall have annually on the average an effective evaporation from the North Indian Ocean of 60 inches or 0.0165 per day. The waters of the Indian Ocean are hotter than those of the Caribbean Sea, and the evaporating force there is much greater. These two facts, taken together, tend, it would seem, to show that large currents of warm water have their genesis in the Indian Ocean. One of them is the well-known Mozambique current, called, at the Cape of Good Hope the Lagulhas current. Another of these warm currents from the Indian Ocean makes its escape through the Straits of Malacca, and being joined by other warm streams from the Java and China Seas, flows out into the Pacific, like another Gulf Stream, between the Philippines and the shores of Asia. Thence it attempts the great circle route for the Aleutian Islands, tempering climates, and losing itself in the sea as its waters grow cool on its route towards the north-west coast of America. Near the shores there is a counter-current of cold water. The Lagulhas current, as the Mozambique is sometimes called skirts the coast of Natal as the Gulf Stream does the coast of Georgia, where it gives rise to the most grand and terrible displays of thunder and lightning that are anywhere else to be witnessed. There is sometimes, if not always, another exit of warm water from the Indian Ocean. It seems to be an overflow of the great intertropical caldron of India; seeking to escape thence, it works its way polarward more as a drift than as a current. It is to the Mozambique current what the northern flow of warm waters in the Atlantic is to the Gulf Stream. This Indian overflow is very large. The best indication of it is afforded by the sperm whale curve. In shore of, but counter to the "Black Stream," along the eastern shores

of Asia, is found the cold current of 'Okotsk a streak or layer, or current of cold water answering to that between the Gulf Stream and the American coast. *This current, like its fellow in the Atlantic, is not strong enough at all times sensibly to affect the course of navigation; but, like that in the Atlantic, it is the nursery of most valuable fisheries. The fisheries of Japan are nearly as extensive as those of Newfoundland, and the people of each country are indebted for their valuable supplies of excellent fishes to the cold waters which currents of the sea bring down to their shores. There are also about the equator in this ocean some curious currents, which Maury called the "Doldrum currents" of the Pacific, but which he says, he does not understand, and as to which observations are not sufficient yet to afford the proper explanation or description. There are many of them, some of which at times run with great force. On a voyage from the Society to the Sandwich islands Maury encountered one running at the rate of ninety-six miles a day. These currents are generally found setting to the west. They are often, but not always, encountered in the equatorial Doldrums on the voyage between the Society and the Sandwich Islands. The Pacific Ocean and the Indian Ocean may, in the view we are about to take, be considered as one sheet of water. This sheet of water covers an area quite equal in extent to one-half of that embraced by the whole surface of the earth, and, accordingly Professor Alexander Keith Johnston so states it in the new edition of his splendid Physical Atlas. There is, also, at times another warm current running to the south midway between Africa and Australia, of which the whales give indications. These convey immense quantities of highly saline water which has to be replaced by colder water. The Aleutian Islands are in the tract of the current from the Straits of Malacca. They are as subject to fogs and mists as the banks of Newfoundland. No trees grow on them, and for all household purposes the natives depend on the drift wood, amongst which camphor wood and woods of Japan and China are often seen. The Japan stream known as the Kuro Sino sweeps along the outer or eastern shores of the Japanese islands. This stream carries with it the Gulf weed or Sargossa with many animal forms such as Clio, Cavolina, Pteropods, Spiralis, Atlanta and the Pelagian skeleton shrimps, Alima and Erichthys; also the Carapaces of the sailor-crab called Planes. Near Japan a current runs in a thin layer in shore similar to that between the gulf stream and the American coast, and like it is the nursery of many valuable fisheries. It is in the cold waters which the currents of the ocean bring to its shores that the people of Japan obtain their supplies of

fish, there as abundant as those of Newfoundland. Surrounding the coasts of Southern Asia, patches of the waters become occasionally crimson, brown, black or white, which, especially in the Indian Ocean, occasionally extend as far as the eye can reach. These are caused by organic matter, but whether it is wholly animal or wholly vegetable, or both has not been satisfactorily ascertained. The water from pink-stained patches has been found to contain animalcules. The Red Sea is supposed to be named from the quantities of slimy red colouring matter which it, at certain times throws up on its shores and which consists of a delicate seaweed. Along the coasts of China, yellowish spots are said not to be uncommon, and red and white patches occur on the waters of the Pacific, which, when seen at night by navigators, cause alarm, as they are taken for shoals. In lat. 8° 46' S., and long. 105° 30' E., Captain Kingman entered a white patch at dusk, he filled a tub with the water and found it filled with luminous particles, insects and worms, some like a hair and about two inches long. This patch was 23 miles in length, north and south, with a strip of dark water dividing its centre. The whole appearance was that of a plain covered with snow. There was scarcely a cloud, but the sky was as black as if a storm was raging. Whales are principally about Celebes and the Sulu and Banda Sea, north of the Bilolo passage, few English ships now visit there from want of success. The Red Sea is in a riverless and rainless region, and its waters are heavier than any other mere arm of the ocean. The saltiest part is in the gulf of Suez, the saltness diminishes south of Socotra, and again increases eastwards to Bombay, the temperature of its waters for three or four hundred miles from the Straits, has been found as high as 95°. This is probably caused by the slight evaporation, as the more saline a fluid is the slower is its evaporation. Cyclones have been treated of by Colonel Capper, formerly Quarter Master General of Madras, Redfield of America, Reid in England, Tom of the Mauritius, and Peddington of Calcutta. These writers regard cyclones as rotatory storms, which revolve against the sun in the northern and with the sun with the handles of a watch in the southern hemisphere; also that the nearer the centre or vortex, the more violent the storm, while the centre itself is calm, which travels sometimes a mile or two in an hour and sometimes 40 or 50 miles; that in the centre, the barometer is low, rising as you approach the periphery of the whirl; that the diameter of these storms is sometimes a thousand miles, and sometimes not more than few leagues; that they arise somewhere between the parallels of 10° and 20° N. and S.

travelling to the westward in either hemisphere, but increasing their distance from the equator, until they reach the parallel of 25° or 30° , when they turn towards the east or recurvate, but continue to increase their distance from the equator, i. e., they first travel westwardly inclining towards the nearest pole; they then recurve and travel eastwardly still inclining towards the poles, and that such is their path in both hemispheres. It is known that the path of every wind, is a long curved line. Though the wind be blowing around in spirals against the hands of a watch, yet, from the fact that the centre about which it is blowing is also travelling along the changes of the wind as observed by a vessel over which the storm is passing will not under all circumstances, be against the sun in the northern or with the sun in the southern hemisphere. Great exaggeration has prevailed in respect to the altitude of ocean waves. Even learned writers, until very recently, continued to speak of their rising 40 or 50 feet high. In November 1840 a writer during a voyage from New York to Barbadoes, in a small barque, encountered one of the severest hurricanes of the present century. It was one of those great cycloidal storms, reported on by the late Colonel Reid, which swept down the whole length of the Carribean Sea, and, turning with the Gulf stream, followed the coast of North America to Newfoundland, and finally crossed the Atlantic to the shores of England. When they reached the middle of the Gulf stream, where the current was three knots an hour, off the Capes of Carolina, the wind was at its greatest force from the north, almost in an opposite direction to the current, thus raising the waves to what people delight to call in poetic language, "mountains high." When he mounted about 30 feet, he was on a level with the crest of the waves when the ship was at the bottom of the "troughs." They never rise above 16 or 18 feet above the ocean's level when at rest.—(i, 87), *Yule Cathay*, Vol. i, p. clxviii; *Dr. Buist's Report of the Bombay Geographical Society, from May 1849 to August 1850*, Vol. ix; *Ben. Pharm.*, p. 285; *Mauzy's Physical Geography*, pp. 130, 197-198, 199, 200, 202, 204, 330-31; *Adams*, p. 318; *Mauzy, Lt. M.F., L.L.D., United States sailing directions*, Washington, 1858; *Wilson's Science of Ship-building*; *Adams*, p. 240.

OCEANICA includes all the Indo-Pacific islands, but Mr. Logan proposed to use the word Asianesia to indicate the great south-east insular region which has intimate connexions, geographical and ethnic, with Asia. It would include Indonesia, Melanesia, Micronesia and Polynesia, but not the north-east chain that lies along the continent, because it forms a distinct and

well-defined geographic and ethnic group. He would therefore call it Aino-japanesia, and it will include all the Japanese and Aino islands from Formosa to Kamtschatka. The Formosa people are called by the Chinese Tai-lokok, their hair is short and fringed on the forehead, behind it hangs loose. The language of Formosa or Tai-wan, according to M. de Rosner, appears to be a branch of the Oceanic. The great work of Baron William von Humboldt, on the Kavi speech, has afforded the important result that the resemblance known to exist between the nations of the islands in the pacific Ocean termed Polynesian, and the tribes of the Indian Archipelago, Malacca and Madagascar, are not the effect of casual intercourse, but are essential affinities, deeply-rooted in the construction of these languages. The Papua languages, or those spoken by the black and woolly-haired nations, are for the most part as yet unexplored. One observation to be made respecting them is, that the dialects of the Papuan races often partake more or less of the Polynesian. Whether this arises from the adoption by the Papua of the Polynesian vocabulary has not been determined, though most persons incline to this last opinion. It is however now well known that some black nations have Polynesian dialects. The idiom of the Fijian islanders, for example, is properly a dialect of the Polynesian language. Infanticide long prevailed in Eastern Polynesia and till recently in New Hebrides. The principal groups of Oceanica are—

OCHRA, or okro, *Abelmoschus esculentus*, the *Hibiscus esculentus* of authors, a plant of which the fruit issued as a vegetable in the East and West Indies, the United States, and in South America, and which is remarkable for the similarity of its name to the vegetable called Ochra by the Greeks, but which has not been ascertained by botanists. The names by which this produce of the New World is distinguished in the works of Maregrave and Piso are Quingambo and Quigombo, and in the later works by that of Gombo and Gombaut or Gombeau. It is possible, therefore, that a classical name which was not otherwise engaged may have been applied to a new vegetable, and, as has been the case in many instances, without any attempt being made to identify the plant named with that which had been described by classical authors. The okra plant abounds all over the East and West Indies, and in the Tenasserim Provinces.—*English Cyclopædia*, p. 60; *Mason*.

OCHRE, *Red*.

Ch'ih-t'u, Red ochre, Reddle,	CHIN. ENG.	Red-chalk, Bole,	ENG
-------------------------------------	---------------	---------------------	-----

Yellow ochre.

Hawang-t'u, Pewdee,	CHIN. GUZ., HIND.	Sonagaroo,	TEL.
------------------------	----------------------	------------	------

An earthy mixture of alumina, silica, oxide of iron, and other substances, found in beds in various parts of England, India, on the Continent, &c. It is generally of a yellow or brown colour, but is sometimes reddened by calcination. It is prepared for use by grinding and elutriation; and is employed as an ingredient in painter's colours, in the polishing of metals and stones, and for other purposes. Ochre sometimes contains a little calcareous matter and magnesia. The oxide of iron may occur in so large a proportion that the ochre becomes an ore of that metal. In England, ochre is found in beds some feet thick, generally above the oolite, and covered by sandstone and quartzose sands more or less ferruginous, and accompanied by grey plastic clays of a yellowish or reddish colour. All these substances enter into the composition of the ochres. The ochry earths are ground under edge millstones and elutriated for use: the yellow ochres may be changed into red or reddish brown by calcination, whereby the iron is raised to a higher degree of oxidation. Native red ochre is called red chalk and reddle or bole. The ochres are used as pigments, and in China, as a dusting powder to burns, scalds, itchy and herpetic eruptions.—*Smith's Chin. Mat. Med.*, p. 157; *Bingley*, Vol. i, p. 199.

OCHTERLONY, Sir DAVID, a general officer

of the Bengal army, who was Resident at Delhi and afterwards commanded in the Népaul war.

OCIMUM ADSCENDENS, *Willd.*

<i>O. cristatum</i> , <i>Kon.</i>	<i>Plectranthus indicus</i> , <i>Spreng.</i>
<i>O. indicum</i> , <i>Roth.</i>	Ban-tulsi, <i>BENG.</i>

Grows in the peninsula of India and in Bengal. It has small pale rose-coloured scentless flowers.—*Voigt*.

OCIMUM BASILICUM, *Burm.* Common Basil, has many varieties, differing in their size, in the form and colour of their leaves, and in minor particulars: in their qualities they are nearly alike. The small seeds are deemed cooling and mucilaginous, and consequently given in gonorrhœa, ardor urinæ, and affections of the kidneys. Common sweet basil is not rare in gardens, but not met with indigenous in Tenasserim; the varieties are—

var. (a) <i>O. pilosum</i> , <i>Benth.</i>	<i>O. hispidulum</i> , <i>Schum.</i>		
	<i>O. ciliatum</i> , <i>Horn.</i>		
<i>O. minimum</i> , <i>Burm. not L.</i>	<i>Basilicum indicum</i> , <i>Rumph.</i>		
<i>O. hispidum</i> , <i>Lam.</i>			
Habak, Babui-tulsi,	AR. HIND.	Rihan, Naz-bu,	PERS.

Grows throughout India. It has small white flowers, the whole plant is aromatic and fragrant, the seeds steeped in water swell into a pleasant jelly, which is demulcent and nourishing, and is used by the natives in cases of catarrh, diarrhœa and chronic dysentery. It is common in Upper India, and very common as a weed over all Rajwarra. The green leaves have a delicious smell, exactly like verbena, the seeds are exceedingly mucilaginous and sometimes used as a demulcent. The dried plant prevents bugs approaching beds, &c. The seeds are aromatic, and used by women to relieve after-pains.

var. β. <i>O. anisatum</i> , <i>Benth.</i>	<i>Basilicum citratum</i> , <i>Rumph.</i>
<i>O. basilicum</i> , <i>L. not Burm.</i>	

Sweet Basil.

A native of Persia, with small white flowers, aromatic and fragrant.

var. γ. <i>O. glabratum</i> , <i>Benth.</i>	<i>O. lanceolatum</i> , <i>Schum.</i>
<i>O. caryophyllatum</i> , <i>Roxb.</i>	Gulal-tulsi, <i>BENG.</i>
<i>O. integerrimum</i> , <i>Willd.</i>	

A native of Guinea, Bengal, and Penang. It has smallish white flowers. The whole plant is very aromatic and fragrant.

var. δ. *O. thyrsiflorum*, *BENG. L., Roxb., Jacq.*

A plant of the peninsula of India, with small pale pink flowers, the whole plant very aromatic and fragrant. The following are synonyms of the above varieties.

Kala tulsi,	HIND.	Nalla gaggeru,

Whole plant slightly aromatic, prescribed by the hindoos in decoction in the bowel complaints of teething children. Every vaishnava household has a plant in its parterre, which is held in reverence by the family, and is encircled daily in the morning and worshipped

The Root.

Toolsi ki jar, DUK. | Tolasee vayr, TAM.

The Beads.

Toolsike munke, DUK. | Tolasee vayr munni, TAM.

The tulasi plant is sacred to Vishnu, held in the highest veneration by all his followers,

and is grown in the court yard of almost every vaishnava house, however small. Its root is made into beads and worn round the necks and arms of the Vishnu brahmins. The root of the plant is given in decoction in fevers, half a tea-cupful twice daily. The brahmins use it in their funeral ceremonies. The Malays also strew it over the graves of their dead. In the Dekkan it is grown in almost every native garden, and is used for various purposes by Europeans for flavouring sauces, wine or vinegar. It is seen about the temples of hindoos, where it

"waves

Its fragrant blossoms o'er their graves."

In Pegu, it is steeped in water and drunk as a sherbet. The leaves have a pleasant aromatic smell and taste, and are used as stomachics, and in the catarrhs of children. The seeds are mucilaginous and are used in gonorrhoea.—*Drs. Roxburgh's Fl. Ind.*; *O'Shaughnessy*, p. 493; *Ains. Mat. Med.*, p. 143; *Rheede*; *Riddell*; *Mason*; *Cut. M. Ex.*, 1857; *Powell's Handbook*, Vol. i, p. 366; *Genl. Med. Top.*, p. 200.

OCIMUM THYRSIFLORUM, *Benth.* Syn. of var. *Ocimum basilicum*, *Burm.*, *Linn.*

OCIMUM TOMENTOSUM, *Lam.*, *Spreng.* Syn. of *Ocimum sanctum*, *Linn.*

OCIMUM TUBEROSUM.

Ka-tang.

Its root is used for food in Java. See *Convolvulus batatas*.

OCIMUM VILLOSUM, *Roxb.* Woolly basil.

Sufaid tulsi,	HIND.	Tella gaggera chettu, ..	
Tulasi,	TAM., TEL.		

Cultivated in gardens and near temples. An aromatic herb, leaves used for seasoning, of easy cultivation. In all Courts of Justice, the hindoos are sworn by these leaves, which are placed on the palm of the hand by a Brahmin, who repeats the prescribed oath, and at the termination they are masticated and swallowed. A good number of the species of this genus are used in cookery.—*Genl. Med. Top.*, p. 199; *Jaffrey*. See *Vegetables of Southern India*.

OCODOMA, a genus of ants. See *Ants*.

OCOTEA. Species of *Ocotea* extend from Sylhet to Deyra Dhoon, and ascend to 7,000 feet. The fruit, Sassafras nuts, or Pichurim beans, would be worth examination. The Massoy bark of commerce is of doubtful origin. It is light, soft to the touch, in long, convex fragments, covered with an epidermis of a whitish grey colour, with numerous lichens, internally reddish, tissue rather spongy, brittle, fracture irregular, thickness not surpassing two lines. Taste pungent, bitter, and peppery, odour strongly that of sassafras, with a trace of nutmeg. The natives of India attribute tonic properties to this bark; it is rich in essential oil, and proceeds from a lofty and robust tree, very

common in New Guinea and in Java. M. Guibourt has detected in this bark the volatile substance previously observed in the pichurim bean. Fee adds to the preceding articles 'brief notices of two more species of *Ocotea*, and three of *Litsea*, but their properties are not of material importance.—*O'Shaughnessy*, pp. 546-547.

OCK-SEU, or Wu-Kiu, three islands on the east coast of China, the western and largest of which is in lat. $24^{\circ} 59' N.$, long. $119^{\circ} 27\frac{1}{2}' E.$

OCTOPODIDÆ, a family of Cephalopodous mollusca which may be thus shown:

CLASS I.—Cephalopoda, Cephalopods.

ORDER I.—Dibranchiata.

SECTION A. Octopoda.

FAMILY I. Argonautidæ.

Genus.—*Argonauta*. Argonaut or paper sailor; recent, 4 sp., fossil, 1 sp. *Syn.* *oethoo nautilus*.

FAMILY II. Octopodidæ.

Genera.—*Octopus*, rec. 46 sp. *Syn.* *cistopus*.

Sub-genus. *Tremoctopus*, rec. 2 sp.

Pinnoctopus, Finned octopus, rec. 1 sp.

P. cordiformis.

Eledone, rec., 2 species.

Cirrotheuthis, rec. 1 species. *C. Mülleri*.

Philonoxis, rec. 6 species.

Professor Owen divides the Octopods into two groups or families, the Testacea and the Nuda. The Testacea consist of the genera *Argonauta* and *Bellerophon*. Of *Argonauta*, several species occur in the seas on the south and east of Asia, viz., *A. argo*; cornu; cymbium; gondola; hians; thanstrum; tuberculata; and vitrea. *A. argo* has been from the earliest periods an object of interest to zoologists, in consequence of the accounts of its sailor-like habits handed down to us from Aristotle, Pliay, Ælian, Oppian and others—and in consequence of the difference of opinion entertained with regard to the inhabitant of the shell by naturalists; some holding that the cephalopod found in it was a mere parasite or, even worse, a pirate that had destroyed the legitimate owner and possessed himself of the shell; and others, that the animal was the lawful possessor and original constructor of it. In 1836 Madame Jeannette Power laid before the academy at Catania her 'Osservazione Fisiche sopra il Polpo de l'Argonauta Argo,' in which, after a long and careful course of inquiry, she mentioned that it constructs its own shell. The Argonaut is furnished with eight arms, having on each two rows of suckers; the first two arms are more robust than the others, and should be so because they serve as masts to support the sails, which, spread out, act before the wind as such. At the base they have on the inferior sides the double row of suckers, like the other six; but from the inferior row, at about an inch from the base in adults, a rather furrowed membrane begins to develop itself, which extends as far as the tip of the arm,

and, holding it bent, it can no longer execute the office of a rowing arm, but is employed by the animal as a sail. These sails are so large that, when turned backwards and pressed against the shell, they can entirely cover and protect it. The true office of these sails is that of keeping themselves applied to the shell at all times, in reserve for the moment when the animal, coming to the surface of the water, removes them, and, spreading them, raises them as sails. In fact, the series of suckers of the sail-arms, when the membrane of the sails is wrapped about the shell, is placed exactly over the keel of it in such a manner that each sucker corresponds to each point in which the ribs of the shell terminate, until they reach the two margins of the spiral. Captain Philip Parker King, R. N., during his well-known voyage, met with specimens of *Argonauta*. On his passage from Santos to St. Catherine's, in lat. 28° south, he caught, a Dolphin (*Coryphæna*), the maw of which was found filled with shells of *Argonauta tuberculosa*, [Arufa of Owen] and all containing the *Octopus ocythoe* that has been always found as its inhabitant. Most of the specimens were crushed by the narrow passage into the stomach, but the smaller ones were quite perfect, and to some of them was attached a nidus of eggs, which was deposited between the animal and the spire. The shells varied in size from two-thirds of an inch to two and a half inches in length; each contained an *Octopus*, the bulk and shape of which were so completely adapted to that of the shell, that it seemed as if the shell increased with the animal's growth. In no specimen did there appear to be any connection between the animal and the shell. Several species are already known as inhabitants of the seas of warm latitudes, both littoral and pelagic;

Eledone (*Aristotle*; *Leach*).—Arms provided with a single series of sessile acetabula.

E. ventricosa (*Octopus ventricosus*, *Grant*). Body short, round, the eight arms connected at their base by a membrane.

Octopus, *Linn.* Πολύπους, *Leach*. Its arms are provided with a double alternate series of sessile acetabula.

O. vulgaris (*Sepia octopodia*, *Linn.*; *Sepia octopus*, *Gmel.* Body short and ovoid, the eight arms connected at their base by a wide membrane.

Madame Power writing on the habits of the Poulpe or Cuttle, mentions that into one of her aquaria she had put a living *Pinna nobilis* adhering to a fragment of rock; this aquarium also contained an *Octopus vulgaris* and some living testaceous mollusca. One day she saw that the Poulpe was holding a fragment of rock in one of its arms, and watching the *Pinna*, which was opening its valves. As soon as they

were perfectly open, the Poulpe, with incredible address and promptitude, placed the stone between the valves, preventing the Pinna from closing them again, when the Octopus set about devouring the mollusc. The next day she saw the Poulpe crush some Tellinæ, then search about amongst other shells, and finally stretch itself close to a Triton nodiferum. The Triton extended half the body from its shell, no doubt with the purpose of going to seek its food, when the Poulpe sprang upon it, and surrounded it with his arms; the Mollusc retired precipitately into its shell, and in closing this with its operculum, pinched the point of one of the arms of the Poulpe, which, by struggling, at last left the tip of its arm in the shell of the Triton. The voracity of the Poulpe is such, that notwithstanding the abundance of nourishment with which she furnished it, she was compelled to remove it from the aquarium, or it would have devoured all the mollusca. So great is its voracity that it even attacks man, tears away his flesh, and eats it. In the port of Messina, they occur in great numbers and of large size. One Octopus chinensis, measured by Adams was six feet from tip to tip of the arms.—*Voyages of the Adventure and Beagle, Vol. i, p. 106; Madame Jeanette Power, in the Annals and Magazine of Natural History; Eng. Cyc.; Woodward's Recent and fossil shell; Indian Field; A. Adams' Travels in Japan and Manchouria.* See Mollusca.

OCYPODA, a genus of swift-footed crabs which run with swiftness on level sand.

Ocyпода cordimann, *Ehws.*, Mauritius.

" frabricii, *Ehws.*, Oceanica.

" ceratophthalma, *Ehws.*, Egypt, Mauritius, New Holland.

" brovicornis, *Ehws.*, East Indies.

" macrocera, *Ehws.*, East Indies, Brazil.

See Crabs. Crustacea.

OCYPODE CORDATA, syn. of Gecarcinus carnifex.

ODA, KARN. A ferry boat.

ODALLAM, MALEAL. Cerbera odallam, *Gært.*

ODALAPORE battle, fought on the 4th Dec. 1848.

ODASSI, a hindoo sect, founded by Sreechund, son of Nanuk. The sect is widely diffused, and all are proud of their connection with the Sikhs.

ODAY OIL, of Cochin, is extracted from a creeper of that name and given to cattle when much worked. It sells at 8 annas a quart. It was sent to the Exhibition of 1851.

ODDA, a river of Rewah.

ODDA-MARAM, TAM. ? A tree of Travancore, 3 feet in circumference, wood of a dark colour, used for tent-pegs, mallets, &c.; very strong wood.—*Col. Frith.*

ODDY-SAGA, TAM. ? A wood of Travancore, of a dark-brown colour. Used for common building purposes.—*Col. Frith.*

ODEYPOOR, see Mahratta government, Rajputanah.

ODIAL, see Kelingoo.

ODIN, a deity of the Scandinavians; Odin, like Zeus was the Æther. See Hindoo, Sacrifice, Sati.

ODINA PUMATA.

Woodiah wood, ENG. *Eaythya marum*, TAM.
—M. C. C.

ODINA WODIER, *Roeb.*

Mageer,	MAHJ.	

A large tree which grows in the warmer parts of the island of Ceylon, up to an elevation of 1,500 feet. It is a native of mountainous districts in the peninsula of India, grows in Coimbatore, and is found in the coast jungles of the Bombay presidency. In the Madras presidency it is grown from cuttings and planted in avenues, but it yields no shade in the hot weather, being without leaves till June. The tree is rather common on the hills of British Burma. The heart-wood is red and is used for sheaths of swords, spear handles, oil presses and rice-pounders. A cubic foot weighs 65 lbs. In a full-grown tree on good soil the average length of the trunk to the first branch is 50 feet, and the average girth, measured at 6 feet from the ground, is 12 feet. It sells in Pegu at 12 annas per cubic foot. The wood is very difficult to season, requiring to be kept, even in planks, 2 or 3 years: but, once well-seasoned, it is a close-grained, beautiful wood, well adapted for cabinet-making purposes, the central reddish portions in particular. It is a rare tree in Murree and Hazara. It, or another species, occurs quite common from Mouhnein to Toun-goo, where it yields a valuable timber. It is much used at Shawaygyen, in the manufacture of oil presses and rice-pounders. The tree sometimes attains a girth of twelve feet. A considerable quantity of gum exudes from the trunk of this tree, which the natives use as a medicinal application. Its gum, the Kania or Koonce gond, also gum-jingna, resembles the true gum arabic both in appearance and properties, and is often largely mixed up with the East India gum arabic of commerce, which often contains gums, collected indiscriminately from a number of different trees, including several species of Acacia, Odina wodier, and Feronia elephantum. In some places it is lopped for fodder. The gum is used in cloth-printing, also by weavers for stiffening their thread, and is given in asthma, and as a cordial to women. It ascends the slopes of the mountains in the Bhabar forests of Kumaon, attains

a height of 12 to 15 feet clear of branches with a girth of 4 feet. In the Siwalik region of the Punjab, up to near the Indus and near the Sal Range, to a height of 3,500 to 4,000 feet, this tree attains a considerable size. The outer wood is liable to be attacked with worms, the inner is dark-coloured and tolerably durable and is used for door frames.—*Cal. Cut. Ex.* 1862; *Rohde's MSS.*; *Thompson's MSS.*; *Thw. En. Pl. Zeyl.* p. 78; *Drs. Roxb., Voigt, Wight, Cleghorn, Gibson, Mason, Brandis, O'Shaughnessy*, p. 276, and *J. L. Stewart*, p. 46.

ODOARDO BARBOSA, a gentleman of Lisbon, who, in his youth, travelled in the East, and he appears to have visited Malacca before it was taken by the Portuguese in 1511. He wrote a book in 1516. In 1519 he joined Magellan and was treacherously murdered in 1521 by the natives of Zebu, one of the Philippines, four days after the great Navigator had suffered a like fate.—*Bikmore*, p. 100.

ODOOJATEE, HIND. *Justicia ecbohium*.

ODOORAH VENG, TAM. ? A strong good wood of Travancore, of a dark-brown colour, specific gravity 0.853. 4 feet in circumference, and 40 feet long; used for wheels, gun carriages, &c.—*Col. Frith*.

ODORICUS, a friar, who visited many parts of the east. He commenced his travels in 1318, and died at Padua in 1331. From the southern part of the coast of Coronandel, he proceeded by a navigation of twenty days, to a country named Lamori (perhaps a corruption of the Arabian Al-rami,) to the southward of which is another kingdom named Sumoltra, and from thence a large island named Java. His account, which was delivered orally to the person by whom it was written down, is extremely meagre and unsatisfactory.—*Marsden's History of Sumatra*, p. 7.

ODRA or Orissa. General Cunningham believes that the kingdom of U-cha, or Oda, spoken of by Hwen Thsang, corresponds exactly with the modern province of Odra, or Orissa. In the time of that buddhist pilgrim, the province was 7,000 li, or 1,167 miles in circuit, and was bounded by the great sea on the south-east, where there was a famous seaport town named Che-li-ta-lo-ching, or Chari-trapura, that is, the "town of embarkation" or "departure." This, General Cunningham supposes to have been the present town of Puri, or "the city," near which stands the famous temple of Jaganath. Outside the town there were five contiguous stupa with towers and pavilions of great height, and he supposes one of these, which is now dedicated to Jaganath. The three shapeless figures of this god and his brother and sister, Baladeva and Subhadra, are simple copies of the symbolical figures of the buddhist triad, Buddha, Dharma

and Sangha, of which the second is always represented as a female. The buddhist origin of the Jaganath figures is proved beyond all doubt by their adoption as the representative of the brahmanical avatar of Buddha in the annual almanacs of Mathura and Banaras. The political limits of Orissa under its most powerful kings, are said to have extended to the Hooghly and Damuda rivers on the north, and to the Godavari on the south. But the ancient province of Odra-desa, or Or-desa, was limited to the valley of the Mahanadi and to the lower course of the Suvarna-riksha river. It comprised the whole of the present districts of Katak (Cuttack) and Sambhalpur, and a portion of Medinipur. It was bounded on the west by Gondwana, on the north by the wild hill-states of Jashpur and Singhbhum, on the east by the sea, and on the south by Ganjam. These also must have been the limits in the time of Hwen Thsang, as the measured circuit agrees with his estimate. Pliny mentions the Oretes as a people of India in whose country stood Mount Maleus; but in another passage he locates this mountain amongst the Monedes and Suari; and in a third passage he places Mount Mallus amongst the Malli. As the last people were to the north of the Calingæ, and as the Monedes and Suari were to the south of the Pambithri, we must, he says, look for the Oretes somewhere about the Mahanadi river and its tributaries. The Monedes and Suari must therefore, says General Cunningham, be the Munda and Suar, and the Oretes must be the people of Orissa. Malle is one of the Dravidian terms for a mountain; and as the Uraon, or people of west Orissa, still speak a Dravidian dialect, he thinks it probable that Mallus was not the actual name of the mountains, but may have been the famous Sri-Parvat of Telingana, which gave its name to the Sri-Parvatiya Andhras?—*Cunningham's Ancient Geography of India*, pp. 507-511.

ODRE, TAM. A Ceylon tree which grows to fourteen inches in diameter, and ten feet in height; used by carpenters for palanquins and coach-work.—*Edye, on the Timber of Ceylon*.

ODUGAL, TAM. Tiles.

ODUL OIL, or Adul oil of Travancore, separates into two portions; the upper fluid, of the colour of golden sherry; the lower, reddish white, of the consistence of ordinary hard salt butter.

ODYKARY, see Korambar.

O'E, of the Limbu, *Hystrix longicauda*, *Marsden*.

CEDICNEMUS CREPITANS, the bastard florken of Europeans in India, is very common in the banks of rivers. It is tame and easily shot, consequently little sought after by sportsmen.

OEL, GER. Oil.

ÆNOTHERACEÆ, Lindl. The evening primrose tribe of plants, comprising 5 genera, 17 species, viz., 10 *Ænothera*; 2 *Clarkia*; 2 *Jussieuia*; 2 *Ludwigia*; 1 *Lopezia*. There are between 70 and 80 species and varieties of *ænothera*. The plants are raised from seeds, cuttings and layers, during the rains, will grow in any good garden soil, succeeds best in flower beds, requires plenty of water during the hot months. There are 85 species enumerated by Don, growing chiefly in North America. They are handsome border-flowers and deserve to be cultivated, but have no valuable properties. The yellow and white flowering kinds are easily cultivated by seed, in any good garden soil, and will continue during the hot weather to blossom.—*Dr. Riddell; Mr. Jaffrey; Eng. Cyc.*

OESAR or Oesaran, JAV. A whirl in the hairs of the head, indicating a good sign.

ÆSTRUS, the Cephalaemia ovis (syn. Æstrus ovis) is found in Europe and the E. Indies, it lays its egg in the nostrils of the sheep, and the worm from it occupies the frontal sinuses.

ÆSTRUS EQUI occurs in the south of Europe and in Persia. It is a dipterous insect. Its eggs are deposited on the hair of the horse and licked into the stomach, and when complete the insects pass through the canal.—*Piquier.*

QETHIRA SERUPOSA, a greyish coloured crab, length 2 to 3 inches. It is found near the Island of Mauritius and in the Indian Archipelago.—*Eng. Cyc.*

QEUS, FR. Eggs.

QFAH, see Mesopotamia.

OGAI, HIND. *Astragalus tribuloides*.

OGAL, HIND. *Fagopyrum emarginatum*, Ban ogal is *Fagopyrum cymosum*.

OGECERAS MAJUS.

Hulsi, BENG.

A small tree, a native of the Delta of the Ganges, and such other places as are overflowed at spring tides. Flowering time, the hot season.

OGEL, HER. Adjel, ARAB., a calf.

OGHUZ KHAN is supposed by Mr. Prinsep to be king Azes, a Tartar conqueror who united Tartar tribes and attacked and conquered Kashgar and Khotan. Then, returning by the frontiers of India, he took Talash, Saran and Tashkund, and sent his son to reduce Turkistan and Andekan on the Jaxartes which was effected in six months. Oghuz Khan then advanced and conquered Samarkand and Bokhara. Next he took Balkh, and in the middle of winter he crossed the mountains to Chor (Charikar?) suffering much from snow and frost. Here he wintered, and reviewed his army in the spring, and then marched against Kabul, Ghazni and Kashmir, where a king named Jagma (Hermæus?) reigned, who maintained himself in mountain positions for a year, but in the end was defeated and slain. Oghuz Khan then

returned to Samarkand by Badakhshan and sent an expedition westward against Khorasan. Oghuz Khan was the third prince of the Moghul dynasty, being the grandson of Moghul Khan, its founder. Over the early history of British India, much obscurity rests; for it is generally recognized that prior to Alexander's time and in long periods subsequent thereto, there are doubts as to the correctness of the Indian accounts of kings and localities. It is, however, certain that several conquerors, in ancient times approached the present western boundaries of British India without absolutely invading it. The conquest of the Hercules Belus of Cicero, who is supposed to be the Osiris that invaded India, extended only up to the Indus. It was undoubtedly approached by Semiramis, B.C. 1230, but the warrior-queen was driven back across the Indus with great loss, retreating into Bactria with only a third of her army. This great Assyrian queen, however, extended her conquests into Central Asia, until they even embraced Bactria or Bactriana, which is now represented by the modern Balkh. Darius the Persian conqueror of Babylon, spread his rule over Bactria, which is enumerated as one of his provinces in the extraordinary inscription which he caused to be carved on the rock of Behistun. Alexander afterwards overran this same country, and penetrated from it, into the valley of the Indus, which he merely crossed. But in the days of the decline of Syrian power, Bactria was erected into an independent state by Theodotus I. in 256 B.C., and he extended his dominion over parts of India which the arms of Darius and Alexander had not reached; and it is the monarch's descendants who are designated as a Syro-Bactrian dynasty. Numerous relics of his successors have been found near Peshawar, Jellalabad, and in places near Cabul, in the shape of coins. Another name is mentioned in connection with Indian history, that of Ogyges, supposed to be Oghuz Khan the Scythian, whose historian, Abul Ghazi, relates that after establishing the religion of Japhet in his own dominions and in those of Tibet, Tanjat, Kitay, and other states immediately adjoining, he conquered Irak, Babylon, Azerbaijan, and Armenia, and subsequently took Kashmir after a year's resistance.—*Malcolm's History of Persia, Vol. ii, p. 289.* See India.

OGGI, see Semetic races.

OGNEE, BENG. Plumbago zeylanica.

OGRI, a hill near Tezpur, looking into Central Assam and the Brahmaputra L. N. 26° 34' 6" and L. E. 92° 46' 8". It is near this that tea was much cultivated.

OGUNA. Taking a section of about sixty miles in the Alpine Aravalli, from the ascent at the capital of Oodipoor, passing through

Oguna, Panurna, and Meerpoor, to the western descent near Sirohi, the land is inhabited by communities of the aboriginal races, living in a state of primeval and almost savage independence, owing no paramount power, paying no tribute, but with all the simplicity of republics; their leaders, with the title of Rawut, being hereditary. Thus the rawut of the Oguna commune in the early part of the nineteenth century, could assemble five thousand bows, and several others could on occasion muster considerable numbers. Their habitations are dispersed through the valleys in small rude hamlets near their pastures or places of defence.

OHI, HINN. *Acacia stipulata*.

OHIND, Oilhand, or Utakhanda, has been identified with Embolima. The continual discovery of Indo-Scythian coins is a sufficient proof that the city was already in existence at the beginning of the christian era, which may perhaps induce us to put some faith in the tradition, mentioned by Abul Feda, that Wehand or Ohind, was one of the cities founded by Alexander the Great.—*Cunningham's Ancient Geography of India*, p. 56.

OH! ME! The Chinese buddhist invocation is Oh! me to Fo! Oh me to Fo!

OHUD, a mountain about four miles north of Medina, where a battle took place between Mahomed with 1,000 and the Korseish with 3,000 troops. Mahomed had the hill in his rear with archers placed on its flanks to annoy the enemy's horse, but the archers quitted their position to plunder and Mahomed was wounded and defeated.

OIL, HIND., of Kangra, *Acacia stipulata*.

The oils which form the chief exports from different parts of India to England, France, the Mauritius, &c., are Cocoonut, Gingelly or Sweet oil, Ground nut, Mustard, Rape, Sandalwood, Roosa or Grass, oil and Fish oil. Oils are generally divided into two primary groups, "Fixed" and "Volatile," the former class being again subdivided into drying, greasy, and solid oils. The value of oil as an article of commerce and its numerous uses in candle and soap-making, wool-dressing, food and medicine, as well as its importance as a lubricating agent, are well-known. The following table compiled from the official reports of the Madras Custom House will show the quantity and value of all the oils and oil seeds exported from the Presidency:—

Comparative Statement of the Gross Quantity of Oils and Oilseeds, exported from the Madras Territories to the United Kingdom, Foreign Ports and Home Ports, for the years 1847-48 to 1856-53.

In addition to the above, about 300,000 lbs. of Wax and Wax Candles, are yearly exported. These exports are sent to the United Kingdom, America, Arabia, Persian Gulf, Cape of Good Hope, Ceylon, China, France, Maldiv Islands, Mauritius, New South Wales, Persia, West Coast of Sumatra, West Indies, Bengal, Bombay, Concan, Cutch, Goa, Guzerat, French, (Indian) Ports, Siam, Salsaca and the Straits, Travancore.

The value of the exports from all India was in			
1852-53..	£90,039	1857-58..	£265,271
1853-54..	104,159	1858-59..	192,562
1854-55..	130,958	1859-60..	180,066
1855-56..	154,540	1860-61..	234,379
1856-57..	179,164		

The exports were equally distributed amongst the three presidencies. Oils are found both in the animal and vegetable kingdoms. They are divided into fixed and volatile. The latter are principally products of the vegetable kingdom. The fixed oils are composed of carbon, hydrogen, and oxygen. Most of them are composed of two compounds, a liquid called Olein, and a solid called Margarin, or another called Stearin. According as these solid substances abound in oils, they are liquid or solid at the ordinary temperatures of the atmosphere. Fixed oil is found in the fat or adipose tissue of animals. Fixed oil is found amongst plants principally in their seeds. In some cases as in the olive (*Olea*) it is yielded by the fruit. Some families of plants especially abound in oil. Thus among the Cruciferae we have mustard, rape, and colza seed oil, with other species cultivated in Europe, India, and Japan, of which some have of late years been imported into England. Several of the family of Compositae secrete oil in quantities large enough to render it desirable to cultivate them for this purpose alone, as some species of *Carthamus*, or Bastard saffron, and also the *Verbesina sativa* of India, now known to be identical with the Abyssinian *Guizotia oleifera*, and of which the oil is known in India as Gingly oil and in commerce by the name of hutsyelloo oil. So *Madia sativa* yields madi oil, and its seeds are said to be more abundant in oil than any plant introduced into Europe. Most of the Cucurbitaceae also, as the melon, gourd, cucumber, and the numerous varieties, cultivated especially in India, contain a large proportion of oil, which is expressed in the East Indies as it formerly was in Europe. The Rasaceae also store up a large proportion of oil in the kernels of their fruit, as in the almond, which is particularly valued; so also that of the apricot, as well as that of the Briancon apricot, and other species of *Prunus*. In the Himalaya, oil is also expressed from the apricot kernel, and has been made of a fine quality. From among the Amentaceae also nut oil is obtained from the Hazel; beech-nut oil, from *Fagus sylvatica*; walnut oil, from *Juglans regia*. Besides these, poppy oil, ben-nut oil, (*Hyperanthera*), ground-nut oil (*Arachis*), physic-nut oil (*Jatropha*), are well known. The cotton-seed and the seeds of the tea-plants, yield oil especially of the species called *Thea oleifera* and some of the Camellias. Two species of *Bassia*, *B. longifolia* and *B. latifolia*, both yield oil; another species, *B. butyracea*, yields a vegetable butter, and is commonly known as the ghee tree or butter-tree of Almora. The native name of this tree is Chonee, and Mr. Traill describes it as not being found in Kumaon, but in the adjoining Goorkha pro-

vince of Dotee. Oils are extensively used for candle and soap-making, for burning in lamps, for diminishing friction in machinery of all kinds, and especially for locomotives,—in wool dressing, in the manufacture of paints and varnishes, as an article of food, for medicinal purposes, &c. The time of burning of equal quantities of the following oils is found to be:—

Oil of poppy... Hours, 14	Gold of pleasure,
" sunflower..... 13	(<i>Camelina sativa</i>) Hours 9½
" rape..... 11	" olives..... 9
" mustard.. 11½	" hemp seed.. 8
" flax seed. 10	" tallow..... 10½

The imports of foreign vegetable oils have greatly increased while those of fish oils have decreased.

	1821—Tons.	1845—Tons.	1850—Tons.
Cocoanut oil	2,148	98,040
Olive oil.....	1,900	12,315	20,783
Palm oil.....	3,200	25,285	448,580 cwt.
Rape-seed oil...	800	3,973	
Linseed oil....	10,500	33,634	
Fish oils.....	32,356	22,620	21,328

The ultimate analysis of fats and oils reduces them all to carbon, hydrogen and oxygen. Some of them yield minute portions of nitrogen, the result of adhering impurities. The following table shows the relative proportions of the three elements in 100 parts of each of the oils named:—

	Carbon	Hydrogen.	Oxygen.
Olive.....	77.21	13.36	9.43
Almond.....	77.40	11.48	10.82
Linseed.....	76.01	11.35	12.62
Nut.....	79.77	10.57	9.12
Castor.....	74.17	11.03	14.78
Whale.....	76.13	12.40	11.50
Spermacetti.....	78.91	10.97	10.12
Hog's lard.....	79.09	11.14	9.75
Suet.....	78.99	11.70	9.30
Butter.....	65.60	17.60	16.80

The following is a list of the principal unctuous oils of commerce:—

Linseed oil— <i>Linum usitatissimum</i> et pe- renne. Drying.....	Sp. Gr. 0.9347
Nut oil, <i>Corylus avellana</i> , and <i>Juglans regia</i> , D	0.9260
Poppy oil— <i>Papaver somniferum</i> , D.....	0.9243
Hemp-seed oil— <i>Cannabis sativa</i> , D.....	0.9279
Oil of sesamum— <i>Sesamum orientale</i> , Greasy.	
Olive oil— <i>Olea europæa</i> , G.....	0.9176
Almond oil— <i>Amygdalus communis</i> , G.....	0.9180
Oil of ben— <i>Guilandina moringa</i> , G.	
Cucumber oil, <i>Cucurbita pepo</i> et <i>melapepo</i> , D	0.9231
Beech oil— <i>Fagus sylvatica</i> , G.....	0.9225
Oil of mustard— <i>Sinapis nigra</i> et <i>arvensis</i> , G	0.9160
Oil of sunflower— <i>Helianthus annuus</i> et <i>perennis</i> , D.....	0.9231
Rape-seed oil, <i>Brassica napus</i> et <i>campestris</i> , G	0.9136
Castor oil— <i>Ricinus communis</i> , D.....	0.9611
Tobacco-seed oil— <i>Nicotiana tabacum</i> et <i>rustica</i> , D.....	0.9232
Plum-kernel oil— <i>Prunus domestica</i> , G.....	0.9127
Grape-seed oil— <i>Vitis vinifera</i> , D.....	0.9202
Butter of cacao— <i>Theobroma cacao</i> , G.....	0.8920
Cocoanut-nut oil— <i>Cocos nucifera</i> , G.	
Palm oil, <i>Cocos butyracea</i> vel <i>Avoira clais</i> , G	0.9668
Laurel oil— <i>Laurus nobilis</i> , G.	
Ground nut oil— <i>Arachis hypogæa</i> , G.	
Piney tallow— <i>Vateria indica</i> , G.....	0.926
Oil of Julianne— <i>Hesperis matronalis</i> , D.....	0.9281
Oil of Camelina— <i>Myagrum sativa</i> , D.....	0.9252
Oil of wild-seed— <i>Rasda luteola</i> , D.....	0.9232
Oil of garden-cresses— <i>Lepidium sativum</i> , D.	0.9240

Oil of deadly nightshade— <i>Atropa bella-donna</i> , D.....	0-9250
Cotton-seed oil— <i>Gossypium barbadense</i> , D....	
Colza oil— <i>Brassica campestris</i> , B. <i>oleifera</i> , G.	0-9136
Summer rape-seed oil— <i>Brassica præcox</i> , G.	0-9139
Oil of radish-seed— <i>Raphanus sativus</i> , R. <i>oleifera</i> , G.....	0-9187
Cherry-stone oil— <i>Prunus cerasus</i> , G.....	0-9239
Apple-seed oil— <i>Pyrus malus</i> , G.	
Spindle-tree oil— <i>Eunonymus europæus</i> , G....	0-9380
Cornel-berry-tree oil— <i>Cornus sanguinea</i> , G.	
Oil of the roots of cyper-grass— <i>Cyperus esculenta</i> , G.....	0-9180
Henbane-seed oil— <i>Hyosciamus niger</i> , G.....	0-9130
Horse-chestnut oil— <i>Æsculus hippocastanum</i> , G.	0-9270
Pine top oil— <i>Pinus abies</i> , D.	0-9280

Linseed contains 20 per cent. of oil; rapeseed from 35 to 40; castor oil seeds as much as 60 per cent. The volatile oils are very numerous in the vegetable kingdom. They are called volatile on account of the ready manner in which they may be volatilised under the influence of heat. The facility with which they are diffused in the atmosphere renders them easy of detection, and it is to this class of substances that plants owe their peculiar odours. Many of them are employed in perfumery, others are used as stimulants in medicine, and some are poisonous. Their composition is much

more varied than that of the fixed oils, and to the chemist they offer an exceedingly interesting field of research. Many of them have a constitution analogous to the compounds obtained by chemists from the compound radicals. They are divided by chemists into three groups:—1, those containing only carbon and hydrogen, as oil of turpentine; 2, those containing also oxygen, as oil of cloves; 3, those containing sulphur, as oil of garlic. Many natural orders are characterised by yielding volatile oils. Thus the Lamiaceæ, Myrtaceæ, and others, embrace species all of which contain volatile oil in their leaves. Many of the Umbelliferae yield a volatile oil in their fruits. The petals are often the seat of these secretions, and especially those most prized as the rose, the jasmine, the heliotrope, and many others. Appended is a table of volatile oils employed in medical practice. They are almost all powerful stimulants and carminatives. A drop or two dissolved in a few minims of spirit, and an ounce of water added, gives an extemporaneous substitute for the distilled water of the plant, and a useful vehicle for many draughts or mixtures. These oils are often added in minute quantities to pill-masses, either to give an agreeable flavour or counteract their tendency to griping:—

Table of Volatile Oils.

Names.	Native names.	Part used.	Colour of Oil.	Sp Gr.	Uses and Remarks.
<i>Fimpinella anisum</i> , common anise....	Fruits ...	Yellow ...	0-985	Carminative congeals [at 50°.
<i>Illicium anisatum</i> , star anise... ..	Badian kutai.	Do. ...	Do.	Do.	Ditto.
<i>Anthemis nobilis</i> , chamomile	Baboone ...	Flowers ...	Deep blue.	Tonic, anthelmintic.
<i>Lavandula vera</i> , lavender...	Do. ...	Yellow ...	0-877-0-905	Fragrant, stimulant.
<i>Euthymus graveolens</i> , & other species, rue.	Sudab ...	Do., and herb ...	Do.	Stimulant given in amenorrhœa.
<i>Andropogon iwaranchusa</i>	Roosa ...	Grass ...	Do.	Fragrant & stimulant.
<i>Anethum graveolens</i> , dill... ..	Sonf. ...	Fruits ..	Do.	0-994	Stimulant in flatulence.

<i>Fœniculum officinale</i> , (fennel)	Fruits	0-997	Stimulant & diuretic.
<i>Melaleuca cajuputi</i> , (cajuput)	Kyapooti... ..	Leaves ...	Green ...	0-927	
<i>Juniperus communis</i> , (juniper)	Hoobor ...	Fruits ...	Do.	0-878	
<i>Piper cubeba</i> , (cubebæ)	Kubab chinee ...	Do. ...	Yellow	
<i>Caryophyllus aromaticus</i> (clove)	Long ...	Unripe flowers dried ..	Do.	1-055	Almost caustic.
<i>Laurus cinnamomum</i> , (cinnamon)	Darchinee... ..	Bark ...	Reddish yellow...	Ditto.
<i>Juniperus sabina</i> , (savine)	Tops ...	Yellow	In amenorrhœa.
<i>Ocimum basilicum</i> , (basil)	Tulsi ...	Herb ...	Do.	Carminative. Vesicatory. [cholera. Ditto. much used in Ditto. stimulant. Ditto.
<i>Rosmarinus officinalis</i> , (rosemary)	Tops ...	Do.	0-934	
<i>Moringa pterygosperma</i> , (sohunjuna)	Sohunjuna ...	Roots ...	Do.	
<i>Mentha piperita</i> , (peppermint)	Herb ...	Do.	0-920	
<i>Mentha pulegium</i> , (pennyroyal)	Do. ...	Do.	Ditto.
<i>Mentha viridis</i> , (spearmint)	Pudina ...	Do. ...	Do.	
<i>Amomum cardamomum</i> , (cardamom)	Elachee ...	Fruits ...	Do.	
<i>Origanum majorana</i> , (marjoram)	Herb ...	Do.	
<i>Sassafras officinale</i> ,* (sassafras)	Bruised root ...	Do., or colourless.	1-094	Fragrant and diuretic.

* A beautiful oil has been obtained from the Nipal sassafras.

Of vegetable substances of Southern Asia, producing "volatile oils" there is an immense variety, but with the exception of the oils of cassia and cinnamon, roosa and the rose utter, few are of any commercial importance, nor are they prepared in any quantity for consumption in India. Scented oils erroneously termed "volatile" obtained by the repeated distillation of fragrant herbs, &c., over into a receiver containing a portion of any fixed oil, to which the aroma is imparted, are prepared to some extent but chiefly for native use. Sandalwood oil and the large variety of att'r, attar or otto, &c., which form the principal part of native perfumery are included in this class. The sub-joined list will serve to exhibit the richness of the produce of different seeds of Southern Asia, from which varieties of oil are extracted; it gives the proportion of oil per cent. in weight:—

Black til (<i>Verbesena sativa</i>),	46·4
Gingely oil (<i>Sesamum orientale</i>),	46·7
Ground nuts, <i>Arachis hypogæa</i> ,	45·5
Pounded seeds of <i>Calophyllum inophyllum</i> ,	63·7
Kurunj seeds, from the <i>Pongamia glabra</i> ,	26·7
Ramtil, the seeds of <i>Guizotia oleifera</i> ,	35
Poppy seeds (<i>Papaver somniferum</i>),	43 to 58
Silaam, an oil seed from Nepaul,	41
Rape seed (<i>Brassica napus</i>),	33

The foregoing are only a few of the seeds from which oil is extracted by the natives of Southern Asia. The oil seeds most generally cultivated in India are the castor, gingely, rape, mustard, ground nut, ramtil, linseed, and poppy, but the latter is cultivated for its opium the seed forming a secondary consideration. The following plants grow in a wild state, their fruit being collected and the oil expressed as occasion requires; margosa, ben, bramadundoo, pinnacottay, soap nut, kurunj, cashew-nut, poovana, piney, nera-dimootoo, physic-nut, cheeronjee, boorookoopilly, &c. &c. &c. Oil is, in Malay, minak, and in Javanese, langa, both of them words of extensive currency throughout the Malay and Philippine Archipelagos. The plants from which fatty oils are chiefly extracted are the coco-palm, the ground pea, the sesame, and the palma christi; the first for edible use, and the three last for the lamp. In the islands of the Molucca sea, a fine esculent oil is expressed from the nut of the kanari tree (*Canarium commune*). Crawford was not aware that oil is expressed in any of the islands from cruciform plants; nor is flax reared for this purpose. Animal oils are hardly used in any shape: essential oils are obtained from the clove, the nut-meg, the kayu-puti (*Melaleuca cajuput*) and in great abundance and cheapness from the Malay camphor-tree (*Dryobalanops camphora*). One hundred and twenty fixed oils are known to be produced throughout the Madras presidency and Burmah. These may be arranged as follows:

Fixed vegetable oils, including drying, greasy and solid oils	105
Wood oils	10
Mineral oil	1
Animal oils	4

Total . . . 120

Of the first class, cocoa-nut, castor, ground-nut, gingely and its variety, rape, mustard and linseed form considerable articles of foreign trade. The first three being exported in the shape of oil, the last two as oil seed, and gingely, both as an oil and oil seed. In addition to these, the following are consumed to a large extent in India—lamp, ramtil, kurunj, pinnacottay, illoopoo, piney or doopada, margosa or neem, physic nut, bramadundoo, saflower and poppy. Of the remainder some are medicinal and some are prepared only in those localities, in which the substances producing them happen to abound in a wild state. The prices of these products vary very considerably, not only in different parts of British India, but even in various towns of the same district. It is therefore difficult, if not altogether impracticable, to fix their respective values, with any degree of certainty; an increased demand or greater facility of transit moreover considerably affect their present value. The following list contains the names of the better known oils of Southern Asia:—

Sweet flag	<i>Acorus calamus</i> .
	<i>Adenanthera pavonina</i> .
Belgaum walnut	<i>Aleurites triloba</i> .
Almond oil	<i>Amygdalus communis</i> .
Caju oil	<i>Anacardium occidentale</i> .
Khus-khus, or vetiver	<i>Anatherum muricatum</i> .
Grass oil, or oil of spike	<i>Andropogon calamus</i> Arnold (roosa ka tel) . . . maticus.
Bishop's weed seed	<i>Anethum sowa</i> .
	Apricot oil, Choochara and Zind Aloo ka tel.
Ground nut oil	<i>Arachis hypogæa</i> .
Prickly poppy oil	<i>Argemone mexicana</i> .
Margosa, or bitter oil	<i>Azaderachta indica</i> .
Hingum, or hingota oil	<i>Balanites egyptiaca</i> .
Butter or ghee tree	<i>Bassia butyracea</i> .
Do. mawa	<i>Bassia latifolia</i> .
Do. illoopoo	<i>Bassia longifolia</i> .
Do. kavan	<i>Bassia, speciosa</i> .
Downy mountain ebony	<i>Bauhinia tomentosa</i> .
Limbolee	<i>Bergera canigui</i> .
Butter of Shanghae	<i>Brassica chinensis</i> .
	<i>Brassica eruca</i> .
	<i>Brassica juncea</i> .
Rape seed	<i>Brassica napus</i> .
Chironjee berries & seeds	<i>Buchanania latifolia</i> .
Pulas oil	<i>Butea frondosa</i> .
	<i>Cassalpinia oleosperma</i> .
Poon seed oil	<i>Calophyllum inophyllum</i> .
Oil of hemp seed	<i>Cannabis sativa</i> .
	<i>Carthamus oxyacantha</i> .
Do. koosum	<i>Carthamus tinctorius</i> .
Do. of cloves	<i>Caryophyllum aromaticus</i> .
Deodar oil	<i>Cedrus deodara</i> .
Malkunganee, or staff tree oil	<i>Celastrus paniculata</i> .
Oil of cheeronjee	<i>Chirongia sapida</i> .

OIL.

OIL.

Oil of cassia	<i>Cinnamomum, species.</i>
Do. of cinnamon	<i>Cinnamomum zeylanicum.</i>
Do. of lemons	<i>Citrus limonum.</i>
Do. cocoanut	<i>Cocos nucifera.</i>
Do. of coriander	<i>Coriandrum sativum.</i>
Nut oil	<i>Corylus colurna.</i>
Oil of cucumber seed	<i>Cucurbita pepo.</i>
Do. melon seed	<i>Cucumis melo.</i>
Coloquintida seed oil	<i>Cucumis colocynthis.</i>
Cucumber seed oil	<i>Cucumis sativus.</i>
Oil of pumpkin seed	<i>Cucurbita maxima.</i>
Do. of cummin	<i>Cuminum cyminum.</i>
Do. purging	<i>Curcas purgans.</i>
	<i>Cyperus, species.</i>
Poongum oil	<i>Dalbergia arborea.</i>
Thorn apple oil	<i>Datura, sp.</i>
Wood oil	<i>Dipterocarpus, several sp.,</i> <i>empyreumatic.</i>
Agait, or napoota	<i>Didymania gymnosperma.</i>
Oil of mijo	<i>Dolichos soja.</i>
Moneela gram oil	<i>Dolichos biflorus.</i>
Oil of cardamom	<i>Ellettaria cardamomum.</i>
Persimmon oil	<i>Embryopteris glutinifera.</i>
Oil of Japan	<i>Erysimum perfoliatum.</i>
Eugenia oil	<i>Euphorbia dracunculoides.</i>
Oil of sweet fennel	<i>Foeniculum dulce.</i>
Do. gamboge butter	<i>Garcinia pictoria.</i>
Cotton seed oil	<i>Gossypium, species.</i>
Kokum oil	<i>Garcinia purpurea.</i>
Oil of bonduc nut	<i>Guilandina bonduc.</i>
Do. ramtil	<i>Guizotia oleifera.</i>
Do. of Ben, Sohujna	<i>Hyperanthera moringa.</i>
Sun flower	<i>Helianthus annuus.</i>
Oil of glaucous-leaved	
physic nut	<i>Jatropha glanca.</i>
Do. of star anise	<i>Illicium anisatum.</i>
Balsam oil	<i>Impatiens, species.</i>
Do. "	<i>Impatiens tingsens.</i>
Oil of jessamine.	<i>Jasminum, (var. sp.).</i>
Physic nut	<i>Jatropha curcas.</i>
Do. "	<i>Jatropha glanca.</i>
Walnut oil	<i>Juglans regia.</i>
Chinese oil	<i>Kin.</i>
Linseed oil	<i>Linum usitatissimum.</i>
	<i>Litsaea, species.</i>
Sweet basil	<i>Ocimum or Lavandula.</i>
Oil of cajaput	<i>Melaleuca cajuputi.</i>
Do. neem	<i>Melia azaderach.</i>
Do. of mint	<i>Mentha piperita.</i>
Do. mimusops	<i>Mimusops elengi.</i>
Do. ben	<i>Moringa pterygosperma.</i>
Do. nutmeg	<i>Myristica moschata.</i>
Do. of tobacco	<i>Nicotiana tabacum.</i>
Do. fennel flower	<i>Nigella sativa.</i>
Olive oil	<i>Olea europea.</i>
Peppermint oil	<i>Mentha sativa.</i>
Oil of keora	<i>Pandanus odoratissimus.</i>
Do. poppy seed	<i>Papaver somniferum.</i>
Do. anise	<i>Pimpinella anisum.</i>
Pine oil	<i>Pinus gerardiana.</i>
Oil of pepper	<i>Piper nigrum.</i>
Do. putchapat	<i>Pogostemon patchouli.</i>
Do. kurrunj	<i>Pongamia glabra.</i>
	<i>Prinsepia utilis.</i>
Castor oil	<i>Prunus armeniaca.</i>
Oil of roses	<i>Ricinus communis.</i>
Kikuel oil	<i>Rosa, species.</i>
Sandal oil	<i>Salvadora persica.</i>
Do. of sandalwood	<i>Santalum album.</i>
Do. poonga	<i>Sapindus emarginatus.</i>
Do. of sassafras	<i>Sarcostigma kleinii.</i>
Saul	<i>Sassafras officinale.</i>
Oil of shayncotay	<i>Shorea robusta.</i>
Do. gingely	<i>Semecarpus anacardium.</i>
	<i>Sesamum indicum.</i>

Do. mustard of kinds.

Kalee surson, Sur-
son, Tira, Toria kur-
wa, Raec

Species of sinapis, viz.,
Sinapis alba.
Sinapis chinensis. *Sinapis*
glauca, Sinapis nigra, Sin-
apis toria.

Chinese tallow tree *Stillingia sebifera.*

Oil of pea

Suchaw.

Oil of fetid sterculia

Sterculia foetida.

Do. nux vomica

Strychnos nux vomica.

Do. wild almond

Symplocos cratagiodes.

Do. portia nut

Terminalia catappa.

Do. croton

Thespesia populnea.

Thorny Trichilia

Theobroma cacao.

Oil of vegetable tallow

Tigilium officinale.

Kuttaella, Black til of

Trichilia spinosa.

Deccan, Kala-til-ka-tel

Vateria indica.

Khatzum oil

Vorbesina sativa.

Carab oil

Vernonia anthelmintica.

..... *Xylocarpus granatum.*

Cotton-seed oil is used for lamps. Castor oil and Argemone seed similarly used. Oil obtained from the fruit of *Melia azadirachta*, &c., for medicine and lamps. Apricot oil in the Himalayas, sunflower oil, oil of cucumber-seed for cooking and lamps, oil of colocynth seed, used as lamp oil. The seeds of bastard saffron (*Carthamus tinctorius*) yield oil. Mustard oil, the produce of various species of *Sinapis*, &c. Shanghai oil, from *Brassica chinensis*; Illipic oil, from *Bassi longifolia*, which is used for frying cakes, &c., in Madras; and Mahwa oil, from *Bassia latifolia*, another species of the same genus. Oil is expressed from the seed of *Cesalpinia oleosperma*, a native of the East. The neem tree seeds afford a very clear or bitter oil, used for burning. Wood oil is a remarkable substance, obtained from several species of *Dipterocarpus*, by simply tapping the tree. The seeds of the Argemone mexicana, also contain a bland, nutritious, colourless, fixed oil. The mass from which the seed is expressed is found to be extremely nutritious to cattle. A solid oil, of a pale-greenish colour, a good deal resembling the oils of the *Bassia* in character, though rather harder, and approaching more in properties to myrtle wax, was shown at the Great Exhibition, from Singapore. It is supposed to be the produce of the tallow tree of Java, called locally "kawan," probably a species of *Bassia*. It is very easily bleached; indeed, by exposure to air and light, it becomes perfectly white; if not too costly, it promises to become a valuable oil. According to Mr. Low, there are several varieties of solid oil commonly used in the Islands of the Eastern Archipelago, and obtained from the seeds of different species of *Dipterocarpus*. Pincy tallow is obtained from the fruit of the *Vateria indica*, a large and quick-growing tree, abundant in Malabar and Canara. It is a white solid oil, fusible at a temperature of 97 degrees, and makes excellent candles, especially when saponified and distilled in the manner

now adopted with palm oil, &c. It has one great advantage over cocoa-nut oil that the candles made of it do not give out any suffocating acrid vapors when extinguished, as those made with the latter oil, do. An oil is produced from the inner shell of the cashew-nut, *Anacardium occidentale* var. *indicum*, in the East Indies. In Japan a kind of butter called *mijo*, is obtained from species of the *Dolichos* bean (*Dolichos soja*). The kernel of the seeds of the tallow tree of China, *Stillingia sebifera*, an evergreen shrub, contains an oil, which when expressed, consolidates through the cold to the consistence of tallow, and by boiling becomes as hard as bees' wax. The plant also yields a bland oil. A similar fatty product is obtained from a shrub in British Guiana, the *Myristica* (*Virola*) *sebifera*. Oil is obtained in South America from the sand box tree (*Hura crepitans*), and from the *Carapa guianensis*. The seeds of several plants of the cucumber family frequently supply a bland oil, which is used in the East as a lamp oil and for cooking. Among the vegetable oils imported into Ningpo and other Chinese ports, from Shantung, Leatong, and Teisin, are oil of teuss, obtained from green and dried peas; black oil of the fruit of the tree kin (?) and oil from the pea of suchau. A pale brownish yellow oil is obtained from the seeds of *Carthamus tinctorius*, in Bombay, the seeds of which contain about 28 per cent. of oil. Excellent oil is expressed in various parts of India from the seeds of different species of *Sinapis*, especially from the black mustard seed, and *S. glauca*, *S. dichotoma*, and *S. juncea* are extensively cultivated in the East for their oil. The *Erysimum perfoliatum* is cultivated in Japan for its oil seeds. A beautiful pale yellow oil is procured from the seeds of the angular-leaved physic nut, *Jatropha curcas*, a shrub which is often employed in the tropics as a fence for enclosures. It is used by the natives in medicine and as a lamp oil. About 700 tons of this oil was imported into Liverpool in 1850 from Lisbon, for the purpose of dressing cloth, burning, &c. An oil called Carab oil is also obtained in the East, from the almonds of *Xylocarpus granatum*, or *Carapa moluccensis* of Lamarck, which is used by the natives to dress the hair and anoint the skin, so as to keep off insects. Cacao fat, the butter-like substance obtained from the seeds of *Theobroma cacao*, is esteemed as an emollient. The *Agaiti*, as it is called by the Portuguese, or *Napoota* by the natives and Arabs (*Didymia gymnosperma*?), is much cultivated in all Eastern Africa for its oil, which is considered equal to that of olives, and fetches as high a price in the Indian market. The plant, which is as tall and rank as hemp, and equally productive, having numerous pods throughout the

stems, is found everywhere in a wild as well as cultivated state. The *Cape Shipping Gazette* of August 1850, says—that an excellent oil, equal to the olive oil of Italy, can be extracted from the kernel of the fruit known by the name of "T'kou Pijte" and "Pruim Besjee," Cocum oil, or butter, is obtained from the seeds of a kind of mangosteen (*Garcinia purpurea*), and used in various parts of India to adulterate ghee or butter. It is said to be exported to England for the purpose of mixing with bears' grease in the manufacture of pomatum. It is a white, or pale greenish yellow, solid oil, brittle, or rather friable, having a faint but not unpleasant smell, melting about 94 degrees, and when cooled after fusion remaining liquid to 75 degrees. An excellent solid oil, of a bright green colour, is obtained from Bombay, having a consistence intermediate between that of tallow and wax, fusible at about 95 degrees, and easily bleached; it has a peculiar and somewhat aromatic odour. There is some uncertainty as to the plant from which it is obtained. It was referred to the *Salvadora persica*, and to the *Vernonia anthelmintica*, a plant common in Guzerat and the Concan Ghats. A pale yellow clear oil is obtained from the seed of *Dolichos biflorus* (?). Oil is also expressed in India from the seed of the *Argemone mexicana*, which is used for lamps and in medicine; and from the seeds of the cashew nut (*Anacardium occidentale*); from *Sapindus emarginatus*, and the country walnut (*Aleurites triloba*.) The fruit of the *Chironia sapida*, (or *Buchanania latifolia*), yields oil. From the seeds of the *Pongamia glabra*, or *Galedupa arborea*, a honey-brown and almost tasteless oil is procured, which is fluid at common temperature, but gelatinises at 55 degrees. Other sources of oil are the *Celastrus paniculatus*, *Balanites egyptiaca* and the saul tree (*Shorea robusta*.) Cinnamon suet is extracted by boiling the fruit of the cinnamon. An oily fluid floats on the surface, which on cooling subsides to the bottom of the vessel, and hardens into a substance like mutton suet. The Singhalese make a kind of candles with it, and use it for culinary purposes. It emits a very pleasant aroma while burning. According to the analysis of Dr. Christison, it contains eight per cent. of a fluid not unlike olive oil; the remainder is a waxy principle. Croton oil is obtained by expression from the seeds or nuts of *Croton tiglium*, a tree, 15 to 20 feet in height, belonging to the same order as the castor oil plant, producing whitish green flowers, and seeds resembling a tick in appearance, whence its generic name. It is a native of the East Indies. 100 parts of seeds afford about 64 of kernel. 50 quarters of croton nuts for expressing oil were imported into Liverpool from the Cape Verd Islands, in 1849.

OIL.

Oil of cassia.....	Cinnamomum, <i>species</i> .
Do. of cinnamon.....	Cinnamomum zeylanicum.
Do. of lemons.....	Citrus limonum.
Do. cocoanut.....	Cocos nucifera.
Do. of coriander.....	Coriandrum sativum.
Nut oil.....	Corylus colurna.
Oil of cucumber seed.....	Cucurbita pepo.
Do. melon seed.....	Cucumis melo.
Coloquintida seed oil.....	Cucumis colocynthis.
Cucumber seed oil.....	Cucumis sativus.
Oil of pumpkin seed.....	Cucurbita maxima.
Do. of cummin.....	Cuminum cyminum.
Do. purging.....	Curcas purgans.
	Cyperus, <i>species</i> .
Poongum oil.....	Dalbergia arborea.
Thorn apple oil.....	Datura, <i>sp</i> .
Wood oil.....	Dipterocarpus, several <i>sp.</i> , empyreumatic.
Agnit, or napoota.....	Didymia gymnosperma.
Oil of mijo.....	Dolichos soja.
Moneela gram oil.....	Dolichos biflorus.
Oil of cardamom.....	Ellettaria cardamomum.
Persimmon oil.....	Embryopteris glutinifera.
Oil of Japan.....	Erysimum perforatum.
Eugenia oil.....	Euphorbia dracunculoides
Oil of sweet fennel.....	Feniculum dulce.
Do. gamboge butter.....	Garcinia pictoria.
Cotton seed oil.....	Gossypium, <i>species</i> .
Kokum oil.....	Garcinia purpurea.
Oil of bonduc nut.....	Guilandina bonduc.
Do. ramtil.....	Guizotia oleifera.
Do. of Ben, Sohujna.....	Hyperanthera moringa.
Sun flower.....	Helianthus annuus.
Oil of glaucous-leaved physic nut.....	Jatropha glauca.
Do. of star anise.....	Illicium anisatum.
Balsam oil.....	Impatiens, <i>species</i> .
Do. „.....	Impatiens tingens.
Oil of jessamine.....	Jasminum, (<i>var. sp</i>).
Physic nut.....	Jatropha curcas.
Do. „.....	Jatropha glauca.
Walnut oil.....	Juglans regia.
Chinese oil.....	Kin.
Linseed oil.....	Linum usitatissimum.
	Litsaea, <i>species</i> .
Sweet basil.....	Ocimum or Lavandula.
Oil of cajaput.....	Melaleuca cajuputi.
Do. neem.....	Melia azaderach.
Do. of mint.....	Mentha piperita.
Do. mimusops.....	Mimusops elengi.
Do. ben.....	Moringa pterygosperma.
Do. nutmeg.....	Myristica moschata.
Do. of tobacco.....	Nicotiana tabacum.
Do. fennel flower.....	Nigella sativa.
Olive oil.....	Olea europea.
Peppermint oil.....	Mentha sativa.
Oil of keora.....	Pandanus odoratissimus.
Do. poppy seed.....	Papaver somniferum.
Do. anise.....	Pimpinella anisum.
Pine oil.....	Pinus gerardiana.
Oil of pepper.....	Piper nigrum.
Do. putchapat.....	Pogostemon patchouli.
Do. kurrunj.....	Pongamia glabra.
	Prinsepia utilis.
	Prunus armeniaca.
Castor oil.....	Ricinus communis.
Oil of roses.....	Rosa, <i>species</i> .
Kikuel oil.....	Salvadora persica.
Sandal oil.....	Santalum album.
Do. of sandalwood.....	Sapindus emarginatus.
Do. poonga.....	Sarcostigma kleinii.
Do. of sassafras.....	Sassafras officinale.
Saul.....	Shorea robusta.
Oil of shayncoyay.....	Semecarpus anacardium.
Do. gingely.....	Sesamum indicum.

OIL.

Do. mustard of kinds.....	Species of sinapis, viz., Sinapis alba. Sinapis chinensis, Sinapis glauca, Sinapis nigra, Sinapis toria.
Kalce surson, Sur- son, Tira, Toria kur- wa, Race.....	
Chinese tallow tree.....	
Oil of pea.....	
Oil of fetid sterculia.....	Sterculia foetida.
Do. nux vomica.....	Strychnos nux vomica.
	Symplocos cratagiodes.
Do. wild almond.....	Terminalia catappa.
Do. portia nut.....	Thespesia populnea.
	Theobroma cacao.
Do. croton.....	Tigilium officinale.
Thorny Trichilia.....	Trichilia spinosa.
Oil of vegetable tallow.....	Vateria indica.
Kuttsella, Black til of Deccan, Kala-til-ka-tel	Verbesina sativa.
Khatzum oil.....	Vernonia anthelmintica.
Carab oil.....	Xylocarpus granatum.

Cotton-seed oil is used for lamps. Castor oil and Argemone seed similarly used. Oil obtained from the fruit of *Melia azadirachta*, &c., for medicine and lamps. Apricot oil in the Himalayas, sunflower oil, oil of cucumber-seed for cooking and lamps, oil of colocynth seed, used as lamp oil. The seeds of bastard saffron (*Carthamus tinctorius*) yield oil. Mustard oil, the produce of various species of *Sinapis*, &c. Shanghai oil, from *Brassica chinensis*; Illipie oil, from *Bassia longifolia*, which is used for frying cakes, &c., in Madras; and Mahwa oil, from *Bassia latifolia*, another species of the same genus. Oil is expressed from the seed of *Cesalpinia olcosperma*, a native of the East. The neem tree seeds afford a very clear or bitter oil, used for burning. Wood oil is a remarkable substance, obtained from several species of *Dipterocarpus*, by simply tapping the tree. The seeds of the Argemone mexicana, also contain a bland, nutritious, colourless, fixed oil. The mass from which the seed is expressed is found to be extremely nutritious to cattle. A solid oil, of a pale-greenish colour, a good deal resembling the oils of the *Bassia* in character, though rather harder, and approaching more in properties to myrtle wax, was shown at the Great Exhibition, from Singapore. It is supposed to be the produce of the tallow tree of Java, called locally "kawan," probably a species of *Bassia*. It is very easily bleached; indeed, by exposure to air and light, it becomes perfectly white; if not too costly, it promises to become a valuable oil. According to Mr. Low, there are several varieties of solid oil commonly used in the Islands of the Eastern Archipelago, and obtained from the seeds of different species of *Dipterocarpus*. Piney tallow is obtained from the fruit of the *Vateria indica*, a large and quick-growing tree, abundant in Malabar and Canara. It is a white solid oil, fusible at a temperature of 97 degrees, and makes excellent candles, especially when saponified and distilled in the manner

now adopted with palm oil, &c. It has one great advantage over cocoa-nut oil that the candles made of it do not give out any suffocating acrid vapors when extinguished, as those made with the latter oil, do. An oil is produced from the inner shell of the cashew-nut, *Anacardium occidentale* var. *indicum*, in the East Indies. In Japan a kind of butter called *mijo*, is obtained from species of the *Dolichos* bean (*Dolichos soja*). The kernel of the seeds of the tallow tree of China, *Stillingia sebifera*, an evergreen shrub, contains an oil, which when expressed, consolidates through the cold to the consistence of tallow, and by boiling becomes as hard as bees' wax. The plant also yields a bland oil. A similar fatty product is obtained from a shrub in British Guiana, the *Myristica* (*Virola*) *sebifera*. Oil is obtained in South America from the sand box tree (*Hura crepitans*), and from the *Carapa guianensis*. The seeds of several plants of the cucumber family frequently supply a bland oil, which is used in the East as a lamp oil and for cooking. Among the vegetable oils imported into Ningpo and other Chinese ports, from Shantung, Leatong, and Teisin, are oil of teuss, obtained from green and dried peas; black oil of the fruit of the tree kin (?) and oil from the pea of suchau. A pale brownish yellow oil is obtained from the seeds of *Carthamus tinctorius*, in Bombay, the seeds of which contain about 28 per cent. of oil. Excellent oil is expressed in various parts of India from the seeds of different species of *Sinapis*, especially from the black mustard seed, and *S. glauca*, *S. dichotoma*, and *S. juncea* are extensively cultivated in the East for their oil. The *Erysimum perfoliatum* is cultivated in Japan for its oil seeds. A beautiful pale yellow oil is procured from the seeds of the angular-leaved physic nut, *Jatropha curcas*, a shrub which is often employed in the tropics as a fence for enclosures. It is used by the natives in medicine and as a lamp oil. About 700 tons of this oil was imported into Liverpool in 1850 from Lisbon for the purpose of dressing cloth, burning, &c. An oil called Carab oil is also obtained in the East, from the almonds of *Xylocarpus granatum*, or *Carapa moluccensis* of Lamarck, which is used by the natives to dress the hair and anoint the skin, so as to keep off insects. Cacao fat, the butter-like substance obtained from the seeds of *Theobroma cacao*, is esteemed as an emollient. The *Agaiti*, as it is called by the Portuguese, or *Napoota* by the natives and Arabs (*Didymia gymnosperma*?), is much cultivated in all Eastern Africa for its oil, which is considered equal to that of olives, and fetches as high a price in the Indian market. The plant, which is as tall and rank as hemp, and equally productive, having numerous pods throughout the

stems, is found everywhere in a wild as well as cultivated state. The *Cape Shipping Gazette* of August 1850, says—that an excellent oil, equal to the olive oil of Italy, can be extracted from the kernel of the fruit known by the name of "T'kou Pijte" and "Pruim Beejee," Cocum oil, or butter, is obtained from the seeds of a kind of mangosteen (*Garcinia purpurea*), and used in various parts of India to adulterate ghee or butter. It is said to be exported to England for the purpose of mixing with bears' grease in the manufacture of pomatum. It is a white, or pale greenish yellow, solid oil, brittle, or rather friable, having a faint but not unpleasant smell, melting about 94 degrees, and when cooled after fusion remaining liquid to 75 degrees. An excellent solid oil, of a bright green colour, is obtained from Bombay, having a consistence intermediate between that of tallow and wax, fusible at about 95 degrees, and easily bleached; it has a peculiar and somewhat aromatic odour. There is some uncertainty as to the plant from which it is obtained. It was referred to the *Salvadora persica*, and to the *Vernonia anthehmintica*, a plant common in Guzerat and the Concan Ghats. A pale yellow clear oil is obtained from the seed of *Dolichos biflorus* (?). Oil is also expressed in India from the seed of the *Argemone mexicana*, which is used for lamps and in medicine; and from the seeds of the cashew nut (*Anacardium occidentale*); from *Sapindus emarginatus*, and the country walnut (*Aleurites triloba*.) The fruit of the *Chironia sapida*, (or *Buchanania latifolia*), yields oil. From the seeds of the *Pongamia glabra*, or *Galedupa arborea*, a honey-brown and almost tasteless oil is procured, which is fluid at common temperature, but gelatinises at 55 degrees. Other sources of oil are the *Celastrus paniculatus*, *Balanites egyptiaca* and the snail tree (*Shorea robusta*.) Cinnamon suet is extracted by boiling the fruit of the cinnamon. An oily fluid floats on the surface, which on cooling subsides to the bottom of the vessel, and hardens into a substance like mutton suet. The Singhalese make a kind of candles with it, and use it for culinary purposes. It emits a very pleasant aroma while burning. According to the analysis of Dr. Christison, it contains eight per cent. of a fluid not unlike olive oil; the remainder is a waxy principle. Croton oil is obtained by expression from the seeds or nuts of *Croton tiglium*, a tree, 15 to 20 feet in height, belonging to the same order as the castor oil plant, producing whitish green flowers, and seeds resembling a tick in appearance, whence its generic name. It is a native of the East Indies. 100 parts of seeds afford about 64 of kernel. 50 quarters of croton nuts for expressing oil were imported into Liverpool from the Cape Verd Islands, in 1849.

The *Croton tiglium* grows plentifully in Ceylon, and the oil, if properly expressed, might be made an article of trade. The best mode of preparing it is by grinding the seeds, placing the powder in bags, and pressing between plates of iron; allow the oil to stand for fifteen days, then filter. The residue of the expression is triturated with twice its weight of alcohol, and heated on the sand-bath from 120 to 140 degrees Fahrenheit, and the mixture, pressed again. In this step the utmost caution is necessary in avoiding the acrid fumes. One seer of seed furnishes by this process rather more than eleven fluid ounces of oil, six by the first step, and five by alcohol. The oil acts as an irritant purgative in the dose of one drop. In large doses it is a dangerous poison. When applied externally it produces pustules. In 1845 eight cases of croton oil and six cases of the seed were exported from Ceylon. Other species of croton as *C. pavana*, a native of Ava and the north-eastern parts of Bengal, and *C. roxburghii* yield a purgative oil. The bark of *C. eleuteria*, *C. cascarilla*, and other species is aromatic, and acts as a tonic and stimulant. It forms the *cascarilla* bark of commerce already spoken of. When bruised, it gives out a musky odour and is often used in pastilles. The oil obtained from the seeds of *Jatropha curcas*, a native of South America and S. Asia, is purgative and emetic, and analogous in its properties to croton oil. It is said to be a valuable external application in itch. In British India it is used for lamps. Oil of Ben, known as *Sohnunjuna* in Bengal, and *Moringa* in Malabar, is obtained from the seed or nuts of the horse-radish tree, the *Hyperanthera moringa*, of Linnaeus. This clear limpid oil, having no perceptible smell, is much esteemed by watch-makers and perfumers; it is expensive and not often to be procured pure, consequently the oil would be a very profitable export. It grows rapidly and luxuriantly everywhere in British India, in Jamaica, particularly on the north side of the island as well as in Trinidad and other quarters of the West. It is easily propagated either by cuttings from the tree (the branches) or by seeds, and bears the second year. The produce of each tree may be estimated at from one to two gallons. From the flowers a very pleasant perfume might be easily distilled. It is a small tree, of about twenty feet in height, of most rapid growth, coming into flower within a few months after it has been sown, continuing to produce seeds and blossoms afterwards throughout the year. The timber is said to dye a fine blue, and the gum, which exudes from wounds in the bark, bears a strong resemblance to that obtained from the *Astragalus tragacantha*, for which it might, no doubt, be substituted. The numerous racemes of white blossoms with

which the tree is constantly loaded, are succeeded by long triangular pods, somewhat torulose at the ends, and about two feet in length, when arrived at the full growth. These pods, while yet young and tender, are not unfrequently cooked and served up at the tables, in India, like asparagus, for which they are not a bad substitute. The pods, when full-grown contain about fifteen seeds; each considerably larger than a pea, with a membranous covering expanding into three wings, whence the specific name of *pterygosperma*. On removing the winged envelope the seeds appear somewhat like pith balls; but upon dividing them with the nail, they are found to abound in a clear, colourless, tasteless, scentless oil, of which the proportion is so large that it may be expressed from good fresh seed by the simple pressure of the nail. Geoffroy informs us, that he obtained 30½ ounce of oil from eight pounds of the decorticated seeds being at the rate of very nearly 24 lbs. of oil from 100 lbs. of seed. All over British India, it is cultivated for the sake of its young pods or the horse-radish of its roots, as luxuries for the table, but its gum is used medicinally and its leaves and flowers as greens. The oil is peculiarly valuable for the formation of ointments, from its capability of being kept for almost any length of time without entering into combination with oxygen. This property, together with the total absence of colour, smell, and taste, peculiarly adapts it to the purposes of the perfumer, who is able to make it the medium for arresting the flight of those highly volatile particles of essential oil, which constitute the aroma of many of the most odoriferous flowers, and cannot be obtained by any other means in a concentrated and permanent form. To effect this, the petals of the flowers, whose odour it is desired to obtain, are thinly spread over flakes of cotton, wool saturated with this oil, and the whole enclosed in air-tight tin-cases, where they are suffered to remain till they begin to wither, when they are replaced by fresh ones, and the process thus continued till the oil has absorbed as much as was desired of the aroma; it is then separated from the wool by pressure, and preserved under the name of essence, in well stopped bottles. By digesting the oil thus impregnated in alcohol, which does not take up the fixed oil, a solution of the aroma is effected in the spirit and many odoriferous tinctures or waters, as they are somewhat inaccurately termed, prepared. By this process most delicious perfumes might be obtained from the flowers of the *Acacia tortuosa*, *Pan-cratiūm caribaeum*, *Plumieria alba*, *Plumieria rubra*, and innumerable other flowers, of the most exquisite fragrance, which abound within the tropics, blooming unregarded, and wasting their fragrance on the barren air. Three varie-

ties of til are extensively cultivated throughout India, for the sake of the fine oil expressed from their seeds, the white-seeded variety, the parti-coloured, and the black. It is from the latter that the sesamum or gingely oil of commerce is obtained. Sesamum seed contains about 45 per cent. of oil. Good samples of oil were shown at the Great Exhibition from Vizianagaram, Ganjam, Hyderabad, Tanjore, the district of Moorsheadabad, and Gwalior. The gingely seed is stated to be worth about £4 per ton in the Northern Circars. An oil resembling that of sesamum is obtained from the seed of *Guizotia oleifera* or *Abyssinica*, a plant introduced from Abyssinia, and common in Bengal. The ram til, or valisaloo seeds, yield about 44 per cent. of oil. The oil is generally used for burning, and is worth locally about six annas per gallon. Black til (*Verbesena sativa*) is known as kutsela or kala til, in the Deccan. It is largely cultivated in Mysore and the western districts of Peninsular India, as well as in the Bombay presidency. About Seringapatam, as soon as the millet crop has been reaped the field is ploughed four times, and the seed sown, a gallon per acre, during the month of July or August, after the first heavy rain. No manure or weeding is required, for the crop will grow on the worst soils. It is reaped in three months being cut close to the ground, and stacked for a week. After exposure to the sun for two or three days, the seed is beaten out with a stick. The crop in Mysore rarely yields two bushels per acre, but about Poonah the produce is much larger. The seed is sometimes parched and made into sweetmeats, but is usually grown for its oil. This is used in cooking, but it is not so abundant in the seed, nor so good as that of the sesame. Bullocks will not eat the stems unless pressed by hunger. About 5,000 maunds are exported annually from Calcutta. 3,730 bags were imported into Liverpool in 1851. The price per quarter of eight bushels, in January 1853, was from 30s. to £2; of teal oil, in tins, weighing 60 to 100 lbs., £2 to £2 4s. Bombay linseed was worth £2 11s. to £2 12s. the quarter of eight bushels, in January 1853. Bengal ditto., 2s. less. The imports into Liverpool were 68,468 bags and 54,834 packets in 1851, and 14,490 bags and 33,700 packets in 1853. About 9,000 bags of mustard seed and from 18,000 to 20,000 bags of rape seed are also imported thence. The price of the latter is about £2 the quarter.

Cocoa-nut oil.—The chief oil made on the seaboard of India, is that yielded by the cocoa-nut palm. The nut having been stripped off the husk or coir, the shell is broken and the fatty lining enclosing the milk is taken out. This is called cobra, copra, or copperah in different localities. Three maunds, or ninety pounds of

copra, are thrown into the mill with about three gallons of water and from this is produced three maunds, or seven and three-quarter gallons of oil. The copperah in its unprepared state is sold, slightly dried, in the market. It is burned in iron cribs or grates, on the top of poles or torches, in processions, and as means of illumination for work performed in the open air at night. No press or other contrivance is made use of by the natives of India for squeezing out or expressing the oil from the cake, and a large amount of waste, in consequence of this necessarily ensues.

Apricot oil, of the finest kind, is made in India by expression from the kernels of the apricot. It is clear, of a pale yellow colour, and smells strongly of hydrocyanic acid, of which it contains, usually, about 4 per cent.

Sun-flower oil is raised in Tartary chiefly for the oil expressed from it. But it is also of use for many other purposes. The people eat the seeds, which, when boiled in water, taste not unlike boiled Indian corn. In some districts of Russia the seeds are employed with great success in fattening poultry; they are also said to increase the number of eggs more than any other kind of grain. Pheasants and partridges eat them with great avidity, and they cause the same effects on them as other birds. The dried leaves are given to cattle in place of straw; and the withered stalks are said to produce a considerable quantity of alkali.

Linseed oil is but little made in India.

Margosa, or Neem oil, is made from the pericarp or fleshy part of the fruit of the *Melia azadirachta*, and of the *Azadirachta indica*. Dr. Maxwell has found this oil equally efficacious as cod-liver oil in cases of consumption and scrofula. He began with half-ounce doses, morning and evening, which were gradually reduced.

Bassia oils.—The seeds of three species of *Bassia* trees, indigenous to British India, and one of E. Africa yield solid oils, and are remarkable for the fact, that they supply at the same time saccharine matter, spirit and oil, fit for both food and burning in lamps: they are

a. The *Illepe* (*B. longifolia*): it is abundant in the Madras presidency, the southern parts of Hindoostan generally, and the northern province of Ceylon. In Ceylon the inhabitants use the oil in cooking and for lamps. The oil cake is rubbed on the body as soap, and seems admirably adapted for removing the unctuousness of the skin caused by excessive perspiration, and for rendering it soft, pliable and glossy, which is so conducive to health in a tropical climate. The oil is white and solid at common temperatures, fusing at from 70 to 80 degrees. It may be advantageously employed in the manufacture of both candles and soap; in Cey-

lon and some parts of India this oil forms the chief ingredient in the manufacture of soap.

b. Mahwa (*B. latifolia*) is common in many parts of British India. The oil a good deal resembles that last described, obtained from the *Illepe* seeds; and may be used for similar purposes. It is solid at common temperatures, and begins to melt at about 70 degrees.

c. Vegetable butter is obtained from the Choorie (*B. butyracea*). Though far less generally abundant than the other two species, it is common in certain of the hilly districts, especially in the eastern parts of Kumaon; in the province of Dotec it is so abundant that the oil is cheaper than ghee, or fluid butter, and is used to adulterate. It is likewise commonly burnt in lamps, for which purpose it is preferred to cocoa-nut oil. It is a white solid fat, fusible at about 120 degrees, and exhibits very little tendency to become rancid when kept.

d. Shea, or galam butter, is obtained in Western Africa from the *Bassia parkii* or *Pentadesma butyracea*, a tree closely resembling the *B. latifolia* and other species indigenous to Hindoostan. According to Park, the tree is abundant in Banbara, the oil is solid, of a greyish white colour, and fuses at 67 degrees. Its product is used for a variety of purposes—for cooking, burning in lamps, &c. This tree has much of the character of the laurel, but grows to the height of eighteen to twenty feet. Its leaf is somewhat longer than the laurels and is a little broader at the point; the edge, of the leaf are gently curved, and are of a dark sap green colour. The nut is of the form and size of a pigeon's egg, and the kernel completely fills the shell. When fresh it is of a white drab colour, but, if long kept, becomes the colour of chocolate. The kernel, when new, is nearly all butter, which is extracted in the following manner:—The shell is removed from the kernel, which is also crushed, and then a quantity is put into an earthen pot or pan, placed over the fire with a portion of water and the nut kernels. After boiling slowly about half an hour, the whole is strained through a grass mat into a clean vessel, when it is allowed to cool. Then after removing the fibrous part from it, it is put into a grass bag and pressed so as to obtain all the oil. This is poured into the vessel along with the first mentioned portion, and when cold is about the consistence of butter. The nuts hang in bunches from the different boughs, but each nut has its own fibre, about seven or eight inches long, and about the thickness and colour of whip-cord. The nut is attached to the fibre in a very singular manner. The end of the fibre is concealed by a thin membrane, about half an inch wide and

three-quarters of an inch long. This membrane is attached to the side of the nut, and, when ripe, relinquishes its hold, and the nut falls to the ground, when it is gathered for use. A good-sized healthy tree yields about a bushel of nuts, but the greater number are not so prolific. The trees close to the stream present a more healthy appearance, probably on account of being better watered, and the fire being less powerful close to the stream. Very extensive collection of Madras oils was exhibited the Madras Exhibition of 1855, by Lieut. Hawkes, viz.:

The *Adul* oil of Travancore was forwarded to the Great Exhibition of 1851. It seems to be medicinal, but the botanical name of the plant producing it is not given.

Aleurites triloba,

Belgam walnut oil. | Hidjee Badam ka tel, HIND.

The Molucca tree, which produces the 'Lumpbang nut' grows plentifully near Hyderabad. The nuts yield a very large percentage of oil, and the tree is found to be very prolific. The nuts are said to be strung upon a thin strip of bamboo, and when lighted will burn like a candle; a notice of this interesting substance may be found in the Transactions of the Agricultural Society of India, Vol. viii, p. 220.

Allium sativum.

Garlic oil | Vellay-pundoo yennai, TAM.
This medicinal oil is obtainable in most parts of British India.

Anacardium occidentale, Cashew-nut oil.

Kajoo ka tel, HIND. | Moondree cottay yennai, TAM.
The light yellow, sweet tasted and edible oil obtained from the nut of this tree, is in every respect equal, if not indeed superior, to either olive or almond oil. It is however very seldom prepared, the nuts being used as a table fruit.

Another oil is prepared from the *Anacardium occidentale* and called Cashew apple oil. It is a powerfully vesicating oil obtained from the pericarp of the Cashew apple and has been long known to the native physicians of India. It much resembles in its properties the acrid oil obtained from the marking nut, *Semecarpus anacardium*.

Andropogon calamus aromaticus, Roosa grass oil, differs but little either in appearance or quality from the Lemon grass oil. It is used for the same purposes.

Andropogon chœnanthus

Camachie pilloo tyllum, TAM. | Lemon grass oil. ENG.
is obtained by distillation from a grass which grows plentifully in many parts of British India. It is much used as a rubefacient for rheumatic affections, as well as in perfumery, for which purposes it is said to be largely exported from Travancore. When newly made, this oil is of a light straw-colour, but age changes it to a deep-red.

Castor oil.—Castor's seed oil. These well-known medicinal seeds yield by distillation a very useful oil which is given medicinally, as a cathartic.

ANIMAL OILS.

Fish oil is chiefly prepared in Malabar and the Western Coast of the peninsula of India; whence it is exported to England, in large quantities, the demand is also yearly increasing.

Fish liver oil, is also prepared chiefly on the Western Coast although some is now made at Madras. The liver of the white shark is that generally used. The best cod liver oil is prepared early in January when the livers are plump, firm, large, white, and full of oil—the livers are sometimes found diseased, and are specifically lighter than water, should be rejected. Good livers should cut smooth, and not tear, when cut none of the substance should flow out in a half liquid state. The quantity of oil produced by livers depends much upon the time of the year. In the beginning of January 1,000 livers were found by experiment to yield 37 imperial gallons, and at the end of February an equal number only gave 23 gallons of oil. In the beginning of January 1,000 livers of average size weighed 900 lbs. whilst in the last day of March the same number weighed only 575 lbs. The oil at these different seasons was equally pale, and the livers equally white, although much smaller and more flabby in the latter season. To prepare the oil—wash the liver very carefully, first removing the gall bladders which adhere to them, and infuse them in rain or other water free from salt. Place them over the fire and never allow the heat to exceed 120 or 130°. On this head especial care must be taken, a higher degree of heat although yielding a larger product, communicates a rank fleshy taste and smell and heightens the colour of the oil, thereby rendering it disgusting to the patient.

Neat's foot oil is used as a softener of leather, &c., &c.

Oleum ceræ, oil of wax: Bees wax submitted to destructive distillation with the addition of a little salt yields an empyreumatic oil which is much used in medicine by native doctors.

Iguana oil, a medicinal oil.

VEGETABLE OILS.

Arachis hypogæa, Ground nut oil.

Willayett-moong ki-phuli ka tel. HIND. | Vayr-cuddala-yennai, TAMIL. |

This valuable oil is now exported from Madras to a large amount. It is obtained by expression from the seeds of the ground or Manilla nut, which is now cultivated to a considerable extent in most parts of the peninsula. In the year 1848-49—37,000 gallons were shipped, but in the two following years

the export exceeded 100,000 gallons. It has, however, fallen to 57,207 gallons in 1850. It does not seem to be consumed to any great extent in this country, although the seed is much eaten by the poorer classes. It is to be used for adulterating gingelly oil in Arcot, where it costs Rs. 1-8-0, to 2-12-0 per maund. In the Nellore District, the seeds are procurable at Rs. 1-8-0 per maund, and in Tanjore about 200 acres are cultivated, producing annually 75 candies of oil at Rs. 2-6-0 per maund. The seeds yield about 43 per cent. of a clear straw-coloured edible oil, which is an excellent substitute for olive oil, and makes a good soap. Its value in London in January 1855 was £47-10 per ton. Perfect decolorization, far from depreciating, considerably enhances the value of this oil.

Argemone mexicana.
Brumadundoo oil.
Coorookoo oil.

Prickly poppy oil.
Jamina yellow thistle oil.

Faringi datura ka tel. HIND. | Brumadundoo-yennai, TAMIL. |
HIND. | Brumadundi noona, TAMIL. |

A pale yellow limpid oil may be obtained in large quantities from the round corrugated seeds of the prickly poppy, which was originally introduced from Mexico in ballast, but now flourishes luxuriantly in all parts of India. It is sometimes expressed by the natives and used in lamps, but is doubtless adapted to other and more important uses. In North Arcot it costs from Rs. 1-14-0 to Rs. 2-1-0 per maund.

Bassia longifolia. Illoopoo oil.

Mohay ka tel. HIND. | Illeppe yennai, TAMIL. |

This semi-solid oil is expressed from the seeds of a tree which is everywhere common in Southern India. It is seldom sold in the bazar, but the seeds are collected, and the oil manufactured by the natives for private consumption. The seeds contain about 30 per cent. of oil of a bright yellow colour. It is procurable in South Arcot at Rs. 25 per candy, or Rs. 1-4-0 per maund—in Bellary at 3-8-0, in Bhopaul at Rs. 3-12-0. In Tanjore it may be had to the extent of 2,702 candies at the rate of 2-8-8 per maund. This oil makes excellent candles and soap. Its chief use is, however, for burning in lamps, and as a substitute for butter in native cookery. A very great difference is observable in colour, consistence and flavour, but is entirely attributable to the mode of preparation and to the presence in some cases of a very large proportion of mucilage and other extraneous matter.

Bassia latifolia, Mahwa oil is a solid oil or butter. The *B. latifolia* grows plentifully in the Northern parts of British India.

Bombax pentandrum, Silk cotton seed oil. A dark-brown, though clear, oil is obtained by expression from the seed of the silk cotton tree, the fibre of which is largely used as a stuffing for pillows, mattresses, &c., &c.

OIL.

Bryonia oil.

Poonuttikai yennai, TAM. | Boddama kaia noona, TEL.
This oil is used for burning in lamps in those parts of British India where the fruit abounds. It is extracted by boiling in water, and is procurable only in very small quantities.

Broonga Malagum ointment and *Vishnamoosty* or *snake tree ointment* of Masulipatam appear to be new products.

Butea frondosa, Moodooga oil. The seeds of this tree yield a small quantity of a bright clear oil which is sometimes used medicinally.

Cabbage seed oil, is prepared in small quantities.

Calophyllum calaba? a new oil under the name of Cherroo pinnacottay was sent from Cochin.

"Pootronjie." A new oil from Mysore and Madras.

Calophyllum inophyllum. Pinnacottay or Poon-seed oil.

Surpun ka tel, HIND. | Pinnay noona, TEL.
Pinnay yennai, TAM.

The fresh seeds of the "Alexandrian laurel" when shelled and subjected to pressure, yield a dark-green oil of a peculiar odour. Old seeds yield a higher coloured and thicker product. In the year 1847-48, gallons 3,871 of the oil, and cwt. 508 of the seeds, were shipped from Madras chiefly to Ceylon and the Straits, it has now ceased to be an article of export. In Tanjore, 437 acres producing on an average 24½ cullums per acre of seed are covered with this tree: this yields 2,671½ maunds of oil at Rs. 20-4 per maund. In Tinnevely, it costs As. 4-8 and Trichinopoly As. 4 per seer. In Tanjore, it is used for lamps, and for caulking vessels, but it appears to be chiefly valuable as a medicine. It is seldom procurable in the bazaar, but is expressed when required. Samples from Canara, under the name of "Honay," from Goa by the name of "Oleum unda," from Cochin called "Perun poonaka," and from Masulipatam.

Canabis sativa, Hemp seed oil.

Ganja yennai, TAM.

This oil is obtained by expression from the seeds of the common hemp, which is cultivated in many parts of the country. In Russia, the oil is much used for burning in lamps, but it is unknown to the natives of India. Of three specimens exhibited, at the Madras Exhibition of 1855 one was of a deep-green colour from Tanjore, another of an olive-green, sent by Lieut. Hawkes.

Cardamom seed oil, (This fixed oil is well known.

Carthamus tinctorius, Safflower oil.

Kurrur or Coosum ka tel, HIND. | Chendoorookoo yennai, TAM.
tel, HIND. | Koosumba noonay, TEL.

A light yellow clear oil obtained from the seeds of the plant, yielding the well known

OIL.

dye. It grows plentifully in Mysore and Tinnevely. In Mysore and Bellary it costs about Rs. 2-8-0 per maund, and is used for lamp culinary and other purposes.

Celastrus paniculata, Malkungunee or stal tree oil.

Malkungunee ka tel, HIND. | Bavungi noona, TEL.
Valuluvu yennai, TAM.

The deep scarlet coloured oil obtained by expression from the seeds of this shrub is used in medicine, the seeds submitted to destructive distillation yield the

Oleum nigrum.

Vaylari tylum, TAM.

An empyreumatic oil obtained by the destructive distillation of the seeds of this *Celastrus*, either alone or in combination with other ingredients. It is much used in the treatment of Beri-beri.

Cheerongie oil, *Chirongia sapida* or *Buchanania latifolia*.

Cheeronji or Charooli ka tel, HIND. | Saraypuppo noonay, TEL.

The kernels of this tree are eaten by the natives to promote fatness, they abound in a straw coloured, sweet tasted and limpid oil which is seldom extracted. The tree grows plentifully in Mysore and Cuddapah.

Cocos nucifera, Coconut oil.

Narel-ka-tel, HIND. | Tencaya noona, TEL.
Taynga yennai, TAM.

The average annual quantity of this oil exported from Madras, from 1847-48 to 1852-53 was about gallons 900,000 per annum. Of this by far the largest portion was sent to the United Kingdom and France, the remainder found its way to Arabia, Mauritius, Bombay and the (Indian) French ports. The prices of this oil vary considerably in different parts of the country. For the quarter ending 31st October 1854, the max. and the min. were Rs. 8-5-4 at Jubbulpore and Rs. 1-12-9 at Mhow per maund. The average of 21 large stations in the Madras presidency giving Rs. 4-9-5 per maund, or about £41-2 per ton. The market-value of "Cochin oil" in London (January 1855) was £46-10—the average being £46 to 48. The best oil is that exported from Cochin, and the neighbouring ports on the Malabar Coast. It usually fetches 20s. per ton more than the Ceylon or Coromandel coast article. In Europe, it is used for candle and soap manufacture, for lubricating machinery, &c., &c. In India, for making soap, anointing the person, for cookery, lamps and in medicine. An empyreumatic oil and pyroligneous acid are obtained by the destructive distillation of cocoanut shells. The latter substance has been used successfully in developing photographs by the collodion process. The oil of tar mixed with ordinary "japan varnish" is said to be used with advantage in the "backing up" of positive pictures.

Croton tiglium, Croton or Napalah oil.

Jumalgotay ka tel, HIND. | Naypalum noonay, TAM.
Neervalum yennai, TAM.

This is a well known medicinal oil, the use of which as a drastic purgative, seems to be decreasing.

Cucumis colocynthis, Colocynth seed oil.

Cucumis melo, Melon seed oil. Pitcha pus-jhum, the Tharbooza, Khurbooza, or Pumpkin seed oil.

Cucurbita pepo, Cucumber seed oil.

Valerikai yennai, TAM. | Thosa noona, TEL.
A clear edible oil.

Garcinia pictoria, Gamboge butter (*Rox.*)

Arasinagoorhy yennai, CAN. | Mukki-tylum, TAM.

A solid butter is contained in the seeds of the "Gamboge tree," a species closely allied to the *G. purpurea* which produces the "cocum butter" and has attracted attention. The Gamboge tree grows abundantly in certain parts of the Mysore and Western coast jungles. The oil which is procurable in moderate quantities, is prepared by pounding the seed in a stone mortar and boiling the mass, until the butter, or oil rises to the surface. Two and a half measures of seed should yield one seer and a half of butter. In the Nuggur Division of Mysore, it is sold at the rate of As. 1-4 per seer of 24 Rs. weight, or at £36-6 per ton, and is chiefly used as a lamp oil.

Ghirgilly oil, from Canara obtained from the pulp of the tree; considered an excellent remedy for rheumatic pains.

Guilandina bonduc, bonduc nut oil.

Calichi-kai yonnai, TAM.

The oil of this common seed is mentioned by Ainslie, as being considered useful in convulsions and palsy. The seeds themselves are believed to possess tonic virtues. Used solely as a medicine.

Guizotia oleifera, Ramtil oil—*Verbesina sativa*.

Kala til ka tel, HIND. | Valeesaloo noonay, TEL.

This sweet-tasted edible oil is plentiful in the Mysore, Vizagapatam and Ganjam Districts. It is used for nearly the same purposes as the sesamum. It is procurable in the Nuggur Division of Mysore at Rs. 3-8-0 per maund, but is considered inferior to gingely oil.

Hura crepitans, Sand-box tree oil. This tree has been introduced from Jamaica. Its seeds yield by expression an oil; as the whole tree abounds in poisonous matter, this oil probably partakes of its deleterious nature.

Hydnocarpus inebrians, Thortay oil. From Canara a very valuable vegetable tallow, used for sores.

Inga dulcis, Coorookoopilly oil. The seeds of this common hedge plant yield by expression a light coloured oil, about the consistence of castor oil. Its qualities and uses are unascertained.

Jatropha purgans, or *Curcas purgans*, Angular leaved physic-nut oil.

Jangli erandi ka tel, CAT-AMUNAK YENNAI, TAM.
HIND. | Adavi amedapoo noona, TAM.

This oil, has of late been imported into England, as a substitute for linseed oil; it is expressed from the fruit of a species of *Jatropha*, which abounds in all parts of the Madras presidency. The colour is somewhat paler than the best linseed oil. It can be obtained in some parts of the country where it is plentiful, for little more than the cost of manufacture. It is now chiefly used in lamps.

Jatropha glauca, Glaucon-leaved physic-nut.

Addalo or Authaulay yonnai, TAM.

This in appearance approaches castor oil, and seems to be but little known. It is fluid and light straw-coloured, and is procurable in South Arcot, where the plant grows on waste land. It is now chiefly used medicinally as a counter-irritant, but if procurable in sufficient quantity seems likely to prove a useful oil. A high coloured specimen was sent to the Madras Exhibition from Tinnevely and one of a pale straw colour from Madras.

Lepidium sativum, Country Cress oil.

Ali-veri yonnai, TAM.

This oil is extracted from the seeds of the "Chinese wall cress." It must not be confounded with "Linseed oil," the Tamil name of which is the same as that of the present article.

Linum usitatissimum, Linseed oil.

Ulsee ka tel, HIND. | Aveesee noona, TAM.
Aliveri yonnai, TAM.

The seed from which this oil is expressed, has long been cultivated to a limited extent in Nagpore, Bellary and other parts of the Madras presidency. There is an impression that the oil obtained from the Indian plant is inferior to that imported from England, but it will be found on experiment, that this arises from the former having been imperfectly freed from mucilage, which prevents its drying. The seed is now an article of export from Madras to the amount (1852-53) of cwt. 1,106. In the year 1852-53, English Linseed oil to the amount of gallons 4,552 and valued at Rs. 8,763 was imported into Madras, whilst at the same time cwt. 1,045 of the seed were exported from hence mostly to England: it can be made on the spot for much less than the average value of the English oil. It would, however, be necessary to guard against the adulteration of this oil, with any of the other greasy oils which would of course infallibly destroy its drying properties.

Macassar oil, is used by the natives of Singapore as a hair oil.

Manaloo oil, of Canara, is used for lamps.

Azadirachta indica, and *Melia Azadirach*, Margosa or Neem oil.

Neem ka tel, HIND. | Vapa noona, TEL.
Vapum yonnai, TAM.

This valuable and much used medicinal oil is obtained by either expression or boiling, from the seeds of species of *Melia* and *Azaderachta*, which are common throughout Southern Asia. It enters much into the practice of native Physicians, by whom it is administered internally as an anthelmintic, and externally as a liniment in rheumatism, and headache and as an application to ulcers. The oil is of a deep yellow colour, has a strong smell and an unpleasant bitter taste. In the year 1847-48, gallons 1,587 were exported from Madras, and in the year 1851-52, gallons 1,917, in 1852-53, gallons 3,111. The chief market is Ceylon, but the demand is not constant.

Mesua ferrea, Naga-sumpunghce oil. This valuable oil is procurable in Canara, at the rate of Rs. 4 and the seed at 1-8-0 per maund. It is used both as a lamp oil and as a healing application to sores.

Mimusops elengi, Mimusops oil, a medicinal oil, obtainable in tolerably large quantities in some parts of the country. It is known in England.

Mooroogana tallow. This valuable substance, which even at high temperatures is perhaps the most solid oil with which we are yet acquainted, is made in Canara. If procurable in large quantities, and at a moderate cost, it promises to be a valued material for the manufacture of candles, &c., &c. It is used for medicinal purposes, &c., &c., and as a cure for cattle wounded by tigers.

Hyperanthera moringa: *Moringa pterygosperma*, Ben or moringa oil.

Sahujna, HIND. | Morunga noona, TEL.
Morungy yennai, TAM.

Ben nut oil has long been considered valuable on account of the lengthened period, which it may be kept without contracting rancidity. The tree from which the "nuts" are obtained, is common in all parts of British India the flowers, leaves and fruit are eaten by the natives, and the rasped root is used by Europeans as a substitute for horse-radish, to which circumstance it owes its common name of "horse-radish tree." The oil however is seldom made in India, nor does it now form an article of export.

Myristica moschata, Nutmeg butter.

Japhul ka tel, HIND. | Jaikkarra noona, TEL.
Jadipootri tyilm, TAM.

It is obtained by expression from the nutmeg, it has an aromatic smell from the volatile oil it contains.

Neeradimootoo oil. Neerada.

Jungli badam ka tel, HIND. | Mootoo yennai, TAM

This valuable oil was sent to the Madras Exhibition of 1855 under the various names of Neerade-mootoo, Jungle almond, Maroty, Tamana, Maravetti, Neervetti and Soorty. It is

in great repute, as a medicine amongst native practitioners, and the kernel enters largely into their prescriptions. It might probably be found of use in the arts, it much resembles almond oil but is rather thicker. The seeds cost in Madras As. 2-6 per seer.

Nigella sativa, Fennel flower oil.

Kulonjee; Siah Danah, Carun seeragum, TAM
HIND. | Nalla gillikarra, TEL.

The black aromatic seeds of the *Nigella sativa*, yield by expression a dark coloured fragrant oil.

Papaver somniferum, Poppy oil.

Khush-khush-ka-tel, HIND. | Cas-casa yennai, TAM.
Casa-casa noona, TEL.

The poppy is largely cultivated throughout Malwa and the opium districts, where the drying oil obtained from the seed is more extensively used than any other, both in lamps and as food. At Bhopaul the oil is procurable at the rate of Rs. 4-8-0 per maund of 25 lbs. or £40-6 per ton. By simple exposure to the rays of the sun in shallow vessels, this oil is rendered perfectly colourless. It is much prized by European artists.

Wild olive, or Pootroojie oil, obtained by expression from a handsome tree growing plentifully in Canara and Mysore.

Polanisia viscosa, Viscid Cleome oil.

Nahi-cadaghoo, TAM.

This warm and pungent little seed when subjected to very powerful pressure, yields a moderate per-centage of a light, olive-green, coloured limpid oil, which promises to be useful for purposes requiring a very liquid oil.

Poonga or Kurunj oil, *Dalbergia arborea*, or *Pongamia glabra*.

Kurunj ka tel, HIND. | Poonga yennai, TAM.
Kanoogoo noona, TEL.

This oil, which, in some parts of the country, is used to a large extent in adulterating lamp oil, is expressed from the seeds of a tree, common in most parts of the Madras presidency. In North Arcot, Bellary, and the Nuggur Division of Mysore, the oil is procurable at Rs. 2-8-0 per maund. It is chiefly used as a lamp oil by the poorer classes.

Sahocottuy oil, from Canara, is used for cutaneous diseases.

Santalum album, Sandal seed oil.

Chundana pusjhum yennai, TAM.

The seeds of the sandalwood tree yield by expression a thick and viscid oil which is burnt by the poorer classes in lamps.

Santalum album, Sandalwood oil.

Chundana yennai, TAM.

This oil is made in Salem, Mysore and Canara from the sandalwood. The exports amount annually to about 100 cwt.

Raphanus sativus, Radish seed oil.

Ricinus communis, Castor oil, *Fruetibus minoribus*, or small seeded variety.

Barik erundi ka tel, HIND. | Chitt-amindialoo noona,
Sitt-amunaku yennai, TAM. TEL.

Two varieties of the *Ricinus communis*, one being small and the other large-seeded, are produced all over India. The small-seeded variety yields the best product, and is employed in preparing the oil exported for medicinal purposes. The fresh seeds after having been sifted and cleaned from dust, stones, and all extraneous matters, and slightly crushed between two rollers, freed by hand from husks and coloured grains, are enclosed in clean gunny. They then receive a slight pressure in an oblong mould which gives a uniform shape and density to the packets of seed. The "Bricks" as they are technically called, are then placed alternately with plates of sheet iron in the ordinary screw or hydraulic press. The oil thus procured is received in clean tin pans, and water in the proportion of a pint to a gallon of oil being added, the whole is boiled until the water has evaporated, the mucilage will be found to have subsided and encrusted the bottom of the pan, whilst the albumen solidified by the heat, forms a white layer between the oil and the water. Great care must be taken in removing the pan from the fire, the instant the whole of the water has evaporated, which may be known by the bubbles having ceased, for if allowed to remain longer, the oil which has hitherto been of the temperature of boiling water or 212° , suddenly rises to that of oil or nearly 600° , thereby heightening the colour and communicating an empyreumatic taste and odour. The oil is then filtered through blanket, flannel, or American drill, and put into cans for exportation. It is usually of a light straw colour, sometimes approaching to a greenish tinge. The clean seeds yield from 47 to 50 per cent. of oil, worth in England from 4d. to 5d. per lb. The following is the result of experiments made at Madras and Calcutta to ascertain the percentage of oil in the Castor seed on January 27th, 1853.)

Calcutta.—1,400 lbs. of seed yield kernels and raw oil as follows:—

1st sort Kernels..	632 lbs.	Oil..	324 lbs.
2nd sort "	184 lbs.	"	87½ lbs.
3rd sort "	164 lbs.	"	76½ lbs.

making a total of 980 lbs. of kernels and 488 lbs. of raw oil from 1,400 lbs. of seed.

Madras.—1,400 lbs. of seed yield raw oil as follows:—

1st sort.....	318 lbs. of oil.
2nd sort.....	88 lbs. do.
3rd sort.....	74 lbs. do.

making a total of 480 lbs. of oil from 1,400 lbs. of seed.

The cost of the Madras oil was Rs. 76-1-0 as follows:

1,400 lbs. seed at Rs. 3-3 per bag of 164 lbs.	27 3 4
--	--------

Husking and selecting kernels and cooly hire.....	3 11 9
---	--------

Crushing, moulding, pressing and boiling	2 7 1
Filtering and sundries.....	2 8 0
Overseer's pay, godown rent, &c. &c. .	1 6 2
300 empty quart bottles, corks, &c. .	34 4 8
Cleaning and packing charges.....	4 8 0
Or an average of Annas $4\frac{3}{80}$ per quart of first, second and third sort oil = 4d. per lb.	

This oil is chiefly used as a mild purgative. Soap of good quality may be made of it, but the cost and disagreeable smell which it communicates, preclude its general use. The average exports for the 4 years 1849-50 to 1852-53 11,325 gallons per annum. The qualities of clearness and limpidity do not arise from any superiority of the seed, or care in extraction, but from repeated decolorization with animal charcoal, which in the opinion of many eminent medical men, considerably detracts from its strength and efficacy. When manufactured in the ordinary native mill, this oil is sometimes used by the richer classes in lamps.

Castor oil, extracted hot, differs from the preceding only in the mode of preparation. The seeds are boiled for two hours in water, dried for three days in the sun, freed from the shells, pounded and then boiled in fresh water, until the whole of the oil has risen to the surface. Five seers of the seeds or $3\frac{1}{2}$ lbs., should by this process, yield a quart of oil. This is the sort generally used in medicine by native practitioners, it is straw-coloured, and free from any unpleasant taste or smell.

***Ricinus communis*, Castor oil or lamp oil; Fructibus majoribus, large seeded variety.**

Chiragh-ka-tel,	HIND.	Ped-amidam,	TEL.
Vullak ennai,	TAM.		

This oil which is obtained from the large-seeded variety of the "*Ricinus communis*" is sometimes drawn cold, it is then of a straw-colour scarcely distinguishable in quality from the oil of the small-seeded variety. It is however more usually extracted by heat, and forms the common "lamp oil" of the bazaar. The seeds having been partially roasted over a charcoal fire, both to coagulate the albumen and to liquify the oil, are then pounded and boiled in water until the oil rises to the surface. The roasting process, however, gives it a deeper red colour and an empyreumatic odour. The price of this oil varies in different parts of the country from Rs. 1-10-0 to Rs. 3-13-6 per maund of 25 lbs. The average of nineteen large stations, in all parts of the Madras presidency for the quarter ending 31st October 1854, was Rs. 2-8-6 per maund. It is used chiefly for lamps. Average exports of the six years ending 1854, were gallons 27,561 per annum.

Castor oil, from a new wild species in Canara, is burnt in lamps.

***Sapindus emarginatus*, Soap-nut oil.**

Reethay ka tel,	HIND.	Poongum-kai yennai,	TAM.
Poovandi cottay,	TAM.	Koocoodi muna,	TEL.

OIL.

This semi-solid oil is used medicinally by the natives, and is extracted from the kernel of the soap-nut. Its cost prevents its general use.

Sarcostigma kleinii, Poovana oil, made in Tinnevely, Travancore and Cottayam, is reported to be useful for rheumatism. This substance has been long known under the name of Poovana and Poovengah, as medicinal oil; it is used largely on the western coast, and seems especially to merit further investigation.

Semecarpus anacardium, Marking nut oil. Bhillawan ka tel, HIND. | Nellajidi noonaa, TEL. Shayang cottay yennai, TAM.

The acrid and vesicating-oil which is found between the two laminæ of the pericarp of the marking nut is collected and used as a preventive against the attacks of white ants, and by native practitioners in rheumatic and leprosy affections. By boiling the whole nut not divested of its pericarp, an oil is also obtained which acts as a blister. The preparation or collection either of the oil or acrid juice is liable to cause much irritation and inflammation of the hands, face, &c., of those engaged in the work.

Sesamum orientale, Gingelly oil or sesamum oil (black-seeded variety.)

Meetha Til ka tel, Nool ennai, TAM. HIND. | Mundie noonay, TEL.

This oil which is perhaps consumed to a greater extent than any other by the natives of India, is, moreover, second only to cocoanut oil in its importance as an article of commerce. It is extensively cultivated throughout the whole of the Madras presidency, and its seeds and oil have been exported as follows :

Gingelly Seed.

Year 1847-48.	Year 1848-49.
Qr. 17,518.....Rs. 160,134	Qr. 8,594.....Rs. 1,02,726
Year 1849-50.	Year 1850-51.
Cwt. 1,44,125, Rs. 299,412	Cwt. 2,27,779, Rs. 4,37,185
Year 1851-52.	Year 1852-53.
Cwt. 1,09,414, Rs. 302,559	Cwt. 2,51,613, Rs. 5,31,664

Gingelly Oil.

Year 1847-48.	Year 1848-49.
GL 19,520.....Rs. 14,766	GL 14,686.....Rs. 11,535
Year 1849-50.	Year 1850-51.
GL 52,721.....Rs. 36,294	GL 77,262.....Rs. 48,605
Year 1851-52.	Year 1852-53.
GL 46,196.....Rs. 26,722	GL 72,607.....Rs. 43,608

Of the gingelly seed exported in 1852-53 the United Kingdom received cwt. 12,713—Ceylon, cwt. 590—France, cwt. 2,87,225—Pegue cwt. 741—Bombay, cwt. 113—Malacca, cwt. 33 and Travancore, cwt. 148. Of the quantity of oil (72,607 gals.) exported in the same year—gals. 42,043 were shipped to the United Kingdom—gallons. 2,968 to Ceylon—gals. 4,232 to Mauritius and Bourbon—gals. 19,698 to Pegue—gals. 46 to Bengal—gals. 27 to the French (Indian) ports, and gals. 3,593 to Malacca.

First sort Gingelly oil.—The great disparity of colour observed in the samples of this oil is merely to be attributed to the mode of preparation.

OIL.

The method sometimes adopted is that of throwing the fresh seeds, without any cleansing process, into the common mill, and expressing in the usual way. The oil thus becomes mixed with a large portion of the colouring matter of the epidermis of the seed, and is neither so pleasant to the eye, nor so agreeable to the taste, as that obtained by first repeatedly washing the seeds in cold water, or by boiling them, for a short time, until the whole of the reddish-brown colouring matter is removed, and the seeds have become perfectly white. They are then dried in the sun, and the oil expressed as usual. This process yields 40 to 44 per cent. of a very pale straw-coloured sweet smelling oil, an excellent substitute for olive oil, for which indeed it is largely sold. In India, it is chiefly used in cookery, in anointing the person, for making soap, and for burning in lamps. In Europe, it is chiefly used for the manufacture of soap, and for burning in table-lamps, for which it is better suited than cocoanut oil, owing to the lower temperature at which the latter congeals. The value in England (January 1855) £47-10 per ton. In different parts of the Madras presidency the price of this oil varies from Rs. 1-5-0 to Rs. 6 per maund of 25 lbs. In S. Arcot it is procurable at Rs. 27-12-5 per candy. The prices per maund of this oil at the undermentioned stations, for the quarter ending 31st October 1854, were as under :

Arcot.....Rs. 3 8 0	Madura.....Rs. 5 8 3
Bangalore..... „ 3 7 3	Mangalore..... „ 4 1 8
Bellary..... „ 3 2 0	Nagpore..... „ 1 12 0
Berhampore... „ 2 8 0	Palamcotta... „ 4 12 0
Cannanore.... „ 6 0 0	Paulghaut.... „ 3 7 0
Cuddapah..... „ 2 13 0	Samulcotta... „ 2 10 8
Jaulnah..... „ 2 6 0	Secunderabad. „ 2 3 11
Jubbulpore... „ 1 5 0	Trichinopoly. „ 4 1 8
Madras..... „ 3 14 0	Vellore..... „ 3 14 0
Masulipatam. „ 3 9 0	Vizagapatam.. „ 3 2 0

Second sort Gingelly oil, is, in commerce, erroneously called 'Rape,' (Kharasance yellow), is expressed from a variety of sesamum and differs but little from the one above-mentioned. In Tanjore, it is procurable at Rs. 3 per maund.

The following particulars concerning the two varieties of plant, yielding this important oil have been furnished by F. Copleston, Esq., Rajahmundry. He tells us that two varieties of sesamum are cultivated for the sake of the oil,

The 1st sort of gingelly seed is the produce of the plant, which is sown in the month of March, after the rice crop, and is irrigated twice, once at sowing, and once afterwards. The seed which is black, and is called 1st sort gingelly, from the fact of its yielding the largest percentage of oil, ripens in May, and sells at the rate of Rs. 60 per candy of 500 lbs. The oil obtained from both varieties, sells at the same price, viz., Rs. 2-14-6 to Rs. 3 per maund of 25 lbs. according to quality.

The 2nd sort of gingelly is sown in June, and

produces a red seed. The plant although a little larger, resembles in most respects the former, it has, however, a somewhat longer leaf, and the flower differs a shade or two in colour. A candy of 500 lbs. of this seed sells at Rs. 57-8-0. The price of the oil is the same as that of 1st sort gingelly. This seed about A. D. 1850 began to be largely exported to France, in consequence of which the price doubled.

Sinapis, species, Mustard oil.

Rai ka tel, HIND. Avaloo noona, Sarsava noo-
Kadaghoo yennai, TAM. na, TEL.

Five or six species of *Sinapis* are cultivated in all parts of India, for the sake of the valuable oils they yield, those most frequently seen are *S. glauca*, *S. toria* and *S. racemosa*. The seeds of the '*Sinapis alba*' yield by expression 36 per cent. of a bright yellow, pleasant tasted, edible oil, having a strong smell, and slight taste of mustard. The seeds of '*sinapis nigra*,' yields only 28 per cent. of an oil in all respects similar to the above. The average price of mustard seed in eighteen large stations, in all parts of the Madras presidency, for the quarter ending 31st October 1854 was Rs. 1-2-8 per maund of 25 lbs., the maximum being Rs. 1-11-6 at Cannanore and the minimum As. 10-5 at Nagpore. In Vizagapatam it costs Rs. 208 per Sicca garce. The oil is not exported, but the seeds have been shipped as follows: 1847-48...Cwt. 5,828 1850-51...Cwt. 9,909 1848-49... „ 6,767 1851-52... „ 3,636 1849-50... „ 9,435 1852-53... „ 16,075

Uses.—This valuable oil, although seldom sold in the market, being made when required, is used in most parts of India in cookery, and is considered superior to all other oils for anointing the body, which it is supposed to invigorate. In medicine, it is sometimes given internally, but is more frequently applied as a rubefacient. The common mustard oil cake is obtained from four different sorts of *Sinapis*.

Sterculia foetida, Fetid sterculia oil.

Coodira pasjun-yennai, TAM.

This semi-solid oil obtained by expression from the seeds of a large jungle tree, appears to contain a large per-centage of stearine, but it is doubtful if it can be obtained in large quantities.

Strychnos nux vomica, Nux vomica oil.

Carun jooty, CAN. | Moo yettie cottay yennai, TAM.

An empyreumatic oil prepared from the fresh nut, is used medicinally by native practitioners.

Terminalia bellerica, Belleric myrobolan oil.

Tanikai yennai, TAM.

A medicinal oil obtainable in small quantities from the kernel of the Belleric myrobolan, the drupe is used as a tanning material.

Terminalia catappa, Wild. Almond oil, the product of this species of *Terminalia*.

Terminalia chebula, Chebulic myrobolan oil

A medicinal oil procurable in very small quantities from the kernel.

Thespesia populneum, Portia nut oil.

Paras pippul, HIND. | Poorasam yennai, TAM.

This deep, red-coloured and somewhat thick oil, is obtained from the seeds of the portia tree, which grows in great abundance in the peninsula. It is extensively planted as an avenue tree, for which its quick-growth and the beauty of its flowers render it a favorite. The wood is capable of being worked when fresh cut and is used for boat-building and cabinet work. The juice of the tree is used on the western coast, as a remedy for various cutaneous affections, and the oil might probably be of use in similar cases. Its expense precludes its use otherwise than medicinally.

Thevetia nerifolia, the "exile" oil. The kernels of the seeds of this common shrub yield by expression a large percentage of a clear bright yellow coloured oil.

Thoronogullo oil, *Pongamia glabra*? from Canara used for cutaneous diseases.

Tuntapoo oil, (*Cassia tora*?) an empyreumatic medicinal substance called Tuntapoo oil known about Masulipatam.

Vateria indica, Piney tallow or Deopada oil.

Piney yennai, TAM.

This most valuable tree, which, besides the product under consideration, yields a resin nearly equal to copal, and furnishes an excellent building wood, grows plentifully in the jungles of the western coast. The oil which is perfectly solid even in hot climates, is prepared by cleaning the seeds, then roasting and grinding them into a mass. To 5 seers of seed, add 12 seers of water, and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected and the process repeated. The oil is principally used for lamps, but is very suitable for soaps and candle-making.

Wood oils.—This class of oils is obtained for the most part from the Burmese coast and the Straits. They are usually procured by tapping certain trees of the noble order *Dipterocarpaceae*, and applying heat to the cavity. The oil which flows from the wound, is a mixture of a balsam and volatile oil, and when applied as a varnish to wood or other substance the oil evaporating deposits a hard and durable coat of resin. They are chiefly used as natural varnishes, either alone or in combination with coloured pigments, also as a substitute for tar in paving the seams of shipping, and for preserving timber from the attacks of white ants. They are said also to be useful as an ingredient in lithographic inks. Owing to the distance from which they are brought, and the imperfect knowledge we yet

process of the countries whence they are imported, the names of the trees from which these valuable substances are derived, are involved in some degree of obscurity. The oil, therefore generally receives the names of the localities from which they are imported. Some of them differ considerably in colour and consistence, but they all possess the same balsamic odour. About the end of the dry season, that is in March or April, several deep incisions are made with an axe into the heart of the wood, and a good sized piece scooped out; into these holes fire is placed, and kept burning until the oil begins to run, when it is received into a bamboo, and allowed to run slowly drop by drop.

Teakwood oil.—An opaque dull ash-coloured oil procurable in most of the large bazaars of India; when allowed to rest for some time, it separates into two layers, or an upper dark-coloured clear stratum and a lower and more solid deposit. Its chief use is for applying to wood-work of all sorts, either alone as a natural varnish, or in combination with certain resins.

Wood oil from Pegu.—The oil which is generally known by this name is a very clear and liquid substance forming a natural varnish when applied to wood or other substance.

Deodar or Shernanatahu oil, *Erythroxylon areolatum*. An empyreumatic medicinal oil.

Wood oil from Chittagong.—Much resembles Teakwood oil and Wood oil from Pegu. It is less liquid than the latter, but is used for the same purpose; procurable in all large bazaars.

Wood oil from Rangoon and Moulmein differs very considerably from any other specimen of "wood oil" sent to the Exhibition, it is quite white and almost solid, but has the usual resinous smell of this class of oils.

Wood oil from China, is one of the substances of which the well-known and much prized China lacquer is made. It is used in Singapore for painting the beams and wood-work of native houses, and may also be mixed with paint when not exposed to the sun.

Sissoo-wood oil, *Dalbergia sissoo*. An empyreumatic medicinal product.

Wood oil from Tinnevely.—An empyreumatic product similar to tar, chiefly used medicinally by native practitioners.

Camphor wood oil, *Dryobalanops camphora* belongs to the class of "Volatile oils," is used largely in Singapore as a substitute for turpentine, and sells at from 15 to 20 cents. a bottle.

Wood oil of Malacca is obtained from the tree without any preparation. It is obtained from a large tree of the Dipteraceous family which is very common in the dense jungles of the Malayan peninsula, and grows to a great height. When not lopped too soon,

the base of the trunk is of immense girth—the wood is reddish brown and has a smell not unlike that of English fir, the bark is smooth, the leaves alternate, pinnate and exstipulate, fruit a one-seeded drupe, seed angular and anatropal. The oil when permitted to remain at rest divides itself into two layers, the upper consisting of a clear chesnut-coloured liquid balsam, and the lower being in appearance like flakes of granulated sugar and consisting probably of the surplus resin deposited by the action of the atmosphere.

Mineral oils, or Petroleum, the produce of Burmah.

The Wound-tree oil, or Gayapa-noona of Rajahmundry.

Wrightia antidysenterica, Rosebay oil.

Vaipallay yonnay, TAM.

A thick, scarlet-coloured, medicinal oil, partaking doubtless of the properties of the seed.

Although the number of oil-producing plants in Southern India is very large, but few are cultivated to any great extent, the larger portion consisting of trees, shrubs, or herbs growing in a wild state, the fruits of which are gathered by the poorer people, and the oil pressed as necessity requires. The oils of the peninsula may be classed under the following heads:

(1.) Oils procured from plants which are cultivated for the sake of their products, such as cocoanut oil (*Cocos nucifera*); gingelly oil (*Sesamum orientale*); castor oil, often in the South of India called lamp oil (*Ricinus communis*); ground-nut or Manilla-nut oil (*Arachis hypogæa*); linseed oil (*Linum usitatissimum*); ramtil oil (*Guizotia oleifera*); mustard oil, much used for anointing the body (species of *Sinapis*); poppy oil (*Papaver somniferum*).

(2.) Oils procured from plants which grow spontaneously and are found in sufficient quantities to admit of the produce becoming an article of inland trade. Such as margosa oil or neem-oil (*Azadirachta indica* and *Melia azaderach*); solid bassia oil, used for candles and for butter (*Bassia longifolia* and *butyracea*); pinacotay oil (*Calophyllum inophyllum*); karinj oil (*Dalbergia arborea*); coorookoo oil (*Argemone mexicana*); cat-amunak oil (*Jatropha curcas*); piney tallow (*Vateria indica*); and gamboge oil (*Garcinia pictoria*).

(3.) Oils procured from plants which grow spontaneously, but to a limited extent, in many parts of the country. These oils are sometimes extracted by the poorer classes for home consumption;—Safflower oil (*Carthamus tinctorius*); Belgaum walnut oil (*Aleurites triloba*); poorana oil (*Sarcostigma kleinii*); jungle almond oil (*Hydnocarpus inebrians*); Addale oil (*Jatropha glauca*); cress oil (*Lepidium sativum*); cucumber, melon, and gourd oil (species of cucu-

mis and cucurbita); coorkapilly oil (*Inga dulcis*) a common hedge plant.

(4.) Oils procured in small quantities from plants, and used chiefly for medicinal purposes, and for perfumery, such as soap-nut oil (*Sapindus emarginatus*); cashew oil (*Anacardium occidentale*); cotton oil (species of *Gossypium* and *bombax*); croton oil (*Croton tiglium*); bryony oil (species of *bryonia*); colocynth oil (*Citrullus colocynthis*); fenugreek oil (*Trigonella foenum-græcum*), and others. The following are the particulars of an experiment made to ascertain the periods to which the same quantities of different oils burn, together with their respective powers of illumination:—

English Name.	Botanical Name.	Selling price. Per Madsen Measure of eight Oloocks.		Quantity used in the Experiment.		Date of Experiment.	Thermometer and hour of the day at which experiment was made.		Duration of burning, i.e. period to which the oil lasts.	Distance from the lamp at which the printed let- ters in an Octavo Vol. of Burn's Poems page 3, became illegible.	
		Whole- sale.	Retail.							Ma.	In.
Cocoonut	<i>Cocos nuncifera</i>	Rs. A. P. 0 7 11	Rs. A. P. 0 8 0	4 Oz.	1857	July 10	87° 8,	20 A. M.	6	14	0
Lamp	<i>Ricinus communis</i>	0 4 10	0 5 0	4 do.	do.	10 30° 3,	0 P. M.	20	45	9	0
Poppy	<i>Papaver somniferum</i>	19 0 0	19 8 0	4 do.	do.	13 38° 2,	30 P. M.	50	55	15	6
Gingelly	<i>Sesamum indicum</i>	0 5 9	0 6 0	4 do.	do.	11 38° 8,	45 A. M.	30	35	8	0
Earth-nut.	<i>Arachis hypogea</i>	0 6 2	0 6 4	4 do.	do.	12 37° 8,	30 A. M.	30	30	8	6

The place in which the experiment was made was the western sally-port of Fort St. George, closed, quite dark. Atmosphere during the burning of each kind of oil, calm and serene, wick stand, in each case, iron wire, 1-10th of an inch in circumference, 2½ inches high, with small round tin stand at bottom, wick, ordi-

nary white lamp cotton, thickness in each case, 50 threads, burnt in a small tumbler half filled with water. Age of the party making the experiment 34 years, eyesight in perfect vigour. The gingelly oil (*Sesamum indicum*) must be extremely prejudicial to the health of those using it, from the vast amount of smoke it emits, the earth-nut oil (*Arachis hypogea*) emits a large quantity of smoke though not so much as the gingelly, but has a disagreeable smell whilst burning, the smoke from the other three kinds of oil is scarcely perceptible.

Kruing or *Miniak kruing*, a wood oil, of Borneo, is extracted from the trees which produce it, by simply cutting a large hole in the tree, to which fire being placed, the oil distils over.

Between balsam of copaiba and the wood oils there is this difference, viz., that the wood balsam distilled with the addition of a small quantity of an oxidizing agent, as chlorine, hypo-chlorite of lime, or bichromate of potash, yields an essential oil of a fine blue, whilst ordinary copaiba, containing "soft resin" affords hardly any coloured essential oil. Cold sulphuric acid produces with copaiba a purple coloration similar to that obtained with cod-liver oil, so that dishonest persons might substitute for the latter, a mixture of olive, oil or of some other fatty oil, mixed with a small proportion of copaiba.

To obtain wood oil, a large incision is made in the trunk of the *Dipterocarpus turbinatus* tree, at about 30 inches from the ground, in which a fire is lighted and kept up until the incision is charred: soon after this, the liquid begins to flow. It is conducted by a little trough into a vessel placed to receive it. The average produce of the better trees in a single season, is 30 gallons. Roxburgh says that wood oil is also produced by *Dipterocarpus incanus*, *D. alatus*, and *D. costatus*. The first of these three is reputed to yield the best sort, and in the greatest quantity. When filtered, it is a transparent liquid, of a somewhat dark-brown when seen by transmitted light, but appearing opaque and of an obscure green if viewed by reflected light. It possesses, therefore, in a very marked degree, the dichroism observable in all resin-oils obtained by the action of fire. This character determines the nature of wood oil, and shows that it is not simply a natural product like copaiba; but that it is in part the result of a liquid modification of the *Dipterocarpus* resin, effected by the agency of heat. Moulmein wood oil is of somewhat greater consistence than olive oil; it has a sp. gr. of 964, and possesses an odour and taste very analogous to those of copaiba. It dissolves in twice its weight of absolute alcohol, with the exception of a minute residue which is deposited upon repose. But the most curious pro-

erty of this oil is that of solidifying when heated in a closed vial to 266° F.; at this temperature the oil becomes turbid and so gelatinous, that it is not displaced upon the inversion of the vial. After cooling, the solidification is yet more perfect; but a gentle warmth, assisted by slight agitation, restores its former liquidity.

Vegetable butters, is the name given to the concrete oils of certain vegetables, from the resemblance to the butter obtained from the milk of animals, and from being employed for similar purposes. The term is also occasionally, but improperly, applied to some vegetable products which are entirely of a waxy nature, such as the wax of *Myrica cerifera*. The name is likewise bestowed in Siberia on certain algæ, species of the genus *Nostoe*, such as *N. prunifforme*. The most important vegetable butters are produced by the *Bassia butyracea*, and other species of *Bassia* and certain palms, such as the *Cocos butyracea*, and the *Elais guineensis*; the former of which is of great utility to the inhabitants of Brazil, where it grows naturally, and to the negroes of St. Domingo, where it is cultivated: while the latter is very serviceable to the natives of Guinea. The generally known solid oils or vegetable butters are as follow:

Butter of Cacao, from *Theobroma cacao*: 1,000 parts of the seed yield 300 parts of a concrete oil or butter, of a most agreeable flavour.

Butter of Cinnamon, from *Cinnamomum verum* or *C. zeylanicum*. By strong decoction, the fruit yields a concrete oil, called Cinnamon wax, used for candles, and which exhales while burning a most delicious odour.

Butter of Nutmeg, from *Myristica moschata*: this is brought from the Moluccas, of two kinds, and is obtained by bruising the nutmegs into a paste which is compressed in bags between hot metallic plates.

Butter of Coconut, from *Cocos nucifera*, which yields a concrete oil, but perhaps expensive.

Cocoanut oil, prepared by rasping the pulp of fresh ripe cocoanut, adding a little hot water, squeezing and boiling the milky juice until the water has evaporated, and filtering through paper, produces an oil which separates into two portions, the one fluid and limpid, the other a solid concrete substance of a pure white colour, which in the shade remains unliquided at all temperatures. It may possibly be found that the process of manufacture affects the out-turn of the solid product.

Butter of Palm oil, from *Elais guineensis*, a native of Africa and America. The concrete palm oil is much esteemed in Europe for unguents and has been lately recommended for culinary purposes.

Solid Palm oil, a new export from the west-

ern coast of Africa, has large quantities of solid palm oil, of the consistence of hard butter.

Galam butter or Ghee, from *Bassia butyracea*, Fulwa or Phulwara, HIND., a native of Nepal and Almora in northern India: produces an excellent butter.

Bassia latifolia, the TAM. Illoopai-yennai, TEL. Ippa noona; HIND. Mahwa ka tel. The oil of this *Bassia* separates into two portions, one on the surface, fluid, and of a pistacio green colour: the other of a brownish green, and almost solid.

Bassia longifolia, TAM. Illoopoo yennai; TEL. Ippa noona; HIND. Mohe ka tel. Of three samples of the Illoopoo oil, one separated into two portions; the upper, fluid, of a pale oil-green in colour; and the lower, greenish-white and of the consistence of ghee. Another specimen of the oil of this *Bassia* separated into three portions; the uppermost a golden yellow and fluid, the middle yellowish white, solid and floating in the upper; and the lowest solid, and brown in colour. A third sample in the Madras Exhibition of 1855, was of the consistence of ordinary ghee and was sent as a material fit for the lubrication of railway carriages, and another beautiful specimen, almost solid, from Tanjore, was of a light golden yellow colour.

Chinese vegetable butter from the *Stillingia* which sebifera, produces the butter and oil so much in use in China: the number of these trees in the province of Chekiang is immense.

Indian vegetable butter, Piney butter, or Doo-pada solid oil, from the *Vateria indica* or Piney marum, TAM., which grows on the western coast of India and in Canara. It is white or yellowish white, of the consistence of hard salt butter, and in the shade remains always solid. It can be procured in quantities in southern India. It is used for lamps principally, but is very suitable for soaps and candles. It is prepared by cleaning the seeds; then roasting and grinding them into a mass. In making it to five seers of seed, add twelve seers of water, and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected and the process repeated.

African butter, also called Shea butter, from the *Bassia parkii* or *Pentadesmis butyracea* of Sierra Leone.

Japan wax, from *Rhus succedaneum*.

Almond butter.

Gamboje butter, a product of the *Garcinia pictoria*, Roxb., is called Mukke tyllum, TAM. Arasana ghoorhy yennai, CAN. The tree grows abundantly in Mysore and the western coast jungles.

Cucum butter, *Garcinia purpurea*? is from one of the two species of *Garcinia*, *G. pic-*

toria and *G. purpurea*, the seeds of which produce solid oil, the former the Gamboge butter and the latter the Cocum butter: the Gamboge butters are solid and of a deep leek green colour. The *G. pictoria* grows abundantly in certain parts of Mysore and the western jungles. The oil is procured by pounding the seed in a stone mortar and boiling the mass until the butter or oil rises to the surface: $2\frac{1}{2}$ measures of seed yield one seer of butter, and it is sold at the rate of Annas 1-4 per seer of Rupees 24, in the Nuggur division of Mysore, and is there used as lamp oil and as ghee.

Sterculia foetida oil, in Tamil Coodiray yennai or Coodira pusjun yennai, is thick at all seasons of the year, and is obtainable probably in large quantities in the forests on the Nulla Mulla and Yella Mulla range.

Butter of Laurel, *Laurus nobilis*.

Solid oils are obtained from the *Dipterocarpi*, in the Indian Archipelago.

The *Solid oil* of the Horse eyes and Cocoons of Jamaica, *Fevillea scandens*, is white and hard.

Kuan solid oil is procured from a species of *Bassia* of Singapore or Java.

Mijo or *Japan butter* from *Dolichos soja*, Japan.

Solid oil from *Myristica* (*Virola*) *schifera*, of British Guiana.

Solid oil from the Demerara butter tree, *Saonari*, *Pekea tuberculosa*.

Vegetable wax from Shanghai.

Myrtle wax from Cape of Good Hope.

Solid oil of Bombay from *Salvadora persica* or *Vernonia anthelmintica*.

Curap or *Carab* vegetable butter, from *Carapa guianensis*, a large tree in Trinidad, and British Guiana.

Butter of the Great Macaw tree, from *Acrornia fusiformis*.

Broonga malugum oil or ointment from *Malsulipatam*, separates into three portions, the uppermost, fluid, resembling brown sherry, the middle of the consistence of ghee, and brownish yellow; and the lowest almost solid and of a hair-brown colour.

Mooragana butter, or *Moorogana* or solid oil of Canara, is used for medicinal purposes and as an ointment for the wounds of cattle, injured by tigers. It is said to be produced from a forest tree growing in the Canara jungles. The specimens are dark-brown and quite solid, and this product merits the best consideration. A very excellent sample of this solid oil was in the Madras Exhibition of 1857, from Mangalore. It is the most solid of the solid oils.

Odul or *Adul* oil of Travancore is separated into two portions; the upper, fluid, of the colour of golden sherry; the lower, reddish white of the consistence of ordinary hard salt butter.

Camujay tree oil, a small bottle, priced Rupees $2\frac{1}{2}$ from the same district, by the same exhibitor, was a dark gelatinous mass, of the consistence of blanc mange.

Oil of Hydnocarpus uebrians, the Thortay oil of Canara, a very valuable vegetable solid oil, used for sores, is solid and of the consistence of ordinary hard salt butter.

During British rule, the cultivation of cotton, sugar, oil seeds, fibres, tea, coffee and indigo have been largely increased.

* Table showing the range of prices in Bombay of the undermentioned Oil Seeds taken monthly for four years.

Shacotty oil of Canara is used for cutaneous eruptions. The specimen of this oil in the Government Central Museum, Madras, separated into two portions; the upper, yellowish and fluid, and the lower brownish red and of the consistence of hard ghee.

Hibavania oil of Canara; under this name there was exhibited at the Madras Exhibition of 1857, a solid oil of a clove brown colour, from the Sampajoy district by Pedro Probhoo, a small phial was priced at Rupees 4½.

Places of chief production in India, the quality, prices, in 1861, and quantity of the principal oils and oil seeds exported from Bombay for the year ending 30th April 1860.

The candles used in Japan are made of an oil said to be pressed out of the seeds of the

Rhus succedanea? This oil becomes, when concrete, of the consistence of tallow, and is not so hard as wax. The province of Fetsigo, more particularly, produces this tree, and consequently supplies the greatest quantity of this oil.

In the eastern parts of China, the product of the tallow tree, *Stillingia sebifera*, and beef and hog's tallow in the south, are used in the manufacture of candles. Wax is only employed to incase the tallow or lard, which, from the heat of the climate and its unclarified condition, never becomes hard.

Butter of Palm oil from *Elais guineensis*, a native of Africa and America a concrete palm oil, is much esteemed in Europe for unguents and has been lately recommended for culinary purposes.

Erysimum perfoliatum, is cultivated in Japan for its oil seeds.

Terminalia bellerica, in Tamil, Thanceka or Tannekac yennay. This oil separates into two portions—the one fluid, of a pale oil-green colour, and the other white, floccular, and of the consistence of ghee.

Oils from the seeds of the gourd tribe.—Nearly all the species of gourds and melons and cucumbers, *L. vulgaris*, *C. pepo*, *C. melo*, *C. utilissimus*, *C. sativus*, *Luffa pentangula*, &c., yield mild clear culinary oils; the skin of the seed is removed, and the inside under the name of “maghz,” khiyar, kadu, &c., &c., sold, and the oil expressed.

Attar, in Europe written *Otto*. These are very strong oils, containing the essential oils of the plants and substances sufficient to produce a perfume which is perfectly overpowering and produced a headache. The natives of British India have the phrase in their language "dimagh nu'attar hona," to be stupified with fragrance. These attars are principally made in Hindustan, at Amritsur and Delli. See *Attar*, *Otto*.

Cheeronee seed oil of the *Buchanania latifolia*, is rarely extracted from the abundantly oleaginous seeds which are eaten by the natives to make them fat. The oil is clear, sweet, and straw-coloured the trees grow abundantly in Mysore and Cuddapah, &c. Its useful wood .875 sp. gr., 9d. per cubic foot, is worked up generally into furniture, house doors and windows, presses, tables, &c. It requires to be polished, otherwise it stains a burnt sienna colour any cloth brought into contact with it.

Almond oil is a term applied to that of the common almond, *Amygdalus communis*: to the Indian almonds, the fruits of the *Terminalia catappa* and *Canarium commune* and the almonds of Gen. xliii, v. 2, have been thought to be Pistachio nuts.

Almond oil.

Badam-ka-tel,	HIND.	Ingudi-tailam,	SANS.
Míniak badam,	MALAY.	Badamcottay-yennay,	TAM.
Roughan-i-badam,	PERS.	Badama vittulu nune,	TUL.

This is from the fruit of *Amygdalus communis*.

is not wholly an article of import, but chiefly so. The almond tree is a native of the Himalaya, and is abundant in Cashmere. The oil is colourless, of very slightly yellow, and is congealed with difficulty. It is obtained for native use in India, but does not as yet form a recognized article of export. Both varieties of almond, bitter and sweet, are imported into the northern parts of India from Ghoorbund, and into the southern parts from the Persian Gulf. According to Simmonds, there are about 80 tons of this oil annually imported into Britain, the price being about 1s. per lb. It is principally the produce of the Arzo tree, forests of which grow to the south of the empire of Morocco, which produce an exceedingly hard species of almond. Its fruit consists of two almonds, rough and bitter; in manufacturing the oil, they are well rubbed or shaken in a coarse bag, to separate a bitter powder which covers the epidermis; they are then pounded to a paste in marble mortars, and the paste subjected to a press. The almond is supposed to contain 46 p. c. of oil, but from 5½ lbs. only 1 lb. 6 oz. can be extracted by the cold process; and above 2 lbs. if heated iron plates be used. The oil of almonds is the basis of the great part of the liniments, ointments, and plasters, of the European pharmacists. It is however little used in Indian pharmacy, the oil of the Sesamum orientale answering perfectly as a substitute.

Indian oils. Messrs. Wilson of Price's candle works, recently received a consignment of oils from India, and found twelve specimens that were entirely new to them, some of which promised to be of the greatest value, and government might add half a crore to their revenue if they would only plant in waste lands along shore the oil-bearing palm of western Africa. A large and profitable trade might be had in palmine made from the cheap oils, the difficulty of transporting which is well-known. The same effect is produced on this oil and on olive oil by adding the nitrate of mercury.

Roosa oil, is from the Roosa grass, a native of the low hills along the base of the Himalaya, at Hardwar and the Kheeree pass and also found at Aseergurh and in Malwah, generally. The roots of this fragrant grass are used by the natives of northern India in intermittent fevers. In habit and taste it comes remarkably near *Andropogon schoenanthus*. The oil is used as a stimulant internally and externally, much in the same manner as oil of cajaput. Roosa oil has long been supposed to be the celebrated grass oil of Nemar, but Dr. Royle does not recognise the correctness of this opinion and refers the Nemar oil to the *A. calamus aromaticus*. It is probable, however, that the several species furnish oils of similar characters.

Essential oils, called also volatile oils, are

obtained from various parts of odoriferous plants, chiefly by distillation, but also by the chemical perfuming process of enflowering. The best known are those of almonds, aniseed, bergamot, cajaputi, camomile, camphor, caraway, cassia, cinnamon, cloves, juniper, lavender, lemons, mint, nutmeg, orange, peppermint, pimento, rhodium, rosemary, roses (otto), savine, sassafras, mint. But, in India, sandalwood, jasmine, nutmegs, indeed every odoriferous plant is by the perfumers made to yield an essential oil.

Chambeli-ka-attur of Lucknow, from *Jasminum grandiflorum*, extracted from the petals, sells at 2 rupees per tola. This plant is extensively cultivated in gardens in Lucknow for the sake of its flowers.

Motiah or Beluk-ka-attur of Lucknow, *Jasminum sambac*, is also extracted from the petals, and sells at 2 rupees per tola. It is cultivated extensively in gardens in Lucknow for the sake of its flowers and is coloured red by means of dragon's blood.

Essential oils of cinnamon, citronelle and lemon grass, are made chiefly in the neighbourhood of Galle in the southern provinces of Ceylon. The oil of cinnamon is also made largely at Colombo: it is obtained from the broken or inferior pieces of bark rejected in packing the bales of spice. Citronelle and lemon grass oils are the produce of two highly scented grasses cultivated to a considerable extent by both natives and Europeans for the purpose of distillation. The extent of the trade in this may be thus stated, say for 1849, oil of cinnamon 32,400 ounces, oil of lemon grass 28,000 ounces.

Several kind of essential oils are produced from strong scented flowers. Other perfumed oils are manufactured without resorting to distillation, merely by the process of enflowering. The layers of the jasmine, or other flowers, four inches thick and two inches square, are laid on the ground and covered over with layers of sesamum or any other oil-yielding seed. These are laid about the same thickness as the flowers, over which a second layer of flowers like the first is placed. The seed is wetted with water, and the whole mass covered with a sheet held down at the end and sides by weights, and allowed to remain for eighteen hours in this form: it is now fit for the mill, unless the perfume is desired to be very strong, when the faded flowers are removed and fresh ones put in their place. The seed thus impregnated are ground in the usual way in the mill, and the oil expressed has the scent of the flower. At Ghazepore, the jasmine and bela are chiefly employed: the oil is kept in leathern bottles or dubbers, and sold for about rupees 2 a seer.

The newest oils afford the finest perfumes. The process here described is the same as that pursued at Bombay. In Europe, a fixed oil, usually that of the ben or moringa nut, is employed. Cotton is soaked in this and laid over layers of flowers, the oil being squeezed out so soon as impregnated with perfume.

Animal oils are in frequent use amongst the people of India as medicinal substances, for external application such as, that from the pea fowls' fat, from the neats' foot, the crocodile and the iguana.

Mineral oils come from the Persian Gulf and Burmah, from the oil pits of Burmah, the Burmese government used to obtain 93,000 tons annually, the oil on the spot fetching about a shilling per cwt.: as it reaches the market it is the most filthy dirty stuff that can be imagined, chemically treated it supplies half a dozen of products of the greatest beauty, several being oils, one a hard wax of snowy whiteness, and one a rich perfume. In several places in the Jhelum district along the Salt Range, at Kafir Kote, at Jabba in the Shapoor district, and in very small quantities at Shah-ke-Noorpoor, in the Rawul Pindee district, a petroleum exudes out of the rocky soil, but hitherto, though every effort has been made by the Punjab authorities to utilize it in a commercial point of view, they have failed, chiefly owing to the enormous cost of carriage, and to the difficulty of retaining the substance itself within any other vessels than those made of tin or glass. Price and Co., of London reported favorably upon it, and asked for some tons of it for further experiments. Their application could not be complied with to the extent of the requisition, not more than eight maunds a day are obtainable, and it appears that the yield of oil is greater in the hot than in the cold weather. Wood smeared with the mineral oil, is effectually preserved from the ravages of white ants. The oil burns with a bright flame but the smoke is insufferable. The natives of India call it Gunduk-ka-tel, and use it only for burning in their lamps. The Jabba spring is the most extensive, it is situated within the jagcer of Malik Ali Yar Khan, who claims the produce.

Oil mills. Oils are usually obtained by expression by means of oil mills of kinds. In Europe, an oil-mill is used for the purpose.

Lint or Rape; it is desirable first to pass such hard seed as lint or rape between iron rollers, in order to crack the shells. These rollers are of cast-iron turned truly in a lathe, and their spindles run in brass bushes, fixed in an iron frame bolted to the framework of the mill. These frames have mortises, in which the bushes for the rollers are placed and are adjusted by screws passing through the ends of the iron

frames: this allows the rollers to be set at any distance apart, according to the size and hardness of the seed to be crushed. The rollers are sometimes of different sizes, so that different velocities may be given to their surfaces: this enables them to draw the seeds in, and to perform their work more quickly. One of the rollers has on its axis a small spur-wheel, which engages a cog-wheel on the main shaft of the mill. Its motion by another pinion to the second roller. By giving to the roller pinions a dissimilar number of teeth, they may be made to revolve with different velocities, which answers the same purpose as making them of different sizes. Above the rollers is a hopper containing the seed, which runs out at an opening in the bottom into a trough or shoe, which is agitated by a piece of wood nailed to it resting on the cog-wheel: the shoe thus feeds the rollers with a small quantity of seed at a time, and prevents them from being choked up. A plate of iron attached to the frame on each side presses by its edge against the lower part of the rollers, and scrapes off any adhering seed. The crushed seed falls upon an incline board, and collects in a heap, from which it is removed to feed the running stones. The arrangement of the rollers resembles that of the crushing mill. The seed broken by the rollers is passed under two vertical mill-stones or runners, revolving on a horizontal bed, where it is further bruised and prepared for compression. In some places the rollers are not used, but the seed is at once subjected to the action of the runners. Hard and smooth grains are, however, liable to slip away from beneath the running stones, and thus require a much longer time to prepare them for the next process, that of compression. Rollers do their work rapidly, but they require great power to work them. When the seed is sufficiently bruised by either or both of these means, it is collected into hair bags and placed in what is called a wedge-press. In *olive oil-mills* ascrew-press may be used but the hardness and smoothness of the grains of lint and rape, and the cavities formed by the broken shell which retain the oil, require the exertion of a stronger force. The hair bags containing the crushed seeds are placed between wedges of wood contained within a strong framing. The wedges are then driven down by a heavy ram or pestle worked by machinery until the pestle rebounds from them three times, when they are judged to be sufficiently tight. The oil thus obtained is of the best quality, and is kept distinct from that obtained by the after-process. The seeds come out of the bags in the form of flat cakes: these are broken up, and pounded in mortars with heavy stampers, which reduce the parenchyma of the seed to a fine meal, so that the oil can

escape more freely when subjected to a second compression, which is now aided by heat. The pounded seed or meal is heated in a pan, to the temperature of melting bees'-wax and is kept in agitation by a spatula worked by machinery. The meal is again put into hair bags and compressed, and the resulting oil is considered to be the best of the second quality. Another compression produces oil of the ordinary second quality. During the heating of the meal a little water is sometimes added; but in Holland this practice is considered to be injurious. The cakes are still fat and soft, and are sold as food for cattle; but the Dutch break them down and stamp them again. The sult is an impalpable paste, which is hard with a very little water, and kept for some time at the temperature of boiling water, with diligent stirring. It is then subjected to the greatest pressure that has yet been applied, and the result is an oil of the lowest quality. The cake is dry and hard like a board, and is used for manure. Some of the small millers in Holland purchase oil-cakes from France and Flanders for the purpose of preparing this inferior oil.

All oils in Oudh are extracted by the native press called 'Kolhoo,' turned by means of bullocks, with the exception of the castor oil seed, the oil from which is extracted by boiling the water and afterwards skimming.

There are, however, two distinct forms of the native oil mill. One of these will be found described under sugar-making, it being used alternately as an oil or sugar mill—the other, of which there are some varieties, is a simple wooden mortar, with revolving pestle, and is of wood or stone—generally granite. Two oxen are harnessed to the gearing which depends from the upper end of the pestle—a man sits on the top of the mortar, and throws in the seed that may have got displaced. The mill grinds twice a day,—a fresh man and team being employed on each occasion. When sesamum oil is to be made, about seventy seers measure, or two and a half bushels, of seeds are thrown in: to this ten seers, or two quarts and three-quarters of water are gradually added: this, on the continuance of the grinding, which lasts in all six hours, unites with the fibrous portion of the seed, and forms a cake, which, when removed, leaves the oil clean and pure at the bottom of the mortar. From this it is taken out by a cocoanut-shell cup, on the pestle being withdrawn. Other seed oils are described by Buchanan as made almost entirely in the same way as the sesamum. The exceptions are the erindi or harulu, or castor oil, made from either the small or large varieties of the ricinus. This at Seringapatam is first parched in pots containing something more than a seer each. It is then beaten in a mortar and formed into balls:

of these from four to sixteen seers are put in an earthen-ware pot, and boiled with an equal quantity of water for the space of five hours—frequent care being taken to stir the mixture to prevent it from burning. The oil now floats on the surface, and is skimmed off pure. The oil mill made use of at Bombay and to the northward, at Surat, Cambay, Kurrachee, &c., differs a little from that just described, in having a very strong wooden frame round the mouth of the mortar: on this the man who keeps the seeds in order sits: in Sind a camel is employed to drive the mill instead of bullocks. Castor oil seed is thrown into the mill like other seeds, as already described—when removed the oil requires to be boiled for an hour, and then strained through a cloth to free it of the fragments of the seed. It is a curious fact, and illustrative of the imperfect manner in which the oil is separated from the seeds, that while the common pressman only obtained some 26½ per cent., Boussingault, in his laboratory, from the same seeds, actually procured 41 per cent. When the oil cakes are meant for feeding stock, such loss is of little consequence, inasmuch as the oil serves a very good purpose, but when the cake is only intended to be used as a manure, it is a great loss, inasmuch as the oil is of little or no use in adding any food for crops to the soil. The chief oil on the seaboard of British India is that yielded by the cocoanut palm. The nut is first stripped of its husk, this furnishing the substance from which coir rope is made, while the shell is broken, and the copra, or fatty lining, enclosing the milk, is taken out. This is called copri or copra. Three maunds or ninety pounds of copra are thrown into the mill with about three gallons (eleven cutcha seers) of water, and from this is produced three maunds, or seven gallons and three-quarters of oil. The copra in its unprepared state is sold slightly dried in the market: it is burned in iron cribs or grates on the tops of poles as torches in processions, and as a means of illumination for work performed in the open air at night. No press or other contrivance is made use of in India for squeezing out or expressing the oil from the cake, and a large amount of waste in consequence of this necessarily ensues.

The manufacture of sandalwood, grass, and other essential oils employed in medicine, is differently conducted.

Chinese oils. In the markets of China, the following oils are obtainable.

Oil of Almonds, the Hang-jin-yu of the Chinese, is manufactured in Persia, N. India and China.

Oil of star Anise, the Pah-koh-yu of the Chinese, is of a pale colour, with a warm or sweetish taste. It is made by distilling the

Heat in small retorts, a picul producing about seven catties of oil.

Oil of Apricot seeds, Hang-jin-yu of the Chinese, is prepared in the north of China from apricot kernels.

Oil of Beans, Tau-yu, Chinese, in the south of China, is prepared in large quantities from the *Dolichos soja* and is used in food.

Oil of Benzoin, Ngan-sih-yu, Chinese, is supposed to be the liquid storax or rose maloes.

Oil of Cabbage, or *Colza oil*, the Ts'ai-yu of the Chinese, is expressed from the seeds of the *Brassica sinensis*, all through the valleys of the Yang-tze and the Han. It is used in cookery, as a hair oil, a lamp oil, and as a purgative.

Oil of Camellia, from the *Camellia oleifera*, the Ch'a-yu of the Chinese, is a thin yellow coloured oil, used in lamps. It is made in the hilly districts of Hunan and Kiang-si, where the *Camellia* grows in abundance. The Chinese call the *Camellia* plant by the same name as the tea plant, hence this oil is often erroneously called tea oil.

Oil of Camphor, the Nau-yu of the Chinese, is obtained from Formosa where it exudes from vats in which camphor is stored; it is oily or uncrystallizable camphor, is a strong smelling liquid of a yellow colour; it is scarcely saleable.

Oil of Camphor, from the *Dryobalanops camphora* of the west coast of Sumatra where the oil drops from the split timber of the tree, felled to procure the Baros camphor, and is these sold at the rate of a large quart bottle-ful for a Dutch guilder: it is a useful embrocation.

Oil of Chaulmoogra, the Ta-fung-yu of the Chinese, is obtained from the seeds of the *Gynocardia odorata*.

Oil of cinnamon, the Kwei-pi-yu of the Chinese, is a volatile oil, used as a perfume and flavouring ingredient and exported from Canton, it is made from the leaves and twigs of the *Cassia* or cinnamon and resembles the genuine oil of cinnamon prepared in Ceylon.

Oil of cloves, Teng-hiang-yu of the Chinese, is made at Canton; it is a heavy oil of a pale reddish-brown oil colour.

Cotton seed oil, the Mien-yu of the Chinese, expressed from Cotton seeds, is used for lamps, in cookery, and externally as an unguent.

Oroton oil, the Pa-tau-yu of China, is a drastic purgative.

Fish oil, the Yu-chi, of the Chinese, is obtained from the porpoise which ascends the Yang-tze river as far as Hang-kow: the oil is used for lamps and to make putty.

Another *fish oil*, called Hwang-ku-yu, is obtained from a small fish, the oil has a strong fishy smell, is used to destroy pedicular, parasitic and other skin affections, and in veterinary practice.

Ground nut or Pea nut oil, is the Hwa-sang-yu of the Chinese, is from the *Arachis hypogaea*. Sp. Gr. 0.916.

Hemp seed oil, Ho-ma-jin-yu, Chinese.

Linseed oil, Hu-ma-yu, Chin, from a species of *Linum*, in China, is used medicinally, internally and externally.

Myrrh oil, Muh-yoh-yu, Chinese, is a reddish oil, having the smell of Myrrh, is used in Cochinchina to dress ulcers.

Olive oil, Yang-kau-yu of the Chinese. The fruit of the *Canarium* is sometimes mistaken for the olive.

Pine oil, Sung-i, of the Chinese, a coarse turpentine obtained by heating pine woods; it is used in skin diseases.

Peppermint oil, the Poh-ho-yu, of the Chinese is made in Canton from several kinds of mint: used in sweetmeats and as a perfume.

Persimmon oil, Po-tze-yu of the Chinese, a glutinous oil from the *Embryopteris glutinifera*. The fruits are of the size of an apple, and are crushed to obtain the dark resinous thick juice. It makes an excellent varnish for the paper umbrellas. An extract from the fruit is an internal and external astringent.

Oil of Poppy seeds, the Chinese, Ying-tze-yu.

Oil of roses, Mei-kwei-yu, an essential oil, used by Chinese women as a scent for the hair.

Sandalwood oil, Tan-hiang-yu, Chinese, a thick yellow fragrant oil extracted from sandalwood. It is used to colour woods in imitation of sandalwood.

Oil of stone chesnut, Shih-li-yu, Chinese, is obtained by expression from the fruit of the *Aleurites triloba*: it is superior to linseed oil as an economic substance: and is used medicinally with properties like castor oil.

Sesamum oil, Chi-ma-yu, also Hiang-yu, Chinese, from the black and white *sesamum* seed.

Sunflower oil, the Kwei-tze-yu of the Chinese.

Oil of sweet basil, Su-tze-yu, Chinese, is expressed from the seeds of a species of *Ocimum* or *Lavandula*. It is a fine drying oil, used in painting on porcelain and for varnishing.

Oil of the tallow tree seeds, Ts'ing-yu, the *Stillingia sebifera*, is clear but of a dark colour; about fifteen or sixteen catties of it can be obtained from one picul of berries. It is used to varnish umbrellas, to dress the hair, to fill lamps and to mix with the tallow of candles: given internally, it acts as a purgative and emetic.

Turpentine oil, Tuh-nau, Hiang-yu, Chinese. — *Monthly Bombay Times Newspaper*, from 25th November 1849 to 24th June 1850; *East. Surgeon Edward Balfour in Madras Central Museum Reports and Records*; *Ibid.*, *Commercial Products of the Madras Presidency*; *Eng. Cyc.*, p. 704; *Simmond's Commercial Products*, pp.

510-519; *Madras Exhibition Juries' Reports for 1855 and 1857; Roxburgh, Flora Indica*, Vol. i, p. 275; *Voigt, Hortus Subarcticus Calcuttensis*, p. 707; *O'Shaughnessy, Bengal Dispensary*, p. 630; *O'Sh., Bengal Dispensary*, p. 187; *Catalogue and Juries' Reports of the Great Exhibition of 1851, Catalogue Exhibition of 1862; Powell's Hand-book for the Panjab*, pp. 426-433; *Low's Sarawak*, p. 48; *Indian Field*; *Madras Exhibition Juries' Reports by Dr. H. F. C. Cleghorn*, M. D., *Dr. A. J. Hunter*, M. D., *Lt. H. P. Hawkes*, *Dr. A. J. Scott*, M. D., *Lieutenant Colonel Balfour*, C. B., and *Colonel G. P. Cameron*, C. B. K. T. and K. C.; *Brenner, Interior of Russia*; *Malcomson's Essay on Beriberi*, p. 312; *Smith's Chinese Materia Medica*; *Letter from Mr. Barter to Sir W. Hooker*; *Mr. F. Copleston in Madras Ex. Jur. Report*; *Lt. E. J. M. Evans*, 51st M. N. I., in do. See Cocos, Grass oil of Nemauro.

OIL-KAUYNSEE, see *Dipterocarpus turbinatus*.

OIL of Neroli, see *Citrus aurantium*.

OIL of Prickly poppy, or Jamaica yellow thistle, the Coorookoo or Brumadundoo oil; *Argemone mexicana*.

OIL of Vitriol, Sulphuric acid.

OIL, PALM, see Coconut palm, *Elaeis* oil.

OIL PAPER, the Yu-chi of the Chinese, is made all over China, by brushing over paper with castor oil or some other drying oil. It is a very useful waterproof-paper, answers all the purposes of oiled silk and is so cheap that it may be freely used and frequently changed, no small matter in the treatment of wounds in a warm climate.

OILMEN, the teli of India, who express oil from seeds. In S. India they have 12½ sections,

1 Mahratta.	6 Erandian.	10 Kawno.
2 Lingali.	7 Lat.	11 Mahomedan.
3 Tehela.	8 Saoji.	12 Teli.
4 Kanula.	9 Termuk.	12½ Mixed.
5 Ekballa.		

OIL of Mace, *Adeps myristicæ*, a concrete oil obtained from nutmegs.

OIL PEA, Su-chaw, CHIN.

OILY FLY, *Cantharides*.

OIMA in Persia, an overcoat used chiefly when on horseback. It resembles a lady's riding habit, fitting tight to the body from the neck to the waist where it is gathered into plaits or folds and swells out above the girdle, falling in ample folds to the feet. It is generally made of broad cloth. See Barani.

OIMA TIPILI, MALEAL. *Scindapsus officinalis*, *Schoff.*

OIMOA, CHIN. *Corchorus olitorius*, *Linn.*

OINOPS, see *Simiadae*.

OINDRA-DADHI, SANS., from Indra, and dadhi, curds.

OI PANDIONES, the Pandyan rulers of S. India at the beginning of the christian era. See Pandiya.

OIRO, SP., Oiro, Ouro, Port. Gold.

OISEAU DE PARADIS, *Chalybæus paradæus*.

OJEIN, an ancient city, in Malwah, belonging to Sindhia, built on the banks of the Seepra river. It has latterly become impoverished. See Oojainu, Ojein, Ujein.

OJHYAL, a Gond tribe, wandering bards and fowlers.

OKA or Poka, TEL. *Areca catechu*, *L.*

OKA CHEFTU, or Vaka or vakudu, *Carissa carandas*, *L.*

OKAB, see *Campanula edulis*.

OKELIS, an ancient ruined city, according to Strabo and Pliny, the sea port of the Catabeii or Gebante, and long the centre of commerce between Europe and the East. The ruins are situated inside the Straits of Bab-ul-mandeb—about a mile inland, at a place called by the natives Dakooa.

OKER of Nepaul, *Helictis nipalensis*, *Jerd.*

OKHAMANDIL is a sterile jungly tract in the extreme west of the Saurashtra peninsula, and contains about 13,000 inhabitants. These are the Wagher. Their only important places are the holy hindoo site of Dwaraka on the west coast, and Beyt a small island a few miles to the north, with shrines boasting of scarcely inferior holiness. Okhamandul, as also Umreyli in Kattyawar proper, and Korinar in south Kattyawar, are under the direct rule of the Gaekwar, and are the Alsatia of Kattyawar. Thrice, in 1803, 1858, and in October 1859, they repulsed British troops, but at length, in 1860, they seemed entirely dispersed or surrendered. Kattaywar is rich in jungle fastnesses. Its population is habitually armed to the teeth and largely intermixed with mercenaries from Mekran, Arabia, Sind and Beluchistan. On a former occasion, the rapidity and severity of the vengeance, in the escalade of the stronghold of the Wagher pirates of Dwarika by the British force under the Hon. Colonel Lincoln Stanhope, induced Singram, the chief of the Badhail of Beyt to sue for terms, and he agreed to surrender Beyt, and to live at Aramra on a stipend furnished by his suzerain, the Gaekwar. These Wagher of Dwarika, who with the Badhail of Aramra, were so long the terror of these seas, are a spurious branch of the Jhareja family of Bhooj, one of whom, called Abra, with the cognomen of Moochwal or the whiskered, from a tremendous pair of these adjuncts to the face, came from Cutch in the time of Rinna Sowah, in whose family he intermarried, and from whom he held in charge the tha'na, or garrison of the castle of Guomtee, or Dwarika. His son had offspring by a woman of impure

caste, and they assumed the name of Wagher, with the distinctive office of Manik, or gen. The last four chieftains of this race were Mahap-Manik, Sadool-Manik, Samicah-Manik and Mulo-Manik, who with all his kin and motley company of Wagher, Badhail, Arab, &c., after a desperate defence, was slain in the storm, or attempted retreat. Throughout the sea coast of Saurashtra, at Gogo, and Mandavie, are seamen who call themselves hindoos, but who keep entirely distinct from all other classes. Some of them claim a descent from the mariners of the Arabian shores, but still as hindoos. The Badhail fixed themselves in the district of Oka (Oka-mandala), on the migration of Seoji from Canouj.—*Tod's Travels*, pp. 220, 440-1; *Tod's Rajasthan*, Vol. ii, p. 14. See Badhail, India, Kattyawar.

OKHER, NEP. Walnuts.

OKIL-HYWAN, AN. *Anthemis nobilis*, Linn.

OKHOTSK, the country of the Amoor, is divided into two provinces, the first of which preserves its actual name of maritime province of Eastern Siberia, and the other takes the name of the province of the Amoor. The Okhotsk district is detached from the province of Yakoutsk and united to the maritime province, which comprises six districts.

OKI-DON-TAKO. The Japanese have numerous festivals and holidays, held in commemoration of ancestors, deities, warriors and sages, or from some untraced ancient custom. That at the winter solstice, the Oki-don-tako, or great holiday, lasts 14 days. It is a period of great rejoicing, all mercantile accounts, are, if possible, settled and much friendly intercourse takes place. The Gokats Seku festival at the summer solstice about the middle of June, is in commemoration of Gongen Sama, a great general to whom the present dynasty owes its origin, and the Japanese date their births from it. Banners with koi or carp are hoisted aloft with scarlet streamers.

OKKODAI was the son and successor of Chingiz Khan. As the result of Chingiz Khan's successes against the nations of Tartary, that leader was saluted in 1206 by the diet of his nation, as Chinghiz khan. According to Quatremere, however, Chinghiz did not use the higher appellation of Kaan (or Quaan), which was adopted by his son Okkodai and his successors as their distinctive title, identical with Khagan, the Xaganos of the Byzantine historians, therefore properly, a distinction should be preserved between Khan, the ordinary title of Tartar chiefs, and which has since spread to Persian gentlemen and become a common affix to the Pathan or Affghan of all classes, and Quaan, as the peculiar title of the supreme chief of the Mongols. The Mongol princes of

the subordinate empires of Chagatai, Persia, and Kipchak, were entitled only to the former affix, though the other is sometimes applied to them in adulation. The conquest of China was commenced by Chinghiz, although it was not completed for several generations. Already, in 1205 he had invaded Tangut, a kingdom occupying the extreme north-west of China, and extending beyond Chinese limits in the same direction, held by a dynasty of Tibetan race, which was or had been vassal to the Kin. This invasion was repeated in succeeding years, and in 1211 his attacks extended to the empire of the Kin itself. In 1214 he ravaged their provinces to the Yellow River, and in the following year took Chingtu or Peking. In 1219 he turned his arms against Western Asia, and conquered all the countries between the Bolor and the Caspian and southward to the Indus, whilst his generals penetrated to Russia, Armenia, and Georgia, but a lieutenant, whom he had left behind him in the East, continued to prosecute the subjection of Northern China. Chinghiz himself, on his return from his western conquests renewed his attack on Tangut; and died in the enterprise on the 18th August 1227. Okkodai, his son and successor followed up the subjugation of China, extinguished the Kin, finally, in 1234, and consolidated with his empire all the provinces north of the Great Kiang. After establishing his power over that part of China, Okkodai raised a vast army and set it in motion towards the west. One portion was directed against Armenia, Georgia, and Asia Minor, whilst another great host, Batu, the nephew of the great khan, conquered the countries north of Caucasus, over-ran Russia, making it tributary, and still continued to carry fire and slaughter westward. One great detachment, under a lieutenant of Batu entered Poland, burned Cracow, found Breslaw in ashes and abandoned by its people, and defeated with great slaughter at Wahlstadt near Lignitz (April 12th, 1241) the troops of Poland, Moravia, and Silesia, who had gathered under Duke Henry of the latter province to make head against this astounding flood of heathen. Batu himself, with the main body of his army, was ravaging Hungary. The king had been very slack in his preparations, and when eventually he made a stand against the enemy, his army was defeated with great loss, and he escaped with difficulty. Pesth was now taken and burnt, and all its people put to the sword. The rumours of the Tartars and their frightful devastations had scattered fear through Europe, which the defeat at Lignitz raised to a climax. Indeed, weak and disunited christendom seemed to lie at the foot of the barbarians. The Pope, to be sure, proclaimed a crusade, and wrote circular letters, but the enmity between

him and the emperor Frederick, II. was allowed to prevent any co-operation, and neither of them responded by anything better than words to the earnest calls for help which came from the king of Hungary. No human aid merited thanks when Europe was relieved by learning that the Tartar host had suddenly retreated eastward. The great khan Okkodai was dead, the depths of Asia, and a courier had come to recall the army from Europe. In 1255 a new wave of conquest rolled westward from Mongolia, this time directed against the Ismaeli or "Assassins" on the south of the Caspian, and then successively against the Khalif of Baghdad and Syria. The conclusion of this expedition under Hulagu may be considered to mark the climax of the Mongol power. Mangu Khan, the emperor then reigning, and who died on a campaign in China in 1259, was the last who exercised a sovereignty so nearly universal. His successor, Kablai, extended indeed largely the frontiers of the Mongol power in China, which he brought entirely under the yoke, besides gaining conquests rather nominal than real on its southern and south-eastern borders, but he ruled effectively only in the eastern regions of the great empire, which had now broken up into four parts—(1) The immediate empire of the Great Khan, seated eventually at Keanbalik or Peking, embraced China, Corea, Mongolia, and Manchuria, Tibet, and claims at least over Tunking and countries on the Ava frontier; (2) the Chagatai Khanate, or Middle Empire of the Tartars, with its capital at Almalik included the modern Dzungaria, part of Chinese-Turkistan, Transoxiana, and Afghanistan; (3) the empire of Kipchak, or the Northern Tartars, founded on the conquests of Batu, and with its chief seat at Sarai on the Wolga, covered a large part of Russia, the country north of Caucasus, Kliwarazm, and a part of the modern Siberia; (4) Persia, with its capital eventually at Tabriz, embraced Georgia, Armenia, Azerbaijan and part of Asia Minor, all Persia, Arabian Irak, and Khorasan. Their conquests brought into China a vast influx of Ouigoar and Toongan emigrants. It was Ali Khan, or Hoolakoo Khan, the grandson of Changhiz Khan, who completed the conquest of Persia, and afterwards subdued and took Baghdad, putting to death the last of the once powerful khalifa. He also employed his force in extirpating the Assassins, well-known in the annals of the Crusades.—*Yule's Cathay*, Vol. i, p. 118. See Luristan.

Melle, SINGH. | Maelle, SINGH.

Under these names, Mr. Mendis describes a tree of the Eastern province of Ceylon, the wood of which is used for common purposes of house-building. A cubic foot weighs lbs. 64, and it is said to last 40 years.—*Mr. Mendis*.

OLAY, also OLA, TAM.

Puttay, HIND. | Neriku, TAM.
Tar-ka-patta, " | Tat-aku, TEL.

The palm leaf prepared for writing on these are made smooth by being drawn for about 20 minutes, between two blocks of wood. The dried raw leaves are called Karak ola, and the finest prepared leaves, Pusk ola, but Olay or Olay is the Tamil vernacular name by which the people designate the leaves, when prepared for being written upon. These are prepared from the leaves of the palmyra (*Borassus flabeliformis*), the cocoanut tree, and the Talipot palm (*Corypha umbraculifera*). The oldest hindoo author who alludes to writing on the olay is Panini, a rishi, who lived about 4,160 years ago and resided at Arittuwarum, near the source of the Ganges. Pliny says expressly (lib. xiii, cap. 2) that the most ancient way of writing was upon leaves of palms, from which, it is believed that the leaf (folium) of a book came to be synonymous with that of a plant. The Olay are written upon with a style, which is pointed with steel and its handle sometimes highly ornamented. During the operation of writing, the leaf is supported by the left hand, and the letters are cut or scratched upon its surface with the style, which is kept always in the same position and the leaf is moved to the left hand side by means of the thumb. To render the characters more legible, the engraved lines are occasionally filled by smearing the leaves with fresh cow-dung, which is tinged black by rubbing the lines over with cocoanut oil, or a mixture of oil and charcoal powder, and for the same object, in Ceylon, an oil, called Doomale is sometimes rubbed on the letters with a burned rag. All the sacred books of the Hindoos, Burmese, Singhalese, &c., are still made of these olay, some

of them being highly ornamented. All accounts in the village revenue department, all grants of land, leases, and all the accounts in shops are still kept on these leaves, and they are likewise sent as letters. Palm-leaf books are never much beyond two feet in length and two inches in breadth, they are said to last from one to four or five hundred years. In the peninsula of India, the Olay are prepared from the leaves of the palmyra palm, the panam olay which are taken while tender, and the flat portions being cut into strips and freed from the ribs and woody tendons, are boiled and afterwards dried, first in the shade and afterwards in the sun. In Ceylon, ola are also made from the dried strips of the yo leaves of the Talipat palm tree. The palmyra palm ola are called by the Singhalese Karak-ola, and applied to the more ordinary purposes. But a still finer description called Pusk olay, is prepared in the temples by the Samanero priests and novices, who, after damping the Karak-ola, draw it tightly over the sharp edge of a board so as to remove all inequalities and render it polished and smooth.—*Seemuttu*.

OLDENLANDIA BILFORA, Lam.

Hedyotis burmanniana, R. Br.

Gerontegia biflora, Cham. and Schle.

Khet-papra, Beng. | Purputi, Papra, Hind.
2-flowered Indian madder, Eng.

A plant of Ceylon, both peninsulas of India and Bengal. Appears in moist ground in the rainy season, is very common and is extensively cultivated in Bengal. The whole plant is used in infusion as an excellent tonic and febrifuge in chronic fever. Dose 1 to 2 drachms. Price 8 annas per lb.; other species also occur and are called Gunda badalee and Poonkha.—*Genl. Med. Top.*, p. 180; *O'Shaughnessy*, p. 400; *Cat. Ex.* 1862.

OLDENLANDIA UMBELLATA, Linn.,
Roeb. Corr., W & A.

Hedyotis umbellata, Lam., Choisy.

Chay root plant, Eng. | Chiri veru, Tel.
Emburel, Ramiseram veri, Tam.

A native of Java, Coromandel, and Mexico; root long and orange-coloured, employed in S. India to dye an excellent red on cotton cloth. The small, white, numerous leaves of this low-growing plant, are slightly bitter, and unpleasant to the taste; the native medical men of the peninsula of India consider them as expectorant and prescribe them, accordingly, in complaints of the chest. When dried and pounded, they are also mixed with flour, and made into cakes, which are eaten by such as suffer from consumption or asthmatic affections. Is largely used by the Indian dyer in the south of India. It furnishes a red dye similar to Munjeet. Experiments in Great Britain with the chay root have hitherto failed

in consequence, it is supposed, of deterioration during the voyage. In the case of this and of some other Indian dye stuffs, the colouring matter could be extracted similarly to indigo before it is exported.—*O'Shaughnessy*, p. 400; *Ainslie's Med.*, p. 79. See Chay-root.

OLEACEÆ, Lindley. The olive tribe of plants, comprising 8 Indian genera, 72 sp. viz:—

20 Olea,	1 Pachyderma,
40 Linociera,	1 Myxopyrum,
3 Ligustrum,	2 Chondrospermum,
1 Syringa,	4 Ornus.

They are trees or shrubs, and about 18 species have been discovered in Nepaul, the Himalaya and the Khassya mountains, the rest natives of the two peninsulas of Ceylon, Java and the Moluccas. In most oil plants the oil is yielded by the seed, but in this tribe, the oil is contained in the pericarp, from which alone oil is entirely expressed. The genera and species are as under:

Olea sativa, Hoff., Aleppo, Lebanon.
" *gardenii*, Thunb., Ceylon.
" *lancea*, Linn., Mauritius, Bourbon.
" *capensis*, Linn.
" *fragrans*, Thunb., Cochinchina, China, Japan.

" *Mysopyrum nervosum*, Bl., Java.

Of the olive tree, or Olea, genus of plants, 20 species have been discovered in India. The olive tree of Europe grows easily in India. *O. glandulifera*, Wall., of the central province of Ceylon, grows from 2,000 to 4,000 feet high, and on the mountains near Dehra Dhoon and Kamaon. Olive-wood is imported from the Mediterranean countries into Britain. It is veined with dark grey, and resembles box-wood in texture, but is softer. The knotted and curled roots are made into embossed boxes. This is done by means of pressure in engraved moulds of metal. Dr. Wight also names *Olea linocieroides*, polygama, and robusta. The genus Olea, seems

opposed to great extremes of heat or cold, as Dr. Royle had only seen species in sheltered valleys and at moderate elevations in the Himalaya, *Olea glandulifera*, at Subansiri and the valley leading to Kuerkotee, as well as near Jurreepance; and *Olea ferruginea* in the valleys of the Jumna and Sutlej: *Olea acuminata* probably also occurs in such situations as it extends from Kemaon to Sylhet and Penang. *Olea compacta* and *O. robusta* (*Phyllrea*, Roxb.)—*Eng. Cyc.*, Voigt., Thwaites; Royle, *Ill. Him. Bot.*, p. 266.

OLEA CUSPIDATA.

Olive tree, ENG. | Kahu, HIND.

Grows in the valley of Parbati; varies much in the shape of its leaves, and Dr. Cleghorn says, appears to be *O. europæa*. Dr. Thomson says that near the Chenab, passing some farm-houses surrounded by fields he entered a scattered wood of wild olive trees (*Olea cuspidata*), mixed with zizyphus and wild pomegranate. On the summit of a pass in the outer Himalayas which was not more than 6,000 feet, he found a beautiful gentian (*G. kurroo* of Royle), and a yellow spinous *astragalus*.—*Dr. Thomson's Travels in Western Himalaya and Tibet*, pp. 306-10; *Cleghorn's Punjab Report, Kullu and Kangra*, p. 80.

OLEA DIOICA, Roxb.

Burra nuge, CAN. Par jamb, MAHR.
Indian olive, ENG. Koli maram, TAM.
Karambu, MAHR.

This tree grows in Chittagong, Sylhet and in Coimbatore, and is common in the forests of Canara and Sunda, on the ghauts, but seldom below or inland above. The wood is white, strong, compact and useful, and might be creosoted with effect. According to Roxburgh, the timber of this tree is reckoned excellent and is put to many uses by the inhabitants of Sylhet.—*Wight, Gibson, Voigt, Roxb.*

OLEA EUROPEA, Linn.

O. ferruginea, Royle. | *O. cuspidata*, Wall.
Kau; kahu; ko, PANJAB. | Wi, SUTLEJ.
Willi, KANAWAR. | Khwau, TRANS-INDUS.
Zaitun, PERS. | Ban kau, "

This tree is a native of the south of Europe, of Persia and the N. W. Himalaya. It is a smallish tree, abundant in Trans-Indus from the plains level, and in the Salt Range, common in the western part of the Siwalik tract, and over a considerable part of Hazara (where it is remarkably fine below Tret), and found on the Chenab, Ravi and Sutlej, reaching 8,000 feet on that river. It is found in the hills of the east Punjab, but is more common in the Salt Range, Hazara and the valley of the Indus, from 3,000 to 5,000 feet along with *Quercus ilex*. It is also found in the Jumna basin to the eastward. Its foliage looks more dense than it really is and gives a rather chequered shade. The wood is hard, heavy, compact, strong and

close-grained, and is the best for cogs of wheels. It is also used for agricultural implements, cotton-wheels, walking-sticks, in turning, and for combs. The crooked timbers are largely used for the knees of boats on the Indus near Attock. On the Chenab at one place, Dr. J. L. Stewart found the twigs used for the short suspending rope of the jhula, (see Parotia) for which purpose, however, the people said it did not answer well. Elphinstone says that the Sherawani tribe eat the fruit, both fresh and dry, but there is little fleshy pericarp to eat, even were it pleasant to the taste, which it is not. European olive trees were imported into the Punjab, in order to test the effect of grafting on the Punjab variety. Several varieties of this plant are known in the south of Europe, two of which have been long distinguished—the wild and the cultivated. The former is an evergreen shrub or low tree, with spiny branches and round twigs; the latter is a taller tree, without spines, and with four-angled twigs. The fruit is a drupe about the size and colour of a damson. Its fleshy pericarp yields by expression the olive oil of commerce, of which the finest comes from Provence and Florence. Spanish or Castile soap is made by mixing olive oil and soda, while soft soap is made by mixing the oil with potash. The wild olive is indigenous to Syria, Greece, and Africa, on the lower slopes of Mount Atlas. The cultivated species grows spontaneously in Syria, and is easily reared in Spain, Italy and the south of France, various parts of Australia and the Ionian islands. Wherever it has been tried on the sea-coasts of Australia, the success has been most complete, and Australia ought to supply herself with olive oil. The olive tree is also grown in Hong-Kong. The five or six varieties of *O. europæa*, or *O. sativa*, grown in the south of Europe, are for the most part natives of that region. The entire exports of olive oil from the kingdom of Naples have been estimated at 36,333 tons a year, which, taken at its mean value, when exported at £62 per ton, is equivalent to the annual sum of £2,252,646. This genus of plants are also much admired for the fragrance of their white flowers. Formerly, on account of its slow growth, the olive was not considered very useful; but the new variety which was introduced into France, and into some parts of Spain and Portugal, which yields an abundant crop of fruit the second year after planting. They are small trees or rather shrubs, about four or five feet high. The fruit is larger than the common olive, is of a fine green colour when ripe, and contains a great deal of oil. The advantages accruing from this new mode of cultivating the oil tree, are beyond all calculation. By the old method an olive tree does not attain its full growth,

and consequently does not yield any considerable crop under thirty years; whereas by the new system of cultivating dwarf trees, especially from cuttings, the olive trees afford very abundant crops in two or three years. An acre of land can easily grow 2,500 trees of the new variety, and the gathering of the fruit can be done by small children. The olive is of slow growth; trees 80 years of age measure only from 27 to 30 inches in circumference at the lower part of their trunks. An olive tree is mentioned by M. DeCandolle as measuring above 23 feet in circumference, which, judging from the above inferences, may be safely estimated at 700 years old. Two other colossal olives are recorded, one at Hieres, measuring in circumference 36 feet, and one near Genoa, measuring 38 feet 2 inches. The produce in fruit and oil is regulated by the age of the trees, which are frequently little fortunes to their owners. One at Villefranche produced on an average, in good seasons, from 200 to 230 pounds of oil. The tree at Hieres, abovementioned, produced about 25 imperial gallons. The olive is found everywhere along the coast of Morocco, but particularly to the south. The trees are planted in rows, which form alleys, the more agreeable because the trees are large, round, and high in proportion. They take care to water them, the better to preserve the fruit. The olive tree, is the *Αλυσ* of the Greeks, *Zait* of the Bible, and *Zaitoon* of the Arabs. The fruit of the olive is esteemed even in its unripe state, as an article of the dessert, having been first steeped in an alkaline ley, and then preserved in salt and water. But it is chiefly valued on account of the bland-fixed oil which is stored up in its outer fleshy part. This is obtained by at once bruising the nearly ripe fruit with moderate pressure in a mill (Virgin oil), or by the aid of boiling water and greater pressure, or when fermentation has taken place in the olives collected in heaps, ordinary and inferior oils are thus obtained, the worst being employed only as lamp-oils or in the manufacture of soap. The finest oils are produced near Aix, Montpellier, Nice, Genoa, Lucca, and Florence. The oil is also largely produced in the kingdom of Naples, and exported from Gallipoli, on the east coast of the Gulf of Taronta, whence it is commonly called Gallipoli oil.—*Powell's Hand-book to the Panjab*; *Dr. J. L. Stewart, Panjab plants*; *Dr. H. Cleghorn, Panjab Report*; *Simmond's Commercial Products*; *Royle, Ill. Him. Botany*; *Royle's Mat. Medica*.

OLEA FRAGRANS. The olive tree of China, the Lanhoa or Kwei Hwa of the Chinese, is a yellow-blossomed variety, used to perfume the teas. It is largely cultivated in China,

planted in different parts of their gardens. The Kwei-wha is one of their most favourite flowers. It forms a good-sized bush, about as large as a ~~tree~~ and flowers in the autumn. There are three or four varieties, the main difference between them consisting in the colour of their blossoms. Those kinds which produce brownish-yellow flowers are the finest and are most highly esteemed by the natives. The bushes are seen growing near all the villages in the north-eastern provinces of the empire, and are plentiful in gardens and nurseries. When they are in flower in the autumnal months, the air in their vicinity is literally loaded with the most delicious perfume. One tree is enough to scent a whole garden. The flowers of the kwei-wha are a source of great profit to the Chinese cottages, as well as to the nurserymen, who produce them in large quantities for the market. There is a great demand for them in all the large towns. Ladies are fond of wearing wreaths of them in their hair; they are also dried and placed in ornamental jars, in the same way as rose-leaves are used in Europe, and they are used largely for mixing with the finer kind of tea, in order to give it an agreeable perfume.—*Williams' Middle Kingdom*, p. 288; *Fortune's Tea Districts*, pp. 17, 79; *Royle's Ill. Him. Bot.*, p. 266.

Dr. Royle tells us that two kinds of olibanum are met with in commerce, one Indian, and the other African, the gum resins of *Boswellia serrata* and *B. thurifera*. This was the frankincense used by the ancients in their religious ceremonies. Moses speaks of it in Exodus xxx, 34, and it long formed a constituent in the preparation of incense. It is produced in the Eastern parts of the peninsula of India from the tree known as the *Boswellia thurifera*, but there are also African and Arabian varieties. Olibanum, in the time of Pliny, was obtained only as a product of Arabia, but there are now three kinds known in commerce, the African, Arabian, and the East Indian. The tree producing those of Africa and Arabia is even not yet known, though the emperor Augustus sent an army of 10,000 Romans under Elius Gallus into Arabia expressly in search of it. The Arabian olibanum was supposed by Linnaeus to be obtained by a species of juniper, *Juniperus lyciae*, one of the Coniferae. But Bruce, and after him Neibuhr, searched in Africa and Arabia and could not learn anything about the tree. The three products, known as olibanum, however, seem to be obtained from species of *Boswellia*, and, probably, from *B. papyrifera* and *B. thurifera*. There is no doubt that the East Indian olibanum is obtained from the latter plant, which grows in Northern and Central India, and the existence of this kind as well as of the Arabian was known to Dioscorides. In ancient times, olibanum was sold at very high prices, caused partly by its trade being monopolised, and in part by the great demand for it in the temples. In commerce, the Arabian is also known as male or tear olibanum, to distinguish it from the East Indian or Stalactic olibanum. The Arabian, as also the African, olibanum reach the European market through Aden and through the ports of the Hadramaut. Mr. Vaughan mentions that, from Bandar-Mait, the Luban maitee is imported into the Aden market for sale; from Bandar-Angure, the Luban nāṅkar, or angure; and from the ports of Ras Rurree, Khor Bandar, Alholu, Murya, and Bandar Khasooin in the country of the Wursangali and Mijerthen Somali about Cape Gardafui. The drug is collected in March, April and May, and chiefly finds its way to Bombay through the entrepôts of Maccala and Shehr. Luban berbera or Mulika, is collected

by the Aial Yunus and the Aial Hamed Somali. The Arabian olibanum, grows in two localities, viz., on the sides of the mountains in the Nedji or highlands and near the Sahila, or sea coast, between lat. 17° 30', N., and long. 55° 47' E., where the desert ends and the wooded tain region begins, and is exported from all the ports in the coast line S. W. to the town of Damkote in the bay Alkanumar in 52° 47' E. L. Good olibanum, as met with in Bombay, is in semi-transparent tears, of a light yellow colour, sometimes inclining to white; brittle, and adhesive when warm; when burnt the odour is very agreeable; its taste is bitterish, and somewhat pungent and aromatic. Olibanum has been celebrated from the earliest ages, and used in nearly all the religious ceremonies of antiquity. It is chiefly employed in fumigations, and in the ceremonies of the Greek and Catholic churches. It is imported into Bombay from the Persian Gulf; the superior or garbled qualities are re-exported to England and France, and the inferior or refuse kinds to China. The gums from the following trees are believed to be mixed with the commercial olibanum.

Boswellia glabra.

Salace, HIND. | Morreda, TAM.
A small tree; leaves pinnate, deciduous, flowers terminal, small, white with a red nectary, anthers yellow; yields the gum salai.

Boswellia serrata, Stach. (*B. thurifera*, Colebr.)—*Roeb. Fl. Ind.*, ii, p. 383.

Boswellia thurifera, Colebrooke, *As. Res.* xi, 317; xi, 158; *Roeb. Fl. Ind.*, 383. Pereira, *Medical Gazette*, xx, 676.

Koonder, Zuchir, ARAB.	Gunda barosa, HIND.
Looban, DUK.	Avul Kundoor, "
Dup-salace, HIND.	

A tree with pinnate leaves grows on the hills of the Deccan, is a native of the mountainous tracts of Central India, and very common in the Shahabad country. Dr. Hooker remarks when ascending from Belcuppee in Behar to the height of 1,360 feet, came upon a small forest of the Indian Olibanum (*Boswellia thurifera*), conspicuous from its pale bark, and spreading curved branches, leafy at their tips; with its general appearance a good deal like that of the mountain ash. The gum, celebrated throughout the east, was flowing abundantly from the trunk, very fragrant and transparent. The Salai or salace tree, *Boswellia thurifera*, remarks Dr. Irvine, is plentiful in the Ajmeer hills: the gunda birosa is the prepared gum resin of this tree, and is similar in appearance and qualities to Venice turpentine. It is brought from Mewar, Harautee and the Shekhawatee hills: and is considered stimulating: an oil is distilled from it, said to cure gonorrhoea, and is used also in ointments and much used in painting and by the

lakheries: one maund costs twelve rupees. From the Shahabad country, Dr. O'Shaughnessy obtained fine specimens of the resinous products there called Sale gond or Sale lassa. At Chandalgur it is termed Gunda biroza, and in the dry state Sukha biroza. Dr. Hamilton, however, thought the English Olibanum to be the produce of an *Amyris*, partly because he could not find that the Sale resin was used as incense by the hindoos. The *B. glabra* and *B. thurifera* both furnish the Male Frankincense of Dioscorides. The resin olibanum occurs in reddish or pale yellow tears, oval, oblong and obtuse, sometimes in dense, opaque, brittle masses. The gunda barosa of the bazars is soft, ductile, opaque, greenish and white. The odour is balsamic and resinous, especially while the resin is burning; the flavour balsamic, and rather bitter. The powder, citron-yellow. It is frequently adulterated by dammer, sandarach, and other cheaper resins; when chewed, the hard variety softens, and dissolves partially in the saliva, which it renders white and emulsive. The ointment from this is Mr. Muston's boil ointment, a very useful application, and is an excellent substitute for the Elemi ointment of the London Pharmacopoeia. According to Dr. Royle, the Indian Olibanum is imported in chests chiefly from Bombay, also from Calcutta. Mr. Turnbull, of the Bengal Medical Service, many years since sent some resin of the Salai tree collected in the hills near Mirzapore, which in the London market was recognized as Olibanum. Mr. Colebrooke determined that luban or olibanum is produced by a tree called salai. Dr. Royle also collected a very fragrant resin from the saleh tree of North-West India, which bears a very close resemblance to common olibanum. This tree is *Boswellia glabra*, *Roxb.*, the former is *B. thurifera* of Colebrooke, called *B. serrata* in many works; but as Messrs. Wight and Arnott say, "we dare not quote here *B. serrata*, Stach. extr. Bruc., p. 19, t. 3, the leaves being usually described as ovate, oblong, and acuminate." Both species were collected by Col. Sykes in the Deccan as the olibanum-tree *Boswellia thurifera* grows to a large size in hilly situations, from the Coromandel coast to Central India. It is much branched but bare of leaves in its lower parts, but these are crowded and alternate towards the ends of the branches, unequally pinnate. Leaflets oblong, obtuse, serrated, pubescent. Stipules none. Inflorescence in single axillary racemes near the ends of the branches, shorter than the leaves. Flowers on short pedicels, of a pinkish white colour. Flowers bisexual. Calyx small, 5-toothed. Petals 5, obovate, tapering to the base, inserted under the margin of the disk;

restivation slightly imbricate. Disk surrounding the base of the ovary, cup-shaped, fleshy, crenulate. Stamens 10, inserted under the sessile, 3-celled, with 2 ovules in each, attached to the axis. Style terminated by a capitate 3-lobed stigma. Fruit capsular, 3-angled, 3-celled, 3-valved, septicidal (splitting at the angles into valves). Seeds solitary in each cell, girded by a membranous wing. Cotyledons intricately folded, multifold.

Indian olibanum, now the most esteemed, is in roundish or oblong tears, of a reddish or a light yellow colour, usually covered with whitish powder, from attrition of the pieces against each other, translucent within of a warm bitterish taste, and having a balsamic odour, especially when warmed or burnt. Sp. Gr. 1.22. Analysed by Dr. O'Shaughnessy, a fine specimen gave, of resin 37 parts, volatile oil 28 parts, gum 4, gluten 11, in 100 parts. But the quantity of volatile oil is necessarily much less when it has been exposed and become dry, as seen in commerce. Bracannot obtained only 8 per cent. of oil, of resin 56, gum 30, matter like gum, 5.2, loss 0.8 = 100. This balsamic gum resin is a considerable article of export from Bombay and other ports of India. The best is found in pieces as large as a walnut, of a bright yellowish colour, sometimes inclining to reddish or brown, covered on the outside with a whitish bloom. It burns with a clear and steady light, diffusing a grateful fragrance. In taste it is slightly bitter, and not perfectly soluble in water or alcohol. African Olibanum is imported into Vienna and Marseilles from Suez, and is obtained from Arabia and the east coast of Africa. It is mentioned by Dr. Pereira as African or Arabian olibanum, and as occurring in smaller tears than the Indian variety, yellowish or reddish and intermixed with crystals of Carbonate of lime. One kind of African olibanum is no doubt produced on the hills of the Somali coast westward from Cape Gardafui, and carried to the Arabian coast chiefly by native boats from Maculla. This tree partially described by Capt. Kempthorne of the Indian navy, has been identified by Mr. Bennett of the British Museum with *Plaslea floribunda* of Endlicher, but appears to Dr. Royle to be nothing but a species of *Boswellia*, which he therefore calls *B. floribunda*. The specimens are covered with little resinous exudations, as are the leaves of a plant collected in the island of Socotra by Lt. Wellsted, which also appear to be those of a *Boswellia*. Olibanum is sometimes used medicinally in chronic affections of mucous membranes, but chiefly in plasters, and as a fumigation.—*Royle*, p. 338; *Hooker's Him. Jour.*, p. 29; *Med. Top. of Ajmeer*; *O'Shaughnessy*; *Beng. Phar.*, p. 383; *Faulkner*; *Birdwood*; *Roxb. Fl. Ind.* ii, 383.

Ulive, Olive,	IT.	Aceitunas,	SP.	
Olivæ,	LAT.			

The olive tree will be found described under Olea. The olive and the Kakkar, a species of Rhus, are observed where the Kuarsi stream joins the Ravi : The olive varies a good deal in the shape of its leaves and in the amount of ferruginescence, hence the synonyms *O. cuspidata* and *ferruginea* ; but it does not appear to differ specifically from the *Olea europea*. This plant of the Mount of Olives is the emblem of peace and plenty. The finest specimens seen are in the Kaghan and Peshawar valleys, where the fruit resembles that of rocky sites in Palestine or Gibraltar. The wood is much used for combs and beads, and is found to answer for the teeth of wheels. This tree is found abundantly on the bare rocks about Tuni, on the Tonse river in the Panjab, and is much valued in the district, where it is often naturally conserved by the inextinguishable position of the trees. The unbranched trunk is rarely more than ten to fifteen feet high. The wood is seldom sound throughout ; it is prized for making the "tangili" used by the

men who prepare the rope bridges.—*Powell's Hand-book ; Econ. Prod., Punjab, p. 571. Cleghorn's Punjab Report, p. 9. See Olea.*

OLIVE, CHINESE, the Chinese olive tree is a species of *Canarium*, and the fruit gets this name from the resemblance it bears to the olive of Europe ; it grows along with the Chinese date, a species of *Zizyphus*, which produces a fruit not unlike the date imported into England.—*Fortune's Wanderings, p. 382.*

Olive oil is of a pale yellow colour, it is often adulterated with the oil of poppies. Olive oil is used largely as an aliment ; also extensively in soaps, cerates, liniments, plasters, &c. Virgin oil, the product of the perfectly recent fruit, is of a greenish colour, and highly esteemed ; common olive oil results from the expression of the fruits after they have undergone a slight fermentation ; it is yellow, sweet, and well suited for culinary purposes. The oils inferior to this are consumed almost exclusively in the fabrication of soap, and are obtained by subjecting to the press a second time the crushed fruits which have already yielded the first and second qualities of oil. The finest olives and the worst oil are produced in Spain. Olive oil now forms an article of export from Chili, being grown in most parts of that republic, particularly in the vicinity of St. Jago, where trees of three feet in diameter, and of a proportionate height, are common. The olive was first carried from Andalusia to Peru in 1560, by Antonio de Ribera, of Lima. Frezier speaks of the olive being used for oil in Chili, a century and a half ago. The culture of the olive has been recommended for Florida and most of the Southern States of America. Olive oil may be taken as the type of the fatty or fixed, called also, expressed oils. It is of a pale yellow or of a light yellowish-green colour, without smell when fresh, having a bland, somewhat sweetish, fatty taste. It is very limpid. Sp. Gr. 0.910 at 77°, insoluble in water, is readily dissolved by volatile oils, and by twice its bulk of ether, but requires much more alcohol. Olive oil is apt to be adulterated with poppy and other oils ; these are distinguished by not congealing at the same temperature as olive oil, also by retaining air when shaken up, more readily than pure olive oil. The oil of the *Sesamum orientale* of the arachis and of the poppy, are perfect substitutes for the olive oil for medicinal and pharmaceutical uses. The adulteration may be detected by 8 parts of liquid nitrate of mercury which when mixed with 92 parts of pure olive oil solidify com-

pletely in a few hours; should the oil contain even one-twentieth of the oil of poppies, a soft mass only is obtainable. These experiments are however only available in India during the nights of the cold season.—*O'Shaughnessy*, pp. 432-433.

OLYMPIAD, amongst the Greeks, a period of 4 years, the first of the Olympiads began, it is supposed, with the nearest new moon to the summer solstice, A.A.C. 776, being the 3,938th year of the Julian period and 24 years before the foundation of Rome.

OLYMPUS, see Lakshmi, Meru, Osiris.

OLYPHANT, DUT. Elephant.

OLYREA, a section of the Graminaceæ.

O'M! a mystic syllable, signifying the supreme god of gods, which hindooes, from its awful and sacred meaning, hesitate to pronounce aloud; and, in doing so, place one of their hands before their mouths. A brahman beginning or ending a lecture of the Veda (or the recital of any holy strain), must always pronounce, to himself, the syllable O'm; for unless that syllable precede, his learning will slip away from him; and unless it follow, nothing will be long retained. It is prefixed to the several names of worlds, denoting that the seven worlds are manifestations of the power signified by that syllable. All rites ordained in the Veda, oblations to fire, and solemn sacrifices pass away; but that which passeth not away, says Menu, is declared to be the syllable O'm, thus called Aschara, since it is the symbol of god, the lord of created beings. From various passages in the Asiatic Researches, principally by Mr. Colebrooke, as well as other authorities, it may be collected that this sacred monosyllable, spelt O'm, and pronounced A, O, M, or A, U, M, is interpreted to signify Brahm, the supreme being, under his three great attributes of the creator, the preserver and the destroyer, the letters standing in succession for the attributes as they are described. The gayatri, called by Sir William Jones, the mother of the Vedas, and in another place the holiest text of the Vedas, is expressed by the trilateral monosyllable

AUM. O'm! Bhurbhuvā suvāhā, O'm! Tatsa vit'hru yarennām. B'hargo devāsyā dhimahi dhiyo a pracho dayāth, is the revered prayer, bringing the divine light of the sun, to illumine the mind of the worshipper. Sir William Jones thus interpretes it. Let us adore the supremacy of that divine sun, the godhead who illumines all, delights all, from whom all proceeds, to whom all must return, whom we invoke to direct our understandings aright in our progress towards his holy seat. And in another place he defines that divine sun as "not the visible material sun, but that divine and incomparably greater light which illumines all, delights all, from whom all proceeds, to which all must return, and which can alone irradiate not our visual organs merely, but our souls and our intellects." Mr. Colebrooke again thus explains it: "On that effulgent power which is Brahm himself, and is called the light of the radiant sun, do I meditate, governed by the mysterious light which resides within me for the purpose of thought. I myself am an irradiated manifestation of the supreme Brahm." These are however mere scholastic or theologic interpretations, to suit the theological doctrines of the various hindoo sects, for there is no doubt that the Vedic doctrine was a nature-worship, and the quoted Sanscrit words are an invocation to the sun, O'm! Earth, Air, Heaven, O'm! let us meditate on the supreme splendour of the divine sun; may he illuminate our minds. Gayatri is a form of metre and thence applied to this verse in the Vedas, which is held to be of peculiar sanctity, and is repeated inaudibly in the daily morning worship of the brahmans. The true sense is, "let us meditate on that excellent light of the divine sun: may he enlighten our minds." Professor Wilson's literal translation of it is, "We meditate on that desirable light of the divine Savitri (the sun) who influences our holy rites." Bunsen thus interpretes it:

We remember with longing, the bright beams of Savitar,
May he prosper the handi-work of our piety!
For sustenance we supplicate the divine Producer;
That he may deign to bestow on us our portion, do we beseech him:

All who are wise of heart, adore God the Regetter,
Bringing him offerings of a devout heart with hymns of praise.
The extreme importance that the hindooes attach to the supposed profundity of the Gayatri, renders it a text of more curiosity, than, perhaps, indifferent readers will be able to discover in the words themselves, in either their ordinary or recondite allusions. Sir W. Jones says that the Gayatri is called the "Mother of the Vedas;" and in the conclusion of the preface to the Institutes of Menu, he intends a translation in the following passage, the words in italics being those immediately of the text:—"The many panegyrics on the Gayatri, the mother, as it is called, of

the Vedas, prove the author to have adored, not the visible material sun, but that *divine and incomparable greater light, which illumines all, delights all, from which all proceed, to which all must return, and which alone can irradiate* (not our visual organs merely, but our souls, and) our intellects. These may be considered as the words of the most venerated text in the Hindoo scripture. Another translation of the Gayatri, or holiest verse of the Vedas, occurs in the thirteenth volume of his work. It is, "Let us adore the supremacy of that divine Sun, the Godhead, who illuminates all, who recreates all, from whom all proceed, to whom all must return : whom we invoke to direct our understandings aright in our progress toward his holy seat." The Gayatri is not spoken, but meditated on, while suppressing the breath. A brahman will write it for a European : he will not, or but rarely, pronounce it. The suppression of the breath is thus performed by the worshippers :—Closing the left nostril with the two longest fingers of the right hand he draws his breath through the right nostril ; then closing that nostril likewise with his thumb, holds his breath, while he meditates the text : he then raises both fingers off the left nostril, and emits the suppressed breath, having during its suppression, repeated to himself the Gayatri, with the mysterious names of the worlds, the trilateral monosyllable, and the sacred text of Brahm. A suppression of breath is thus expounded by an ancient legislator to imply the following meditations : "Om ! sky ! heaven ! middle region ! place of birth ? mansion of the blessed ! abode of truth !—we meditate on the adorable light of the resplendent generator which governs our intellects ; which is water, lustre, savour, immortal, faculty of thought, Brahm, earth, sky, heaven, (Chap. ii, 5.) A commentator on this verse says : as the leaf of the palasa is supported by a single pedicle, so is this universe upheld by the syllable OM, a symbol of the supreme Brahm." The first birth is from a natural mother ; the second, from the ligation of the zone ; the third, from the due performance of the sacrifice : such are the births of him who is usually called twice-born, according to a text in the Veda. "Among them, his divine birth is that which is distinguished by the ligation of the zone and sacrificial cord ; and in that, the Gayatri is his mother, and the Acharya his father." (Acharya, or Guru, means spiritual preceptor.) On another occasion, the Gayatri, properly so called, has been thus expounded :—"On that effulgent power, which is Brahm himself, and is called the light of the radiant sun, do I meditate, governed by the mysterious light which resides within me, for the purpose of thought, that very light is the earth, the subtle ether,

and all that exists within the created sphere ; it is a threefold world, containing all which is fixed or moveable ; it exists internally in my heart, externally in the orb of the sun, being one and the same with that effulgent power. I myself am an irradiated manifestation of the Supreme Brahm. "With such reflections," says the commentator, "should the text be inaudibly recited—(Vol. v, p. 359.) He in another place, thus renders the important text : "Earth ! Sky ! Heaven ! Let us meditate on (thee, and on) the most excellent light and power of that generous, sportive, and resplendent sun ; (praying that) it may guide our intellects."—(Vol. vii, p. 259.) Another exposition is : "Let us meditate on the adorable light of the divine Savitri. May it guide our intellects. Desirous of food, we solicit the gift of the splendid sun (Savitri), who should be studiously worshipped. Venerable men guided by the understanding, salute the divine sun (Savitri) with oblations and praise. The passage in italics appears to contain the whole of the Gayatri ; and, with its context, is sufficient to prove that the hindoos, esoterically, should not be polytheists. In the article Surya it is noticed, that the sun is called Savitri in the Gayatri ; and under the name of Surya, Savitri is personified as a female married to Soma, the moon. Pushan is also among the appellations of Surya. The sacred monosyllable is generally spelled OM ; but being trilateral seems better expressed by AUM, or AOM, or AWM, it being formed of the three Sanskrit letters that are best so represented. This mystic emblem of the deity was first introduced to the European world by the translation of the Gita ; where (p. 142) we are told it is forbidden to be pronounced but in silence. "The first letter stands for the Creator, the second for the Preserver, and the third for the Destroyer." Again "OM, Tat and Sat, are the three mystic characters used to denote the deity. The word Sat is used for qualities which are true, and for qualities which are holy : it is applied also to deeds which are praiseworthy. Attention in worship, zeal, and deeds of charity are likewise called Sat." Aschara is a Sanserit word, which, according to Menu, means the syllable O'M. All rites ordained in the Veda, oblations to fire, solemn sacrifices, &c., pass away ; but that which passeth not away, is the syllable O'M, hence called Aschara since it is the symbol of God, the lord of created beings.—*As. Res.*, Vol. Art. xxii ; *Bunsen, God in Hist.*, Vol. i, p. 304. See Gayatri, Hindu, O'M, Veda.

OM MANE PADMI HUM ; Tibetan words, meaning Oh ! the jewel in the lotus, an invocation of Padmapani, who delivered it to the Tibetans. It is the most common of the Tibetan

of prayer." The lotus is the symbol of highest perfection, and in this prayer is used to illustrate the genesis of Padmapani in the lotus. It is an invocation of Sakya, who is usually represented holding a lotus flower with a jewel in it. Everywhere, at Tumlong, in an oratory, the lotus, the mani, and the chirki (or wheel) with three rays, emblematic of the buddhist Trinity, were introduced "Om mani padmi om" in gilt letters, adorned the projecting end of every beam, and the Chinese "cloud messenger," or winged dragon, floated in azure and gold along the capitals and beams, amongst scrolls and groups of flowers. At one end was a sitting figure of Gorucknath in Lama robes, surrounded by a glory, with mitre and beads. A mythical animal with a dog's head and blood-red spot over the forehead was not uncommon in this chapel, and is also seen in the Sikkim temples and throughout Tibet. Ermann, in his *Siberian Travels*, mentions it as occurring in the Khampa Lama's temple at Maimaochin; he conjectures it to have been the Cyclops of the Greeks, which according to the Homeric myth had a mark on the forehead, instead of an eye. The glory surrounding the heads of Tibetan deities is also alluded to by Ermann, who recognises in it the Nimbus of the ancients, used to protect the heads of statues from the weather, and from being soiled by birds; and adds that the glory of the ancient masters in painting was no doubt introduced into the Byzantine school from the buddhist. Captain Knight, in the monastery of Hemis found specimens of the praying wheels—little wooden drums, covered with leather, fitting into niches in the wall, and moved at the slightest push by a spindle running through the centre. There were about a hundred of these machines at Hemis, and as the scrolls inside them are covered with the mystic sentence, "Om mani padmi hum," and contain nothing else, it was calculated that the charm must occur not less than 1,700,000 times. These sacred words are not only found in the praying wheels, but long mounds of votive stones similarly inscribed are scattered far and wide over the face of the country. M. Klaproth writes the formula thus, "Om mani padmi hum"—the last syllable being probably amalgamated with the first during rapid and constant repetition, and thus perhaps having escaped Captain Knight's notice, who distinctly claims, however, to give the actually existing pronunciation. The meaning given by M. Klaproth is, "Oh the jewel in the lotus, Amen!" and he translates from Mongolian into French a most curious explanatory legend too long to narrate, but of which the kernel is this:—That the savage Empire of Snow (Tibet) had for ages been lying beyond the pale of law and religion—rempli d'une foule d'êtres malfai-

sans—when, by an intellectual creative act of the great Sakya-Muni (Buddha) a certain divinity named Padma-pani was called into being from the flower of the lotus, who successfully undertook the work of conversion. The notion is therefore, that the mystic words, "Oh, the jewel in the lotus!" are commemorative of this great act of Sakya-Muni, and of the incarnation of the divine Tibetan apostle. Their constant repetition is also, as M. Huc has explained, extremely meritorious, and capable of securing immediate absorption after death into the universal soul of Buddha. Besides their Lamas, the Tibetan Buddhists have large numbers of nuns among them—who are not, however, subjected to restraint, but work actively in the fields, and one of them took service for a short distance as a coolie with Captain Knight's party. James Prinsep explains *aum* as meaning *a*, the generative power, *u*, the type of the productive power, and *m*, the union of the essences of both, Buddha signifies intelligence; Mani Padma, is one of the forms of Buddha, and signifies the Mani or holy person who has the padma or lotus for his jewel. Om Ma-ne Pad-mi Hom is styled a six-lettered mantra, Shaduk shari mantra. —*Hooker's Him. Jour.*, Vols. i, 229; ii, pp. 194, 195.

OMAN. The province of Oman is bounded on the east by the ocean; on the north, by the Persian gulf; on the west and on the south by extensive deserts. When Niebuhr travelled, it was possessed by a number of petty sovereigns, the most considerable of whom was the Imam of Oman or Maskat. The princes of Dsjau, Gabria, Gafar, Rank, Gabhi, Dahhara, Makaniat, and Seer, had the title of shaik. The Persian gulf divides Persia from Arabia, is about eight degrees in length, from the Straits of Ormuz to the mouth of the Shatt-ul-Arab: in breadth, at the narrowest part, between Cape Musseldom and Gombroon, it is fifty-five miles; and at the widest part, between Bushire and Khodema, three degrees and twenty miles. The Arabian shore has many sand-banks and shoals, and is navigated with danger and difficulty. The Persian gulf is called also the Sea of Oman, or Erythrean Sea. There are no vehicles of any description either carried or drawn in Oman, nor in any other part of Arabia. In Oman, are the Beni Hasan, Beni Abu-Ali, Beni Geneba, bedouins, also the Beni Gafari; the Yemani and El-Arabi, the most illustrious of the tribes of Oman. Robin-

son, writing of the bedouin Arabs of the northern part of Arabia describes the dress of the women as a wide cotton gown of a dark colour—blue, brown or black, fastened by a leathern girdle. Over their heads they wear a kerchief, called shauber or mekroune, the young females having it of a red colour, the old, black. All the women puncture their lips and dye them blue; this kind of tattooing they call bestoum. Round their wrists they wear glass bracelets of various colours; and silver rings both in the ears and nose. Both in summer and winter they go barefooted. The Bedouin men and women are very tawny; their children, however, at their birth and for some time afterwards, are fair, but of a livid whiteness. But Wellsted, writing in Oman, mentions that in their persons the females are tall and well-made, with a roundness and fulness of form. The Ghafari are among the noblest of the tribes of Oman, and with the Y'harabi, have at different periods respectively furnished an Imam. Southern Oman is but thinly peopled, for the whole number, including women and children, does not exceed fifty thousand; but the northern districts are far more populous. Biadiah is a name adopted for themselves, by the people of Oman, taken from the white (abiad) colour of their turbans, in contradistinction to the green of the Fatimites, and black of the Abassides. Arabia has the topaz, the onyx, and the yemani or akik. The agate is found near Mocha, emeralds in the Hejaz, beryls and cornelian, near San'a and Aden, malachite in the cavern of Beni Salem, also jasper, amethyst, and turquoise, in the environs of the village of Safwa, about three days' journey from Medina. Diamond, the sardonyx, and the topaz, were obtained from this country in former times. Of metals, silver, iron, lead, and copper are met with in different parts of Arabia, and the last, recently in Oman. Gold is mentioned by the ancient writers, but at present is not known to exist in Arabia. Bitumen is obtained in Arabia Petrea; and in Arabia Deserta, lignite and coal. The sea of Oman, called also the Persian gulf, Persian sea, and Erythrean sea, also the sea of Fars, has several islands, the Jazirah-i-Lafet called also Jazirah-i-Daraz or Long-Island, known on maps as Kishm. Also Khareg island, on maps Karrack, a small island but well watered; not very far from Busheer, it once belonged to the Dutch, and was held in 1838 to 1846 by the British.—*Niebuhr's Travels*, Vol. ii, p. 113; *Kinneir's Geographical Memoir*, pp. 10, 11 & 54; *Wellsted's Travels*, Vol. i, pp. 116, 240, 307, 383; *Robinson's Travels*, Vol. ii, p. 184; *Col. Chesney's Euphrates*, p. 210; *Porter's Travels*, Vol. i, p. 458. See Arabia, Khorfaken, Keifet.

OMANDER, SINGH. A variety of Coromandel or Calamander wood, obtained in Ceylon from *Diospyros ebenaster*.—*Simmonds' Dictionary*.

OMAR. The second khalif after Mahomed. Bassorah is built on a creek, or rather canal, about one mile and a half distant from the Euphrates. The banks of the creek are fringed with foliage, among which are the walnut, apple, mulberry, apricot. It is called by the Arabs Al-Sura from Be-al-Sura, signifying the stony soil on which it is built. Never having been the seat of sovereign power, it is not adorned with those structures which decorate the cities of the east. The khalif Omar, in the fifteenth year of the Hijrah, wishing to combine the commerce of India, Persia, and Arabia and secure that of Sind and Guzerat, laid the foundation of this place near to the confluence of the Euphrates and Tigris. The united stream, called the Shatt-ul-Arab, empties itself at the distance of eighty miles into the Persian gulf, and commands the navigation of the surrounding countries, with the coast of India. On the death of Mahomed, his son-in-law Ali was not recognized as his successor, but Abu Bakr was so elected and after a reign of two years was succeeded by Omar who was assassinated in the twelfth year of his reign. Abdullah, son of the khalif Omar, in A. D. 650 defeated Yezdejird. Yezdejird was then on his return from Khorasan and for the last time put himself at the head of his subjects, and was defeated. He again was succeeded by Othman, and then, in A. D. 656, by Ali. With Ali's rule severe political convulsions ensued. The earliest arose from the intrigues of Ayesha, and after such were settled, the governor of Syria, Moawiyah Ibn Abi Sofian, threw off his allegiance to Ali and had himself proclaimed khalif of the western provinces. An appeal to arms resulted in the defeat of Ali, after a desultory war of 102 days, and Ali then retired to Kuffa in Chaldea, on the banks of the Euphrates. The people of Karund in the south of Persia believe Ali to be a god, and they are styled the Ali Illahi. The shiah sect of mahomedans consider that Ali ought to have been the first khalif. In Khorasan, Ali is usually styled Shah-i-mardan "King of men." The Khajah sect, and the entire Ismaili sects all worship Ali as an incarnate deity and the incarnation in 1860 was Aga Mahomed, a pensioner of the British Government at Bombay.—*Ferrier's Journey*, p. 210. See Ali, Arabia, Istakhr, Kajar, Khiraj, Zobeida.

OMARKOTE. This stronghold, or kote, of the Omur tribe, was the capital of the Soda Raj, which extended, in the 17th century, into the valley of Sind, and east to the Looni; but the Rahtore of Marwar and the Talpur family re-

ruled the sovereignty of the Soda to a very confined spot, and, thrust out of Omarkote (the last of the nine castles of Maroo) the descendant of Sehriis, who, from Arore, held dominions extending from Cashmere to the ocean. Omarkote during the opulence of the Soda princes, contained 5,000 houses, but in the beginning of the 19th century it hardly reckoned two hundred and fifty houses, or rather huts. The old castle is to the north-west of the town. It is built of brick, and the bastions said to be eighteen in number, are of stone. The fort of Omarkote is celebrated in the east as the birth-place of the emperor Akbar. It is a place of some strength and considered so inaccessible, from the desert that surrounds it, that the ameers of Sind allotted it as a place of security to deposit a part of their treasures. The family of Omarkote in Sind, is stated by Tod (Rajasthan, i, 92, 93) to be Prammar or Powar.—*Tod's Rajasthan*, Vol. ii, p. 313; *Pottinger's Travels in Beloochistan and Sind*, pp. 401-2.

OMAT-SURI. About the middle of July the mercantile festival of Omat-suri is held. It is a procession of trades and an exhibition of their wares, amongst which the wax-workers are very prominent.

OMBAY or Allor, in the Straits of Timor, is a high island about 47 miles long, and covered with beautiful trees to the summit of its highest mountain.

OMEN, HIND. Amongst the hindoos, throbbing of the right eye, is an unlucky omen in a female—a lucky one in men. One very common mode of divination in Eastern countries is called the ilm-i-shoona or “science of the shoulder-blade,” and practised by cutting out the bladebone of a sheep newly killed and examining the lines and marks upon it. This was common in Britain in old times, and in Scotland in the 18th century. Pennant mentions it in the latter country, where it was termed “reading the spaul-bane,” and gives an account of a Highlander in the Isle of Skye fortelling the event of the battle of Culloden by its means.—*Hind. Theat.*, Vol. ii, p. 89.

OMERZYE, see Khyber.

OMICUND, a Sikh merchant, who was conspicuous in the revolution which was crowned by the battle of Plassey.

OMMASTREPHEs, a genus of Cuttle-fishes, belonging to the family Teuthidæ. The cuttle-fishes of this genus closely resemble those belonging to Loligo. Besides other characters they may generally be distinguished by the short rhomboidal termination of the body formed by the fins, combined with the hinder extremity.

OMMIAH, see Khalif.

OM-NAMO-NARAYANAYA, the principal mantra of the Vaishnava hindoo sect.

OMPHIS, according to Arrian, son of Taxiles, his father dying at the time of the Greek invasion, Omphis did homage to Alexander, who invested him with the title and estates of his father Taxiles.

OMRA, AR., PERS. Nobles: the third title amongst Indian mahomedans as Shams ul Umra, Shurf ul Umra.

OMRAR, a river near Bahadurpoor in Gwalior.

OMULLY, a fish of the Baikal lake that annually ascends the Selingue river to spawn, after which they return to the lake. In their ascent the nomade Mongols catch great numbers of them for their winter provisions.

OMUL MARADAM or Mulmurradan island, in lat. 28° 40', long. 48° 35' E., an island on the west side of the Persian gulf.

OMUM, also Womum, TAM. Ptychotis ajuan? DC., Bishop's weed. Omum water, is the distilled water from Bishop's weed seed. It is a useful carminative and largely used in Madras for children. At the Madras Exhibition of 1855, Mr. Gay exhibited specimens of omum water, crystalized sugar of omum, &c.—*Madras E. J. R.*

OMUSSUNG, a river near Cherapunje.

ONAGRACEÆ, see Clarkia, Eucharidium, Fuchsia, Haloragacææ, Lopezia.

ONAM, a four days' festival amongst the Nairs of Cochin, held about the middle of August, in which the Nair women go from street to street singing songs, and the men join in athletic sports.

ONDATRA AMERICANA, TIEDEMANN. The musk-rat or mus-quash, the tail is imported from America into India.

ON DO, MALAY. Dioscorea pentaphylla.

ONEA—? see Columbidae.

ONE-HUMPED CAMEL, Camelus dromedarius, Linn.

ONESICRITUS, a companion of Megasthenes, who gave the first account we have of Ceylon or Taprobane. He was an officer of Alexander's army, and died B. C. 328. See Megasthenes.

ONESICULUS, see Ceylon.

ONGDES, Angdes or Ondes adjoins Tibet. The inhabitants call themselves Hoongia, and appear to be the Hong-nit of the Chinese authors, the Hun (Hoon) of Europe and India.—*Tod's Rajasthan*, Vol. , p. 136.

ONGLAU, THIBET. Cortinarius emodensis.

ONGWA, HIND. Cæsalpinia sepiaria.

ONYX

Luk. **Latarka,** **Rus.** **Cebolla,** **Sp.**
SANS. **Venggayum,** **TAM.**
SINGH. **Wulligudda,** **TEL.**

Lunc. The onion is the Betzulim of Numbers, xi, 12, it is a common vegetable all over India, and is sown broadcast, at almost all seasons of the year. When about six inches high it is pricked out into beds six fingers' breadth apart; and the plants go to seed without difficulty. This is a favourite pot vegetable of the natives of India, and is a constant ingredient in all their curries, pullaos, &c., &c., &c. With the brahman, however, and the sects of hindoos generally who abstain from animal food, the onion is not eaten, from a fancy that its structure resembles that of flesh. Onion-juice is reluctantly taken when prescribed medicinally, as a powerful stimulant, by those who would reject spirituous liquors. With the Chinese, every part of the onion plant is reckoned to have some special therapeutic property, the bulb is one of their favourite articles of diet; it is rich in nitrogenous compounds.—*Faulkner; Riddell; Ainslie, p. 246; Mason; Smith.*

ONTIS, a genus of the Coleoptera.

ONIQUE, Sp. Onyx.

ONIX, Onice, Fr. Onyx.

ONKAR, HIND., of Kashmir, a bird, a species of pteus which supplies feathers for the helmet plume or kalgi.

ONONIS ROTUNDIFOLIA, little shrubby plants, natives of Britain, and of easy culture from seed.

ONONIS SPINOSA, *Husselq.* Syn. of *Alhagi maurorum*, *Tourne; W. & A.*

ONORE, captured 5th January 1783, S. Honore. Hanaw-ar.

ONOSERIS LANUGINOSA.

Kafi (Kangra) **Kut katulla (Hazara, &c.)**
Kasbal (Sutlej, &c.)

—*Powell's Hand-book, Vol. i, p. 503.*

ONOSMA ECHIOIDES.

Ratanjot, HIND.

A plant of Kaghan, used principally for its colouring matter as a substitute for the alkanet, *Anchusa tinctoria*. It is plentiful in Kangra, and is used to colour liquids, particularly Rowland's Macassar oil.—*Powell's Hand-book, Vol. i, p. 366; Hogg, Veg. Kingd., p. 542.*

ONOSMA EMODI.

Maha-ranga, HIND.

Has lanceolate triple-nerved leaves, less hairy beneath, terminal solitary racemes, linear bracts, not half so long as the flowers; the calyx is 5-cornered with ovate segments a ventricose 5-keeled corolla contracted towards the mouth, and the anthers longer than the filaments. The root is branched, of a dark-purple colour, and is used in dyeing. It is a native of Nepaul, in Gosaingthan, where it is called by the natives Maharanga, grows plenti-

fully on the Himalaya; namely, on the Hindo-coosh—near the Punjab' road, via Pesmbur to Cashmere. It is officinal in Cashmere where its flower-stem and root, are both of them deemed useful in medicine.—*Eng. Cyc.; Honigberger, p. 316.*

ONOSMA MACROCEPHALA.

O. bracteatum, Royle.

Gao-zaban, HIND. | Lisan-ul-asar, AR.

Its rough leaves resemble a cow's tongue, hence the name, but the term Gao-zaban or cow's tongue is often attributed to a species of *Cacalia* (*C. kleinii*) a composite plant. At the Lahore Exhibition, the flowers which accompanied two specimens clearly belonged to a plant of the natural order Boraginaceæ.—*Powell's Hand-book, Vol. i, p. 367.*

ONTHOPIAGI, see Coleoptera.

ONYCHOALE MACCARTHIE, Gray.

Syn. of *Herpestes fulvescens, Kel.*

ONYCHOPRION FULIGINOSUS, syn. of *Sterna fuliginosa*; 'Sooty Tern' is very generally distributed in the Bay of Bengal.

ONYCHO-TEUTHIS, a genus of recent and fossil molluscs of the sub-family Oigopsidæ. There are about six species of this genus in the Atlantic, the Indian and Pacific Oceans. Their position may be thus shown:

SECTION B.—Decapoda.

Family III. Teuthidæ. Calamaries, or Squids.

Sub-Family A. Myopsidæ. Eyes covered by the skin.

GENERA. Loligo. Calamary, rec. 21 sp. syn. teuthis.

Sub-genus, Teudopsis, fossil, 5 sp.

Gonatus, rec. 1 species; G. amena.

Sepioteuthis, rec. 13 sp.

Beloteuthis, fossil, 6 sp.

Geoteuthis, fossil, 9 sp. Syn. belemnosepia.

Leptoteuthis, fossil.

Cranchia, rec. 2 sp.

Sepiola, rec. 6 sp.

Sub-genus. Rossia. rec. 6 sp.

Sub-Family B. Oigopsidæ. Eyes naked.

Loligopsis, rec. 8 sp.

Cheroteuthis, rec. 2 sp.

Histioteuthis, rec. 2 sp.

Onychoteuthis, Uncinated calamary, rec. 6

sp. syn. Ancistroteuthis onychia.

Enoplateuthis. Armed calamary, rec. 10 sp.

syn. Ancistrochirus and Abralia, octopodo-

teuthis.

Ommastrephes, Sagittated calamary, rec.

14 sp. See Mollusca.

ONYX, ENG., GER., LAT.

Stone of Solomon, ENG. Pa'rmeta unam, MALAY.

Onix, onice, Fr. Onique, SP.

Sulimani Pat'har, HIND.

The onyx stone is mentioned in Gen. ii and 11, but the term is said to have been applied also to a shell. This stone is a succession of plates of chalcedony, it is found in great abundance in the great greenstone tract of the Dekhan and at Rajpipli in Guzerat and along with all the other chalcedonic and quartzose minerals, is one of the inferior gems, the silicious particles are arranged in alternating horizontal

Layers of opaque white and translucent blue, grey, or brown, and because these have a resemblance to the marks on the human nail, the stone was called from the Greek word for nail, *onyx*. It was known to the ancients, and was employed by them, as it is now, for those beautiful gems called Cameos, the figure being cut out of the opaque white, the dark part forming the ground, or the contrary. It is most valuable, when the contrast of colours is strong, and when the layer is thick enough to give a high-relief to the object to be engraved. In the royal library at Paris there is an antique cameo cut out of an onyx with four layers, representing the apotheosis of Augustus, eleven inches by nine, which is supposed to be the finest in existence. Agates with an onyx structure are not uncommon, particularly among calcedonies, but the finest are obtained in India. Cameos sold at Rome, are made from a thick shell, having different coloured layers like an onyx. The onyx stone is stained black by being boiled in honey, oil or sugar-water and then in sulphuric acid. For red, protosulphate of iron is added: and for blue, yellow prussiate of potash is added to the protosulphate of iron. The onyx has a peculiar and almost superstitious value in the east, and is especially chosen for amulets. Chaplets of this stone are much esteemed. Colonel Tod had a vase, purchased in Scindia's camp, evidently of Grecian workmanship, and the numerous cameos of the onyx found in the Punjab, and other relics of Alexander's conquests, attest their abundance at that time. In such numbers were these cameos found in 1803-4, when Lord Lake dictated peace to Holkar from the altars of Alexander, that the native artists of Muttra and Agra carried on a successful imitation of them for some time, which encouragement might have raised to celebrity.—*Eng. Cyc.; Emmanuel; Tod's Travels*, p. 217.

OOBALA CHAWAL, HIND., lit. boiled rice, is rice which has been boiled in the husk and then husked. All mahomedans and many hindoos in British India use Oobala chawal.

OOALAGA. The Wokul or Oocalaga, among the Canarese, are hindoo cultivators, whom the Abbé Dubois considered to be identical with the Tamil Vellalar. They eat flesh freely, and are not strict hindoos. They are indifferent soldiers but serve locally. One of their subdivisions are called Gangacara.—*Cumpbell*, p. 130.

OOHELLOO, TAM. *Guizotia oleifera*.

OOCHHYA, BENG. Spiked bitter gourd, *Momordica muricata*.

OOCHI USEREKEE, TEL. *Phyllanthus simplex*.

OOCHOISHRAVA, SANS. From *oochchois*, great, and *shroo*, to hear. See Kurma.

OOCHUNUTI, BENG. *Ageratum conyzoides*. OOD, in India is the name applied to benjamin; and in Persia, to wood aloes.

Ood buttee, are pastiles made of wood aloes, sandal wood, benjamin: Lichen rotundatus, the Patchouli, foliated gypsum; Talisputree (*Flacourtia cataphracta*) gum mastich, sugar-candy and gum, pounded fine and formed into pastiles. They are made in every large town and burnt for the fragrance they give out.

Ood buttee, frankincense pastiles. Ugger kee buttee, is the pastile of the wood aloes, q. v.

Ood buttee ka ekka, a metallic receptacle for pastiles.

Ood buttee ka jhar, a tree formed of benjamin pastiles.

Ood dan, a box for holding the frankincense.

OODA CHIRETTA, HIND. *Exacum tetragonum*.

OODAHARANA, SANS., from oot, a preposition indicating that the action has an upward direction, and aharana, a collecting.

OODANG, MALAY. Prawn.

OODASI, SANS. Oot, prep. and asa, to sit.

OODATAL GEDDA, TEL. *Aquila penata*, *Gmel.*

OODBEG, BENG. Areca catechu.

OODDESHA, SANS., from oot, prep. and desha, to seek.

OODES, a genus of the Callistidæ; the genera *Epomis* and *Chelænius* abound in the tropics: the maculated set appear common to Asia and Africa, each country possessing species almost exact representatives of each other. *Chelænius nepalensis* approaches in form to *Licinus*; *Oodes* is widely dispersed over India, *Callistus* occurs in Mysore.—*Hope, M. L. J., July 1840*, p. 116.

ODEYPUR or Udepur, in L. 24° 37' N., L. 73° 46' E., in Rajwara, 70 miles W. of Nimach, according to Scott is 2,064 ft. above the sea, the level of the railway is 1,336 feet. Oodeypur is the capital of the principality of Mewar, and its name is often taken to designate the entire territory. The area of Mewar is 11,614 square miles and the population 1,161,400 souls. The gross revenue is about Rs. 40,00,000, of which about Rs. 12,00,000 are enjoyed by the subordinate chiefs, subject to the payment of chuttoond. Deducting this and the religious endowments, British tribute, &c., there remain to the state about Rs. 14,00,000. The Maharana receives a salute of seventeen guns. Mewar is ruled by a Rajput prince, but his subjects are of several races. The Rajput premier, is the military minister, with the political government of the fiefs; the civil minister is never of this caste. Local customs have given various appellations to this officer. At Oodipoor he is called bhanjgurh; at Jodpoor, purdhan; at Jeipoor (where they have engraft-

ed a term used at the court of Delhi) moosahib; at Kotah, killadar, and dewan or regent. He becomes a most important personage, as dispenser of the favours of the sovereign. In the Mewar state the beneficial effect of British interposition has been very great, in the more immediate neighbourhood of British officers. The state is too large and, from the hilly and jungly character of a considerable part of it, too difficult of excess, for the influence of English officials to radiate very far or fast. The Rajput rulers control over the Bhoomia chiefs who hold the larger part of the country was barely nominal; while in some districts the authority of those chiefs over the Bheels constituting often the chief part of the population was less still. Peace and legal order may be said to have rested on the presence of a Bheel corps, and to be co-extensive with its distribution. Where the Bheel corps was constantly or often seen, there raids and robberies were as infrequent as in the most settled part of India, while in the hilly tracts of dense forest, where Bheel soldiers seldom penetrate, the native savages complacently followed all their ancestral usages, witch-swinging among the number. The Mewar Bheel corps was formed in 1841, its commandant and second in command having ex-officio political control, as 1st and 2nd Assistant Political Agents in Mewar respectively. Gradually, however, for the convenience of the Durbar, and to the great advantage of the country, these officers had in addition to their political influence, acquired a direct criminal jurisdiction in cases of dacoity, affrays, suttee, witch-swinging, &c. Far from any jealousy being excited in the Durbar by this British interference, there has been the utmost cordiality and the most loyal concurrence on its part. All petty criminal cases are left to its adjudication, while on the more serious, such as raids or a border affray between two Bhoomia chiefs, the Durbar when solicited is only too glad to give its assistance to the officers of the Bheel corps, considering shrewdly enough that such an application on the part of the British authorities is tantamount to a recognition of the suzerainty of the Durbar over the always jealous and often insubordinate Bhoomia chieftains. The great obstacle to the more complete repression of lawlessness in the district is the want of roads. Even so late as 1866 the Agent of the Governor-General in Rajpootana, reported that the only road traversing the country which was at all passable for carriages was a very rough one from Oodeypore through Kherwarra to Ahmedabad; and in this respect the state of the country is not very much better now. The head-quarters of the Bheel corps are at Kherwarra. From thence it has tolerably easy access to all the surrounding country within a certain radius and within that circle,

accordingly, perfect order prevails, and even the Bheels have taken to steady and successful agriculture, raising fine crops of maize, wheat, barley, gram, sugar-cane, &c. But at Kotrah, where there are no roads worthy of the name, although a detachment of the Bheel corps with a British officer is always stationed there, the people are much more intractable and much harder to coerce. In such an inaccessible region the Durbar is more reluctant to exert its authority in support of English influence, lest it should impair its prestige by ill success. The moral, therefore, of the later history of Mewar is the same as that of the Cachar and Sylhet frontier—that roads are the true civilizers, since it is only by their aid that the force can be promptly exerted upon which law and order rest. The physical features of Central India, including Mewar, Malwah, Bhopal, Bundelund, and Shahabad, may be thus epitomized. It extends by the Aravalli, Dongupoor, Vindhya, Bindyachal, Panna and Bandait ranges, 73° to 84°, about 700 miles long; breadth very various, greatest from Amjherra to Ajmeer, 250 miles; from Mhow to Mokundurra, 150 miles; at Saugor and Dumoh, 75 miles; afterwards very narrow. It is highest towards S. and W.; average of Mewar, 2,000 ft. Malwah, 1,500 ft. to 2,000 ft. Bhopal, 2,000 ft. Bundelund, about 1,000 ft. Shahabad, 700 ft. Plain of Ajmere, 2,000 ft. Oodeypore town, 24° 37'; 73° 49'; 2,064 ft. It has a slope to N. E., the Banas river flowing in that direction; gradual fall also to the valley of the Chambul river, where it rises to Malwah; Mhow, 2,019 ft. Deotaun, 1,881 ft. Dhar, 1,908 ft. Indore, 1,998 ft. Crest of Jaum ghaut, 2,328 ft. Oojein, 1,698 ft. Adjygurh, 1,340 ft. Amjherra, 1,890 ft. Saugor, 1,940 ft. Rhotogurh, 700 ft. Sonat river, at source, 1,900 ft. From the Vindhya range, the surface has a generally gradual, but in some places abrupt descent; as at Mokundurra, and the Bindyachal hills, where the rivers occasionally fall over the brow in cascades. Shahabad district is very rocky and uneven. Tin and copper are found in Oodeypur. In Bhopal the prevailing geological formation appears to be trap overlying sandstone. Minerals are few and unimportant. Water is very plentiful. The mineral resources of Bundelund appear to be considerable.—*Treaties, Engagements and Sunnuds*, Vol. iv, pp. 10, 195-97; *Tod's Rajasthan*, Vol. i, p. 186; *Pioneer*; *Ann. Ind. Adm.*, Vol. xi, pp. 312, 353.

OODGATA, SANS., from oot, prep. and goi, to sing.

OODGIR, or Udgir, 18° 23'; 77° 8', in the Dekhan S. E. of Rajuri. The mean height of the village is 2,221 feet.—*Cull.*

OODIAL, also Udhal, HIND. *Sterculia villosa*.

OOD-I-BALESSAN, HIND., is supposed to be

Wood of *Balsamodendron kafal*, a tree of
bia, an article of considerable traffic. See Ud.

OODI-SAGUR, a lake of Rajputanah. There
are in reality three lakes, one at the villa of
Suhalea ki-bari, then the Peshola or inner lake,
which is 80 feet above the Oodi-sagur lake, the
outlet of which is the Bairis river. The
Peshola is fed from the little lake at Suhalea
ki-bari and the Peshola is the feeder of the
Oodi-sagur. Both the Peshola and Oodi-
sagur are from 12 to 14 miles in circumfer-
ence, and some places 35 feet deep, and being
fed from the perennial streams of the Aravalli
they contain a constant supply of water. It
would be easy and unexpensive to lead a channel
from the Oodi-sagur to Chettore as the fall is
slight and few locks would be required. The
Bairis river issues from the Oodi-sagur lake of
Rajputanah and passes within a mile of Chet-
tore. There are thus two grand reservoirs within
six miles of each other, the Peshola, or inter-
nal lake, having an elevation of eighty feet
above the external one, and the Oodi-sagur,
whose outlet forms the Bairis. The Peshola
may be called the parent of the other, although
it is partly fed by the minor lake at the villa
of Suhalea-ki-bari.—*Tol's Rajasthan*, Vol. ii,
p. 627.

OODOMBOO, TAM. Oodoomoo, TEL. Ignana.

ODOOGA MARAM of Wynaud, *Bassia*
longifolia, Willd.

ODOOGOO, TAM. A large tree of Pal-
ghat, wood of a red colour; used for ploughs
and building.—*Col. Frith*.

ODOO-JATI, BENG. *Justicia dentata*.

ODOOMBUR, BENG. Wild fig, *Ficus glo-*
merata.

OOD-SAZ, HIND. A censer in which to
burn ood.

OODUMBARRA, SANS. *Ficus racemosa*.

OODAYA, SANS., to arise, from oot, prep.
and aya, to go.

ODY NAR, TAM. *Acacia leucophloea*,
a common tree in Southern India. The
fibres from the bark are used by the fishermen
in making nets: a coarse kind of cordage is
also made from it.

OOFT, DUT. Fruit.

OOGAL, that which is spit out after chew-
ing betel-leaf. Oogal dan, a spittoon.

OOGHAL, HIND. Oogha maram, TAM. *Sal-*
vadora persica.

OOGOORASSA, SINGH. *Flacourtia sapida*,
Roxb., W. & A.

OOGRA CHANDA, SANS., from oogra, fear-
exciting, and chanda, wrathful.

OOJAL, a river in Kattywar, rises in lat.
21° 31', long. 70° 50'. It has a circuitous, but
generally westerly course and disembogues into
a back water, behind Poorbunder, length 75
miles.

OOJAR, a river near Kujooree in Kotah.

OOJEIN, also Ujein or the new city of Ujjaini,
called also Avanti, boasts of very high anti-
quity, and is considered as the first meridian
by hindoo geographers and astronomers. Mr.
Hunter, in the sixth volume of the Asiatic Re-
searches, ("Journey from Agra to Ougein")
gives a description of the modern city, which,
by repeated observations, he determined to be
in long. 25° 51' 11" N. The ancient city was
about a mile farther south, and now lies buried
in the earth to the depth of from fifteen to
eighteen feet. On digging its walls, are said to
be found entire pillars unbroken, &c. Tradition
imputes its destruction to a shower of
earth, an idea likely to have originated in
superficial observation, for although Mr. Hunter
observed no traces of volcanic hills, nor scoria,
in the neighbourhood, and thinks the style of
the walls militates against the supposition of an
earthquake having effected the submersion of
the city, it is still difficult to impute it to any
other than a volcanic cause, operating, perhaps,
locally, and with less violence and convulsion
than usually attend such a phenomenon. It
may be remarked, that the neighbourhood of
Oojein is particularly subject to inundation
from the alluvion of the river Sippara, near
which the city is situated: and the soil is of a
soft sinking nature. Whatever may have been
the real cause of the catastrophe that befel this
metropolis, it cannot be supposed that the wild
fancies of hindoo historians would suffer the fact,
in itself highly poetical and romantic, to be
simply told; they have dressed it up in a mytho-
logical allegory, with the intervention of the
gods. The following story of the occurrence
is accordingly related. On one occasion Indra
assumed the form of a shepherd's boy, that he
might the easier steal from a garden some
pomegranate blossom to deck the dark tresses
of his charming consort Indrani. The story is
borrowed from the popular mythology of Nepal
and Tibet, and is thus told by Sir W. Jones in
a hymn,

"The reckless peasant, who these glowing flowers,
Hopeful of rubied fruit, had foster'd long,
Seiz'd, and with cordage strong,
Shackl'd, the god who gave him showers.
Straight from seven winds immortal genii flew—
Varuna green, whom foamy waves obey;
Bright Vahni, flaming like the lamp of day;
Kuvera, sought by all, enjoy'd by few;
Marut, who bids the winged breezes play;
Stern Yama, ruthless judge! and Isa cold;
With Nairrit, mildly bold.
They, with the ruddy flash that points his thunder
Rend his vain bands asunder.
Th' exulting god resumes his thousand eyes.
Four arms divine, and robes of changing dyes."

His "robes of changing dyes" are the eva-
nescent and variable clouds, with which he (the
firmament personified) is clad as with a gar-
ment bespangled with a thousand eyes, or

stars. Oojein or Ujen in lat. $23^{\circ} 11'$; $75^{\circ} 50'$, is in Malwa, on the right bank of the Sipra. It is said to be 1,698 feet above the sea.—*Moor*, p. 263.

OOJALA NEEL-MANEE, SANS., from oojala, splendour, nila, blue, and mani, a jewel.

OOJLA, a river near the Mirzapoor cantonment.

OOJLA JAMOON, DUK. Calyptanthus caryophyllifolia, Willd., Swartz.

OOJONG BATTOO TOOTUNG, see Rigas Islands.

OOK, BENG. Saccharum officinarum, Linn.

OOKTA, SANS., spoken, from vach, to speak.

OOJA, HIND. Saccharum cylindricum.

OOLAK, the Baggage boat of Bengal. See Boat.

OOLASSA, a river near Bhewndy in northern Concan.

OOLI, bars of steel, fabricated from the vitums from the crucible.

OOLITE, in geology a rock, also a geological formation. It has been a question whether the fern-bearing coal shales and laminated sandstones of Nagpur are the same as the fish-producing bituminous shales of Kota. The Kota fishes that rewarded the researches of Drs. Walker and Bell, were pronounced by Sir P. Egerton to be true Oolitic forms, and probably of the age of the Lias; between Nagpur and Chanda, the Upper Sandstone has the usual iron bands, and the lower laminated beds the common vegetable remains, there is a district with Mangali as the centre (sixty miles S. of Nagpur) where the superior sandstone is less ferruginous, and the inferior or laminated beds are coloured by iron of a deep brick-red. In the latter strata the remains of reptiles, fishes and entomostraca predominate, while the few vegetables that are found, are generally very different from those occurring in other parts of the Nagpore territory. The skull of a Labyrinthodont, named Brachyops laticeps by Owen might suggest for it a Triassic or even Carboniferous age, but the plentifulness of scales of lepidotoid fishes forbids us to assign a more ancient epoch than the Jurassic; and the conclusion is unavoidable, not that the Nagpore laminated sandstone is older than the age we have attributed to it, but that, in India, the Labyrinthodont family has come down to a more recent period than in Europe. The vegetable remains are Tæniopteris, Equisetum laterale, Tænipteris magnifolia, Phylothecæ, Knorria, Lepidodendron, Aphyllum, Aspidiaria, Entomostraca belonging to the genus Estheria.

OOLKI-PANA, BENG. Salvinia verticillata.

OOLOGY. Mr. Theobalds, during the years 1852-53, made observations on this subject, chiefly in the neighbourhood of Pind Dadan Khan and Katas, in the Salt Range. Layard

and Kelaart, have also given brief notices on same subject from which it is known that curious fact may be deduced, viz., that the same bird's nest varies at times in different parts of the country, when the great extent and varied physical, seasonal and climatic features of our Indian empire are taken into consideration.

What varied and touching instances of craft and devotion does not the maternal *stropy* prompt for the concealment and preservation of the callow brood either from natural enemies or from unforeseen perils, and nowhere can we look for more pleasing instances of self-denial than among birds engaged in tending their eggs or young. This has ever been a favourite and admired subject with poets and lovers of nature, who will not fail to accept in a far wider sense, than originally attached to them, the lines of Flaccus:

“Non ferox
Hector vel acer Deiphobus graves
Excepit ictus pro pudicis
Conjugibus puerisque primus.”

At no time too, are more conclusive proofs displayed by the brute creation of intellectual power, than by birds engaged in the duties of incubation. If reason be defined in terms, their actions in a greater or less degree will be found to fulfil those terms. Milton making Eve address the serpent, says:—

“What may this mean? language of man pronounced?”

By tongue of brute, and human sense expressed:
The first at last of these I thought denied
To beasts, whom God on their creation day
Created mute to all articulate sound
The latter I demur, for in their looks
Much reason, and in their actions, oft appears.”

There are three ways which may be adopted for emptying an egg according to its size and the amount of incubation it has received. All eggs when fresh or only slightly incubated may be blown after a manner, now to be described, but some care and careful handling are required to succeed with such eggs as of the English wren or Indian palm-swift. The ordinary mode is to make a hole at both ends, but after deciding on the proper spot which is best an oval hole must be made in the side varying with the size of the egg, and on holding the hole downwards the contents are easily evacuated by blowing into the egg through a fine pointed blow pipe, the tip of which is just introduced within the shell. The operation is neat and effectual but a violent blast must not be attempted, as in that case the yolk may cause a momentary obstruction and the egg explode from the pressure of the confined air with. Neither should the hole be made too large, as the air will then find too ready an exit and fail to expel the last portion of the contents. The empty shell should then be immersed in water and filled, by first exhaust-

the air with the blow-pipe, this will effectually clean the interior, and the fat remains of moisture may be absorbed on blotting paper. The interior should then be washed with a solution of corrosive sublimate in spirits. A common six-penny brass blow-pipe answers perfectly for this. When, however, the incubation has lasted a long time, a good plan is to extract the contents, by means of a pin bent into a hook. This is a tedious operation which is merely mentioned in case of any rare egg requiring to be so treated. A third plan answers well for all eggs of a large or medium size, when well incubated. A moderately-sized hole must be made in the eggs and the more liquid portion of the contents got rid of. They should then be wiped clean and placed in a shallow pan, when in a few days the maggots of the flesh-fly will consume the contents. They will then only require to be washed. The best mode of packing moderate-sized eggs in store is in wooden boxes with saw dust, after closing the holes in the shells with their paper. Tin boxes are not generally to be trusted, at least when travelling, as with such tender charges committed to their care a little smash goes a great way, as he has ruefully learned from experience. Small eggs travel well-packed in some soft nests as those of "Lanius" with a little wool and placed in wooden boxes. Small tin boxes fitted into trays in a wooden box are also very handy, but are not readily got well-made in India. The following are the commoner forms in the abbreviations used :

O. oval,	O. P. ovato pyriform,
B. O. blunt oval,	B. O. P. blunt ditto diff.,
P. O. pointed ditto,	L. O. P. long ditto ditto,
L. O. long ditto,	R. O. P. round ditto,
R. O. round ditto,	R. round with some minor combinations.
P. pyriform,	

Gyps bengalensis, Gid Girij. March 1st, 2nd. 1. O. P. 3-36—2-62. Dull white. Nest of sticks and twigs ; in large trees.

Neophron percnopterus, Safed doda. March 3rd. 2. L. O. 2-53—1-90 ; 2-75—1-84. Pale brownish red, thickly blotched with dark brownish red. Nest, a few twigs placed in holes of cliffs and difficult to approach.

Halietus gallicus? Burra ludi. March 2nd, 4th, April 2nd. 1. B. O.=L. B. O. 2-78—2-18 ; 2-67—2-30 ; 3-18—2-30. Pure white, with sometimes a few spots of brown. Nest of sticks in large trees.

Circus gallicus, Chota ludi. March 2nd. 1. O. 2-49—1-90. White with a few minute brown specks. Nest of twigs and sticks in large trees.

Polionis teesa, Trumti. April 2nd. 4. O. P.=B. O. P. 1-80—1-50 ; 1-93—1-50. Pure grayish or plumbeous white. Nest small, of twigs, in trees, near cultivation.

Buteo canescens, Hodgson, Hil. March 1st, 4th. 2-3. O. P. 2-00—1-86 ; 2-19—1-86. Greenish white, or white, blotched with red claret brown, vary greatly. Nest large in trees, sticks lined with cotton, rags, &c., and daubed with mud.

Lanius lahtora, Lahtor (generic). March 4th, April 4th. 5. O. P. 1-06—0-80. Pale greenish white, blotched and ringed with yellowish gray and neutral markings, vary much in intensity and colour. Nest of twigs, lined with cotton or wool and usually placed in stiff thorny bushes.

Lanius erythronotus, May 1st, 4th. 5-6 B. O. P. 0-88—0-81 ; 0-93—0-68. White or pale greenish white slightly ringed and spotted with yellowish gray and neutral. Nest of roots, coarse grass, rags, cotton, &c., lined with fine grass and placed in forks of trees.

Lanius hardwickii, May 1st, 4th, June 2nd. 3-4. O. P.=B. O. P. 0-80—0-64 ; 0-87—0-65 ; 0-73—0-55. Colour same as *L. erythronotus*, also creamy or yellowish white, spotted with darker. Nest compact in forks of thorny trees ; outside fibrous stalks, bound with silk or spider web and covered with lichens or cocoons imitating a weathered structure ; inside lined with fine grass and vegetable down.

Corvus corax, Dom kak, Doda, January, February. 4. O. P. 1-70—1-30. Dirty sap green, blotched with blackish brown ; also pale green spotted with greenish brown and neutral. Nest of sticks, difficult to get at, placed in well selected trees or holes in cliffs.

Corvus splendens, Kowa. June 4th. 5. O. P. 1-42—1-05 ; 1-40—0-95 ; 1-56—1-18 ; 1-70—0-97. Clear bluish green, spotted with blackish brown, size and colour variable. Nest, a neat but slight cup of twigs and roots, placed in medium-sized trees. *Columba intermedia*, Kabuter. March, April, May, June, July. 2. P. O.=B. O. 1-03—1-04 ; 1-43—1-17. Pure white. Nest none, or only a few twigs in holes, in walls, buildings, cliffs, &c.

Turtur risorius, Panduk. April 3rd, May 1st, September 1st. 2. P. O.=B. O. 1-21—0-96. Pure white. Nest, a few twigs in low trees and bushes.

Turtur senegalensis, Ghughu (generic). March, April, May, June, August, September. 2. P. O.=B. O. 1-11—0-92 ; 1-20—0-90. Pure white. Nest, a few twigs in low trees and bushes.

Turtur humilis, April, May, June, August. 2. P. O.=B. O. 0-93—0-74 ; 1-02—0-76. Pure white. Nest, a few twigs in low bushes or trees.

Pavo cristatus, Mohr manjur. June, July. O. P.=B. O. P. Clear brownish cream colour. Nest, a mere hole in the ground in difficult stony places in the hills.

Perdix ponteceria, Jita. April 1st, May, September. 9. P.=O. P. 1.29—1.03. Clear cream colour. A little grass in a hole in the ground, usually sheltered by a bush: or in clumps of grass.

Ammoperdix bonhami, Susi. April, May, June. 12. P.=O. P. 1.40—1.00. Clear cream colour. A slight hollow among stones in the hills.

Caccabis chakor, Chakor. April, May. 12. O. P.=B. O. P. Yellowish white or brownish cream colour, faintly ringed and spotted with tan colour. A few leaves on ground under bushes.

Turnix sykesii? Bailer (Taigoor,) August 3rd. 5. R. P. Pale gray closely freckled with dirty yellowish ochre, with a few dots of neutral, and blotched with deep reddish brown or blackish amber. Nest, a little grass hemp yarn; and a few hairs on ground in field of Bajra.

Palaeornis torquatus, Tota (generic.) May, 3rd. 4. R. O. P. 1.25—1.05. Pure white. Nest none, eggs laid in holes, in wall, trees and steep banks in company with *columnba intermedia*.

Palaeornis caeruleocephala, March 3rd. 4. 5. B. P. 1.13—0.95; 1.17—0.93. Pure white. Eggs laid in holes in trees.

Pycnonotus leucotis, Bulbul (generic.) May, June, July. 4. O. P. 0.91—0.64. White much dotted with claret red. Nest, a neat cup of vegetable fibres in bushes.

Pycnonotus bengalensis, May, June, July. 4. B. O. P. 0.87—0.62. Deep pink, blotched with deep claret red. Nest similar to No. 23.

Acridotheres tristis, Maina, June. 5. O. P. 1.20—0.35. Pale bluish green. Nests, roots and other rubbish, in trees or holes in house verandas, &c.

Acridotheres gingianus, Gang-maina. May 3rd. 7. 8. O. P. 1.08—0.81. Clear greenish blue. Nest, a hole in the sand at the end of a gallery run into a steep bank, many nests in company.

Cypselus affinis; Ababil (generic.) April, May, June, August, September. O. P. 0.90—0.56. Pure white. Nest, light straw and feathers strongly agglutinated to rafters of houses nests in colonies and often united together, size varies much, some have long necks, others are mere saucers without any. Second nests are less carefully built. The inside is not lined and feels like coarse card board.

Hirundo sinensis, February 3rd. 4. O. P. 0.62—0.48. Pure white. Nest of grass lined with feathers placed at the end of a gallery in a steep river bank.

Oriolus kundoo, May 2nd. 4. O. P. 1.17—0.81; 1.23—0.75. Pure white with a few black spots. Nest a neat cup of woven grass,

attached by the side to a bough of some fruit tree.

Dicrurus macrocercus, Japul Kalchit, May, June. 4. O. P. 1.08—0.73. Dirty reddish white spotted with red; colours vary, in some the spots seem to have run, as ink does on damp paper. Nest a neat shallow cup of roots and stalks in bushes.

Passer domesticus, Churcia, February, March, April, May, June, July. 5—6. O. P. 0.85—0.65; 0.82—0.61. White spotted and blotched with brownish black or brownish white blotched with deep brown, colour varies much. Nest a loose structure of grass and feathers, in trees or houses.

Malacocercus caudatus, Sor. March, April, May, June, August. 4—5. O. P. L. O. P. 0.84—0.66; 1.04—0.60; 0.75—0.55. Clear greenish blue. Nest a loose but deep cup of grass and twigs in bushes in jungle or garden. The first size is common, the second and third measurements were from eggs of one nest.

Oxylophus melanoleucus. (Identified by Mr. Blyth) August. 1. B. O. 0.61—0.81. Deep greenish blue. This evidently parasitical egg was taken from the nest of *Malacocercus caudatus* containing four ordinary eggs which it closely resembles in colour, though its form indicates its parasitical character.

Galerida cristata, Chandul. March 4th, May 3rd. 4. O. P. 0.88—0.66; 0.82—0.64. Yellowish white uniformly freckled, with grayish yellow and neutral. Nest, a little grass in a hole in the ground.

Thamnolia cambaensis, Jimma (generic.) April 2nd. 4. P. O. P. 0.79—0.60. Greenish white ringed and spotted with pale reddish and a little neutral. Nest, loose grass and bits of snake's skin in holes in the sides of nullas.

Nectarinia asiatica, May 4th. O. P. 0.66—0.47. Grayish white, freckled and ringed with cineritious gray. Nest, a neat purse of vegetable fibre and down suspended from some small bough and masked in front by a few dead leaves loosely attached by silk threads.

Munia malabarica, May, August, September, October, December. 12.13=(25) O. P. 0.59—0.46; 0.64—0.44; 0.60—0.50. Pure white. Two pairs of birds frequently if not usually are employed in the construction of one nest in which the two hens consecutively lay—so the same nest has sometimes 25 eggs in it in different stages of incubation—nest often clumsy and hastily made—but usually a neat domed structure of fine grass with one opening, sometimes prolonged into a short deflected neck partially closed by the elasticity of the long spikes of grass forming it; sometimes the nest is a simple platform of grass, open at each end, but the grass ends curved over to meet at the top, usually placed in thorny

bushes, often very conspicuously and close to roads. It is much to be doubted if the eggs found occasionally in October and December are hatched.

Podiceps philippensis, Pandubi. August, September. 5. P. O. L. P. ♀. 1.50—1.04; 1.42—1.00. Pure white; when recently laid, green: is soon soiled brown in the nest. Nest, a few weeds heaped on the rank vegetation of jheels, but floating and usually several nests together.

Gallinula chloropus, August 4th. O. P. 1.62—1.15. Pinkish cream or gray spotted and slightly ringed with deep red-brown.

Sarciophorus bilobus. Jithiri. May 2nd. 3. P.=O. P. 1.63—1.19. Nest as *Podiceps philippensis* eggs also stained by nest; creamy yellow or stone colour, thickly spotted and blotched with blackish brown.

Ardeola leucoptera. Bogla (generic.) June 4th. 5. 6. P. O. 1.54—1.16. Pale green. Nest of loose sticks in trees.

Kashmir Notes.

Tinunculus alaudanus, Shikra. April 3rd. 6. B. O. P. 1.68—1.22; 1.51—1.27. Pale reddish brown, freckled and blotched with brownish red. Nest, hole in sarai wall of Thanna, S. of Baranegala, Shalabad and valley generally.

Milvus? *Buteo*, April 4th. 2. O. P. 2.10—1.80; 2.40—1.77. Nest and eggs as in plains (*Buteo canescens* ante.)

Corvus, small black hill crow. April 3rd. 4. O. P. 1.70—1.20; 1.60—1.25. Green spotted with brown, valley generally. Nest placed in "Chinar" and difficult trees.

Corvus monedula, May 1st. 4. 5. 6. O. P. L. O. P. 1.26—0.99; 1.45—1.00; 1.60—1.00. Pale clear bluish green; dotted and spotted with brownish black. Valley generally; in holes of rocks, beneath roofs, and in tall trees.

Sturnus vulgaris, Jilgiri. May 2nd, 3rd. O. P. 1.15—0.85. Pale clear bluish green. Valley generally; in holes of bridges, tall trees, &c., in company with *Corvus monedula*.

Acridotheres tristis, April 3rd. Nest and eggs as in plains, Rajaori and lower hills generally.

Cacabis chukor, May 3rd. Nasmana on the Chandra-baga: eggs as ante.

Pycnonotus leucotis, April 4th at Bhimba. May 2nd at Islamabad. Nest and eggs as in plains ante No. 23.

Hirundo rustica, May 2nd. 4. L. O. P. 0.83—0.53. Pure white, spotted with bright reddish brown; valley generally. Nest under eaves, outside coarse straw cemented with mud, inside fine straw lined with feathers.

Budytes citreola, May 3rd. 4. O. P. 0.95—0.70. Pale gray thickly dotted and ringed with grayish brown and grayish neutral mingled

together. A depression in soft earth beneath a rock near B'aragari, valley generally.

Anas boschas, May 1st. L. O. P. 2.27—1.55. Dirty white with a tinge of yellowish green near Supeia, valley of Cashmir.

Podiceps cristatus? May 2nd. 5. O. P. 2.53—1.51. Pure white; when recently laid pale green. Wala lake. Nest, a heap of weeds floating on the surface of the water, but connected to reeds, &c.

Podiceps philippensis, May 2nd. 5. P. O. 1.40—1.00. Pure white. Wala lake. Nest as *Podiceps cristatus*.

Fulica atra, May 2nd. 8. L. O. P. 2.10—1.40. Pale brownish gray, dotted with reddish black. Wala lake. Nest, pieces of dried reeds about 6 inches long, piled together among reed and floating on the water.

Gallinula chloropus, May 2nd. O. P. 1.70—1.26; 1.57—1.11. Pale gray or reddish gray dotted and spotted with deep reddish brown. Nest, a few weeds heaped on the water among reeds.

Centropus rufipennis, Monghyr, June, August. 4. O. 1.30—1.09; 1.47—1.21. Pure white: nest placed in dense trees, a neat but loose structure of twigs domed, and with aperture in the side lined with dried leaves.

Cypselus affinis, Monghyr, May, June. 4. O. P. 0.90—0.56. Pure white; nest described in a former paper. Mr. Layard, however, describes it as building a mud nest in Ceylon (vide annals for 1853, age 311).

Milvus ater, Calcutta, October 4th. 3. O. P. 2.21—1.68. Greenish-white, spotted and blotched with pale reddish brown: nest of sticks, bulky, placed in tall trees.

Gyps bengalensis, near Deoghur, November 4th. 1. O. P. 3.20—2.52. Pure white. Nest of sticks, usually small for the size of the bird, and placed at the top of cotton trees or others, very difficult to ascend.

Buceros cavatus, Tenasserim, February 3rd. 1. O. P. 2.68—1.88. Pure white. For the measurement of an egg, indebted to Capt. Tickell, who was fortunate enough to observe the female on the nest. In holes of trees, in which the female is built in with mud by the male, as observed by Capt. Tickell (p. 279, ante.)

Buceros subruficollis, Tenasserim, February 3rd. 3. O. P. 2.20—1.55. Pure white. Mode of incubation said to be similar to the last.

Haleyon smyrnensis, Mergui, March 4th. 5. B. O. 1.20—1.03. Pure white. Gallery 1½ feet in a stiff bank, near a road.

Haleyon gural, Monghyr, June 4th. 4. R. 1.09—1.02. Pure white. Gallery 1 foot in a stiff bank, in jungle.

Merops erythrocephalus, Mergui, March 3rd. 5. 6. P. O. 0.84—0.79. Pure white. Gallery from 1 to 7 feet in length, in soft sandy soil

near water. It enters the ground at a small angle and then runs horizontally.

Eudynamis orientalis, Monghyr, June 3rd. 1. O. P. 1.20—0.90. Pale dirty green much blotched with reddish brown. Had but one egg brought, and the man reported four crow's eggs in the same nest.

Centropus rufipennis, Monghyr, "Mahoka," "Karnowa," June, August. 4. O. 1.30—1.09; 1.47—1.21. Pure white: nest placed in dense trees, a neat but loose structure of twigs domed, and with aperture in the side: lined with dried leaves.

Cypselus balasienis, Monghyr, June 3rd, Prome, July. 3. L. P. 0.80—0.45. Pure white. Nest of vegetable down, with a few feathers agglutinated with mucus to the frond of the *Borassus*.

Corvus culminatus, Tenasserim, Feb. 3rd. Near Deoghur, March 4th. O. P. 1.66—1.15. Dull sap green, much blotched with brown. Nest carefully placed in tall trees.

Acridotheres tristis, Monghyr, June 1st. Prome, July 3rd (2nd brood.) 5. O. P. 1.20—0.85. Pale green. Nest in trees or holes in houses of grass and rubbish.

Sturnus contra, Monghyr, May 3rd, June 3rd, Tavoy, April 1st. 5. O. P. 1.10—0.82. Clear pale green. Nest of grass and twigs in trees.

Malacocercus bengalensis, Monghyr, June 2nd. "Fat-gobia," "Gogoi." 5. B. O. P. 1.00—0.79. Deep bluish green. Nest of twigs and fibres in bushes.

Malacocercus caudatus, Monghyr, June, July. 4. 5. O. P. Nest and eggs previously described.

Neornis flavolivacea, Darjiling, July 2nd. 3. B. O. P. 0.9—0.55. Deep dull claret red, with a darker band at broad end. Nest, a deep cup, outside of bamboo leaves, inside fine vegetable fibres, lined with feathers.

Orthotomus longicauda, Darjiling, August 4th, Tavoy, May 1st. 4. O. P. 0.61—0.45. Greenish white, dotted with pale reddish. Nest, a neat cup of fibre and vegetable down enclosed in a single leaf, which is secured by stitches of fibre; so as to envelop its entrance at the top and beneath the stalk, the leaf serving as an admirable pentroof to the nest.

Thamnobia cambaiensis, Monghyr, April 2nd, June 3rd. 3. 4. O. P. 0.64. Greenish white, ringed and spotted with pale reddish, with some spots of neutral. Nest rude in holes, in trees and banks, of grass and nearly always snake skin.

Hirundo domicola, Tenasserim, April 2nd. 3. L. O. P. 3.77—0.52. White, spotted and ringed with umber. Nest a saucer of mud, inner part coarse roots, profusely lined with feathers, and vegetable down, attached to the under part

of "Snags" projecting some 4 feet above the water.

Hirundo sinensis; Salween R., January 2nd. 4. O. P. 0.62—0.48. Pure white. Nest of grass and lined with feathers.

Pycnonotus hemorrhous; Monghyr, June 4th. 3. O. P. 0.90—0.68. Nest and eggs like *P. bengalensis*, previously described; eggs not so quite so highly coloured.

Nectarinia flammaxillaris; Tavoy, February 1st. 2. O. P. 0.56—0.43. Pale greenish, speckled with grayish ash. Nest, a neat purse, in a lime tree (*Citrus*), like *N. asiatica*.

Macrophygia leptogrammica; Darjiling, July 2nd. O.—(1?) 1.40—0.98. Dirty white; nest, a few sticks.

Francolinus sinensis; var. *Phayrei*; Burmah, June 4th (Miatch). 4. R. P. 1.40—1.15. Uniform greenish cream; on the ground.

Turnix ocellatus, Monghyr, June 1st. 4. R. P. 0.88—0.74. Yellowish gray, closely freckled with dark yellowish gray, blotched with deep reddish umber with a few dots of neutral: on ground.

Glareola lactea, Tenasserim, March 3rd. B. P. (3?) 1.01—0.81. Dusky buff, ringed and spotted with obscure neutral and irregularly lined with yellowish brown. On churs and river sand-banks.

Edicnemus crepitans, Deoghur, April 1st. 2. O. P. 1.80—1.35. Pale stone-colour or yellowish cream, blotched with deep red brown. On ground in Sal jungle.

Hoplopterus ventralis, Tenasserim, March 3rd. 3. P. 1.60—1.17. Yellowish stone-colour or creamy nankeen, regularly spotted with deep red brown and sparingly blotched with neutral. On sandbanks in the river.

Metopodius indicus, Monghyr, August. L. O. P. 1.50—0.97. Clear brownish ochre, strongly lined and streaked with black. Nest of weeds in jheels.

Hydrophasianus chirurgus, Monghyr, August 2nd. 4. P. 1.33—1.10. Clear brownish or greenish bronze: nest, weeds in jheels.

Ciconia leucocephala, Deoghur, June 4th. 3. P. O. 2.50—1.90. Dull white: nest of sticks placed in tall trees, usually "simul," most difficult to ascend.

Herodias intermedia, Monghyr, July 1st, 2nd. 6. O. P. 1.76—1.26; 1.94—1.30. Dull green. Nest small, of sticks; in company with "Mainas" and *Herodias bubulcus* and *H. garzetta*.

Herodias garzetta, Monghyr, July 1st. 6. O. P. 1.45—1.14; 1.58—1.11. Dull green. Nest as *H. intermedia*.

Herodias bubulcus, Monghyr, June 1st. 6. 8. P. O. 1.80—1.39. Very pale green or greenish white. Nest, as *H. intermedia*.

Porzana phœnicura, Monghyr, August 1st. 7. L. O. P. 1.70—1.10. Dark brownish cream,

much spotted and blotched with brownish red. Nest of weeds in jheels.

Gallinula burnessii, Salt Range, August 4th. 1-62—1-15. Pinkish cream or gray, spotted and ringed with deep red brown. Nest of weeds in jheels.

Dendrocygna awsuree, Monghyr, August 1st. 8. O. P. 1-81—1-50. Creamy white, nest of weeds in jheels.

Nettapus coromandelianus, Monghyr, August. O. 1-47—1-10. Pure white, shell very thin. The nomenclature used above is derived from the valuable catalogue of birds in the Museum of the Asiatic Society, by Mr. Blyth; a work of great labour, which reflects the utmost credit on its author. For scientific purposes, a collection of birds' eggs is only valuable if the birds which have laid them be accurately known, and before the eggs are disturbed in the nests, the parent bird should be secured or shot. The eggs of the Sarus or *Grus antigone*, those of the bustard or *Eupodotus Edwardsii*, and those of the water pheasant the *Hydrophasianus sinensis*, have well marked distinctive characters as compared with any other Indian eggs.—*Notes on the Nidification of some of the commoner birds of the Salt Range, with a few additional from Kashmir, by W. Theobalds, Junr., Esq., in Beng. As. Soc. Jour., Jun., Oct. 1855.*

OOLOO, BENG. *Imperata cylindrica*.

OOLOOLOO-GAS, SINGH. *Machilus macroantha*.

OOLOWA, SINGH. Fenugreek seed.

OOLUT KUMBUL, BENG., HIND. *Abroma augusta*.

OOMAR, a caliph who succeeded Mahomed, and Abu-bakr. He sent an army into Sind. He built Bassorah in the 15th year of the Hijra to secure the trade of Sind, Guzerat and India, Persia and Arabia. See Khalif, Omar, Abdullah, Umar.

OOMAR, a river near Cheinwarra in Gurrawa.

OOMARI-KEERAY, TAM. *Salsola indica*.

OOMBUR, DUK. *Ficus glomerata*, Roeb.

OOME TEAK, TAM., of Palghat, wood of a dark-brown colour; third-rate teak.—*Col. Frith*

OOMGONG, a river near Mophlung in Cherapunji.

OOM-GON-YONG, a river near the Cossyah hills.

OOMIAH, a goddess of the hindoo. Freya is the Scandinavian goddess of love, and Freyr the god of beauty. Freya is supposed to be the analogue of Oomiah, the creative power of the hindoo mythology. The grand festival to Freya was in spring, then boars were offered up to her by the Scandinavians, and boars of paste were made and eaten by the peasantry. At the present day, "Vasanti," or spring personified, is

worshipped by the rajputs, who open the season with a grand hunt, led by the prince and his vassal chiefs when they chase, slay and eat the boar.—*Tod.* See Basant.

OOMRAOTI, a name given to several towns in the peninsula of India usually, also written, Omrooti or Umraoti, a name identical with Amravati. The Oomrawatte of Berar is one of the largest cotton marts, another Oomraoti near Masulipatam is famed for its buddhist ruins.

OOMR-KOT, a fortress in a small oasis on the edge of the desert near the Indus. It was the retreat of the emperor Hamayun and the birth-place of Akbar. See Omarkote.

OOMUR, a river near Nursingpoor.

OOMUR or Oomra and Soomra, are races of Sindh from the Pramur or Puar races of rajputs, and found now chiefly as mahomedans though a few still called Oomra and Somra are to be found in Jessulmer and in the thul.

OOMUS, SINGH. *Vitis vinifera*, Linn., W. & A.

OOMUTWARA, in a hilly and jungly tract, comprising Oomutwarra, Seronge and Keelwarra, with a scanty population.

OOMY TAKOO MARAM, TAM. A species of the teak or *Tectona grandis*.

OONAMAKOO also Unali, SINGH. Tabasheer.

OONARA MARA, CAN. *Tamarindus indica*.

OONDAH, a town in the Burdwan district of Bengal.

OOLOO-NANTHREE MARA, CAN. *Stereospermum suaveolens*.

OONDEY OIL. Its source is not known at Madras, but supposed to be a fish oil manufactured at Malabar. The name in Bombay is, however, applied to an oil obtained from the nut of the *Calophyllum inophyllum*, is imported from the Somali coast, and used as a stimulant externally and internally.—*Simmonds' Dict.*

OONDIE, MAHR. *Calophyllum*, *Species*.

OONG-LAGNIYU, LEPU. *Crossopus himalaicus*, Gray.

OONMRAR, a river near Gwalior.

OONN, GUZ., HIND. Wool.

OONNAY, TAM. A wood of Tinnevely, of a red colour; specific gravity 0.928. A strong wood used for wheelwright's work, handspikes.—*Col. Frith*.

OONS, GUZ. Sugar.

OONT, HIND. Camel. Oont-ka-bal, Camel's hair. Oont shah, a mohurum faqueer.

OONTA DHOORA, a pass in Jooalur.

OONUM, HIND? *Abies webbiana*, Hooker.

OOPADIKEE, or Oopodaki, SANS. *Basella cordifolia*.

OOPANA, SANS. *Asarabacca*.

OOPA, SANS. Above, importing resemblance, hence.

Oopachara chala, from oopa, chara, to move, and chala, a pretence.

Oopanaya, from oopa, and nee, to take.
Oopanayana, from oopa and nayana, an obtaining.

Oopa pataka, from oopa, prep., and pat, to throw down.

Oopapatee, from oopa, and patee, lord.

Ooparatee, from oopa and rum, to play.

Oopasanghara, from oopa and sanghara, destruction.

Oopavasa, or fasting, an act of merit among the hindoos.

Oopanga, from oopa, importing resemblance in an inferior degree, and anga, a part.

Oopasana, SANS., from oopa and as, to throw, preceded by the prep. a.—*Ward's View of the Hindus*, Vol. ii, p. 76.

OOPAZEN, BURM. The regular monks of a Burmese monastery, who are ruled by the Phoon-gyi or superior.—*Yule*, p. 182.

OOPULATE, GUZ., HIND. *Aucklandia costus*, *Falconar*.

OOPOO, TAM., TEL. Salt, hence,

Oopoo-poma, BENG. *Rhizophora mangli*.

Ooppocaree-neer-mullee, *Dilivaria ilicifolia*.

Ooppoo travagum, TAM. Muriatic acid.

Oopp-lee-coddy, TAM. *Pentatropis microphylla*.

OOPREE, a Bombay or Mahratta revenue term to designate a tenant at will.

OOPSUNG, see Kunawar.

OOR, also written ur, also pura, HIND.; a town, as Bangalore, Narsingapur.

OORALAY-GUDDA, TEL. Potatoes.

OOR BOYA WANLOO, a Tiling race, who become mercenary soldiery very devoted in their duties. They generally serve native rajahs, &c., and very rarely enter the British army.

OORDOO, HIND. The language called Hindustani, derived from the Turkish word Oordoo or Urdu, a camp or army or tribe, from which the European nations have formed the word horde.—*Elphinstone's King. of Cabul*, p. 481.

OORDHA-DES, a name of Orissa. See Ooria, Orissa, India.

OORDHA-VAHOO, SANS., from oordha, high, and vahoo, arm.

OORELA-TAMARAY, TAM. *Ionidium suffruticosum*.

OORGA KOOREN, see Kouren.

OORIA, a language which prevails in the northern part of the Ganjam district, as far south as Itchapore. In the southern division, the Telugu prevails.

OORLEE, see Kunawar.

OORMUL, a river near Mulhara in Chutterpore.

OOROOD, DUK., HIND. *Phaseolus mungo*.

OOROOPA, MALEAL. A tree which the natives prefer to teak for building ships, being more durable and close-grained.—*Ainslie, Rohde's MSS.*

OOROOPA, MALAY. Ooroopa wood, ANGLA-MALAY. *Hopea decandra*.

OOROOS, ARAB. The festival day of a mahomedan saint, on which oblations are offered at the tomb, also oblations or offerings to a saint, also called Churaghan (lit. lamps or illuminations).

Ooroos-i-baba boodun, alias Hyat qalandar.

Ooroos-i-bawa, Fuqur ood deen.

Ooroos-i-tubber-i-ullum, are mahomedan ceremonies.

OORU or Oorvasu. Turvasu is a great arm of the line of Yayat. Ooru was the father of a line of kings who founded several empires. Viroota, the eighth prince from Ooru, had eight sons, two of whom are particularly mentioned as sending forth two grand shoots, Druhya and Babru. From Druhya a dynasty was established in the north. Ar, with his son Khandar, is stated to have founded a state. Pritchita is said to have become king of Mhlecha-des, or the barbarous regions. This line terminated with Dushkhanta, the father of the celebrated Sacoontala, married to Bharat, and who, labouring under the displeasure of some offended deity is said by the hindoos to have been the cause of all the woes which subsequently befel the race. The four grandsons of Dushkhanta, Kalinjra, Keril, Pand, and Chowal, gave their names to countries. Kalinjra is the celebrated fortress in Bundelkhund, so well known for its antiquities. Of Keril it is only known that in the list of the thirty-six royal races in the twelfth century, the Keril, makes one, but the capital is unknown. The kingdom founded by Pand may be that on the coast of Malabar, the Pandu Mandel of the hindoos, the Regia Pandiona of the geographers of the west, and of which, probably, Tanjore is the modern capital. Chowal is in the Saurashtra peninsula, and on the coast, towards Jugut Koont, 'the world's end,' and still retains its appellation. The other shoot from Babra became celebrated. The thirty-fourth prince Anga, founded the kingdom of Anga-desa, of which Champa Malini was the capital, established about the same time with Canouj, probably fifteen hundred years before Christ. With him the patronymic was changed, and the Anga race became famous in ancient hindoo history; and to this day, An-des, still designates the Alpine regions of Tibet bordering on Chinese Tartary.—*Tod's Rajasthan*, Vol. i, p. 43.

OORUCK ZYE, an Affghan tribe bordering the Kohat district.

OOR-VASSEE, TEL. Dancing girls, Bogum wanloo, devotees of the Vaisya caste. They belong to the Rhumba and Oor Vussee sections.

OOSARA-REWAND, HIND., from *Stalagmitis gambogioides*, is real gamboge, imported into Ajmir via Pali; considered and used as a

violent cathartic, the punsari or druggists suppose it to be the extract of the *Mirabilis jalapa* root, the dose given is sixteen grains; one seer costs four rupees.—*Gen. Med. Top.*, p. 148.

OOSARICA, TEL. *Phyllanthus emblica*.

OOSSE-MOOLAY-KAI, TAM. *Capsicum* minimum.

OOSHA-HARANA, SANS. Hurunu means stealing.

OO-SHEET, BURM. *Egle marmelos*, *Corr.*

OOSHUPA, SANS., from ooshmun, heat, and pa, to drink.

OOSHITERANNEE, an Affghan tribe considered one of the most warlike of the tribes in the Suliman range. About the year A.D. 1840 they colonized in the skirt of the hills, where they hold perhaps 20,000 acres of arable land. They had been constantly engaged in feuds with the Kusrance, a tribe less warlike than themselves, but still by no means contemptible in spirit and enterprise.—*Records of Govt. of India*, No. 11.

OOSI-MULAGHAI, TAM. *Capsicum* minimum.

OOSINGIA, HIND.? *Sapindus laurifolius*.

OOSTAJALOO, see Kajar.

OOSULAY, TAM.? A wood of Tinnevely, of a light brown colour; specific gravity 0.832; used in building in general.—*Col. Frith*.

OOSUR, HIND., properly soil free from the saline efflorescence called "reh," but underlaid at a depth of six to twelve inches by a stratum, more or less continuous, sometimes of considerable thickness, of kunkur, sometimes in the form of a block (known as silia) and at other times in strings and nodules. "Reh" is a general term for all saline efflorescences. Sometimes it is an impure sulphate or carbonate of soda, sometimes chloride of sodium, and sometimes carbonate or nitrate of potass, but generally more or less a mixture of all. It rises to the surface by capillary attraction. It has occurred to a large extent, on the lands along the banks of the Ganges canal, and has greatly injured the soil. See Reh.

OOTACAMUND, in lat. $11^{\circ} 23' 7''$, long. $76^{\circ} 43' 2''$, a sanitarium in the Neilgherries, Dawson's Hotel is 7,490 feet above the sea. Ootacamund is nearly in the centre of the table-land of the Neilgherries at the foot of the western face of the peak of Dodabetta, and except to the N. W. the station is completely surrounded by grass-covered hills. Houses are scattered about under the shelter of the hills, with gardens and plantations of *Eucalyptus* and *Acacia heterophylla*, and the broad excellent roads are bordered by *Cassia glauca* bushes, honeysuckles, foxgloves, geraniums, roses and masses of the tall *Lobelia excelsa*. The population consists of about Europeans, 2,500; East Indians, 500, but the European and E. Indian

populations are migratory. Every European house has three or four fires daily. Ice is to be had in December and January mornings in the hollows and valleys of Ootacamund. The crust is scarcely half an inch thick, but sufficiently consistent for all freezing purposes.

Land on the Neilgherries, Wynaad, and Goodaloor, the latter lying immediately at the foot of the Neilgherry hills, is very much in demand, and scarcely to be had. The great land-holder at Goodaloor is the Nellenboor rajah. Coffee is not growable on the Neilgherries; the frost would kill the plants. It is on the slopes that land is sought for this description of culture, but on the Neilgherries themselves tea and chinchona can be grown to any extent.—*Bombay Gazette*, Jan. 2; *Mr. E. B. Thomas, Collector*; *Cleghorn's Forests and Gardens of South India*, p. 158; *The Neilgherry Star*, December; *Adolphe Schlagentweit*.

OOTATOOR and Verdachellum, near Trichinopoly, have limestone rocks containing numerous fossils, the limits of which are supposed to be near Trichinopoly on the south, and near Pondicherry on the north. From the examination of a very beautifully preserved and numerous suite of fossils collected from these sites by Messrs. Kaye and Cunliffe, of the Madras civil service, Professor Forbes arrived at the conclusion, that all the beds from which the fossils had been obtained were parts or members of one and the same series, and equivalent to the cretaceous series of Europe; the deposits at Trichinopoly and Verdachellum, being probably equivalent to the upper green sand and gault divisions of that series; the deposit near Pondicherry, being equivalent to the Neocomien, or lower greensand. But of the well marked section of the great genus Ammonites, among the large addition to the known catalogue of species, which Mr. Cunliffe's collection has given, we have none of the Fimbriati, an oolitic and cretaceous section; none of the Flexuosi, also a lower cretaceous section; none of the Dentati, also lower cretaceous; none of the Armati, an upper oolitic section; and none of the Lævigati; while on the other hand, of the Cristati, a section essentially cretaceous, we find of the Clypeiformi also a cretaceous section, one of the Heterophylli five, and all of the cretaceous subdivision of this section; of the Ligati, a group essentially cretaceous, not less than ten. *O. Nautilus*, a genus having a larger development in the upper than in the lower beds of the cretaceous, we have three allied to other cretaceous forms; of *Belemnitella*, confined to the upper portion of the cretaceous group, one. These will suffice to show, that a vast addition to the cretaceous Fauna of India still remains to be worked out. The following fossils from

Ootatoor near Trichinopoly, were furnished by Mr. Brooke Cunliffe:

Zoophyta,	Voluta,	- - -
Turbinolia,	Phasianella,	- - -
Echinodermata,	Strombus,	- - -
Brissus,	Tornatella,	- - -
Nuculolites,	Cephalopoda,	- - -
Holaster,	Baculites,	- - -
Crustacea,	Ptychoceras,	- - -
Cancer (?)	Hamites,	- - -
Mollusca (Acephala.)	Turritiles,	- - -
Luceramus,	Ammonites,	- - -
Pecten,	Cristati,	- - - 1
Ostra,	Lævigati,	- - - 1
Gryphæa,	Clypeiformi,	- - - 1
Pinna,	Heterophylli,	- - - 6
Arca,	Ligati,	- - - 13
Pectunculus,	Nautilus,	- - - 4
Modiola,	Belemnites,	- - - 2
Trigonia,	Belemnitella,	- - - 1
Solecurtus,	Amelida,	- - -
Cardium,	Serpula,	- - -
Gasteropoda,	Pisces,	- - -
Natica,	Odontaspis,	- - -
Trochus,	Otodus,	- - -
Pleurotomaria,	Lamna,	- - -

The fossil Cephalopoda of the cretaceous rocks of southern India are thus enumerated by Professor Oldham.

Belemnites fibula, *Forbes*, at Ootatoor, Trichinopoly.

„ stilus, *Blanford*.

„ seclusus.

Nautilus bouchardianus, Shutanure, Olapandy, Pondicherry, Arrialoor, Trichinopoly, Shillagoody.

„ clementinus, Karapandy, Olapandy.

„ luxleyanus, Moonglepandy, Serlamungalam, Andoor, Shutanure, Moonglepandy Coonun.

„ danicus, Sainthoray, Ninnyoor.

„ justus, Odium.

„ elegans, Thuwvanore, Andoor, Shutanure.

„ splendens, Odium, Appapandy.

„ formosus, Karapandy, Andoor.

„ kayanus, Ootatoor.

„ augustus, Odium, Trichinopoly, Purawoy.

„ clementinus, Coothoor, Trichin., Otacoil.

„ pseudo-elegans, Odium.

„ serpentinus, Rayapootha pakkam.

„ Forbesianus, Moraviatoor, Odium.

„ Nagama, Sirgumpore.

„ crebricostatus, Ootatoor.

„ Trichinopolitensis, Arrialoor.

„ rotha, Mulloor.

OOTALIPANNA, TAM. *Caryota urens*, *Linn.*

OO-TA-LUNG, BURM. *Ceropegia arnotiana*, *Wight*.

OOTERAYNI, TEL. *Achyranthes aspera*.

OOTHAE GIRIA, a term applied to professional thieves of the Tehrie, Dutcah, Shahgurg, Chundeyree or Baupoor States.

OOTHAMUNNI, TAM. *Dæmia extensa*.

OOTRADI KE MUNKE, also Ootraj ke munke, DUK. Seeds of *Elæocarpus lanceolatus*, used as beads by hindoos.

OOTRAR, probably the Ootraracura of ancient hindoo geography: the ootroo (northern) cooru (race), a branch of hindoo stock.—*Tod's Rajasthan*, Vol. i, p. 61.

OOTRAYANAM: the “Tarapanum,” is per-

formed in Ootrayanam and Dutchanayenum by all the hindoos.

OOTRUM FIBRE, ANGLO-TAM. A fibre from the *Dæmia extensa*, a promising substitute for flax.

OOTUNGUN, HIND. A seed used in medicine procurable in all Indian bazaars, obtained, according to Dr. Royle, from a species of *Urtica*.

—*Hornigberger*.

OOTUL HYU, SANS., from oot, prep., and tuthyu, just.

OOVAH HILLS, see Veddha.

OPAL, ENG., GER.

Opale,	FR.	Biduri,	MALAY.
Opallion,	GR.	Opala,	PORT.
Opalo,	IT.	Opalo; Piedra iris,	SP.
Opalus,	LAT.		

This delicate iridescent gem has been known by the name it now bears from the time of Pliny. There is in it the gentler fire of the ruby; the brilliant purple of the amethyst; and the sea green of the emerald all shining together. This is produced by the reflection and the refraction of light, in certain openings of the mass. Mother of opal is a compact serpentine of a dark-brown colour filled with minute opals of extraordinary lustre. It is cut into thin slabs and was formerly much in use for the tops of snuff boxes. In Hungary there is a mine of opals. This mineral is a hydrate of silica, and has several varieties.

Precious Opal or Noble Opal, is white, bluish, or yellowish-white, and exhibits a beautiful variety or play of colours, as blue, green, yellow, and red, several of which appear together. Fracture conchoidal, with a vitreous or resinous lustre; it is easily broken, but scratches glass. Specific gravity 2·06 to 2·09. Infusible by the blow-pipe, but becomes opaque and loses water. The most beautiful specimens occur in Hungary, but it has also been found in Saxony, South America, &c. The analysis of the Hungarian opal by Klaproth showed in 100 parts, Silica, 90; Water, 10.

In Fire Opal, also called Girasol, the internal reflection is bright red. It occurs with the Precious Opal in Hungary, and has also been found in Cornwall.

Hydrophane or Mexican opal is usually opaque, but is rendered transparent, and exhibits the iridescent colours of the Precious Opal by immersion in water. It contains a little alumina in addition to silica and water.

Common Opal or semi-opal, is white, green, yellow and red; it has sometimes a milky opalescence but is entirely destitute of the play of colours exhibited by the Noble Opal. In other properties they greatly resemble each other. It is stated to contain a little oxide of iron mixed with the silica and water. It is found chiefly in Hungary and Saxony, but specimens have also been produced in Cornwall.

and in the Dekhan, is very abundant along the banks of the Seena river, between Sholapore and Ahmednuggur.

Semi-Opal is more opaque than the Common Opal, and is dull. It occurs either white, gray, yellow, brown, or green. It is found in the same places as the foregoing.

Wood-Opal is wood petrified with a hydrated silica so called from its showing the woody structure. It occurs of several tints of white, gray, brown, and black. It is generally harder than the Semi-Opal, but does not materially differ from it in other properties. It occurs in Hungary, in Transylvania, and in Madura, in the peninsula of India.

Cacholong, is white opaque opal; harder than the Common Opal; dull, brittle, fracture flat conchoidal. Specific gravity 2.2. Infusible before the blow-pipe. It contains water and a little alumina. It is found on the banks of the river Cach in Bucharia, in loose masses. It occurs also in the Faroe Islands, Greenland, and Iceland.

Opal Jasper, Ferruginous Opal.—Opaque, or but feebly transparent on the edges. Colour generally deep shades of red, yellow, and gray. Fracture flat conchoidal. It appears to be a silicate of iron with water. Silica, 43.5; Oxide of Iron, 47.0; Water, 7.5. It occurs in Hungary, Siberia, and Madura. Klaproth gave an analysis of a variety from Telkebanya. The opal is the most beautiful of all gems. Its price depends on the play of colours displayed. The hydrophane loses its beauty when exposed to water. Opal generally contains a little oxide of iron, and a small quantity of the alkaline earths. Precious opal scratches glass, but is easily broken on account of the numerous fissures by which it is traversed, and which probably give rise to the splendid play of colours. Opals are cut with rounded faces. Common opal, or semi-opal, has the hardness of opal, and is easily scratched by glass, which distinguishes it from siliceous stones often called semi-opal. Hyalite, Muller's glass florite, a glassy transparent variety, resembling transparent gum arabic, occurs in small concretions, stalactitic, and stalagmitic; Menilite, found in kidney-shaped masses at Mount Menil, near Paris, is a brown opaque variety, not unfrequently slaty; Opal jasper resembles jasper, but contains iron, and is not so hard. Tabasheer, a siliceous aggregation found in the joints of the bamboo; Siliceous sinter, deposited from hot springs, and near volcanoes, has sometimes an opaline character. From its structure of pure silica and water, the latter imbibed from the atmosphere, opal is extremely tender, sometimes bending if exposed to extremes of heat or cold, or if the openings on which the play of colours de-

pends become choked up with dust and grease by wear, its play of colours may be lost. The Hungarian opals are the more valuable and harder, they present a uniform milkiness of surface more or less iridescent. The Mexican opals when recent, present an unmixed globule of green fire, but they become colourless or of an opaque brown if wetted. The opal is only cut in cabuchon. The opal of Nonius, whom Mark Antony prescribed, was valued at £20,000 of British money. According to Pliny, India was the source of opal, but if so, the locality is not unknown. The Hungarian opal is found embedded in porphyry in the mines of Czerventza. It was very successfully imitated by the Roman king.—*King*, p. 292; *Tavernier's Travels*, p. 144; *Eng. Cyc.*; *Chamber's Journal*, June 1868; *Tomlinson*.

OPALESCENT SAPPHIRE, see Corundum, Sapphire.

OPERCULUM is the plate which protects the apertures or exposed parts of certain molluscs. In many of the Testaceous gastropods it fits the aperture of the shell more or less accurately when the animal has retired within it. Opercula are sometimes horny, as in *Trochus* and *Murex*; sometimes shelly, nay almost stony as in *Turbo*. In botany this term is used for the cap which forms the upper extremity of the theca, or sporangium, of a moss, covering over the peristome, and usually falling off when the spores are ready for dispersion. It has also been applied to the lid which covers in the Pitcher of *Nepenthes*, where it is the lobe of a modified leaf.—*Eng. Cyc.*

OPH, Heb. A serpent, was pronounced Ope; Oupis; Opis; Ops; and, by Cicero, Upis, and in the Egyptian Ob, or Aub. The Oph was an emblem of the Sun, also of time and eternity. The basilisk or royal serpent was named Oubaios. The idolatry of the serpent is alluded to in Lev. xx, 27; Deut. xviii, 11. See Ophis; Serpent.

OPHELIA, a genus of plants, belonging to the order Gentianaceæ. Dr. Wight gives *Ophelia corymbosa*, *O. alata*, *O. angustifolia*, and *O. chirata*, *clatior*, *elegans*, *Grisebachiana*, and *minor*. They are slender plants which grow at moderate heights in the Punjab Himalaya, several of them being exported to the plains for use in medicine under the name of *Chirata* which has undoubtedly tonic and febrifuge properties, is largely used by natives, and occasionally by Europeans. Honigberger supposes *harun-tutiya* to be from one of these.—*Wight's Icones*; *Dr. J. L. Stewart's Punjab Plants*.

Agathotes chirata, D. Don.

Hab-ul-mul,	AR.	Chirataka,	SANS.
Kabs-ul-zarreh,		Kirata-ticta,	
Chiretta,	HIND.	Shayraat-koochie,	TAM.
Dowa-i-pechish,	PEHS.	Shilassuttoo coello,	TEL.

Chiraeta is as universally employed throughout Southern Asia as Gentian is in Europe. It has long been known to the hindoes. Dr. Fleming (in *Asiat. Res.*, xi, p. 167), referred it to the genus *Gentiana*, others to *Swertia*, and the late Prof. Don to *Agathotes*; Grisebach now refers it to *Ophelia*. Several plants closely allied to the *Chiretta*, are used for the same purposes. *Ophelia* (*Swertia*, Wall.) *angustifolia*, Don., is so in Northern India, and called pulharee, (*i. e.*, hill) *chiretta*, to distinguish it from the true or dukhunee (southern) *chiretta*. *Justicia paniculata* is also one of the *chiretta* plants. *Exacum tetragonum* is called ooda (that is, purple) *chiretta*. *Ophelia chirata* is an annual of from 2—3 feet high, with a single, straight, round, smooth stem. Seeds numerous, affixed to two receptacles adhering to the sides of the valves. Grows in the Himalaya mountains. *Chiretta* is met with in a dried state, tied up in bundles, with its long slender stems of a brownish colour, having the roots attached, and which have been taken up when the plant was in flower. The whole plant is bitter. They yielded a resin, a yellow bitter substance, a yellow colouring matter, gum, malic acid, salts of potash; and of lime, and traces of oxide of iron. Mr. Brattle states that it contains a free acid; a very bitter extractive and resinous matter, and much gum. Muriate and sulphate of lime and of potash; also, that the spirituous extract is more aromatic than that of *Gentiana lutea*, but that the extractive and the gum are in larger proportion in the latter. Water and spirit take up its active properties. It is a bitter tonic; stomachic in dyspepsia or as a tonic in convalescence; either cold or hot infusion; the former is lighter, and well suited to dyspeptics, and not so apt to create nausea in a hot climate. Sometimes a little orange-peel or cardamom is added. A tincture is made like that of gentian with two ounces to sixteen ounces of proof spirit like other bitters, is best taken half an hour before meals. It acts as a simple bitter tonic, not

OPHELIA ELEGANS.

aromatic nor astringent, and is the best substitute for gentian and quassia. It is principally used by Europeans in fever, debility, and dyspepsia. The root is the bitterest part of the plant, and the bitter principle is easily imparted to water or alcohol. It is found to be a very efficacious remedy in India against intermittents, particularly when associated with *Guilandina bonduc* or *Caranga nuts*.—*Royle's Ill. Him. Bot.*, p. 277; Wall, *Pl. As. Rar.*, iii, pp. 33 to 252; *Powell's Hand-book*; Vol. i, p. 362; *Indian Annals of Medical Science*, No. 6.

OPHELIA ELEGANS, Roeb., W. Ic.

Salaras: Silajitu, TEL.

Ophelia elegans grows plentifully in several parts of the Madras Presidency. *Ophelia elegans* is erect, ramous, above obsoletely 4-sided, leaves sessile, narrow, ovate lanceolate, tapering to a slender point, 3-nerved, lateral nerves close to the margin, branches ascending, slender, bearing at each joint lateral few flowered cymes, forming together a large many flowered leafy panicle, calyx lobes narrow, lanceolate, acute about two-thirds the length of the corolla: lobes of the corolla; obovate, cuspidate, fovea bound with longish coarse hairs, flowers pale blue. Pulney Hills, flowering August and September. A very handsome species when in full flower, forming as it does a rich panicle of light blue flowers streaked with deeper coloured veins. It seems very distinct from all the other species (Wight.) This plant grows plentifully in the Jeypoor zemindary of Vizagapatam, and is largely exported as Salaras or Selajit, the amount being valued at about 2,500 rupees a year. It is preferred by the hukeems or native practitioners to the genuine Himalayan *chiretta* and is considered febrifuge. The samples of the drug seen as exported are about 16 inches long and 4 inches deep, and are always tied up with the tough bark and large leaves of *Bauhinia vahlii* (W. & A.) which abounds in the Northern Circars. *Ophelia elegans* is closely allied to, and greatly resembles *chiretta*—the native name is Salaras or Salajit: the stalks are sold bound together in bundles about one foot long, and a little thicker than a man's arm. The drug is exceedingly cheap, and the amount exported is considerable: to what extent it is employed, is difficult to ascertain, as it is confounded in the bazaar with *chiretta*. This species of *Ophelia* is common on the Pulney Hills in Southern India, also in Vizagapatam, and the plant has long been used as a bitter tonic. Equal quantities of the *Exacum bicolor*, *Ophelia elegans* and of the *chiretta* of the medical stores (which on examination was found to contain some stalks of the *Ophelia elegans*) having been infused, in the usual manner, (2 oz. to 1 pint,) four competent parties were requested to give

their opinion on the respective qualities of the infusions. The result was the unanimous opinion that the cold infusions of *Exacum bicolor*, although a pure bitter, was much milder than that of *Ophelia elegans*, which possesses a powerful bitterness, remaining for several minutes in the mouth. Frequent trials confirm the belief that it exercises a tonic influence on the digestive organs, thereby improving the general health, while it appears also to have a febrifuge property. *Ophelia alata* and *Ophelia chiretta* seem to be used similarly; they grow in the Himalaya.—*Indian Annals of Medical Science*, Nos. 5 & 6; *Cleghorn in M. E. J. R.*; *Honorable W. Elliot in literis*.

OPHELIA PANICULATA, *O. purpurascens* and *O. speciosa* are all three known as *Chiretta* or *Cherayta*: they are found in the Sutlej valley between Rampur and Sungnam at an elevation of 7,000 to 9,000 feet. These annual plants supply the chief portion of the bitter root exported to the plains.—*Cleghorn's Punjab Report*, p. 68.

OPHIDIA, an order of reptiles without feet; as under:—

THE ORDER OF SNAKES—Ophidia.

First Sub-order—Innocuous Snakes.

- I. Blind Snakes—Typhlopidae.
- II. Short-tails—Tortricidae.
- III. Xenopeltides—Xenopeltidae.
- IV. Rough-tails—Uropeltidae.
- V. Dwarf Snakes—Calamariidae.
- VI. Oligodontes—Oligodontidae.
- VII. Colubrides—Colubridae.
- VIII. Fresh water Snakes—Homalopsidae.
- IX. Desert Snakes—Psemmophidae.
- X. Tree Snakes—Dendrophidae.
- XI. Whip-Snakes—Dryophidae.
- XII. Dipsades—Dipsadidae.
- XIII. Lycodontes—Lycodontidae.
- XIV. Blunt Heads—Amblycephalidae.
- XV. Rock Snakes—Pythionidae.
- XVI. Sand Snakes—Erycidae.
- XVII. Wart Snakes—Acrochordidae.

Second Sub-order—Venomous Colubrine Snakes.

- I. Terrestrial—Elapidae.
 - II. Sea Snakes—Hydrophidae.
- ##### Third Sub-order—Viperine Snakes.
- I. Pit-vipers—Crotalidae.
 - II. Vipers—Viperidae.

First Sub-order—Innocuous Snakes.

- I. Blind Snakes—Typhlopidae.
- Typhlina lineata*, Boie... Penang, Hongkong.
Typhlops nigroalbus, D.
and B.... Penang, Singapore.
horsfieldii, Gray... Khasya, Assam, Tenasserim, Cochin-China.

OPHIDIIDÆ, a family of fishes which may be thus shown :

FAM. 4.—Ophidiidae.

FIRST GROUP.—Brotulidae.

- Gen.* 4 Brotula, 2 Lucifuga, 2 Sirembo, 1 Xiphogadus, 2 Dinematchthys, 1 Bythites, 1 Pteridius, 1 Brotulophis.

SECOND GROUP.—Ophidiina.

- Gen.* 6 Ophidium, 3 Genypterus.

THIRD GROUP.—Fierasferina.

- Gen.* 9 Fierasfer, 1 Encheliophis.

FOURTH GROUP.—Ammodytina.

- Gen.* 6 Ammodytes, 1 Bleekeria.

OPHIOCEPHALUS STRIATUS.

FIFTH GROUP.—Congrogadina.

Gen. 2 Congrogadus, 1 Haliophis.

OPHIDION, a genus of fishes of the family Triglidae which may be thus shown:

FAM. 10.—Triglidae.

FIRST GROUP.—Heterolepidina.

Gen. 8 Chirus, 2 Ophidion, 1 Agrammus, 1 Zaniolepis.

SECOND GROUP.—Scorpenina.

Gen. 25 Sebastes, 21 Scorpena, 1 Glyptauchen, 8 Pterois, 1 Pteropichthys, 1 Taniaotus, 4 Centropogon, 2 Apistus, 1 Enneapterygius, 1 Pentarogge, 10 Tetrarogge, 7 Agriopus, 8 Prosopodasys, 9 Aplo-

pus,

THIRD GROUP.—Cottina.

Gen. 2 Podlabrus, 2 Blepsias, 1 Nautichthys, 1 Scorpenichthys, 20 Cottus, 10 Centridermichthys, 1 Icelus, 1 Triglops, 2 Hemilepidotus, 2 Artedius, 1 Ptyonotus, 1 Polycaulus, 29 Platycephalus, 1 Hoplichthys, 2 Bembras, 8 Prionotus, 6 Lepidotrigal, 14 Trigla.

FOURTH GROUP.—Cataphracti.

Gen. 10 Agonus, 2 Aspidophoroides, 6 Peristethus, 4 Dactylopterus, 1 Cephalacanthus.

OPHIEL, see Serpent.

OPHIOCEPHALIDÆ, a family of fishes comprising 25 sp. Ophiocephalus, and 1 sp. Chanua.

The amphibious snake-head fish, (Ophiocephalus amphibeus) occurs in the fresh waters of Burmah, but the natives regard them with superstitious awe and do not eat them. They have a legend that they were formerly men, changed into fish for their sins, and the Pwo Karen of Tavoy say that if people eat them they will be transformed into lions. Frogs do some mischief among the fry of Hylorana malabarica; Hylorana florescens; Rana cyanophlyctis (Schn.) an unnamed species of Polypodates, but they have themselves enough of enemies. In the water, the murrel (Ophiocephalus) feeds almost entirely upon them, generally lying close under the banks for this purpose, and on land mongooses, snakes, kites, crows, and paddy-birds assist in suppressing them, while water-snakes follow them in both elements. The most troublesome is the common brown one, Rana cyanophlyctis. The Ophiocephalus striatus occurs in the Peninsula of India, attains a length upwards of 3 feet. O. gachua, to one foot long, and Dr. Day believes that they breathe air direct from the atmosphere.

OPHIOCEPHALUS STRIATUS, Bloch.

Murrul, ENG. | Karupu veraul, TAM.

This, along with other species of murrul, is found on the Neilgherry hills. Fish travel; not eels alone, which in all countries can move rapidly over moist land. Theophrastus (De piscibus) the contemporary of Aristotle, mentions fishes found in the Euphrates, which, in the dry seasons, leave the vacant channels and crawl over the ground, in search of water,

OPHIOXYLON.

moving along by fins and tail. The Ophiocephalus amphibeus of Burmah travels over land. The Ophiocephalus striatus occurs in the Indian Peninsula, attains a length of upwards of 3 feet. O. gachua, to one foot long, and Dr. Day believes that they breathe air direct from the atmosphere. Hartwig mentions that in several fish the gills communicate with a cellular labyrinth containing water, which keeps the gills moist; by this means the hassar of Guiana, the frog-fish of Ceylon and the climbing perch of India are able to remain out of the water. The hassar throws itself forwards by the spring of its tail, and can move in that way nearly as fast as a man can leisurely walk. The pectoral fins of the frog-fish supported by the bones of its carpus perform the office of feet. The climbing perch moves itself up trees by means of its ventral fins Hartwig.

OPHIOGLOSSACEÆ, Tindley, a natural order of plants of little or no use. The name of the order is derived from two Greek words, ophis a snake, and glossa a tongue.

Ophioglossum reticulatum, Linn., Bengal, Mauritius, Jamaica.

„ filiform, Rorb., Bengal, Peninsula of India.

„ pendulum, Linn., Mauriti., Khassya, Moluccas. Helminthostachys flacinita, Bengal, Pen. of India, Moluccas.

They are of little or no use.

OPHIOPOGON JAPONICUS.

Meh-men-tung, CHIN.

A liliaceous plant growing in Hankow, Yuhau-hien and Hang-chau-fu in the Cheh-kiang province. Its tubers, as seen in the market are shrivelled, pale, yellow, soft and flexible from one to one and a half inch long.—Smith.

OPHIORRIZA MUNGOS, Linn.

Kajo mar, JAV. | Sarpakshi chettu, TEL. Mendi, SINGH.

A native of Java, Ceylon, and Sumatra; all parts are intensely bitter; it has high reputation as a remedy for snake-bites. Roxburgh altogether discredits its supposed virtues. This plant is often confounded with the Ophioxylon serpentinum, of the family of Apocynæ, (Chundra, Bengalee). The Singhalese use it in cases of snake-bites, the leaves and bark are made into decoction and given in doses of half an ounce. Dr. Wight, in Icones gives, Ophiorrhiza eriantha, grandiflora, harrisonii, roxburghiana. The Arabs appear to be ignorant of the virtues of the Ophiorrhiza, which is very common on their hills. But they value highly the Aristolochia sempervirens, which they consider not only as a remedy, but as a preservative too, against the bite of serpents.—O'Shaughnessy, p. 400; Ains. Mat. Med., p. 89; Niebuhr's Travels, Vol. ii, p. 348; Roxburgh's Fl. Ind., Vol. ii, p. 530, ed. Carey; Ainslie, Vol. ii, p. 441.

OPHIOXYLON from ὄφις, a serpent, and ξύλον, wood, because it has a twisted root and

stems, a genus of plants belonging to the natural order Apocynaceae. It has a 5-cleft permanent calyx, a funnel-shaped corolla with a long tube, thickest in the middle, and a five-cleft oblique limb. The anthers are subsessile, inserted into the middle of the tube. The ovary is double, each lobe with one ovule, a filiform inclosed style and a capitate stigma. The drupes are baccate, black, about the size of a pea, twin, or solitary by abortion, each containing a 1-seeded wrinkled nut. Wight gives *Ophioxylon belgaumense*, *ceylanicum*, *macrocarpum*, *neilgherrense*, *serpentinum*.—*Eng. Cyc.*; *W. Ic.*

A plant of Ceylon and of British India. The ophioxylon *serpentinum*, *Ophiorhiza mungos*, *Fistolochia indica*, and *Mimosa octandra* are popularly said to be the plants to which the mungoose resorts in its attacks with snakes. Serpentine snake-wood, is a native of the East Indies. In rich soil it becomes a climbing plant. The stems are woody, erect, climbing and twining, but in poor soil it is a small erect shrub. The leaves are in threes or fives; they are short-stalked, oblong, pointed, wavy, and smooth. The peduncles are long, smooth, round, sometimes nearly erect, sometimes drooping. The pedicles and calyxes are of a bright red colour, and the corollas white. The root of this plant is employed by the Telinga physicians as a remedy in many diseases. The root is used as a febrifuge, as an antidote to snake-poison, and to promote delivery in tedious cases. On the Malabar coast the root is supposed to have sovereign virtues in cases of snake-bites and scorpion stings: it is prescribed in decoction to the extent of a pint in the twenty-four hours and the powder is applied externally to the injured part. The root is said to be a bitter tonic and febrifuge and also purgative.—*Eng. Cyc.*; *qu. Lindley*, p. 532; *O'Shaughnessy*, p. 447; *Ains. Mat. Med.*, p. 115; *Roxburgh's Fl. OPHIR. Gold is often mentioned as an ar-

ticle of commerce. In the Bible (I Kings, c. 9, v. 26) about 1,000 B.C., Solomon, king of all Israel, "made a navy of ships in Eziongeber, which is beside Eloth on the shore of the Red Sea, in the land of Edom." And these ships brought gold, silver and precious stones from Ophir and Tarshish in such quantities that king Solomon "exceeded all the kings of the earth for riches." Silver was so plentiful at his Court that it was "accounted nothing of." The king's drinking cups were made of pure gold, and his shields were covered with beaten gold. It has never, however, been settled where Ophir and Tarshish were situated, but we are distinctly told that the navy of Tarshish brought "gold and silver, ivory and apes and peacocks," and it has been surmised by some writers that Tarshish was either China, or some islands in the China seas. Ophir is supposed to have been some district or port in the Red Sea, on the east coast of Africa, the Malabar coast and the coast of Malacca. The "precious stones" which king Solomon procured from Ophir are specially referred to. Some Portuguese historians have supposed that it was Sofala, or some other place near the mouths of the Zambezi, on the east coast of Africa, whence the Tarshish fleet brought the rich merchandise which contributed so much to the splendour and magnificence of Solomon's kingdom. The Tarshish fleet is said to have arrived at Eziongeber only once every three years, from which we may fairly infer that the voyage was a considerable one, or the ships had to go with the S. W. monsoon and return with the N. E. winds, or that they made a trafficking voyage from one place to another until the cargo was sold and another shipped. Ships or boats coasting from the Red Sea to the mouths of the Zambezi would scarcely take three years for such a voyage. We are inclined to believe, therefore, that king Solomon's navigators crossed the open seas and traded with India and China. *Eziongeber*, on the shores of the Red Sea, (I Kings, ix and 26), is a little port at the head of the Elamitic, or eastern gulf of the Red Sea. This town more naturally belonged to the Midianites of Sinai, or rather to their friends the Egyptians. It was afterwards called Berenies by the Ptolemies; and its place is still pointed out by the Egyptian name of the valley in which it stood as Wady Tabe, the valley of the city, and is no doubt the town known seven centuries later under the name of the Golden Berenice, and not many miles from the modern Souakin, where gold was more common than in every other place of trade. Solomon's ships sent from Eziongeber, brought home chiefly gold from Ophir. From Ophir they also brought precious stones and ebony. There are however conflicting opinions

amongst the learned as to the meaning of Ophir whether it was a country or it be the Arabic verb, *Afr*, to flow, to rush in, to pass on. If the latter etymology be the correct one, whatever place produced gold, would be styled Ophir by the Hebrews. There are, at present, in the Eastern Archipelago two places called *Mt. Ophir*—one of them a mountain in Sumatra, in the Palimbayang district, 9,770 feet above the sea, to which the name was given by the Portuguese, and they gave the same name to a mountain 40 miles N. of the town of Malacca, 4,000 feet high. In the vicinity of both of them gold has been obtained. Josephus expressly says that the *Aurea chersonesus* was the Ophir of Solomon's time. Malacca alone of the three Straits' Settlements has a name in history; it being not improbable, as is thought, that it is the eastern extremity of what was known as Ophir to the ancient Hebrews, or *Sophr* to the authors of the Septuagint version, whither the fleets of Hiram and Solomon voyaged on their trading expeditions. In various parts of the First Book of Kings are notices of the productions of Ophir. "And they came to Ophir, and fetched from thence gold, four hundred and twenty talents. And the navy also of Hiram, that brought gold from Ophir, brought in from Ophir great plenty of almug trees, and precious stones." "Once in three years came the navy of Tarshish, bringing gold and silver, ivory and apes, and peacocks." The learned dispute as to the situation of Ophir; some contend that the eastern part of Africa now called Zanzibar and Mozambique, where there is a region called *Fura* producing gold, was the Ophir or the *Tarshish* of the East, Spain being that of the West. Others believe that the district of Oman in Eastern Arabia, where is a place called *Al Ophir*, is meant; and others say that India and Ceylon are to be understood. But although it is said, that the Queen of Sheba (the present country of the *Habshi* or *Abyssinians* and the southern parts of Arabia) came to see Solomon with great stores of gold, precious stones, and spices, it is nowhere said that these, at least the gold and precious stones, were the productions of Sheba. As Sheba lay contiguous to the gold regions of Africa and not far from India, it does not seem at all improbable that she obtained these precious articles by trade with those countries.

The Mount Ophir of Malacca is called *Goonong Ladong*. In Malay, Ophir is the generic term for any gold mine. Professor Max Muller believes Ophir to be India, and he proves it by a reference to the ancient names for the articles imported by Solomon, which are Sanscrit. Heeren thought the word Ophir had at first a very general signification,

and was used even as early as the time of Moses to signify the distant countries with which the Jews were not acquainted except by hearsay. Gradually it came to mean those countries to the eastward with which the Phœnicians and others carried on trade, including Arabia, Persia, India and Ethiopia. The supposition that India in particular was meant is favoured by the fact that the ancient Egyptian word for this country was *Zophr*. Another supposition is that Ophir was merely a trading depôt of the Phœnicians somewhere on the Arabian coast, where they bartered their commodities for the gold which traders collected there. This is not in harmony with the fact that these voyages to Ophir in the time of Solomon took three years, or rather the ships came every third year with their valuable cargo. This expression might mean the whole of one year and a few months out of two other years. The nature and direction of the winds blowing in those quarters, would allow of a voyage from the head of the Red Sea to India, stopping at several places on the way, being accomplished by the rude vessels and cautious sailing of those days, in a period of from eighteen months to two years. Max Muller's philological argument only adds to the probability of the opinion that India is the Land of Ophir. Among the Biblical records, see I Kings, ch. ix, 28, x, 11 and 22; II Chronicles, ch. ix, 10 and 21. In Bochart's *Geog. Sacr.* (Phalag) Lib. II, §. 27, he affirms that every circumstance required to constitute the Ophir of Hebrew scripture, may be found in the classical *Taprobane*, the modern Ceylon; "*quia Taprobane insulæ, (quam Zeilan esse alibi probabo) omnia ad amussim quadrant quæ de Ophira legere est in libris Regum et Paralipomenon. Ibi enim aurum et çbur, gemmasque et margaritas magna copia nasci nemo est qui nesciat. Scatere etiam pavonibus, scribit steucnius in Arrianum. Et in Chersoneso proxima magni pretii cercopithecus memorat Ludovicus Vartamanus.*" In the second part of his sacred geography, or "*Chanaan*," (Lib. I, cap. 46) he collects diagrammatically, the proofs offered in support of his opinion by classical writers and modern geographers, travellers and others. In an interesting and valuable work on Ceylon, Sir Emerson Tennent has suggested that the port of Galle may be the *Tarshish* of the Bible, "which lay in the track between the Arabian Gulf and Ophir," and that Ophir itself is Malacca, or the *Aurea Chersonesus*, because "Ophir in the language of the Malays is the generic name for any gold mine." But this view seems to General Cunningham to be quite untenable, as the names of all the articles brought back by Solomon's fleet are pure Sanscrit. Sir Emerson states that they are "identical

with the Tamil names by which some of them are called in Ceylon to the present day." These names are sen-habin, or "teeth of elephants," kophim, or "apes," and tukum, or "parrots." But these are the pure Sanscrit words *ibha*, *kapi*, and *suka*, with the mere addition of the Hebrew plural termination. It is true that these Sanscrit names have been naturalized in the south of India, but they have not displaced the original Tamil appellations, which still remains the terms in common use, namely, *yana* for elephant, *kurangu* for monkey, and *myle* for peacock, or *kilip-pullai* for parrot. The writer of the article Ophir in Smith's 'Dictionary of the Bible' argues in favour of Arabia, by assuming that, "ivory, apes, and peacocks" were not imported from Ophir, but from Tarshish, and that gold and alum trees only were imported from Ophir. Sofir is the Coptic name of India at the present day; but the name must have belonged originally to that part of the Indian coast which was frequented by the merchants of the west. If the name of Sauvira was derived, as General Cunningham supposes, from the prevalence of the Ber-tree, it is probable that it was only another appellation for the province of Badari, or Eder, at the head of the Gulf of Cambay. In the Septuagint translation of the bible the Hebrew Ophir is always rendered by Sophir. This spelling was perhaps adopted in deference to the Egyptian or Coptic name of Sofir. The earliest mention of the name is in the book of Job, where the "gold of Ophir" is referred to as of the finest quality. At a later date the ships of Hiram, king of Tyre, "went with the servants of Solomon to Ophir, and took thence 450 talents of gold, and brought them to king Solomon." The gold of Ophir is next referred to by Isaiah, who says, "I will make a man more precious than gold, even a man than the golden wedge of Ophir." The word here translated 'wedge' means a 'tongue or ingot;' and General Cunningham infers that the wedge of gold of 50 shekels' weight that was concealed by Achan was most probably one of the ingots of Ophir. The district of Vadari, or Eder, which General Cunningham suggested as the most probable representative of Ophir, has been, and still is, one of the gold-producing countries of the world. Pliny, describes the people dwelling on the other side of mount Capitalia (or Aliu), as possessing "extensive mines of gold and silver." At the present day the Aravali range is the only part of India in which silver is found in any quantity, while the beds of its torrents still produce gold, of which many fine specimens may be seen in the Indian museum.—*Sharpe's History of Egypt*, Vol. i, p. 107; *Bikmore*, p. 403; *Ouseley's Travels*, Vol. i, p. 46; *Cunningham's Ancient*

Geography of India, pp. 496 to 499, 561; *Tennent's Ceylon*. See Malacca.

OPHTHALMIC BERBERRY, *Berberis lycium*, *Royle*.

OPIAI of Hekæteus, their royal town has not been identified, probably Kabul.

OPIAN, called Hupian by Baber, is supposed by General Cunningham to be Alexandria apud Caucasum. The position of the city founded by Alexander at the foot of the Indian Caucasus has long engaged the attention of scholars. According to Pliny, the city of Alexandria, in Opianum, was situated at 50 Roman miles, or 45·96 English miles, from Ortospana, and at 237 Roman miles, or 217·8 English miles from Peucolaitis, or Pukkalauti, which was a few miles to the north of Peshawur. Ortospana has been identified by General Cunningham with the ancient city of Kabul and its citadel, the Bala Hisar. Pliny further describes Alexandria as being situated sub ipso Caucaso, at the very foot of Caucasus, "which agrees exactly with the position of Opian, at the northern end of the plain of Koh-i-daman, or "hill-foot." The place was chosen by Alexander on account of its favourable site at the triodon, or parting of the "three roads" leading to Bactria. These roads, which still remain unchanged, all separate at Opian, near Begram. The north-east road, by the Panjshir valley, and over the Khawak Pass to Anderab. The west road, by the Kushan valley, and over the Hindu Kush Pass to Ghorî. The south-west road, up the Ghorband valley, and over the Hajiyak Pass to Bamian.

The first of these roads was followed by Alexander on his march into Bactriana from the territory of the Paropamisadæ. It was also taken by Timur on his invasion of India; and it was crossed by Lieutenant Wood on his return from the sources of the Oxus. The second road must have been followed by Alexander on his return from Bactriana, as Strabo specially mentions that he took "over the same mountains another and shorter road" than that by which he had advanced. It is certain that his return could not have been by the Bamian route, as that is the longest route of all; besides which, it turns the Hindu Kush, and does not cross it, as Alexander is stated to have done. This route was attempted by Dr. Lord and Lieutenant Wood late in the year, but they were driven back by the snow. The third road is the easiest and most frequented. It was taken by Janghez Khan after his capture of Bamian; it was followed by Moorcroft and Burnes on their adventurous journeys to Balkh

and Bokhara; it was traversed by Lord and Wood after their failure at the Kushan Pass; and it was surveyed by Start in A.D. 1840, after it had been successively crossed by a troop of horse artillery. As, however, it is noted that there was a mountain named Aruna at a distance of 5 miles to the south, it is almost certain that this city must have been on the famous site of Begram, from which the north end of the Siah-koh, or Black Mountain, called Chehel Dukhtaran, or the "Forty Daughters," lies almost due south at a distance of 5 or 6 miles. Begram also answers the description which Pliny gives of Cartana, as Tetragonis, or the "Square;" for Masson, in his account of the ruins, especially notices "some mound of great magnitude, and accurately describing a square of considerable dimensions. General Cunningham says that if he is right in identifying Begram with the Kiulu-sa-pang of the Chinese pilgrim, the true name of the place must have been Karsana, as written by Ptolemy, and not Cartana, as noted by Pliny. The same form of the name is also found on a rare coin of Eukratides, with the legend Karisiye nagara, or "city of Karisi," which he has identified with the Kalasi of the buddhist chronicles, as the birthplace of raja Milindu. In another passage of the same chronicle, Milindu is said to have been born at Alasandra or Alexandria, the capital of the Yona, or Greek country. Kalasi must therefore have been either Alexandria itself or some place close to it. The latter conclusion agrees exactly with the position of Begram, which is only a few miles to the east of Opian. The appellation of Begram means, he believes, nothing more than "the city" par excellence, as it is also applied to three other ancient sites in the immediate vicinity of great capitals, namely, Kabul, Jellalabad and Peshawur. Masson derives its appellation from the Turki, be or bi, "chief," and the Hindi, gram or city, that is, the capital. But a more simple derivation would be from the Sanscrit vi, implying "certainty," "ascertainment," as in vijaya, victory, which is only an emphatic form of jaya with the prefix in Vigram, would therefore mean emphatically "the city," that is, the capital; and Bigram would be the Hindi form of the name, just as Bijaya is the spoken form of Vijaya. The plain of Begram is bounded by the Panjshir and the Koh-i-daman rivers on the north and south; by the Mahighir canal on the west; and on the east by the lands of Julgha, in the fork of the two rivers. Its length, from Bayan, on the Mahighir canal to Julgha, is about 8 miles; and its breadth, from Kilah Baland to Yuz Bashi is 4 miles.—*Cunningham's Ancient Geog. of India*, pp. 21-29, 237.

Opium is the concrete inspissated juice of the white poppy, *Papaver somniferum* and its varieties, obtained by making incisions in the capsules and collecting the exuding juice. The plant has been long known, and is perhaps one of the earliest described. It is a native of Western Asia and probably also of the South of Europe, but it has been distributed over various countries. In British India, it is largely grown in Malwa, in the neighbourhood of Patna and Benares, in the Panjab, in Assam, in Berar, in Guzerat, and in Mysore. The bulk of it is exported to China, Sumatra, Java and Burmah, but the Rajput races and the Assamese use it largely. In Assam the whole population from the baby at the breast to the very few old men use opium, and in 1864-65 the population consumed £143,543 worth of that drug. Opium, it is said, was first introduced into Assam in 1794 from Bengal when the British Indian troops assisted the rajah against the Muttuck; since then it has spread over the whole country and deteriorated and enfeebled the population. The opium monopoly of the British Indian Government is deemed essentially necessary as a source of revenue, but in its present form is a protection of the most intense description. It is a public patronage of trade in a confessedly deleterious production. In Bengal, cultivators are permitted to cultivate the poppy, but the juice must be sold to Government at a certain fixed price. It is manufactured into opium in the Government factories at Patna and Benares and then sent to Calcutta and sold by auction to merchants who export it to China. There is no poppy cultivation in the Madras and Bombay presidencies, and the opium received at Bombay is brought, paid for under passes, from the native states of Malwa and Guzerat. In the Panjab, opium is not made a Government monopoly as it is in Bengal; the people are free to cultivate if they choose, only it ranks as a "zabt" crop and has certain higher charges made upon it; the sale of opium,

OPIMUM.

OPIMUM.

poppy heads (quite a separate thing), bhang, ganja and charraa, which are collectively termed "maskarat," is restricted, and these articles are subject to excise-duty. Opium used in the Panjab comes principally from Kulu, in the Himalaya, but is grown also in the plains, especially in the district of Shahapore. The poppy is, however, grown generally in the Panjab, and a decoction or infusion called 'post' is made by steeping the unripe poppy head in water. Shahapore opium sells at Lahore at 20s. per pound. In 1870-71, opium to the value of Rupees 44,400 was manufactured in the Nundidroog Division of Mysore and 80 candies of opium were exported. We do not know how many pounds a Mysore candy of opium contains, but two candies are in use in Bangalore, one of lbs. 500 and the other of lbs. 336-12-4, and it would seem to be the lbs. 500 weight that forms the opium candy. In West Berar, the poppy is largely grown in the Maiker, or, as it is now designated the Buldanah district. When we saw it growing between Maiker, Jaumphal and Bassim, we then examined the processes for making opium in which the people were busily occupied and exhibited an expertness betokening full experience, we have passed through and through and crossed the Berar in every possible direction, and the impression left on our mind was that the culture of cotton, cereals and oil seeds would displace all other crops, but in 1870-71, 544 acres of land in the Buldanah district were under cultivation for opium. In the eleven months from April 1871 to February 1872, lbs. 8,688, or tons 3, cwt. 17, lbs. 64, were manufactured in the Bangalore and Kolar districts.

The gross revenues of British India in the eleven years 1861 to 1870, were on average about £46,000,000, of which opium produced nearly a seventh part as will be shown :

Opium Revenue. Gross Revenue.

30th April 1861	£ 6,676,759	£ 42,903,234
1862	6,359,269	43,829,472
1863	8,055,476	45,143,752

EXPORTED.

Am.

Val

Though but little of the produce of British India is sent to Europe, in 1826 the imports of opium into the United Kingdom were 79,829

lbs., of which 28,329 lbs. were consumed in England. The imports and consumption in subsequent years are shown by the following figures:—

	Imports.	Consumed.		Imports.	Consumed.
1827..	lbs. 113,140.	lbs. 17,322	1845..	lbs. 250,644.	lbs. 38,220
1830.	209,076.	22,668	1848.	200,019.	61,055
1833.	106,848.	35,407	1849.	105,724.	44,177
	130,794.	38,943	1850.	126,318.	42,324
1839.	196,247.	41,632	1851.	118,024.	50,682
1842.	72,373.	47,432	1852.	205,780.	62,521

According to Mr. E. Thornton's statistics, the production of opium in Bengal has increased cent. per cent. in the nine years 1840-41 to 1848-49:—

1840-41	Chests.	17,858	1848-49	Chests.	21,437
1841-42	"	18,827	1846-47	"	21,648
1842-43	"	18,362	1847-48	"	30,515
1843-44	"	15,104	1848-49	"	36,000
1844-45	"	18,350			

The chest is about 140 lbs., so that the production in 1849 was 5,040,000 lbs. In India, the income from the opium monopoly is obtained by two principal means, namely, by a system of allowing the cultivation of the poppy by the natives of British India on account of Government, and by the impost of a heavy duty on opium grown and manufactured in foreign states, but brought in transit to a British port for exportation. The former system obtains in Bengal, the latter in Bombay. According to the statements published, Bengal opium yields a profit of 7s. 6d. per lb., whilst the duty derived in Bombay presidency is only equal to a surplus of 5s. 8d. per lb. By these means the total revenue realised by the opium monopoly, in Bengal and Bombay, in the year 1849-50 yielded £3,309,637.

The white variety of the poppy is that which is exclusively brought under cultivation for the production of the drug in India and Egypt, but in a poppy field flowers of all colours are to be seen. For the successful culture of opium a mild climate, plentiful irrigation, a rich soil, and diligent husbandry are indispensable. One acre of well cultivated ground will yield from 70 lbs. to 100 lbs. of "chick," or inspissated juice, the price of which varies from 6s. to 12s. a pound, so that an acre will yield from £20 to £60 worth of opium at one crop. Three pounds of chick will produce one pound of opium, from the third to a fifth of the weight being lost in evaporation. A chief chemical feature, which distinguishes Bengal opium from that of Turkey and Egypt, is the large proportion which the narcotine in the former bears to the morphia, and this proportion is constant in all seasons. It is a matter of importance to ascertain whether the treatment which the juice receives after its collection can influence in any way the amount of alkaloids, or of the other principles in opium. In Turkey it is the custom to beat up the juice with saliva, in Malwa it is immersed as collected in linseed oil, whilst in Bengal it is brought to the required

consistence by mere exposure to the air in the shade, though, at the same time, all the watery particles of the juice that will separate are drained off, and used in making Lewah, or inferior opium. The lands selected for poppy cultivation are generally situated in the vicinity of villages where the facilities for manuring and irrigation are great. In such situations and when the soil is rich, it is frequently the practice with the cultivators to take a crop of Indian corn, maize, or vegetables off the ground during the rainy season, and after the removal of this in September, to dress and manure the ground for the subsequent poppy sowings. In other situations, however, and when the soil is not rich, the poppy crop is the only one taken off the ground during the year, and from the commencement of the rains in June or July, until October, the ground is dressed and cleaned by successive ploughings and weedings, and manured to the extent which the means of the cultivator will permit. In the final preparation of the land in October and November, the soil, after being well loosened and turned up by the plough, is crushed and broken down by the passage of a heavy log of wood over its surface, and it is in this state ready for sowing. The amount of produce from various lands differs considerably. Under very favourable circumstances of soil and season, as much as twelve or even thirteen seers (26 lbs.) of standard opium may be obtained from each biggah of 27,225 square feet. Under less favorable conditions the turn-out may not exceed three or four seers, but the usual amount of produce varies from six to eight seers per biggah. The chemical examination of different soils in connection with their opium-producing powers, presents a field for profitable and interesting inquiry; nor is the least important part of the investigation that which has reference to variations in the proportions of the alkaloids (especially the morphia and narcotine), which occur in opium produced in various localities. Atmospheric causes exert a certain influence in determining these variations is probable; they influence the amount of produce, and cause alterations in the physical appearance of the drug, these are facts well known to every cultivator: thus the effect of dew is to facilitate the flow of the juice from the wounded capsule, rendering it abundant in quantity, but causing it at the same time to be dark and liquid. An easterly wind (which in India is usually concomitant with a damp state of atmosphere), retards the flow of juice and renders it dark and liquid. A moderate westerly wind, with dew at night, form the atmospheric conditions most favourable for collection, both as regards the quantity and quality of the exudation. If, however, the westerly wind (which is an ex-

trely dry wind) blow violently, the exudation from the capsules is sparing. Whilst the effect of meteorological phenomena in producing the above results are well marked, their action in altering the relative proportions of the chemical constituents of the juice of the poppy plant is more obscure, and it is highly probable that the chemical composition of the soil plays a most important part in this respect. Dr. O'Shaughnessy published the results of his analysis of specimens of opium from the different divisions of Behar agency, which are worthy of much attention. In the opium from eight divisions of the agency, he found the quantity of morphia to range from $1\frac{1}{2}$ grains to $3\frac{1}{2}$ per cent., and the amount of the narcotine to vary from $\frac{3}{4}$ grain to $3\frac{1}{2}$ grains per cent., the consistence of the various specimens being between 75 and 79 per cent. In the opium from the Hazareebaugh district (the consistence of the drug being 77), he found $4\frac{1}{2}$ per cent. of morphia and 4 per cent. narcotine; whilst from a specimen of Patna garden opium he extracted no less than $10\frac{1}{2}$ per cent. of morphia, and 6 per cent. of narcotine, the consistence of the drug being 87. With respect to the last specimen, Dr. O'Shaughnessy mentions that the poppies which produced it were irrigated three times during the season, and that no manure was employed upon the soil. It is much to be regretted that these interesting results were not coupled with an analysis of the soils from which the specimens were produced, for to chemical variations in it must be attributed the widely different results recorded above. Opium as a medicine has been used from the earliest ages; but when it was first resorted to as a luxury, it is impossible to state. Such must have happened from the earliest ages, as it happens daily in the present: but as a national vice it was not known until the spread of mahomedanism, when, by the tenets of that reformer, wine and fermented liquors being prohibited, opium came in their stead along with the bang or hasheesh (made from hemp), coffee and tobacco. From the Arabs the inhabitants of the Eastern Archipelago most probably imbibed their predilection for opium, although their particular manner of using it has evidently been derived from the Chinese. China, where at present it is so extensively used, cannot be said to have indulged long in the vice. Previous to 1767 the number of chests imported did not exceed 200 yearly; now the average is 50,000 to 60,000. In 1773, the East India Company made their first venture in opium, and in 1796 it was declared a crime to smoke opium.

Opium has been known in China at least ever since the Mongol dynasty. During the Ming dynasty it came into more general use as an astringent and sedative medicine, in diarrhoea,

dysentery, rheumatism, but generally in combination with other medicines. In A. D. 1736 opium was a recognized product of the prefecture of Yung-chang in the west of the province of Yunnan. Since the year 1859 the poppy has been grown to produce opium in the provinces of Honan and Shensi, and it was introduced into Se'chuen from India and Tibet in the middle of the 18th century. Fully one-half of the best arable land in Se'chuen is believed to be given up in spring to the bearing of an annual crop of poppy; probably seven-tenths of the dwellers in towns in Sech'uen, are habitual opium smokers, and more than one half of the country people have fallen victims to this seductive and injurious habit. Indian opium, Kung-kau or Kwang-t'u is being replaced by the native drug, although the price of the former, and its name for better flavour are still kept up by the native preference for it. Sech'uen opium, called Chuen'tu, is produced to the extent of 6,000 piculs annually, and, in good years, can be produced at half the price of the Indian drug. The drug is made to imitate the Malwa and other forms of Indian opium, and yields 6.94 per cent. of morphia. It is liable to be adulterated with mud, sesamum and hemp seeds, and an extract from the fruit of *Sophora japonica*, but is positively less extensively tampered with than foreign opium in general. The best Sech-uen drug comes from Kai-chau and Pi-hien, and of the extract used for smoking, called Yen-kau and Shuh-yen, the Sech'uen opium yields more than the Indian product. Yunnan opium and that from Kwei-chau, are called Nan-t'u, and, by the Chinese are all derisively spoken of as dirt, or as Yoh-t'u, medicinal earth. This is a good quality of drug, but is perhaps not better than that from Kan-suh province. The opium from Kan-suh, Shensi and Shansi is called Si-t'u, and yields a good extract. A large quantity of opium, some of it of a very inferior kind is produced in Honan province and largely consumed on the spot. Hing-ching-hien, and places in Hwang-chau-fu, all in Hupeh, produce the drug: Manchuria, and in fact all parts of the Chinese empire, produce more or less of this crop, which is sown in the tenth month, and is secured by the third month of the next year. The drug used in smoking is prepared on a large scale by mixing the ashes of the opium-pipes with the raw opium, which facilitate the making of the watery infusion; this is filtered and then evaporated to the consistence of a thin extract which is combustible in the opium pipe held in the flame of a small lamp. Water dissolves from one-half to three-fourths of ordinary opium, but nothing is lost by the Chinese manipulator. The extract is usually made by the keepers of the opium saloons,

who are heavily taxed and squeezed. Rich people and buddhist priests make their own extracts. The burning of this extract, in an incomplete manner as is carefully practised by the Chinese, yields a smoke, containing sundry incomprehensible empyreumatic compounds unknown to the chemist, but producing by absorption into the pulmonary vessels a soothing torpor. The person about to use the pipe lies down and lights the drug at the flame of a candle, the shrivelled skin of the emaciated confirmed opium smoker fills out with a soft warmth, the breathing becomes full, the pulse slow and full, and in a few minutes there is a seeming loss of consciousness. The moderate use of the opium pipe is not incompatible with the health of those who practise it. When smoked to such an extent as that its use becomes a positive necessity, there follows a loss of volitional, digestive and sexual power, or in other words, the gradual degradation of the man. The habit can be and is frequently broken off. The use of ammoniated valerian tincture, the employment of nuxvomica and other tonics, the temporary smoking of the powdered root of the Aucklandia costus and above all the regular provision of wholesome food for both body and mind are among the plans which may be adopted, along with occasional disciplinary measures for the cure of the habit. Prepared opium is exported from China.

The number of persons in China given to the consumption of opium was estimated, in 1837, at three millions, and the average quantity smoked by each individual is about 17½ grains a day. The consumption of Indian opium (independent of Turkey opium) in China has gradually increased from 3,210 chests in 1817, to 9,969 chests in 1827, and about 40,000 chests in 1837, valued at 25,000,000 dollars. By the year 1850, it reached 50,000 to 60,000 chests. The Indian Government derived the following gross revenue from opium sent to China:—

1850-57	£ 5,011,525	1866-67	£ 6,701,928
1861-62	„ 6,282,088	1867-68	„ 8,923,536
1862-63	„ 7,938,608	1868-69	„ 8,453,365
1863-64	„ 6,685,464	1869-70	„ 7,953,800
1864-65	„ 7,232,275	1870-71	„ 6,922,281
1865-66	„ 8,435,745		

The opium shipped to China from India for following years was:—

1820	Bengal Opium,	3,591	Malwa Opium,	2,278
1830	Chests.	7,443	Chests.	12,856
1835		14,851		12,933
1840		18,965		18,321
1845		21,457		20,660
1846		20,000		19,063
1847		21,650		20,523
1848		25,000		17,490
1849		36,000		18,532

A return of the receipts and expenditure of the East India Company during the 10 years

1845-55, in respect of their opium monopoly, has been published. The average receipts were 2,30,43,550-15-8½.

	Rs.	As.	P.
1845-46	1,98,82,577	8	7½
1846-47	2,09,61,421	7	8
1847-48	1,74,51,890	6	8½
1848-49	2,40,27,136	12	5½
1849-50	2,51,83,494	15	1½
1850-51	2,23,72,576	7	1
1851-52	2,74,47,805	8	1½
1852-53	2,73,89,125	8	9
1853-54	2,32,44,991	6	0½
1854-55	2,18,74,489	12	6

Opium is consumed in different ways. In Great Britain it is either used in a solid state, made into pills, or a tincture in the shape of laudanum. Insidiously it is given to children under a variety of quack forms, such as "Godfrey's cordial," &c. In India the pure opium is either dissolved in water and so used, or rolled into pills. It is there a common native practice to give it to children when very young, by mothers, who require to work and cannot at the same time nurse their offspring. In China it is either smoked or swallowed in the shape of Tye. In Bally it is first adulterated with China paper, and then rolled up with the fibres of a particular kind of plantain. It is then inserted into a hole made at the end of a small bamboo, and smoked. In Java and Sumatra it is often mixed with sugar and the ripe fruit of the plantain. In Turkey it is usually taken in pills, and those who do so, avoid drinking any water after swallowing them, as this is said to produce violent colics; but to make it more palatable, it is sometimes mixed with syrups or thickened juices; in this form, however, it is less intoxicating, and resembles mead. It is then taken with a spoon, or is dried in small cakes, with the words "Ma-sha-Allah," imprinted on them. When the dose of two or three drachms a day no longer produces the beatific intoxication, so eagerly sought by the opiophagi, they mix the opium with other drugs. It then acts as a stimulant. In addition to its being used in the shape of pills, it is frequently mixed with hellebore and hemp, and forms a mixture known by the name of majoon, whose properties are different from that of opium, and may account in a great measure for the want of similitude in the effect of the drug on the Turk and the Chinese. In Singapore and China the refuse of the chandu, the prepared extract of opium, is used by the lower classes. This extract, when consumed, leaves a refuse, consisting of charcoal, empyreumatic oil, some of the salts of opium, and a part of the chandu not consumed. One ounce of chandu gives nearly half an ounce of this refuse, called Tye, or Tinco. This is smoked and swallowed by the poorer classes, who only pay half the price of chandu for it.

When smoked it yields a further refuse called sam-shing, and this is even used by the still poorer, although it contains a very small quantity of the narcotic principle. Sam shing, however, is never smoked, as it cannot furnish any smoke, but is swallowed, and that not unfrequently mixed with arrack.

Chandoo is the extract of opium which is employed in opium-smoking. The opium, as received at Singapore from Calcutta, is in boxes containing forty balls, each of the size of a 32lb. cannon shot. These balls are enclosed in a husk of compressed poppy leaves, and contain a certain quantity of moist opium inside, but which, in this state, is unfit for consumption, for which it is prepared by four processes, in the following manner: About three or four o'clock in the morning, fires are lighted, and, as the first process, a ball is divided into two equal halves by one man, who scoops out, with his fingers, the soft part inside, and throws it into an earthen dish; frequently, during the operation, moistening and washing his hands in another vessel, the water of which is carefully preserved, into which, also is thrown the hardened poppy leaf-husks, when all the removable opium is obtained. In the second operation, the husks are boiled until all their adhering opium is dissolved, and then strained through a double filter of cloth and China paper. The strained fluids are then mixed with the opium that was scooped out in the first operation, and boiled down in a large iron pot to the consistence of treacle. The refuse is dried and sold to Chinese, who adulterate good opium with it, and the filter paper is used by the Chinese as an external application in affections of the lower bowels. In the third operation the dissolved treacle-like mass is seethed over a charcoal fire, strong and steady, but not fierce temperature, during which it is worked, spread out, and again and again worked up to expel the water but prevent it burning. When brought to the proper consistence, it is divided into half a dozen lots, each of which is spread like a plaster on a nearly flat iron pot, to the depth of from half to three-quarters of an inch, and then scored in all directions to allow the equal application of heat. One pot after another is then placed over the fire, turned rapidly round, then reversed, so as to expose the opium itself to the full heat of the red fire. This is repeated three times, the time and proper heat being judged by the workman from the aroma and colour. In this part of the process the greatest delicacy is demanded, for a little more or less fire would destroy the morning's work, or 300 or more dollars worth of opium. The head-workmen in Singapore are men who have learned their trade in China, and from their great experience are paid very high wages. The fourth opera-

tion consists in re-dissolving this fired opium in a large quantity of water, and boiling it in copper vessels till it be reduced to the consistence of the chandoo of the shops, the degree of tenacity being the index of its complete preparation, which is judged of by drawing it out by slips of bamboo. The quantity of chandoo obtained by the soft opium is about 75 per cent. But, from the gross opium, that is, including the opium and the bark, the proportion is not more than from 50 to 54 per cent. In this lengthened seething process, the chandoo or extract becomes less irritating and more soporific, the vegetable matter, the resin and oil, the extractive matter and a little opium being all thrown out in the refuse matter. By the seething process the oil and resin are almost entirely dissipated, so that the chandoo or extract, as compared with the crude opium, is less irritating and more soporific. The quantity of chandoo obtained from the soft opium is about 75 per cent.; but from the gross opium, that is, including the opium and the husk, the proportion is not more than from 50 to 54 per cent.

China, where, at present, opium is extensively used, cannot be said to have indulged long in the vice; all the early writers on that country are silent as to its use, except in medicine. "Opium is in truth a medicine, and properly it animates, purifies the breath, and dispels noxious vapours, its nature is very clearly explained in the work of Lina chin. He calls this herb the internal support." During the reign of the emperor Kien Lung, who reigned from 1733 to 1796, a tariff was regularly established, and the duty fixed at three taels for 100 catties and 2 taels, 4 mace and 5 candarines for fecs. Previous to 1767 the number of chests imported did not exceed two hundred yearly. In 1773 the East India Company made their first venture in opium, and in 1796 it was declared a crime to smoke opium, since then, in spite of pains and penalties, edicts, and warnings, the consumption increased, until in 1837 it had reached the enormous extent of 40,000 chests, valued at twenty-five millions of Dollars. From this rapid increase within the last eighty years, it is but fair to conjecture that the use of the drug was, previous to that time, limited to medical purposes, and that, however long it may have been cultivated in the Chinese province of Yunnan, its use was far from universal. Even in that province the cultivation must have been limited, as Major Burney, in a letter dated Ava, 1831, says, "From the Arabs the inhabitants of the Eastern Archipelago most probably imbibed their first predilection for opium, although their particular manner of using it has evidently been derived from the Chinese. Dampier states that the use of opium in his time was

great and widely extended, and could not therefore have been recently acquired. He states that in 1688 he took in at Acheen from 300 to 400 pounds of opium to trade with at Malacca, where he disposed of it privately, as it was prohibited. From Malacca, he says, ships were accustomed to take it to the different Malay states and exchange it for pepper and other articles of produce. Mr. Bruce, Superintendent of Tea culture in Assam, in allusion to the opium-smokers says, the Assamese "will steal, sell his property, his children, the mother of his children, and finally even commit murder for it." Mr. Marsden says, "the use of opium amongst the people of Sumatra is a species of luxury that all ranks adopt, according to their ability, and which when once become habitual, it is almost impossible to shake off." Sir Stamford Raffles gives it as his opinion "that the use of opium is so much more dangerous because a person who is once addicted to it, can never leave it off."

Of the period when the poppy became an object of culture, for the manufacture of opium, we have not the least information. Whatever may be the antiquity of this drug, for medicinal uses, it may be asserted that its abuse is comparatively recent, or not more than a few centuries back. In none of the ancient heroic poems of Hindusthan is it ever alluded to; the guest is often mentioned in them as welcomed by the munwar piala, or 'cup of greeting,' but nowhere by the uml-pani, or 'infused opiate,' which has usurped the place of the phool-ra-arrac, or 'essence of flowers.' Before, however, the art of extracting the properties of the poppy, as at present, was practised, Rajpoots used the opiate in its crudest form, by simply bruising the capsules, which they steeped a certain time in water, afterwards drinking the infusion, to which they give the name of tejarro, and not unfrequently pos, 'the poppy.' This practice still prevails in the remote parts of Rajpootana, where either ignorance of the more refined process, prejudice, or indolence, operates to maintain old habits. The culture of opium was at first confined to the do-abeh, or tract between the Chumbul and Sepra, from their sources to their junction; but although tradition has preserved the fact of this being the original poppy-nursery of Central India, it has long ceased to be the only place of the poppy's growth, it having spread not only throughout Malwa, but into various parts of Rajpootana, especially Mewar and Harouti. But though all classes, Koombi and Jat, and Baniah and Brahman, try the culture, all yield the palm of superior skill to the Koombi, the original cultivator, who will extract one-fifth more from the plant than any of his competitors. It is a singular fact, that the cultivation of opium increased in the inverse ratio of general prosperity; and that as war,

pestilence and famine, augmented their virulence, and depopulated Rajpootana, so did the culture of this baneful weed appear to thrive. The predatory system, which succeeded Mogul despotism, soon devastated this fair region, and gradually restricted agricultural pursuits to the richer harvests of barley, wheat and gram; till at length even these were confined to a bare sustenance for the families of the cultivator who then found a substitute in the poppy. From the small extent of its culture, he was able to watch it, or to pay for its protection from pillage; this he could not do for his corn, which a troop of horse might save him the trouble of cutting. A kind of moral barometer might, indeed, be constructed to show that the maximum of oppression in Mewar, was the maximum of the culture of the poppy in Malwa. Emigration commenced in S. 1840 (A. D. 1784); it was at its height in S. 1856 (A. D. 1800), and went on gradually depopulating that country until S. 1874 (A. D. 1818). Its consumption, of course, kept pace with its production, it having found a vent in foreign markets. The districts to which the emigrants fled were those of Mundisore, Kachrode, Onel and others, situated on the feeders of the Chumbul, in its course through lower Malwa. There they enjoyed comparative protection and kind treatment, under Appa Saheb and his father, who were long the farmers-general of these fertile lands. It could not be expected, however, that the new settlers should be allowed to participate in the lands irrigated by wells already excavated; but Appa advanced funds, and appointed them lands, all fertile though neglected, in which they excavated wells for themselves. They abandoned altogether wheat and barley, growing only mukhi or 'Indian corn,' for food, which requires no irrigation, and to which the poppy succeeds in rotation; to these and the sugar-cane, all their industry was directed. The process of cultivation in *Rajputana* was as follows: When the crops of Indian corn (mukhi) or of hemp (sunn) are gathered in, the stalks are rooted up and burned; the field is then flooded, and, when sufficiently saturated, ploughed up. It is then copiously manured with cowdung, which is deemed the best for the purpose; but even this has undergone a preparatory operation, or chemical decomposition, being kept in a hollow ground during the rainy season, and often agitated with long poles, to allow the heat to evaporate. In this state it is spread over the fields and ploughed in. Those who do not keep kine, and cannot afford to purchase manure, procure flocks of goats and sheep, and pay so much a night for having them penned in the fields. The land being ploughed and harrowed at least six or seven times, until the soil is almost pulverized, it is divided into beds,

and slight embankments are formed to facilitate irrigation. The poppy seed is then thrown in, the fields are again inundated; and the seventh day following, this is repeated to saturation. On the seventh or ninth, but occasionally not until the eleventh day, the plant springs up; and on the twenty-fifth, when it has put forth a few leaves, and begins to look withered, they water it once more. As soon as this moisture dries, women and children are turned into the fields to thin the plants, leaving them about eight inches asunder, and loosening the earth around them with iron spuds. The plant is at this stage about three inches high. A month later, it is watered moderately, and when dry, the earth is again turned up and loosened. The fifth water is given in about ten days more; two days after which, a flower appears here and there. This is the signal for another watering, called 'the flower-watering,' after which, in twenty-four or thirty-six hours, all the flowers burst their cells. When about half the petals have fallen, they irrigate the plants sufficiently to moisten the earth, and soon the rest of the flowers drop off, leaving the bare capsule, which rapidly increases in bulk. In a short period, when scarcely a flower remains, a whitish powder collects outside the capsule, which is the signal for immediate application of the lancet. The field is now divided into three parts, in one of which operations commence. The cutting-instrument consists of three prongs, delicate points, around which cotton thread is bound to prevent its making too deep an incision, and thus causing the liquid to flow into the interior of the capsule. The wound is made from the base upwards, and the milky juice which exudes coagulates outside. Each plant is thrice pierced, on three successive days, the operation commencing as soon as the sun begins to warm. In cold mornings, when it congeals rapidly, the coagulation is taken off with a scraper. The fourth morning, each plant is once more pierced, to ascertain that no juice remains. On each morning this extract is immersed in a vessel of linseed oil, to prevent it from drying up. The juice being all collected, there remains only the seed. The capsules are therefore broken off and carried to the barn, where they are spread out upon the ground; a little water is sprinkled over them, and being covered with a cloth, they remain till the morning, when the cattle tread out the seed, which is sent to the oilmen, and the refuse is burnt, lest the cattle should eat them, as even in this stage they are poisonous. Poppy oil is more used for the lamp than any other in Mewar. They calculate a maund (of forty seers, or about seventy-five pounds weight) of seed for every two seers of milk. The price of seed, in Colonel Tod's time, was

twenty rupees per maund of one hundred and twelve (cutcha) maunds. One beega of Malwa land, of the measure Shahjehani (when the jureeb, or rod, is one hundred cubits long) will yield from five to fifteen seers of opium-juice, each seer being forty-five salimshahi rupees in weight, the medium is reckoned a good produce. The cultivator or farmer sells it, in the state described, to the speculator, at the price current of the day. The purchaser puts it into cotton bags of three folds, and carries it home. Having obtained the leaves of the poppy, he spreads them in a heap of two or three inches in depth and thereon deposits the opium, the balls of fifteen rupees' weight each, which are allowed to remain five months for the purpose of evaporation. If the milk has been thin, or treated with oil, seven parts in ten will remain; but if good and pure, eight. The beopari (speculators) then sell it, either for home-consumption in Rajpootana, or for exportation. From the year S. 1840 (A.D. 1784) to S. 1857 (A.D. 1801), the market-price of the crude opium from the cultivator ran from sixteen to twenty-one salimshahi rupees per durri, a measure of five pukka seers, each seer being the weight of ninety salimshahi rupees. This was the price of the drug by the grower in the first stage, and a better criterion than that of the manufacturer in its prepared state. In the year S. 1857, it rose to twenty-five rupees; in S. 1860 to twenty-seven, gradually increasing till S. 1865 (A.D. 1809), when it attained its maximum of forty-two, or an advance of one hundred and seventy per cent. above the price of the year A.D. 1784; after which it gradually fell, until S. 1870 (A.D. 1804), when it was so low as twenty-nine. In S. 1873 it had again risen to thirty-three, and in S. 1784-5, when its transit to the ports of Sind and Guzerat was unmolested (whence it was exported to China and the Archipelago), it had reached thirty-eight and thirty-nine, where in (S. 1876 or A.D. 1820) it stood. In Kanthul (which includes Pertabgurb Deola), or the tracts upon the Myhie river, opium was, about A. D. 1820, cultivated to a great extent, and adulterated in an extraordinary manner. This being sold in China as Malwa opium, had greatly lessened the value of the drug in that market. The adulteration was managed as follows: a preparation of refined goor (molasses) and gum, in equal proportion, is added to half its quantity of opiate coagulum; the mass is then put into cauldrons, and after being well amalgamated by boiling, it is taken out, and when sufficiently dry is well beaten, and put into cotton bags, which are sewn up in green hides, and exported to Muska-mundi. The Gosains of these parts were the chief contractors for this impure opium, which was reckoned pecu-

harly unpalatable, and was never consumed in Rajpootana. In selecting land for the poppy, care should be taken to avoid calcareous soils; the less lime there is in the soil the better for the poppy. In the Himalaya the opium is not grown on calcareous soils, but in soils which contain much iron, sand, and some clay—poor soils in fact—and if such soil is to be met with ... the plains it would suit hill opium well; but iron seems to be an essential ingredient in opium soils. Perhaps the hills near the Rajmahal would afford such soil—any red soil, be it in the hills or plains, contains iron, and will do for poppy; but the higher above the sea, the better is the opium.

Preparation of Opium in British India.—Towards the end of March when the plant is nearly ripe the bleeding of the capsules takes place. This operation is performed in the evening, and consists of tracing four parallel lines with a sharp knife or shell, penetrating the epicarp and sarcocarp of the capsule; a milky juice immediately exudes and its flow is promoted by the deposition of dew during the night; each set of incisions yields on an average one grain of opium. This is removed the ensuing morning, and the incisions repeated so long as any milk flows. The whole of the opium collected daily and which is necessarily mingled with variable proportions of dew, is mixed together in earthen or wooden vessels. Should the quantity of dew have been excessive, a partial solution of the opium occurs, and an exudation of drops of a black, shining liquid (Pasewa) occurs on the surface of the opium. This pasewa contains many of the active principles of the drug, and should be mixed with it again, to secure the uniform power of the mass. The proportion of pasewa is often much increased by the fraudulent admixture of water by the growers, in hope of having their opium purchased by the gross weight. When brought to the factories, the opium is usually of the consistence of 64 to 68, that is, containing that proportion of solid matter per 100. It is then placed in large tanks of brickwork, or in wooden vats, with the upper surface exposed to the air. From these reservoirs, portions are daily removed and exposed on wooden trays three inches deep by four feet long and two broad; evaporation takes place under such circumstances with tolerable rapidity, and the opium eventually reaches the consistence of 70—the standard of the factory for the Chinese investment. The degree of inspissation is estimated on the purchase of the drug, as well as during its subsequent evaporation, by drying average portions of 100 grains each, on a metallic table heated to 208° by steam. A sufficient quantity of opium, average quality is permitted to attain the consistence of 80°; and in

that state is issued under the name of “Abkaree” to the licensed dealers of the bazaars. Lastly, the finest opium which can be procured is set apart for medical purposes, and allowed to lose by evaporation nearly the entire of its water. The Chinese investment opium is of a rich chestnut colour, translucent at the edges of thin masses, tears into portions with ragged margins; its structure is granular, its taste and bitter, its smell rich, peculiar, and agreeable; if a small portion be rubbed between the finger and thumb for a few seconds, it draws out into long colourless threads, and from the number, fineness, and tenacity of these threads the Chinese form their first estimate of the value of the drug. The abkaree, or Bengal bazaar opium is more solid than the Chinese investment drug, of a darker colour, and often of a heavy ascendent smell. For the Chinese investment the opium is made into cakes, each containing 4 lbs., and enveloped in a case made of the petals of the poppy, and agglutinated with a paste made of opium and water (Lewa). The abkaree opium is also vended in balls weighing 2 lbs. covered by strips of a coarse kind of silk cemented by a mucilage of gum. The medicinal opium is solid, brittle in the cold season, of a brown colour, and fine smell. The medicinal drug is packed with great care in 4 lb. and 2 lb. squares, covered with layers of talc, and further defended by a case of brown wax, $\frac{1}{2}$ an inch in thickness. Besides the above, several kinds of opium are to be met with even in Indian commerce—that from Malwah demands most attention.

Malwah opium.—There are many varieties of this opium, some of which the Bengal Committee who investigated the drugs, had opportunities of examining through the means of Dr. Morehead of Bombay. The specimens were on the average, 1½ lb. in weight, hard, brittle, containing from five to ten per cent. of moisture, mixed with fragments of leaves and seeds, and impregnated with oil, apparently used in the collection; the colour was almost a rusty brown, the odour very powerful, and taste intensely bitter and lasting.

Preparation in Asia Minor.—Men, women, and children, a few days after the flower falls from the poppies, proceed to the fields, and with a shell scratch the capsules, wait twenty-four hours, and collect the tears, which amount to two or three grains in weight from each capsule. These being collected and mixed with the scrapings of the shells, worked up with saliva and surrounded by dried leaves, it is then sold, but, generally speaking, still more adulterated with cow's dung, sand, gravel, petals of flowers, &c.

Different kinds of opium are known in the

markets of Europe and Asia. M. Berthemet, in a paper published in the "Journal de Pharmacie," for September 1838, describes three principal kinds of opium known in Europe, viz. :

Alexandrian opium, is in small, very dry pieces, enveloped in fragments of leaves, of a very deep brown colour, clean and shining fracture, of faintly virose smell.

Constantinople opium is in two forms, usually in flattened morsels contained in large leaves, sometimes rather soft, occasionally dry and brittle, softening between the fingers, and translucent when pressed into thin layers. The smell is stronger than the Alexandrian opium, and is deemed a sufficient distinguishing sign between both.

Smyrna opium, is either in flat pieces, or roundish balls; one kind is very dry; wrapped up in large leaves, of shining fracture, reddish brown colour internally, of bitter, acrid, and enduring taste. The second kind is rolled in seeds of the Rumex, is soft, and easily torn, of fawn colour internally, but darkens rapidly on exposure to the air, transparent when drawn out, and often mixed with the seeds which constitute its outer covering. The Smyrna opium is the most valuable of the varieties now described, containing the largest proportion of the narcotic alkali morphia, and in a state which permits this principle to be purified with greatest ease.

Smyrna opium, known in commerce as the Turkey or Levant, is the first in point of quality. It occurs in irregular, rounded, flattened masses, seldom exceeding two pounds in weight, and surrounded by leaves of a kind of sorrel; the quantity of morphia said to be derived from average specimens is eight per cent.

Constantinople opium, is of two kinds in the market, one in very voluminous irregular cakes, which are flattened like the Smyrna; this is a good quality. The other kind is in small, flattened, regular cakes, from two to two and a half inches in diameter, and covered with the leaves of the poppy; the quantity of morphia is very uncertain in this description of opium, sometimes mounting as high as 15 per cent, and sometimes descending so low as six, showing the great variety in the quality of the drug.

Egyptian opium, occurs in round flattened cakes, about three inches in diameter, and covered externally with the vestiges of some leaf. It is distinguished from the others by its reddish colour, resembling Socotrine Aloes. The quantity of morphia in this is inferior to the preceding. It has one quality which, when adulterated, ought to be known, that is, a musty smell. By keeping, it does not blacken like the other kinds.

English opium, is in flat cakes or balls enveloped in leaves. It resembles fine Egypt-

tian opium more than any other kind. Its colour is that of hepatic aloes, and in the quantity of morphia it is inferior to the preceding, but in the strength of the mass it is said by one of its most extensive cultivators to be superior.

French and German opium, require no particular remarks. The French are cultivating the poppy in Algeria, from which they get opium giving a small percentage of morphia.

Trebizond or Persian opium, is sometimes met with of a very inferior quality in the form of cylindrical sticks, which by pressure have become angular.

Indian opium, of commerce, is of four kinds, Cutch, Malwa, Patna and Benares, but it is also made in Berar and in Mysore. Of these Cutch is but little known. It occurs in small cakes covered with leaves, and its colour is much inferior to Smyrna. Malwa opium is to be met with of two kinds. The inferior is in flattened cakes, without any external covering, dull, opaque, blackish brown externally, internally somewhat darker, and soft. Its colour is somewhat like the Smyrna, but less powerful, and with a slight smoky smell. Superior Malwa is in square cakes, about three inches in length and one inch thick. It has the appearance of a well prepared, shining, dry, pharmaceutical extract; its colour is blackish brown, its odour less powerful than Smyrna; it is not covered by petals as the following kinds are, but smeared with oil; it is then rubbed with pounded petals. Behar, Patna, and Benares opium is strictly in the hands of Government, and no adulteration can take place, without a most extensive system of fraud; but it will not be uninteresting to trace the progress of the opium from the hands of the natives, to the condition in which it is delivered to the public by the Government. From the commencement of the hot season to the middle of the rains the Government is ready to receive opium, which is brought by the natives every morning, in batches, varying in quantities from twenty seers to a maund. The examining officer into each jar thrusts his examining rod, which consists of a slit bamboo, and, by experience, he can so judge of the qualities of the specimens before him, which are sorted into lots of No. 1 to No. 4 quality. Opium of the first quality is of a fine chesnut colour, aromatic smell, and dense consistence. It is moderately ductile, and, when the mass is torn, breaks with a deeply notched fracture, with sharp needle-like fibres, translucent and ruby-red at the edges. It is readily broken down under water, and the solution at first filters of a sherry colour, which darkens as the process proceeds. One hundred grains of this yield an extract to cold distilled water of from

35 to 45, and at the temperature of 212 degs., leaves from 20 to 28 per cent., having a consistence of a 70 to 72, the consistence of the factory. The second quality is inferior to the first, and the third quality is possessed of the following properties, a black paste, of a very heavy smell, drops from the examining rod, gives off from 40 to 50 per cent. of moisture, and contains a large quantity of "Pasewa;" while the fourth or last number embraces all the kinds which are too bad to be used in the composition of the balls, comprising specimens of all varieties of colour and consistence. This number is mixed with water, and only used as a paste to cement the covering of the balls. The three first qualities are emptied from their jars into large tanks, in which they are kept until the supply of the season has been obtained. The opium is then removed and exposed to the air on shallow wooden frames until it becomes of the consistency of from 69 to 70, when it is given to the cake-maker, who guesses to a drachm the exact weight, and envelops the opium in its covering of petals, cemented by a covering of quality number 4. The balls are then weighed and stored, to undergo a thorough ventilation and drying. Formerly the covering of the balls was composed of the leaves of tobacco; but the late Mr. Flemming introduced the practice of using the petals of the poppy, which was such an improvement that the Court of Directors presented him with 50,000 rupees. The balls, forty in number, are packed in a mango wood case, which consists of two stories with twenty pigeon holes in each, lined with lath and surrounded by the dried leaves of the poppy. Sometimes these balls are so soft as to burst their skins, and much of the liquid opium running out, is lost. In 1823 many of the chests of Patna lost five cattles from this cause, and to this day we have the same thing continuing to occur. Patna chests are covered with bullock hides, Benares with gunnies. A very elaborate, useful paper, by Mr. Little, Surgeon, of Singapore, appeared in the 2nd vol. of the "Journal of the Indian Archipelago," furnishing a complete history of the drug, and the physical and mental effects resulting from its habitual use. There are also some able remarks in Dr. O'Shaughnessy's Bengal Dispensary.

Malwa.—Dr. Impey, who resided in Malwa from 1843 to 1846, published, at Bombay, in 1848, a valuable treatise on the cultivation, preparation and adulteration of Malwa opium. It was some time before he obtained permission to publish the result of the experience he had acquired in Malwa, and as Government inspector of opium at Bombay. For the successful cultivation of opium, a mild climate,

plentiful irrigation, a rich soil, and diligent husbandry, are indispensable. In reference to the first of these Malwa is placed most favorably. The country is in general from 1,300 to 2,000 feet above the level of the sea: the mean temperature is moderate, and range of the thermometer small. Opium is always cultivated in ground near a tank or running stream, so as to be insured at all times of an abundant supply of water. The rich black loam, supposed to be produced by the decomposition of trap, and known by the name of cotton soil, is that prepared for opium. Though fertile and rich enough to produce thirty successive crops of wheat without fallowing, it is not sufficiently rich for the growth of the poppy until largely supplied with manure. There is, in fact, no crop known to the agriculturist, unless sugarcane, that requires so much care and labor as the poppy. The ground is first four times ploughed on four successive days, then carefully harrowed; when manure, at the rate of from eight to ten cart-loads an acre, is applied to it; this is scarcely half what is allowed a turnip crop in Britain. The crop is after this watered once every eight or ten days, the total number of waterings never exceeding nine in all. One begah takes two days to soak thoroughly in the cold weather, and four as the hot season approaches. Water applied after the petals drop from the flower, causes the whole to wither and decay. When the plants are six inches high, they are weeded and thinned, leaving about a foot and a half between each plant; in three months they reach maturity, and are then about four feet in height if well cultivated. The full-grown seed-pod measures three and a half inches vertically, and two and a half in horizontal diameter.

Early in February and March the bleeding process commences. Three small lancet-shaped pieces of iron are bound together with cotton, about one-twelfth of an inch of the blade alone protruding, so that no discretion as to the depth of the wound to be inflicted shall be left to the operator; and this is drawn sharply up from the top of the stalk at the base, to the summit of the pod. The sets of the people are arranged that each plant is bled all over once every three or four days, the bleedings being three or four times repeated on each plant. This operation always begins to be performed about three or four o'clock in the afternoon, the hottest part of the day. The juice appears almost immediately on the wound being inflicted, in the shape of a thick gummy milk, which is thickly covered with a brownish pellicle. The exudation is greatest over night, when the incisions are washed and kept open by the dew. The opium thus derived is scraped off next morning, with a blunt iron tool resembling

a cleaver in miniature. Here the work of adulteration begins—the scraper being passed heavily over the seed-pod, so as to carry with it a considerable portion of the beard, or pubescence, which contaminates the drug and increases its apparent quantity. The work of scraping begins at dawn, and must be continued till ten o'clock, during this time a workman will collect seven or eight ounces of what is called “chick.” The drug is next thrown into an earthen vessel, and covered over or drowned in linseed oil, at the rate of two parts of oil to one of chick, so as to prevent evaporation. This is the second process of adulteration—the ryot desiring to sell the drug as much drenched with oil as possible, the retailers at the same time refusing to purchase that which is thinner than half-dried glue. One acre of well-cultivated ground will yield from 70 to 100 pounds of chick. The price of chick varies from three to six rupees a pound, so that an acre will yield from 200 to 600 rupees worth of opium at one crop. Three pounds of chick will produce about two pounds of opium, from the third to a fifth of the weight being lost in evaporation. It now passes into the hands of the Bunniah, who prepares it and brings it to market. From twenty-five to fifty pounds having been collected, is tied up in parcels in double bags of sheeting cloth, which are suspended from the ceilings so as to avoid air and light, while the spare linseed oil is allowed to drop through. This operation is completed in a week or ten days, but the bags are allowed to remain for a month or six weeks, during which period the last of the oil that can be separated comes away; the rest probably absorbs oxygen and becomes thicker, as in paint. This process occupies from April to June or July, when the main begins. The bags are next taken down and their contents carefully emptied into large vats from ten to fifteen feet in diameter, and six or eight inches thick. Here it is mixed together and worked up with the hands five or six hours, until it has acquired an uniform colour and consistence throughout, become tough and capable of being formed into masses. This is peculiar to Malwa. It is now made into balls of from eight to ten ounces each, these being thrown, as formed, into a basket full of the chaff of the seed-pods. It is next spread out on ground previously covered with leaves and stalks of the poppy; here it remains for a week or so, when it is turned over and left further to consolidate, until hard enough to bear packing. It is ready for weighing in October or November, and is then sent to market. It is next packed in chests of 150 cakes, the total cost of the drug at the place of production being about fourteen rupees per chest, including all expenses. About 20,000

chests are annually sent from Malwa, at a prime cost charge of two lakhs and eighty thousand rupees. It may easily be supposed that manipulations so numerous, complex, and tedious, as those described, give the most ample opportunities for the adulteration to which the nature of the drug tempts the fraudulent dealer.

In order to enable the cultivator to carry on his agricultural operations, he receives from time to time certain advances, the amount of which reaches in the aggregate to about one-half of the value of the estimated out-turn of produce. If the land has been under cultivation in previous seasons, its average produce is known; if it be new land, and considered by the Sub-Deputy Agent as eligible, then the cultivator, in addition to the usual advances, receives an advance of so much per biggah to enable him to bestow a certain amount of extra care in tilling and dressing the soil. The first advance is made on the completion of the agreement or bundobust, and this takes place in September and October. The second advance is made on the completion of the sowings in November, and the final or Chook payment is made immediately after the delivery and weighing of the produce. Nothing therefore can be fairer to the cultivator than this system of advances; he is subject to no sort of exaction, in the shape of interest or commission on the money which he receives, and it puts within his power the certain means of making a fair profit by the exercise of common care and honesty. It is an established rule in the agency that the cultivator's accounts of one season shall be definitively settled before the commencement of the next, and that no outstanding balances shall remain over. When a cultivator has from fraud neglected to bring produce to cover his advances, the balances due by him are at once recovered, if necessary by legal means; whereas, if he can satisfactorily show that he has become a defaulter from calamity and uncontrollable circumstances, and that the liquidation of his debt is placed entirely beyond his power, his case is then made the subject of report to the Government by the Agent, with the request that the debt may be written off to profit and loss. These provisions are most wise, for outstanding balances may be made the means of oppression, and to their operation, may be traced a considerable amount of litigation and agrarian crime in the indigo districts of lower Bengal. It is clear that when such balances become so large that the cultivator cannot discharge them, he is no longer a free agent, but is perfectly subservient to the will of his creditor, for whom he must cultivate whether he desire it or not. Such burdens may even be handed down from father to son. The fairness of the agency system, and the justice

with which the cultivators are treated are best evidenced by the readiness with which they come forward to cultivate, and also by the comparative rarity of agrarian crime, arising out of matters connected with the poppy cultivation.

Egypt.—Opium is grown to some extent in Egypt, 39,875 lbs. were produced even in 1831, and sold at two dollars a pound. At the end of October, after the withdrawal of the Nile waters the seed, mixed with a portion of pulverised earth, is sown in a strong soil, in furrows; after fifteen days the plant springs up and in two months has the thickness of a Turkish pipe, and a height of four feet; the stalk is covered with long, oval leaves, and the fruit, which is greenish, resembles small orange. Every morning before sunrise, in its progress to maturity, small incisions are made in the sides of the fruit, from which a white liquor distils almost immediately which is collected in a vessel; it soon becomes black and thickish, and is rolled into balls, which are covered with the washed leaves of the plant; in this state it is sold. The seeds are crushed for lamp oil, and the plant is used for fuel.

Dr. Royle tells us that opium seems to have been known from early times. Hippocrates is supposed to have employed it, and Diogenes condemned its use in affections of the eyes and in ear-ache. Dioscorides describes it; but it does not appear to have been much employed until the time of the Arabs, except in the form of the confections called Mithridatica, Theriaca, and Philonium. The Arabic name *afion*, the Hindu *afim*, and the name *afuyung*, by which it is known in China, must all have proceeded from the original Greek name, which is itself derived from *opos*, juice. The Sanscrit *apoynum* seems to have a similar origin. Opium is obtained by a very simple process, consisting merely in making incisions in the evening into the capsules of the poppy, shortly after the petals fall off, taking care not to penetrate into the interior, when a milky juice exudes, and either concretes upon the capsule, whence it may be taken off in little tear-like masses, or earlier in the morning in a softer state. Upon this will depend whether the grains run together, or remain separate even when pressed. When thus collected, they require nothing more than being dried in a warm and airy room, when the opium becomes of a brown colour, with a shining fracture, and has a strong and peculiar odour. Some opium which Dr. Royle prepared in this manner in the Saharunpoor Botanic Garden in 1828-29, was pronounced by the Medical Board of Bengal to be like Turkey opium. Most of the opium made in the Himalaya mountains is similarly prepared, and is of very fine quality. Belon and Oliver de-

scribe the opium of Asia Minor as formed by the assemblage of the small tears collected off the capsules. Dioscorides, however, describes the process as consisting in making incisions into the capsules when the dew has evaporated, collecting the juice in a shell, mixing the several portions, and rubbing them up in a mortar. Kämpfer gives this as the Persian process, and M. Texier describes it as being adopted in Asia Minor; and it is certainly practised with the immense quantities collected in India in the provinces of Behar and Benares and of which an excellent description has been given by Dr. Butter in the Journal of the Asiatic Society, v, p. 136. When this method is adopted, the mass will appear homogeneous; when it is omitted, it will appear to be composed of agglutinated tears. Both appearances may be observed in the opium of commerce. Dr. Butter describes the quantity of opium from each capsule as varying according to soil, irrigation, and to the quantity of dew which falls, but averaging about 1 gr. from each quadruple incision. The tears are of a reddish white colour externally but semi-fluid in the interior, and of a reddish-white colour. The juice is apt to be mixed with dew, and fraudulently with a little water, and will separate into a fluid portion (*passewa*) and into one which is more consistent, the former containing much the largest portion of the bimeconate of morphia. The whole of the day's collection is rubbed together in a mortar, so as to break down the grains, and reduce the whole to a homogeneous semi-fluid mass, which should be dried as quickly as possible in the shade, when it is called *pucka* or matured, being called *raw* in its former state. All samples of opium brought for sale are submitted to a steam drying process, by which the quantity of fluid in each is easily ascertained. The opium for the China investment contains about 30 per cent. of moisture: that for medical use in India is made quite dry.

The Opium of European commerce have been described under the following heads by Professor Guibourt.

That collected in *Asia Minor*, Anatolia, is generally all included under head of Turkey opium, and most of it is exported from Smyrna; some of it, however, is taken to Constantinople, whence it is re-exported to other parts of Europe. Some Egyptian is imported into Britain. The Persian is only known. The Indian kinds are exported to China.

Smyrna opium, called also *Levant opium*, is generally in flattened masses, and in consequence of its original softness, without any definite regular form; weighing from a half to two pounds and covered with the capsules of a species of *Rumex*. It is at first soft, of a distinct

brown colour, becoming blackish and hard when dried, losing weight from evaporation of water, having the strong and peculiar odour of opium. "When examined with a magnifier, it is seen to be composed of yellowish agglutinated tears." This is the purest kind of opium, yielding about 8 per cent. of morphia and 4 per cent. of narcotine, and on an average, about 12 per cent. of Hydrochlorate of morphia. An inferior kind is, however, also imported from Smyrna, which is more apt to be adulterated, is harder, of a darker colour, appears homogeneous, and may be seen covered either with *Rumex* capsules, or with the leaves of the poppy. The Smyrna opium is produced at several places, at from 10 to 30 days' distance in the interior; but that grown at Caïsar, about 60 miles from Smyrna, is the most esteemed for its cleanness and good quality. Mr. Hamilton states that much is produced at Bogaditza: it is made into lumps about four or five inches in diameter, round which leaves are wrapped.

Constantinople opium, M. Guibourt conceives, may be collected in the northern parts of Anatolia. One kind is in small lenticular pieces about two inches in diameter, weighing from four to eight ounces, and always covered with a poppy leaf, of the midrib of which the mark may be seen on the middle of the pieces of opium. Another variety is in large irregular cakes. Both are more mucilaginous than the Smyrna kind, and, though of good quality, the Constantinople is less uniform in the quantity of morphia it contains, some yielding less, and others as much as, the best kinds of opium.

Egyptian opium is in flattened roundish cakes about three inches in diameter and covered with the remains of some leaf which M. Guibourt was unable to distinguish. It looks well externally, is homogeneous, has something of a reddish hue, not blackening by keeping, but softening on exposure to the air, and has somewhat of a musty smell. It is generally inferior, and M. Guibourt obtained only $\frac{1}{4}$ of the morphia yielded by Smyrna opium.

Persian opium, Dr. Pereira calls Trebian opium, from his specimens having been obtained from thence. The specimens in the *British College Museum* were sent by Mr. Morson, to whom M. Guibourt was also indebted. This kind is of a black colour, apparently homogeneous in texture, and in sticks some inches in length, each wrapped up in a separate piece of paper, and tied with a piece of cotton. Opium has been collected in Algiers. A new variety imported from Turkey has been described by Mr. Morson (*P. J.*, iv, 503). It resembled the Constantinople, but was soft and light coloured; contained much wax, caoutchouc, and about $6\frac{1}{2}$ per cent. of morphia. Some opium is occasionally met with of Euro-

pean manufacture; and it might easily be produced in England if the summer was more regular. In the south of Europe the summer is probably too hot and dry. Some good English opium has been produced, but it is irregular in strength. The quantity of morphia said to have been obtained from some specimens of French and of German opium is enormous,—being from 16 to 20 per cent.

Indian opium, is largely used in India and is exported to China. In India it can only be cultivated in the cold weather. The Saharunpoor garden opium, sent to Britain in 1844, was of a brown colour, shining fracture, with the strong and peculiar smell of opium, and yielded 8 per cent. of morphia. Some specimens of this opium, prepared when Dr. Royle was superintendent of the Saharunpoor Botanic Garden, sent to the Medical Board of Bengal in 1829, were considered equal, if not superior to the finest Turkey opium that comes into the market in England.

Himalayan opium possesses similar sensible properties and though liable to be adulterated, is, when pure, of very fine quality.

Malwa opium, is in flat circular cakes, average weight $1\frac{1}{2}$ lb., of a rusty brown colour, strong odour, and bitter permanent taste, varying much in quality. Some Malwa opium lately analysed yielded only 2 per cent. of morphia, was oily and mucilaginous and appeared to have been obtained by expression of the capsules. Dr. Smyttan, late opium Inspector at Bombay, obtained from three to five per cent. of morphia from some varieties, and from $7\frac{1}{4}$ to 8 per cent. from finer kinds. Some Kandeish opium yielded to Mr. E. Solly 72 per cent. of soluble matter, and about 7 per cent. of morphia.

Bengal opium, which is chiefly produced in the provinces of Behar and Benares, with some in that of Cawnpore, is of different qualities: that intended for medicinal use in the hospitals in India is of very fine quality, of a brown colour, and fine smell, packed with great care in 4lb. and 2lb. squares covered with layers of talc, and further defended by a case of brown wax half an inch in thickness. This Dr. Jackson, lately Opium Inspector at Calcutta, informed Dr. Royle is the Patna Garden Opium, cultivated, prepared, and selected exclusively for the Dispensary, and that it yields about 7 to 8 per cent. and sometimes more ($10\frac{1}{2}$), of morphia. It is of this kind that Dr. Christison says, "I have examined specimens little inferior to average Turkey opium in the quantity of morphia they contained."

Chinese Investment Opium, which is highly esteemed by the Chinese, is made into cakes or balls, each containing about 4 lbs. and covered with a thick layer of poppy petals, made to adhere to the opium and to each other by means of a mixture of inferior kinds of opium and

water. It is of a dark-brown colour, of the consistence of an extract when first cut into, containing 70 per cent. of solid matter, and about $2\frac{1}{2}$ per cent. of morphia. The British Indian Government grant licenses for the cultivation of the poppy, and contract for all the produce at certain rates, varying with the quality. No opium can be grown without this licence, and an advance equal to about two-thirds of the value of the produce is made to the grower. This produce is made over to district collectors, who approximately fix the worth of the contents of each jar, and forward it to Patna, where rewards are given for the best samples, and the worst are condemned without payment; but all is turned to some account in the reduction of the drug to a state fit for market. The cultivation is very carefully conducted. During the N. W., or dry winds, the best opium is procured, the worst during moist, or E. and N. E., when the drug imbibes moisture, and a watery bad solution of opium collects in cavities of its substance and is called "passewa," according to the absence of which the opium is generally prized. At the end of March, the opium jars arrive at the stores by water and by land, and continue accumulating for some weeks. Every jar is labelled and stowed in a proper place, separately tested with extreme accuracy and valued. When the whole quantity has been received, the contents of all the jars are thrown into great vats, occupying a very large building whence the mass is distributed, to be made up into balls for the markets. This operation is carried on in a long paved room, where every man is ticketed, and many overseers are stationed to see that the work is properly conducted. Each workman sits on a stool, with a double stage and a tray before him. On the top stage is a tin basin containing opium sufficient for three balls; in the lower another basin holding water: in the tray stands a brass hemispherical cup, in which the ball is worked. To the man's right hand is another tray, with two compartments, one containing thin pancakes of poppy petals pressed together, the other a cupful of sticky opium-water, made from refuse opium. The man takes the brass cup, and places a pancake at the bottom, smears it with opium-water, and with many piles of the pancakes makes a coat for the opium. Of this he takes about one-third of the mass before him, puts it inside the petals and agglutinates many other coats over it: the balls are then again weighed, and reduced or increased to a certain weight if necessary. At the day's end, each man takes his work to a rack with numbered compartments, and deposits it in that which answers to his own number, thence the balls (each being put in a clay cup) are carried to an

enormous drying-room, where they are exposed in tiers, and constantly examined and turned, to prevent their being attacked by weevils, which are very prevalent during moist winds, little boys creeping along the racks all day long for this purpose. When dry, the balls are packed in two layers of six each in chests, with the stalks, dried leaves, and capsules of the plant, and sent down to Calcutta. A little opium is prepared of very fine quality for the Government hospitals, and some for general sale in India; but if the proportion is trifling, and such is made up into square cakes. A good workman will prepare from thirty to fifty balls a day, the total produce being 10,000 to 12,000 a day; during one working season 1,353,000 balls are manufactured for the Chinese market alone. The poppy-petal pancakes, each about a foot radius, are made in the fields by women, by the simple operation of pressing fresh petals together. They are brought in large baskets, and purchased at the commencement of the season. The liquor with which the pancakes are agglutinated together by the ball-maker, and worked into the ball, is merely inspissated opium water, the opium for which is derived from the condemned opium, (Passewa,) the washing of the utensils, and of the workmen, every one of whom is nightly laved before he leaves the establishment, and the water is inspissated. Thus not a particle of opium is lost. To encourage the farmers, the refuse stalks, leaves, and heads are bought up, to pack the balls with; but this is far from an economical plan, for it is difficult to keep the refuse from damp and insects. A powerful smell of opium pervaded these vast buildings, which Dr. Corbett assured Dr. Hooker did not affect himself or the assistants. The men work ten hours a day, becoming sleepy in the afternoon; but this is only natural in the hot season; they are rather liable to eruptive diseases, possibly engendered by the nature of their occupation. Even the best East Indian opium is inferior to the Turkish, and owing to peculiarities of climate, will probably always be so. It never yields more than five per cent. of morphia, and its inferiority, but is as good in other respects, and even richer in narcotine.

Cultivation.—The mode of raising the poppy in the Patna district in India, is thus described: "The ryot or cultivator having selected a piece of ground, always preferring (*cæteris paribus*) that which is nearest his house, fences it in. He then, by repeated ploughings, makes it completely fine and removes all the weeds and grass. Next, he divides the field into two or more beds by small dykes of mould, running lengthwise and crosswise according to the slope and nature of the ground, and again into smaller squares by other dykes leading from

the principal ones. A tank is dug about ten feet deep at one end of the field, from which by a leathern bucket, water is raised into one of the principal dykes and carried to every part as required; this irrigation is necessary because the cultivation is carried on in the dry weather. The seed is sown in November, and the juice collected in February and March, during a period, usually, of about six weeks; weeding and watering commence as soon as the plants spring up, and are continued till the poppies come to maturity. Incisions are then made in the rind of the seed vessel, from them the juice exudes.

The Chinese Repository, (Vol. v., p. 472,) states that four sorts of opium are brought to China: Turkey, which sells cheapest in China, and is brought chiefly from Smyrna; Patna and Benares, which are grown in the British Indian territories, and sold at Calcutta; and Malwa, which is cultivated out of their jurisdiction, but pays them a revenue of about 200 rupees each chest for its transit to Bombay where it is shipped. The Portuguese also export a small quantity from their settlement in Damaun. The drug is rolled in balls, and then packed in strong boxes weighing from 116 lbs. for Patna to 134 lbs. or 140 lbs. for Malwa. The Malwa opium is grown and prepared entirely by natives, and is often so extensively adulterated as to be worthless. There are between 400 and 500 cakes in a chest of Malwa, and the cultivator there receives double the wages of the ryot in Bengal. The chests of Patna and Benares are made of mango wood, and consist of two stories or parts, in each of which there are twenty partitions; the forty balls to fill these partitions are carefully rolled in dried poppy leaves. The chest is covered with hides or gunny bags, and the seams closed so as to render it as impervious to the air as possible, but considerable allowances is made for dry gage.

Effects of opium-smoking.—Opium is at present largely consumed in the Malayan islands, in China, in the Indo-Chinese countries, and in a few parts of Hindustan, much in the same manner in which wine, ardent spirits, malt liquor, and cider, are consumed in Europe. Stupor, reverie, and voluptuous listlessness are the immediate effects produced. In this state the individual can be at once and easily aroused to exertion or business. No sickness, constipation, or any other functional disturbance supervenes on each indulgence; gradually, however, the appetite diminishes, the bowels become irregular, emaciation takes place, sexual tendencies are destroyed, and premature old age speedily comes on. This it is admitted is an extreme case; when the habit is but moderately followed, it appears to occasion

no greater evil than the proportionate indulgence in wine or other spirituous liquors. Its deleterious character has been much insisted on, but, generally, by parties who have had no experience of its effects. Like any other narcotic or stimulant, the habitual use of it is amenable to abuse, and as being more seductive than other stimulants, perhaps more so; but this is certainly the utmost that can be charged to it. Thousands consume it without any pernicious result, as thousands do wine and spirits, without any evil consequence. There is not known any person of long experience and competent judgment who has not come to this common sense conclusion. Dr. Oxley, a physician and naturalist of eminence, and who has had a longer experience than any other man of Singapore, where there is the highest rate of consumption of the drug, gave the following opinion: "The inordinate use, or rather abuse, of the drug most decidedly does bring on early decrepitude, loss of appetite, and a morbid state of all the secretions; but I have seen a man who had used the drug for fifty years in moderation without any evil effects; and one man I recollected in Malacca who had so used it, was upwards of eighty. Several in the habit of smoking it have assured me that, in moderation, it neither impaired the functions nor shortened life; at the same time fully admitting the deleterious effects of too much." There is not a word of this that would not be equally true of the use and abuse of ardent spirit, wine, and, perhaps even of tobacco. The historian of Sumatra, whose experience and good sense cannot be questioned, came early to the very same conclusion. The superior curative virtues of opium over any other stimulant are undeniable, and the question of its superiority over ardent spirits, appears to have been for ever set at rest by the high authority of Sir Benjamin Brodie. "The effect of opium, when taken into the stomach," says this distinguished philosopher, "is not to stimulate but to soothe the nervous system. It may be otherwise in some instances, but these are rare exceptions to the general rule. The opium-eater is, in a passive state, satisfied with his own dreamy condition while under the influence of the drug. He is useless but not mischievous. It is quite otherwise with alcoholic liquors. It may be worth while to show what is really the relative consumption in those countries in which its use is alleged to be most pernicious. In the British settlement of Singapore owing to the high rate of wages, and the prevalence of a Chinese population, the consumption is at the rate of about 330 grains, or adult doses, a year, for each person. In Java, where the Chinese do not compose above one in

a hundred of the population, and where wages are comparatively low, it does not exceed 40 grains. Even in China itself where the consumption is supposed to be so large, it is no more than 140 grains chiefly owing to the poverty of the people, to whom it is for the most part inaccessible. Opium is eaten to a very considerable extent by the Burmese and the drug is easily procured. The value of opium increases for a short time by age; but this soon ceases to be the case, and Turkey opium in particular deteriorates unless carefully preserved from the air. The opium brought from India sells from \$ 550 to \$ 700 a chest, and the Turkey from \$ 370 to \$ 500 a peccul. The price of the commodity fluctuates, however, according to the extent of importation and other causes.

Opium adulterations.—The modes of adulterating opium are various. Pounded leaves, catechu, cow-dung, coarse sugar, and many other ingredients, are used for this purpose. They are easily detected by incineration. If adulterated with

Water,—Heat 100 grs. on a water bath for half an hour, the loss is water.

Starch, pease-meal, flour—boil 20 grs. with water, strain, allow to cool, add tincture of iodine which gives a blue precipitate with these impurities.

Resins, dammar and clay—subside as a harsh mass during the trituration of 100 grains in distilled water.

Catechu, Gab.—To the first solution add a solution of isinglass, there is a copious precipitate.

Mucilaginous extracts of bel (fruit of *Ægle marmelos*) and mckanna, seeds of *Euryale ferox*,—add alcohol to the water solution previously concentrated to 1th. A copious precipitate of gummy matter ensues, quite soluble in hot water.

The presence of datura, tobacco and bang can only be detected by the smell of the drug, which resembles that of a bad hookah.

Dr. Royle says, the most injurious fraud is that of washing out the soluble and most valuable parts of opium, and bringing the residual mass for sale. In this case the opium loses its translucency and redness of colour, also its adhesiveness. Sand, clayey mud, sugar, molasses, cowdung, *Datura*-leaves, the glutinous juice of *Ægle marmelos*, and even pounded poppy-seed, are employed to adulterate opium. Malwa opium often contains oil and other matters obtained by the expression of the poppy-heads. Some kinds of opium from which morphia has been extracted have been occasionally met with in European commerce. To be enabled to judge of good opium, one must be well acquainted with the different varieties of opium, their

respective colours, tastes, and textures, as well as the natural degree of moisture, and see that no mechanical admixtures are apparent, nor left on a filter. Several methods have been proposed for ascertaining the quantity of morphia in opium, but none of them are very satisfactory. Dr. Christison considers Dr. Gregory's method of obtaining muriate of morphia as the only one; but it requires about a pound of opium to be operated on which, if good, should not yield less than ten per cent. of a snow-white salt.

Uses.—Opium, applied externally, is at first stimulant, producing pain, as on the eye, and then sedative. When taken internally, in small doses, excitement is first produced, as apparent in the increased frequency of the pulse, and heat of the skin. This is soon followed by diminished sensibility, calmness, and sleep, with abatement of pain, suspension of mucous secretion, with the exception of that of the skin. But if the tendency to sleep be resisted, opium, in moderate doses, and in those habituated to its use, in excessive doses, will produce intellectual excitement accompanied by bodily activity, soon to be followed by general debility, as is exemplified in opium-eaters. In large doses, it is a narcotic poison. It is frequently employed as an anodyne and hyponotic, as a sedative, and to restrain inordinate discharges, as in diarrhoea and cholera, also as a diaphoretic, often as an antispasmodic, and even as a febrifuge. In delirium tremens it is beneficially given in large doses, and, combined with calomel and sometimes with the addition of ipecacuanha, even in inflammatory affections; though in general it is contraindicated when there is inflammation or much fever. It is no doubt the most important of all therapeutical agents, and that which is perhaps the most frequently employed. Before the discovery of Cinchona, it was counted one of the most powerful febrifuges, and given either plain or with bark, or an aromatic tonic, it has since then been found very useful. Its action has been thus explained. "It first excites the ganglionic system, increasing its action on the vascular apparatus, and especially augments the activity of the nerves and vessels on the periphery of the body, causing fulness of the pulse, and heat and some turgor of the skin. By this increased peripheral action, the ganglionic system is somewhat relieved and thus a portion of the real cause of the affection is removed, and this effect is still more strongly produced, when the opium is given according to the old fashion with wormwood or bark. If now the cold stage comes on it occurs when the opium has already begun to exercise its secondary operation. It then manifests its power of controlling cramps; the shivering and the heat also are less, and the equili-

trium of the nervous system is restored without so strong a reaction as usual of the vascular system being produced. Opium therefore is a medicine which both acts on the causes of the disease, and dilates the vassal of the attack. Whatever may be the theory of it this last fact is attested by many.—*Simmond's Commercial Dictionary*; *Journal of the Indian Archipelago*, 1st January 1848; *Les Anglais et l'Inde*, p. 251; *Powell's Hand-book*, p. 293; *Dr. Little*; *Cameron*, pp. 215–16; *Tod's Rajasthan*, Vol. ii, pp. 630–34; *McCulloch's Dictionary*, *London Home News*, 10th April 1857; *O'Shaughnessy*, pp. 172–74; *Letter from the Inspector-General, I. OPIUM-CLIPPER, a quick-sailing vessel, formerly engaged in smuggling opium from India into China, now replaced by Steamers.—*Simmond's Dict.*

OPLISMENUS, a genus of plants of the order Panicaceæ; *O. burmanni*, *Rom. and Sch.*, grows in Bengal, as also does *O. colonus*, *Kth.*, called in Bengali, Shama, cattle are very fond of it. Enormous islets of living water-grasses (*Oplismenus stagninus*), and other plants float on the Megny river. *O. lanceolatus*, *Kth.* and *O. strictus*, *Sch.*, are also Bengal *Oplismenus Stagninus* is cultivated in *Ins* at Kotah, but the inhabitants do not value it in its reputed virtues.—*Hooker, Himal. Journ.*, Vol. ii, p. 338; *Genl. Med. Top.*, p. 185; *Voigt*; *Roxburgh*.

OPLISMENUS FRUMENTACEUS, *Roxb.*

Panicum frumentaceum, *Roxb.*

<i>Damra-shama</i> ,	BENG.	<i>Samaka</i> ,	HIND.
<i>Shama</i> ,	"	<i>Sanwak</i> ,	"

Several varieties of this grass are cultivated in British India, cattle are fond of it, and the seeds are wholesome and nourishing; and constitute an article of diet, amongst the poorer people; in a good soil, it yields about fifty-fold. In the Punjab, it is a cultivated cereal uncommon out in the plains except Cis-Sutlej and

common in places in the eastern part only of the Punjab Himalaya. Its grain is considered heating and is one of the poorer of the millets. —*Drs. Roxburgh*, i, 304; *Voigt*, 708; *J. L. Stewart's Punjab Plants*, 257.

OPOPHORUS TYPUS, *Edwds.* One of the crustacea of N. Guinea, belonging to the order Stomatopodes, Fam. Cardioides.

OPOBALSAM.

<i>Akuyila-semun-i-rumi</i> , AR.	<i>Balsamum verum</i>
<i>Balassan</i> , EGYPT.	<i>album</i> , LAT.
<i>Balm of Gilead</i> , ENG.	<i>egyptiacum</i> , "
<i>Balsamier de la Meque</i> , FR.	<i>Judaicum de Mecca</i> , "
<i>Opobalsamo</i> , IR.	<i>Roughan-i-Bulsan</i> , PERS.

Balm of Gilead called also Opobalsam and Balm of Mecca, is procured from the *Balsamodendron gileadense*, a middle-sized tree growing in Arabia, also from the *Balsamum berry-anum*. There is but little of the true balm of Gilead which reaches Britain. The same may be said of another of the terebinthine resins, *Bdellium*, which is obtained from India and from Africa. The best opobalsamum is obtained from the greenish liquor found in the kernel of the *Balsamum berry-anum*. An inferior quality of opobalsam is obtained by expression from the fruit of *Amyris gileadensis* when the fruit is at maturity. The *carpobalsamum* of the ancients was from the fruit of *Balsamodendron gileadense*. It is a liquid gum-resin, obtained from the *Amyris gileadensis*, a tree found in Arabia, Abyssinia, and Syria. It is first turbid and white; of a pungent smell resembling turpentine, but sweeter; and of a bitter, acrid, astringent taste. When old it becomes thin, limpid, of a greenish hue, then of a golden yellow, and at length of the colour of honey. It is chiefly used as a cosmetic by the Turkish ladies.—*McCulloch's Com. Dict.*, p. 60.

OPOEK, *Rus.* Currants.

OPOIDIA GALBANIFERA, of the tribe Symnææ. It occurs in commerce in agglutinated plastic masses. It is hot, acrid and bitter, and in properties resembles *assafetida*, but weaker.—*McCulloch*; *Royle Ill.*; *O'Shaughnessy*; *McClelland*. See *Galbanum*.

O-PO-KIEN, a people mentioned by Hwen Thsang, supposed to be Affghan.

OPOPONAX.

<i>Jawashir</i> , AR., HIND., PERS.	<i>Opopo-nace</i> ,	IR.
<i>Peh-chi-hiang</i> ,	CHIN.	<i>Gawsher</i> ,
<i>Opoponax</i> ,	FR.	<i>Opoponaca</i> ,
<i>Panax gunmi</i> ,	GER.	

A gum resin obtained from the stalks of *Opopanax chironium*, a tall plant. According to *Pelletier's analysis* 100 parts contain—resin 42, gum 33, starch 4, extractive and malic acid 4, volatile oil 5, with traces of caoutchouc and wax, and 9 of woody fibre. The sp. gr. 1622; with water it forms a milky fluid. *Opopanax* is derived from *eros* juice, *war* all, and *axos* a remedy, meaning that it is a remedy for all diseases! In action it resembles *assafetida*, but

is much feebler. The plant occurs in dry fields in the South of Europe and Asia Minor. A milky juice exudes from the root when wounded, and hardens into a fetid gum resin, in most of its properties closely resembling assafoetida. The resin is found in all the bazaars of Bengal, and is even exported from British India to Europe. According to Dr. Royle "Jawashir" is imported into India from Arabia and into England from Asia Minor. He says that Dr. Lindley had some seeds sent from the hills of Beluchistan which were called "hashi" and were then considered to be the *Opopanax*. "Jawashir" occurs in the bazaars of Bagdad, it sells for 10½*d.* per lb., and is imported from Persia.—*O'Shaughnessy*, p. 361; *McCulloch's Commercial Dictionary*, p. 866; *Powell's Hand-book*, Vol. i, p. 403.

QPOPONACA, Sp., *Opoponace*. It *Opopanax*.

OPPIDAM, see *Kasra-i-shirin*.

OPPIO, It. *Opium*.

OPPOSITE-LEAVED MANGO, *Cambesedea oppositifolia*.

OPUNTIA, a genus of plants the order *Cactaceæ*, several species of which have been introduced into British India, from the West Indies, Peru and Brazil.

brasiliensis, DC., from Brazil, with large greenish yellow flowers

cochinillifera, Haw., syn. of *Cactus cochinillifer* of S. America, with the petals bright rose coloured at several seasons of the year. It is employed in the West Indies for rearing the cochineal.

curassavica, Haw., syn. of *C. curassavicus*, L. from Curacao, with large yellow-flowers, 1½ inch across.

cylindrica, DC., syn. of *C. cylindrica*, Lam., from Peru with largish scarlet flowers.

dillenii, Haw., syn. of *C. dillenii*, Ker., and *C. indicus*, Roxb., from S. America, is the Nagphena of Bengal, and the prickly pear of Europeans in India; the cochineal insect thrives on this plant.

elator, Haw., from S. America, with large purplish yellow flowers.

ficus indica, Haw. " " syn. of *C. ficus indica* with large sulphur yellow flowers.

leucantha, Hort., Berol.

nigricans, Haw., DC., *C. tuna*, *β nigricans*, B. M., from S. America.

roxburghiana, syn. of *C. chinensis*, Roxb.

rubeacens, Salm., from Brazil.

triacantha, DC., " S. America.

tuna, Haw., syn. of *C. tuna major*, Roxb., from S. America, with large reddish flowers, it is the favourite food of the cochineal in Mexico and Brazil.

vulgaris, Haw., syn. of *Cactus opuntia*, L., Southern States of N. America, cultivated in Europe, where its fruit is called the Indian fig.

Dr. Fontana, in an interesting communication, published in the Asiatic Annual Register for 1799, and re-printed in Pennant's Indian Recreations, mentions both the Manilla and Chinese *Opuntias*, states that the cochineal

insects thrived best on the species indigenous to Bengal. The cultivation was extended, and the quality improved, as in 1795 only five rupees a seer, but in 1797 seven rupees a seer were given for Bengal cochineal when Mexican was selling at about 16—20 rupees. The Bengal *Sylvestris*, Dr. F. states contains only from 9—16 to 10—16 parts of the colouring matter contained in the Mexican. The cultivation however, was subsequently given up, probably on account of the decreased price of cochineal, and the more profitable cultivation of indigo. The cochineal, *Coccus cacti*, is chiefly cultivated with any care in Mexico, where the grana fina is sown on the plants about the 10th of October, on the return of the fine weather, the females having been kept under cover during the rains, the *Grana sylvestra* is gathered from insects in a wild state, but cochineal is also imported from Georgia and South Carolina, and some of the West India Islands. It has also been tried in Peru, Hayti, and Brazil. The imports are from 220,000 to 330,000 lbs., and have been as high as 700,000 lbs., but the price is kept down by the importation of large quantities (600,000 lbs.) of lac, the produce of another species of *coccus* *C. lacciferus*, peculiar to India. A demand, however, exists for it in Central Asia, as we learn from Lieut. Burnes they give at Herat thirty-two rupees a seer for which they import from Bokhara and Yarkund, probably the Kermes produced in Russia and Tartary. A kind is also produced on the roots of plants in the marshes near Herat; as is the scarlet grain of Poland, *Coccus polonicus*, or the roots of *Scleranthus perennis* in the north-east of Europe. The Kermes, or *Coccus ilicis*, produced on the *Quercus ilex* and *quercus cocciferus* growing in the south of Europe, has yielded a crimson dye from the earliest ages. The Persian name *kirm*, a worm, indicates that the Asiatics were acquainted with its nature, when in Europe, it was thought to be the seed of a plant. The French introduced the cochineal into Algiers, with other tropical products.—*Royle*, Ill. Him. Bot., pp. 5, 224.

OPUNTIA COCHINELLIFERA, Haw.

Cactus cochinelliferus, Linn. Ka-la-zoung-let-wa, Burm. | Cochineal plant, Eng.

A plant of S. America, where it is largely employed for feeding the Cochineal insect. It has large red flowers at several seasons of the year. It has been introduced into India.

OPUNTIA DILLENII, Haw.

Cactus dillenii, Ker. | *Cactus indicus*, Roxb.

Ka-la-zoung, Burm. | Prickly pear, Eng.
Hodge pear, Eng. | Nopal, Hind.

A plant of S. America, domesticated throughout British India. The Cochineal insect of S. America thrives on this.

OPUNTIA SPINOSISSIMA, Haw. Spined opuntia, a plant of Jamaica.

OR, Fr. Gold.

OR, or Odru tribe, see Odru, India.

ORA, see Kaffir.

ORACHE, or Mountain spinach, one of the Chenopodiaceæ. Of these there are several varieties, commonly known as red and green sage—the leaves are slightly acid, both sorts are boiled as spinach, but the red is most esteemed. Propagated by seed—no particular soil required.—*Riddell*.

ORAK ZYE, an Affghan tribe, reside in Tirah, intermingled with the Afree and some of them are found in the hills south of Peshawur. It was amalek or chief of this tribe who conducted Nadir Shah and a force of cavalry, by the route of Chura and Tirah, to Peshawur, when the principal road through the hills was defended against him. The Orak Zye are to be met with to the north-west of Kohat, near the Hungoo valley.

ORAL, Kol. *Pteromys petaurista*, *Pallas*, *Blyth*.

ORANG, MALAY. A word, meaning a people, a race.

Orang-Binua, the people of the country, the aborigines. See Binua, Kedah, India, Jakun, Johore, Dyak.

Orang-Baju, or Baju-laut, sea-faring people. See Banca, Borneo.

Orang-Dusun, see Ambong.

Orang-Gunong, people of the mountains, hill-men.

Orang Utan, wild men, the Orang utan, monkey of Europe.

The island of Borneo bears the same relation to eastern India, that the continent of America bears to Europe, being a country in which the various tribes inhabiting the further east may find a refuge from religious persecution, or escape the disadvantages of over-population in their mother countries. Thus we find the coasts of the island to be inhabited by several nations, totally unconnected with each other, governed by their own laws, and adopting their own peculiar manners and customs. The west coast is occupied by Malays and Chinese; the north-west coast by the half-caste descendants of the Moors of Western India; the north part by the Cochin-Chinese; the north-east coast by the Sulu; and the east and south coasts by the Bugis tribes of Celebes. In addition to these, there are no fewer than three distinct tribes, living in prahus, and wandering about the shores of the island; the Lanun from Magindano; and the Orang Baju and Orang-Tidong, source unknown. The Dyak who are the Orang-Benua, or aboriginal inhabitants of Borneo, constitute by far the most interesting portion of its population. They are scattered in small tribes over the face of the island, those inhabiting the banks of the large

rivers being generally under the dominion of one more powerful than the rest; but the tribes which reside in the depths of the forests, where the communication between them is more difficult, are generally perfectly distinct from each other, and these people would scarcely know that other human beings existed beside themselves, were not individuals of their little communities sometimes cut off by the roving warriors of a distant, and more powerful tribe. The various tribes are said to differ considerably from each other, but Mr. Earl saw individuals belonging to several distinct tribes, who with the exception of a difference of dialect, might be recognized as the same people, those who lived entirely on the water being much darker than the rest. It is said by the Dyak themselves, that some parts of the interior are inhabited by a woolly-haired people: but as they also assert that men with tails like monkeys, and living in trees, are also discoverable, the accuracy of their accounts may be doubted. He met with no Dyak who had seen either, but as a woolly-haired people to be found scattered over the interior of the Malay peninsula, their existence in Borneo seems by no means improbable. The Dyak are of the middle size, and, with the exception of those who are continually cramped up in their little canoes, are invariably straight-limbed, and well formed. Their limbs are well rounded, and they appear to be muscular, but where physical strength is to be exerted in carrying a burthen, they are far inferior to the more spare-bodied Chinese settlers. Their feet are short and broad, and their toes turn a little inwards, so that in walking they do not require a very wide path. The native paths are found very inconvenient by a European traveller. The paths used by the Dyaks and Chinese being generally worn down several inches below the surface of the soil, and, as they are very little wider than the foot, pedestrian exercise proves both painful and fatiguing. The Chinese guides mentioned that he should soon become accustomed to these by-ways, from which he judged that the settlers had adopted the native mode of walking with one foot before the other, since their arrival in the country. Their foreheads are broad and flat, and their eyes, which are placed further apart than those of Europeans, appear longer than they really are, from an indolent habit of keeping the eye half-closed. The outer corners are generally higher up the forehead than those nearer to the nose, so that were a straight line drawn perpendicularly down the face, the eyes would be found to diverge a little from right angles with it. Their cheek-bones are prominent, but their faces are generally plump, and their features altogether bear a greater resemblance to those of the Cochin-Chinese than of any other of the

demi-civilized nations in Eastern India. The Laos tribes inhabiting the inland parts of Cochin-China and Cambodia are undoubtedly the same race as the Dyak, speaking a dialect of the same language; and, as the Cochin-Chinese are probably descendants of these people, civilized by communication with the Chinese, the resemblance may be easily accounted for. The Cochin-Chinese, however, are physically superior to the Dyak, the natural results of a different mode of life. The hair is straight and black, and is kept cut rather short by both sexes, but if permitted, would grow to great length. Some of the Dyak women who are married to Chinese adopt the fashion of wearing tails. He never saw a nearer approach to a beard among the men than a few straggling hairs scattered over the chin and the upper lip. The Dyak countenance is highly prepossessing. The countenances of the Dyak women, if not exactly beautiful, are generally extremely interesting, which is, perhaps in a great measure owing to the soft expression given by their long eyelashes and by their habit of keeping the eyes half-closed. In form they are unexceptionable, and the Dyak wife of a Chinese, whom Mr. Earl met with at Sinkawan, was, in point of personal attractions, superior to any eastern beauty who had come under his observation, with the single exception of one of the same race, from the north-west coast of Celebes. The one he met with at Sourabaya soon after her arrival from Celebes, was, for a native, extremely fair, and her portrait would not have disgraced the "Book of Beauty." In complexion, the Dyak are much fairer than the Malay from whom they also differ greatly in disposition and general appearance, although not so much as to lead to the conclusion that they could not have sprung from the same source, giving rather the idea that the cause of the dissimilarity has proceeded from the long disconnection of the Malay from the original stock, in addition to their admixture and intercourse with foreign nations. The Dyak are a much superior people to the Malay, although the latter affect to consider them as beings little removed from the orangutan. Though the most numerous of the aboriginal tribes are found congregated in villages on the banks of the rivers and the large inland lakes; they also possess several towns of considerable size. The capital of the most powerful tribe on the west coast is Sigao, a town about forty days' journey up the Pontianak river, which has a population of several thousands. The Dyak inhabit thatched bamboo houses, erected upon piles, those belonging to each family or petty tribe being joined together by means of a stage or verandah running along the front. Many of the small vil-

lages are defended by stockades, and the ladders by which they ascend into their dwellings are always pulled up when they retire to rest at night. Under these dwellings the pigs are kept; for, although some of the tribes in the vicinity of the Malay have adopted the mahomedan religion, they are not sufficiently rigid in their observance of its tenets to abstain from the use of pork. The Dyak cultivate rice in large quantities, as it forms their principal vegetable food, their animal sustenance being pork, fish and the flesh of deer and other animals which are procured by the chase. Some of the tribes possess bows and arrows, but the sumpit or blowpipe, a wooden tube about five feet long, through which small bamboo arrows are shot with great precision, is in more general use. The arrows are steeped in a subtle poison, which is said to destroy birds and smaller animals, when struck with them, almost instantaneously, a slight wound from an arrow on which the poison is strong, being said to occasion inevitable death, even to man. The effects of weapons of this description are always exaggerated by those who use them; the poison therefore, is not, in all probability, so destructive to the human species as it is represented; and although the Dyaks assert that no antidote is known, yet the preparation of the poison being similar to that practised by the aboriginal inhabitants of Celebes, for which a remedy has been discovered, the people of Borneo are probably acquainted with it. They show no hesitation in eating animals which have been killed by their arrows, taking the precaution, however, of removing the flesh immediately adjacent to the wounded part. The poison, which is called *ippo* throughout the island, consists of the juice of a tree, and its mode of preparation appears to be perfectly similar to that practised in Java, and other islands where it is employed.

The *Orang Binua* of Johore occupy all the interior of Johore over which the *Tamungong* now rules. They also possess the interior of the most southerly portion of Pahang. They occupy the upper branches of the last or most southern system of rivers in the Malay peninsula, that is, of the rivers Johore (the *Lingiu* and the *Sayong*) *Binut*, *Pontian*, *Batu Pahat* or *Rio Formosa* (the *Simpang Kiri*, *Pau*, and *Simrong* with their numerous affluents) and *Indau* (the *Anak Indau*, *Simrong* and *Made*), with the country watered by them. By means of these rivers a constant communication is maintained between the families of the *Binua* on the two sides of the peninsula. The *Indau* and its branches are directly connected with the *Batu Pahat*, and its branches by the *Simrong*. The other principal branch of the *Batu Pahat* the *Pau* is connected with the *Slabin*, a branch of the *Indau*, by a path of

only one day's journey. Paths lead from the Made and the Simrong to the Lingiu, thus connecting the Johore with the eastern rivers, while it is still more closely united to the western by its other branch, the Sayong, which rises in the same low hill from which the Binut issues. No Binua were found on the river Johore below the junction of the Sayong and Lingiu. There are none on the Pulai; and the aboriginal families on the Tamrao and Sakodai, which fall into the old Straits of Singapore, (*Orang Sabimba*) were about A. D. 1840 imported by the Tamungong from the islands of Battan to the south of Singapore, for the purpose of collecting taban (Guttah percha.) The river nomades (*Biduanda Kallang* or *Orang Sletar*) and the sea nomades (*Orang Tambusa*), termed also *Orang Laut* and *Ryat Laut*, people of the sea, &c., who lurk about the estuaries and creeks of the Johore, Libbam, and other rivers along the southern coast of the peninsula are distinct from the Binua, and cut off from all communication with them. Binua have never been known on the upper part of the Sidili although it has its source in the same mountains where the Johore and the Made rise. On the north-west they do not extend beyond the Simpang Kiri and Pau. About half a day's walk from the source of the former rises an affluent of the river Muar called Sungei Pago, which gives its name to a tribe found on its banks and amongst the adjacent hills. The Binua describe the *Orang Pago* as a wild race, naked, without houses, shunning all intercourse with the Malays, and having very little intercourse even with them. They are probably a secluded and rude branch of the Udai, or of the Jakun. Whether the Pahang tribes immediately to the north of the Indau (who are said to be very numerous), are similar to the *Orang Binua* is uncertain, but the *Orang Binua* inhabiting the country indicated, undoubtedly form a separate family in themselves; for, while they are all mutually related, they have no connection with any other tribes, and hardly any knowledge of such. Their language, appearance, and habits are similar. They describe themselves as being "leaves of the same tree." Individuals on the Indau had relatives and acquaintances on the Lingiu, Sayong, Binut, and the branches of the Batu Pahat, and they had visited all these rivers.

The lofty Gunong Bermun is probably nearly one hundred miles to the north of the Lulumut group. This with the mountains which adjoin it, may be considered the central high lands of the *Orang Binua*. In the ravines and valleys of Gunong Bermun, two of the largest rivers of the peninsula, the Pahang and the Muar, with their numerous upper tributaries have their source. There also rises

the Simujong which unites with the Lingi. The upper part of these rivers and many of their feeders are occupied by five tribes of aborigines differing somewhat in civilization and language.

The *Udai* (who appear to be the same people who are known to the Binua of Johore under the name of *Orang Pago*) are found on some of the tributaries of the Muar, as the Segamet, Palungan and Kapi, and in the vicinity of Gunong Ledang. This tribe has less approximated to Malayan habits than the others.

The *Jakun* partially frequent the same territory, the lower part of Palungan, Gappam, &c., and extend northwards and north-westward within the British boundaries. They are found at Tidong, Ayer Chirmin, Ayer Itam, Darat Yassin, Ulu Kissang and Bukit Singer.

The *Mintira*, the largest tribe, dwell around Gunong Bermun and the adjacent mountains, G. Rissam, G. Licha, G. Singwang, G. Kamuning, G. Kayn Libet and G. Garun. They possess the higher part of both the western and eastern streams. Thus they occupy the Triang, Simplas, Gipau, Bangkong, Gading and Tuang. On the south they frequent the upper part of the Longat, &c. Amongst the other streams occupied by them are the Limama, Ayer Mangis, Langkap, Kunu, Kapayang, Nahacha, Sabangas, Sabulu, Seneng Jimpul, Bayai, Tapak, Jilibu, Singi, Berumpun, Klassa, Jinani, Kamen, Trus, Bilabong and Klu.

The *Sakai* succeed to them in the interior, frequenting the neighbourhood of Gunong Kinabui. On the north-west the *Mintira* march with the *Besisi*, one of the most numerous tribes, who occupy all the streams flowing in that direction from Gunong Bermun and the mountains lying to the southward of it, as G. Angsi, G. Beraga and G. Datu. It is this tribe which occupies the Sungei Ujong and Lingi, the Lukut, the Sippang, and the lower part of the Langat, with their feeders, the Kallang, Pijam, Tike, Jijan, Lamar, Gallah, Labu, Chinchang, Trip, Girintul, Rami, Lana, Gimru, Pinang, &c. These five tribes (as well as those inhabiting all the interior of the peninsula to the north), are sometimes by the Malays called *Orang Binua*. Another group, are the Bermun tribes, so called from the circumstance of most of the streams on which they are found rising in the Bermun mountain system, receiving accessories from it, or joining rivers which have their source in its ravines.

The *Orang Laut* or sea-people, also called *Ryat Laut* who are similar in their habits to the *Baju*, and are found upon the coasts of Borneo and Celebes, though belonging to it, can scarcely be said to inhabit the island, for they live entirely in their little prahus, and wander

about the coasts. They subsist principally by fishing, and it is said that they are always ready to give information to the piratical rovers. The arms of the Orang laut (men of the sea), dwelling on the coasts and among islands, are the limbing, or lance; the tampuling, a large hook; the kujore, a sort of spear with a very broad head, used in fishing; and the serampong, a sort of prong. The Udai, or Semang have not any other weapons than the sumpitan. This is the most savage of the aboriginal tribes that roam the mountains and forests in the centre of the Malay peninsula, and upon the borders of the Malacca territory.

Orang Rawa, a people of Rawa, Raw or Ara in Sumatra, immediately to the north of Menangkabau and penetrated by the large but scarcely navigable river, Rakan.

Orang Sleetar, originally with the Biduanda Kallang, joint occupants of Singapore. They speak a Malay dialect with a guttural accent.

Orang-Malayu, the Malay race.

Orang-Menangkabau, the people of Menangkabau.

Orang-Milanowe, see Kyan.

Orang-Tatou, see Kyan.

Orang-Tidong, see Borneo; Kyan.

Oran-ula, see Binua.—*Mr. G. W. Earl; Newbold's Malacca, Vol. ii, p. 210; Journal Indian Archipelago.*

ORANG-UTAN, or Orang-outan; names by which the *Pithecus satyrus* of Geoffroy (*Simia satyrus* of Linnaeus), the Red Orang, is now generally designated. The muzzle is large, elongated, somewhat rounded anteriorly; forehead sloping backwards, slight superciliary ridges, but strong sagittal and lambdoid crests. Facial angle 30°. Auricles small. Twelve pairs of ribs; bones of the sternum in a double alternate row. Arms reaching to the ankle-joint. No ligamentum teres in the hip joint. Feet long and narrow, hallux not extending to the end of the metacarpal bone of the adjoining toe; often wanting the ungual phalanx and nail. Canines very large, their apices extending beyond the intervals of the opposite teeth. Intermaxillary bones ankylosed to the maxillaries during the second or permanent dentition. Height under five feet. It is an inhabitant of the islands of Borneo and Sumatra. Professor Owen remarks that the young individual exhibits the anthropoid character in the relative smallness of the face to the cranium, resulting from the state of dentition, but that it corresponds with the adult skeleton in the number of ribs and in the relative proportion of the lower extremities. With regard to the number of the vertebrae, he observes that the figure of the adult skeleton, in the Museum of the Royal College of Surgeons, exhibits the abnormal number of five

lumbar vertebrae instead of four, which is the number existing in the trunk of the mature Orang preserved in the Museum of the Zoological Society of London, and in the skeleton in the Museum of Comparative Anatomy in the Jardin-des-Plantes. Mr. Russell Wallace tells us that with the exception of the Orang Utan, the Siamang, the *Tarsius spectrum* and the *Galeopithecus* all the Malayan genera of quadrumana, are represented in India by closely allied species. The Indo-Malay islands have 170 species of mammalia. Of these, 24 are quadrumana. The Orang utan species occur in Sumatra and Borneo; the Siamang, next to them in size, in Malacca and Sumatra; the long-nosed monkey in Borneo, and Gibbons, long-armed apes and monkeys, and the lemur-like animals *Nycticebus tarsius* and *Galeopithecus* in all the islands. Thirty-three Carnivora are known, amongst them the Malayan glutton, *Holictis orientalis*, which is represented in N. India by *H. nipalensis*.

Bos sondaicus is found in Burmah, Siam, Java and Borneo. The two-horned rhinoceros and also the long-horned are found in Burmah, Sumatra and Java. The Sumatra elephant of Sumatra and Borneo is identical with that of India, Ceylon and Malacca. There are about 50 bats, 34 rodents. There are 22 hoofed animals, seven of which occur in India and Burmah. Some of the cattle occur also in Malacca, and the *Bos sondaicus* is found in Burmah and Siam.

Bos sondaicus are large and handsome animals of a light brown colour with white legs.

The Bengal Asiatic Society's museum received from Sir James Brooke of Sarawak seven skeletons of large adult Orang-utans and the results of Mr. Blyth's examination of them, were given as a sequel to a former memoir on the genus published in the 22nd volume of the Society's Journal.

Of these seven skeletons, five are referable to the *Mias Rambis* of Sir J. Brooke; although one of them (a small but full-grown female) is marked by himself M. Pappan; and another is sent by the new name M. Chapin, which is also that of an old female animal, remarkable for its extraordinarily large and vertically elongated orbits. It is probable that this alleged Chapin merely represents an individual variation; and Sir J. Brooke states, in his letter announcing the presentation, that some of these skeletons had been labelled by him with the names specified by natives, who, accordingly (as may be supposed in such a case), are not particularly conversant with the osteological distinctions of the different species.

The sixth skeleton is that of an old female of the *Mias Pappan*, with double-crested skull like that of the male. It even exceeds that male

in size, but the skull is smaller; and the sexual distinctions of the two are unmistakable. In this female, the epiphyses of the limb-bones, scapulæ, ilia, &c., are thoroughly ankylosed, denoting completion of growth; even the symphysis pubis is united (with much irregular deposition of bone externally), and the sacro-iliac symphysis on the right side only. The male Pappan had not quite completed his growth; for some of the epiphyses are loose, and others are but partially soldered: those of the humeri are fixed and semi-ankylosed; as are those of the left radius and ulna; but the epiphyses of the right radius and ulna are detached; those of the scapulæ and ilia are fixed but slightly, and those of the ischia more extensively. This animal had therefore (as will be attempted to be shown presently) not completed its full growth: the female being much more advanced in age, with its teeth proportionally worn down. On comparison of the skulls of the two sexes, that of the female is seen to be smaller, with the maxillæ less protruded, increasing the facial angle from 32° to 35° ; the Zygomatic arch is much less robust; and the longitudinal grinding surface of the upper molars less by $\frac{1}{8}$ in., while that of the lower molars is less by $\frac{1}{4}$ in. than in a youthful male presented by Mr. Nicholl, and by $\frac{1}{8}$ in. than in Dr. Clarke Abel's Sumatran male. In the form of the ascending ramus of the lower jaw, this female specimen more nearly resembles the Sumatran male referred to than any other of numerous specimens; but the condyle is considerably larger; and, as compared with Mr. Nicholl's Bornean male, the antero-posterior diameter of the ascending angle is much less; being in the Bornean male (on a level with the surface of the grinders) $2\frac{5}{8}$ in.—in Dr. Abel's Sumatran male but $2\frac{1}{4}$ in.—and in Sir J. Brooke's Bornean female $2\frac{1}{2}$ inch. Lastly, this Bornean female presents the very extraordinary anomaly (throughout the series of placental mammalia) of a fourth true molar above and below, though on the left side only: that of the upper jaw being of small size and round form, its crown scarcely exceeding that of an upper false molar of *Macacus rhesus*; and it is placed posteriorly to the ordinary last true molar on a line with its outer surface, that tooth having been pressed a little inward: in the lower jaw the accessory fourth true molar is very little smaller than the normal molars; and it projects from the internal margin of the anterior surface of the ascending angle of the jaw, its crown being directed obliquely inwards much more than forwards or upwards: as a functional tooth, it must, therefore, have been almost useless; though the outer or upper margin of its crown is a little worn down by attrition, as is also the

outer cusp of the small accessory molar above. This old female Pappan had been badly wounded in its day; having had its left humerus everely fractured, and the fibula of that side also broken; the fractured bones having healed; the unset humerus, however, in an extraordinary manner, exhibiting two large and deep perforations in the great lumpy mass of united bone, where suppuration had ensued and large shot had probably been ultimately discharged from the orifices.

The seventh skeleton is that of a species altogether distinct and new. Although that of a large old male, with the cranial sutures much obliterated, and the ankylosis of the epiphyses of its limb-bones complete, it is very remarkable for the comparatively slight protrusion of the jaws, and the consequently increased facial angle; apparently, however, to a greater extent than really, from the flatness of the face, the unusually slight protrusion of the sockets of the upper incisors, and, above all, the elevation of the condyle of the lower jaw raising so considerably the occipital portion of the skull and consequently the auditory orifice. The facial angle does not actually exceed $32\frac{1}{2}^{\circ}$; while in the two Rambis (male and female) figured in Mr. Blyth's former memoir, it is as low as 30° —(this being also Prof. Owen's estimate of his adult skulls of the Rambis). The zygomata (or cheek-bones) are unusually prominent. The canines, incisors, and the first three upper molars on each side, are exceedingly much worn down by attrition; the canines even to a level with the other teeth: but the circumference of these canines, especially in the lower jaw, is conspicuously less than in males and even large females of the Rambis and Pappan; though they are proportionally larger than in the Kassars. It is further remarkable that the frontal ridges of the skull, instead of uniting upon the vertex to form a single sagittal crest (as in the Rambis), or continuing separate and well apart throughout (as in the Pappan), approach to contact upon the vertex but without uniting; which is very likely to prove a constant and specific distinction, as the present old males show much irregular deposition of bone externally to its contiguous double sagittal crest. The long bones of the limbs, though fully as stout as in the Rambis and Pappan, and about twice as stout as those of the old female Kassars, yet probably do not exceed the corresponding bones of the full-grown male Kassars in length; being very much shorter than those of the adult Rambis and Pappan: and this remarkable brevity of limb, combined with the conspicuous differences in the skull and sundry other distinctions, can scarcely be considered otherwise than as indicative of specific peculiarity.

Of the five Rambis sent, there are two

large full-grown females (including that ticketed Mias Chapin), and also a full-grown female of smaller dimensions (which was labelled M. Pappan :) with a male of superior age and stature to the male Pappan presented formerly by Mr. Nicholls; and also a young male, with the last molars brought into wear, but which nevertheless had not nearly attained its full growth, which bade fair to rival that of the gigantic Sumatran male already noticed.

The specimen to which the name Mias Chapin was attached, appears (as already mentioned) to be a large old female Rambí, very remarkable for the enormous size and vertically elongated form of its orbital cavities, which measure 2 inches, by nearly $1\frac{3}{4}$ inch, across. Its skull is larger, though less massive, than that of the female Rambí figured in the former memoir: the muzzle is conspicuously more slender, measuring but $2\frac{5}{8}$ in. in greatest width (outside the canines), instead of $2\frac{7}{8}$ in.: and whereas the coronoid process of the lower jaw in the former specimen is smaller and about on a level with the condyle, in the present example (labelled Chapin) the posterior or condyle process is unusually prolonged, and raises the skull (with lower jaw in situ) so remarkably, that placing it on a level surface together with the other skull noticed, the zygoma of the so-called Chapin not only overlaps that of the other, but its lower edge is about $\frac{1}{8}$ in. higher than the upper edge of the zygoma of the other specimen: the nasal bones, which in the other are united and ascend to the very summit of the glabella, in this skull continue separate, and reach only to the lower portion of the glabella. The limb-bones are even rather longer than in the great female Pappan, and in fact exceed in length those of any other of the full-grown specimens: the humerus measuring 15 in., the ulna (to tip of styloid process) $15\frac{1}{4}$ in.; femur $11\frac{1}{2}$ in.; and tibia $10\frac{1}{2}$ in.; circumference of middle of trunk of humerus $3\frac{1}{8}$ in.: and of femur $2\frac{7}{8}$ in. The few digital bones seem to accord in dimensions with the corresponding bones of our male Pappan. The extreme length of the scapula is 8 in.; and of pelvis $10\frac{7}{8}$ in.; clavicle 8 in. specimen is marked as having been procured in Sadong (in Borneo).

Another specimen, which was marked Pappan, Mr. Blyth considers to be a small female Rambí, though fully mature and even old, as shown by the almost complete obliteration of the cranial sutures, the ankylosis of the various epiphyses, and the amount of attrition of all the teeth. The cranial ridges are very small; and the sagittal crest is hardly at all raised, but nevertheless exhibits a tendency to rise along the median line of the skull, between the frontal ridges which converge from the temples, and to be prolonged in front, anterior

to the convergence of the latter, which takes place unusually far back: the nasal bones are united and singularly minute, actually not rising so high as the wide part of the orbital cavities; and the latter are small and circular, measuring barely $1\frac{1}{8}$ in every way. The skull considerably resembles that of the female Rambí formerly figured, only that the sagittal crest is so much smaller; the zygomata being also more raised (in consequence of the greater prolongation of the condyle process of the lower jaw); and the orbits are smaller and more circular, and surmounted by much slighter ridges: consequently the face is flatter, and the sockets of the incisors are also less protruded. This skeleton was unfortunately very imperfect, wanting most of the bones of the hands and feet, and one tibia and fibula: a portion of the lower jaw, with the canine, first præmolar, and part of the second, is also lost: but the other long bones are present, and the pelvis is complete. Length of humerus but $13\frac{1}{2}$ in.; of ulna $13\frac{7}{8}$ in.; of femur $10\frac{3}{8}$ in.; and of tibia 9 in.; circumference of middle of humerus $2\frac{1}{8}$ in.; and of femur $2\frac{7}{8}$ in.; metacarpal bone of middle finger $3\frac{1}{8}$ in.; metatarsal of corresponding toe $3\frac{7}{8}$ in.; os calcis 2 in. Total length of scapula (with acromion $1\frac{1}{8}$ in.); and of pelvis $9\frac{7}{8}$ in.; extreme breadth apart of the ilia (or hips) $10\frac{7}{8}$ in.; clavicle $6\frac{3}{8}$ in. This specimen also is marked from Sadong in Borneo.

The third female Rambí is of large size and fully mature, with the various epiphyses well soldered; but it has even less trace of sagittal crest than the last; the frontal ridges meeting as far back upon the skull, but not quite uniting, and a small mesial ridge rising between them above the vertex: the orbits are moderately large and a little elongated vertically, measuring $1\frac{5}{8}$ by $1\frac{1}{2}$ in.; and the nasal bones are united and ascend a little into the glabella. Size about that of first specimen (marked Chapin), but the muzzle rather broader or $2\frac{1}{8}$ in. This specimen is nearly perfect: length of humerus $14\frac{1}{4}$ in.; ulna $15\frac{1}{4}$ in.; femur $11\frac{5}{8}$ in.; tibia $10\frac{5}{8}$ in.; circumference of middle of trunk of humerus 3 in.; and of femur $2\frac{7}{8}$ in.; metacarpal bone of second or middle figure $4\frac{5}{8}$ in. first phalanx of ditto $3\frac{1}{8}$ in.; second phalanx $1\frac{1}{8}$ in.; metacarpal bone of thumb $2\frac{1}{8}$ in.; first phalanx of ditto $1\frac{3}{8}$ in.; metatarsal bone of middle toe $3\frac{1}{8}$ in.; first phalanx of ditto $2\frac{1}{8}$ in.; second phalanx $1\frac{3}{8}$ in.; metatarsal bone of hallux $2\frac{1}{8}$ in.; first phalanx of ditto $1\frac{3}{8}$ in.; and ungual $\frac{1}{8}$ in. Total length of scapula 9 in.; clavicle $7\frac{5}{8}$ in.; extreme length of pelvis $11\frac{1}{4}$ in.; and extreme breadth of ilia 12 inches.

The two remaining Rambí were males: and one of them was a young animal, whose skull

which had obviously not attained its full dimensions, though the last true molars had been brought into wear: but the general massiveness of this skull indicates that the animal would probably have become a male of the largest size: the sagittal crest had begun to rise on a grand scale; and the frontal ridges converge directly to it, although these are scarcely indicated for $\frac{3}{4}$ in. before their junction. The teeth are more crowded than in the full-grown animal; the inter-space between the upper canine and outer incisor, which in a large Sumatran male, is $\frac{3}{8}$ in., being scarcely $\frac{1}{4}$ in.; and the first false molar, instead of being completely posterior to the canine, advances considerably on its outer surface posteriorly; in the lower jaw, also, there is a bony inter-space between the canine and first false molar in the large mature male, but not in the adolescent male: nasals partially ankylosed, and continued upward to the lower part of the glabella: epiphyses of the humeri considerably ankylosed, and also, those of the tibiae and fibulae but not of the radii and ulnae. This skeleton also was tolerably complete. Length of humerus $14\frac{3}{8}$ in.; of ulna $13\frac{1}{4}$ in.; of femur 10 in.; and of tibia 9 in.; circumference of middle of trunk of humerus $21\frac{1}{8}$ in.; and of femur $27\frac{1}{8}$ in.; metacarpal bone of middle finger (the epiphyses beginning to ankylose) $3\frac{3}{4}$ in.; first phalanx of ditto $2\frac{7}{8}$ in.; second phalanx $1\frac{1}{8}$ in.; metacarpal of thumb $1\frac{7}{8}$ in.; metatarsal of middle toe $3\frac{1}{8}$ in.; first phalanx of ditto $2\frac{3}{4}$ in. and $1\frac{1}{4}$ in.; metatarsal of hallux $1\frac{7}{8}$ in.; clavicle $6\frac{1}{8}$ in. Extreme length of scapula (minus epiphysis) $7\frac{1}{2}$ in.; of pelvis (with ischial but not iliac epiphysis) $9\frac{3}{4}$ in.; and extreme breadth at the hips $10\frac{1}{8}$ inches.

The next is a mature male, but certainly not of the largest dimensions: being about the size of the great females already described; and not otherwise recognisable from them than by the general massiveness of the skull (which is remarked at the first glance), and less conspicuously than usual in the present instance, by the form of the pelvis. The superciliary ridges are much broader than in any female skull; and the zygomata equally robust: the sagittal crest is also broad and well developed: nasals distinct, and reaching up to the lower part of the glabella. Skeleton tolerably complete; wanting most of the ungual phalanges and some other small bones. Length of humerus $14\frac{3}{8}$ in.; of ulna (with loose epiphysis) $15\frac{1}{8}$ in.; of femur $11\frac{1}{8}$ in.; tibia $9\frac{7}{8}$ in.; circumference of middle of trunk of humerus $3\frac{1}{8}$ in.; and of femur $2\frac{3}{4}$ in.; metacarpal bone of middle finger $4\frac{1}{4}$ in.; first phalanx of ditto $3\frac{1}{8}$ in.; second phalanx $1\frac{1}{8}$ in.; metacarpal of thumb $1\frac{1}{8}$ in.; first phalanx $1\frac{1}{8}$ in.; metatarsal of middle toe

$4\frac{1}{8}$ in.; first phalanx of ditto $2\frac{1}{8}$ in.; second phalanx $1\frac{1}{8}$ in.; metatarsal of hallux $2\frac{1}{8}$ in.; clavicle $7\frac{1}{4}$ in.; scapula $8\frac{3}{8}$ in.; pelvis $10\frac{1}{4}$ in. in extreme length, and $11\frac{1}{4}$ in. broad at the hips. This specimen was marked Mias Rambli by Sir J. Brooke; and was from Sadong in Borneo. The female Pappan already noticed though of greater size than the male described on a former occasion, with considerably longer and broader pelvis, had nevertheless a smaller skull, less prominently developed jaws, and conspicuously smaller teeth: the zygomatic arch is shorter and a little weaker than in the male; but the superciliary ridges and width of the bony orbits are much the same, and in fact there is little further difference between two skulls: the bony crests on the vertex are less prominent in the female, and they approach to within $\frac{3}{4}$ in. of each other; whereas in the male they remain 1 in.; apart where most approximated: length of base of skull, from between the middle incisors to the anterior margin of the occipital foramen, $6\frac{7}{8}$ in.; in the male, and $6\frac{1}{8}$ in. in the female; breadth of zygomata apart $6\frac{3}{8}$ in., in both. Length of humerus 15 in. of ulna $15\frac{5}{8}$ in.; femur $11\frac{1}{8}$ in.; tibia $10\frac{3}{8}$ in.; circumference of middle of trunk of humerus $3\frac{1}{4}$ in.; of femur 3 in.; metacarpal bone of middle finger $4\frac{1}{8}$ in.; first phalanx $3\frac{1}{8}$ in.; second $1\frac{1}{8}$ in.; metacarpal bone of one thumb 2 in., of the other somewhat less and, bearing a very short first phalanx, only $\frac{7}{8}$ in.; metatarsal bone of middle toe 4 in.; first phalanx 3 in.; second $1\frac{3}{8}$ in.; metatarsal of hallux $2\frac{1}{2}$ in.; clavicle in. scapula $8\frac{1}{2}$ in. in extreme length; and pelvis $10\frac{5}{8}$ in. long, and $11\frac{3}{4}$ in. broad at the hips.

A new species, which has been designated *Pithecus curtus*, is perhaps the genuine Mias Chapin of the Dyaks. The specimen is decidedly male, and well advanced in years; and the skull has a more anthropoid appearance than that of any other Orang-utan known. This chiefly results from the much reduced prolongation of the muzzle, while the cheek-bones project remarkably, giving a sort of Kalmuk expression to the skull. The absolute projection of the maxilla, in a horizontal line carried from the lower margin of the orbital ring, is, in the large Sumatran male Rambli skull, fully 3 in.; in the male Pappan it is about the same; in the female Pappan $2\frac{1}{2}$ in.; in the old female Kassaz (a much smaller animal) about $2\frac{1}{4}$ in.; and in the great male curtus barely 2 in. Extreme breadth of zygomata 7 in.; height of the skull with lower jaw in situ, 11 in.; length, in a straight line, from the summit of orbital cavity to between the incisors, $4\frac{1}{4}$ in. (the same measurement being of the male Rambli $5\frac{1}{8}$ in.; and in the male Pappan $4\frac{5}{8}$ in.): length from occipital foramen to base of upper

incisors 6 in. in the male Rambi $7\frac{1}{2}$ in. and male Pappan $6\frac{7}{8}$ in.): length of the palate 3 in. (in the other $3\frac{1}{2}$ in. and $3\frac{5}{8}$ in.) on orbital cavities $1\frac{1}{2}$ by $1\frac{1}{2}$ in. across: extreme width of bony orbits apart externally 5 in.: extreme breadth of ascending ramus of lower jaw $3\frac{3}{8}$ in.; height of the condyle $4\frac{3}{8}$ in.; length of grinding surface of the upper molars $2\frac{1}{4}$ in. The skeleton was fortunately nearly perfect. Extreme length of humerus $13\frac{1}{4}$ in.; ulna $14\frac{5}{8}$ in.; femur 10^3 in.; tibia $9\frac{3}{8}$ in.; circumference of middle of trunk of humerus, $3\frac{1}{4}$ in.; of femur $2\frac{7}{8}$ in. (length and circumference of humerus of old female Kassar $12\frac{3}{4}$ and $2\frac{1}{2}$ in.; ditto of femur $9\frac{7}{8}$ in. and $2\frac{1}{2}$ in.): length of metacarpal bone of middle finger $3\frac{7}{8}$ in.; first phalanx of ditto $2\frac{1}{2}$ in.; second $1\frac{1}{2}$ in.; metacarpal bone of thumb $2\frac{1}{8}$ in.; first phalanx $1\frac{1}{2}$ in.; metatarsal bone of middle toe $3\frac{1}{2}$ in.; first phalanx $2\frac{1}{2}$ in.; second $1\frac{5}{8}$ in.; metatarsal bone of hallux 2 in.; clavicle $6\frac{7}{8}$ in.; extreme length of scapula $8\frac{3}{4}$ in.; of pelvis $10\frac{1}{4}$ in.; and breadth at the hips 11 in.; length of the vertebral column, from atlas to sacrum, measured internally, $16\frac{1}{4}$ in.; in the scarcely full-grown male Pappan, $17\frac{1}{2}$ in., and in the female Kassar, $15\frac{1}{4}$ in.; axis-vertebra

dered to the next. As compared with the Rambi and Pappan, the metacarpals and metatarsals are shorter, and the first phalanges of the fingers and toes are longer. It has been remarked that in the adult and aged specimens of the Rambi and Pappan, the canines are always perfect; whereas in those of the small Kassar they are as regularly broken or worn down to about a level with the incisors. This remark is borne out by the series of skulls now under examination. The canines are long and unbroken in all the specimens of the Rambi and Pappan; and are ground down in the old female Kassar, and also in the old male *P. curtus*! Denoting probably a difference of food. The different species of these animals do not appear to inhabit the same district; and, seemingly, *P. owenii* represents, in the southern part of the great island, the *P. morio* of the northern part.

When examining the grand series of skulls and skeletons of adult Orang-utans amounting to twelve in all (viz., 3 males and 4 females of *Pithecus brookei* or *Mias rambi*, 1 male and 1 old female of *P. satyrus* or *M. pappan*, one old male of the *P. curtus* or *M. chapin*?, an old female of the *P. morio* or *M. kassar*, and the adolescent female with short fore-arms, provisionally designated *P. owenii*,—in addition to Professor Owen's excellent lithographs of the male Kassar and of male and female Rambi in the *Tran. Zool. Soc.*, Vols. i and ii), the observer is first struck with the very obvious and conspicuous distinctness of the comparatively puny *Mias kassar*, and of the

adolescent small skeleton, from all the rest. The next glance suffices to separate the Rambi, pappan, and *P. curtus*: the last being quite as thoroughly distinguished apart by the tout ensemble of its appearance, as the Pappan is by its conspicuously double-crested vertex. No zoologist, accustomed to the discrimination of specific characters would hesitate, with the present series of skulls before him, to acknowledge the distinctness of each of these three, but such an observer would ponder for a while over the remarkable female Rambi skull with enormous and vertical oblong orbits, and would doubtless hesitate in regarding it as specifically identical with the old female Rambi of small size so great is the contrast between them. Presuming, however, that he arrived at the conclusion here ventured upon, it still follows that the Rambi is subject to an extraordinary amount of variation for a wild animal; and this, although it may not invalidate the opinion of its distinctness from the Pappan and *P. curtus*, nevertheless prompts a reconsideration of the grounds for the view formerly expressed, with regard to the specific distinctness of the small specimen having short fore-arms. From the detached state of the epiphyses of its limb-bones, it is certain that that specimen was not full-grown; and as those of the ulnæ at least (as shown by the adult male Rambi, and also by that of the male Pappan,) are the last to become ankylosed, it should follow that the fore-arm continues to increase in length after the upper arm and the leg had ceased to grow; but the difference is still too great to be thus accounted for satisfactorily.

This fact would appear certain, that the partial ankylosis of the epiphyses of the limb-bones does not rigorously denote cessation of growth, unless the female Orangs attain to greater stature than the males, which is most unlikely. It would seem rather, that as the earthy salts are continuously absorbed and re-deposited, some continuance of extension supervenes, until finally checked and stopped by the considerably increased deposition of bone. The skull also continues long to increase in size, after the last true molars have been brought into use.

As regards the sexual distinction, a practised eye discerns it readily in the adult skull, by its superior general massiveness in the male; and, in the skeleton, the larger and broader pelvis of course denotes the female animal, combined with a proportionally smaller and less robust skull than in the other sex. There is no reason to doubt the correct determination of sex in any one of the specimens here noticed.

The occasional but rare occurrence of the ungual phalanx to the hallux or great toe, would seem to be proper to no particular sex

or species ; for it exists in the male Pappan from Sumatra, and in the female Rambi from Borneo.

It now remains to connect the osteological with the external characters of the different species ; to determine the stature attained by the largest males of the Rambi, Pappan, and also Kassar, to obtain further information of the *Pithecus curtus*, and to verify or otherwise the *P. owenii*.—*Blyth in Beng. As. Soc. Journ.*

Like the lemon, this is a native India, being found in the forests on the borders of Sylhet, and also on the Neilgherries, perhaps also in China. The Sanscrit Nagruna, and the Arabic Narunj, (are no doubt the European names of Naranja (Spanish), Arancia (Italian), whence we have Aurantium and Orange. The orange-tree attains a height of 16 or 20 feet and bears great abundance of fruit, and like others of the genus, bearing the fruit at all ages at the same time with the flowers. Though a native of India, it does not ripen its fruit there until the winter, and hence has been able to travel so much further north than others of its compatriots. Oranges are cultivated in many parts of the East Indies and are carried by land and by water to considerable distances. The Cooloo orange of China, the Ch'ang of the Chinese, is a large thorny tree, but there is also a small variety: its fruit has a thin, yellow, closely adhering skin, and fine, but rather sharp flavour; marmalade is made of the fruit. In China kiuh means any orange. The kan of the Chinese, also called by them Chii and sha-kan, is the red skinned variety, the *Citrus nobilis* of authors: its rind is connected with the endocarp, with many loose threads. It grows in Central China and its fruit is smaller and sweeter than that of the Cooloo orange: it is used as dessert and its peel is exported to Japan. The orange is extensively cultivated all over the Deccan. The finest sorts are the Cintra, Cowlah, and a small sweet orange which grows on a tree more like a creeper. The principal method of culture is by budding, the stocks generally being either seedlings or cuttings from the sweet lime. The best Cintra, with a thin close rind, is produced upon the seedling stock, and it is said that the fruit grown upon the sweet lime stock is generally

loose and soft: this is very perceptible with some of the oranges. The best time for budding is in the cold season. In Tenasserim, oranges are quite abundant, but for the want of proper attention they are much inferior to the West India oranges, and to those cultivated in the south of Europe. The trees are often exceedingly prolific. A seedling planted, produced in the ninth year more than two thousand oranges. The leaves are rather bitter, and contain essential oil. A still more fragrant oil, called oil of neroli by perfumers, is afforded by the flowers. The berries while unripe are gathered, dried, and turned in the lathe to the size of peas, and are used in issues on account of their fragrant odour. The rind or peel of the orange is bitter and aromatic, and affords a very useful stomachic tincture and syrup. The juice of the ripe fruit contains sugar, malic and citric acids, citrate of lime, mucilage, albumen and gum. Like the lemon juice it makes an excellent cooling drink, and is an invaluable specific in the treatment of scorbutic diseases. The seeds of the orange yield oil by expression. The fruit of the orange is eaten as a dessert, is candied and is made into marmalade. From its extremely agreeable and refreshing juiciness it is much esteemed as a fruit even for the sick, and as a refrigerent. When of a small size, the fruit which falls off is dried, and forms the *Aurantii baccae* or Curacao oranges, so called from being employed in flavouring curacao. The smaller ones are smoothed, and used for making issues. The rind or peel for the fruit is sometimes substituted for that of the bitter orange, as are also the flowers and their essential oil, also the oil expressed from the grated rind, likewise orange flower water; all being used for the same purposes as those produced from the bitter orange. One variety of the orange fruit is in high estimation amongst the Tamil medical practitioners, who suppose that it purifies the blood, improves the appetite and cures catarrh. The wood of the orange tree is not available of any size, or in any quantity. Leaves of the orange are officinal on account of their bitterness and the aromatic properties of the essential oil stored up in the vesicles with which their substance is studded. This essential oil may be obtained by distillation, as also a distilled water. An infusion of the leaves may be employed as a bitter and aromatic excitant and diaphoretic. The orange, lemon and lime trees, (*Citrus*), are evergreens that seldom exceed about 15 feet in height. The wood is only met with as an object of curiosity; it is of a yellow colour, but devoid of smell. In confirmation of the orange and lemon being natives of India, it may be adduced, that the Asiatic names of the orange are in Sanscrit, Nagruna; Hind. Narungee; Arab,

Narunj, and those of the lemon, Sans. ; Nimbooka ; Beng. Neeboo ; Hind. Neemoo, leemboo. It is further worthy of notice, that the Persian and Arabian authors do not, as is their wont, give any Greek synonyme of either ; but of the citron, which is supposed to have been known to the Romans, they say that marsecska is the Yoonancee, and atrogla, the Syrian name, neither of which terms have been traced. The Sanscrit name of the citron is beejapooru, the Arabic ooturuj, and the Persian toorunj. By the last it is also known in the northern provinces of India.—*Drs. Riddell ; Mason ; O'Shaughnessy ; Ainslie ; M. E. J. R. ; Predgold ; Royle Ill. Him. Bot., p. 130.*

ORANGE-BELLIED GRAY SQUIRREL, syn. of Sciurus lokriah, *Hodg.*

ORANGE-DYE PLANTS. The flowers of the butea with an alkali, the corolla tubes of the tree of mourning, and the leaves of the henna tree, yield beautiful orange dyes. The latter are used in India to dye skins of a reddish-yellow.—*Mason.*

ORANGE GOURD, Cucurbita aurantia.

ORANGE PEEL.

Chin-pi, CHIN. | Post-i-Turanj, PERS.
Huang-pi,

This is the peel of the various kinds of orange fruit, the Citrus aurantium, C. bigaradia, C. margarita and C. nobilis. It is used as a stomachic, stimulant, anti-spasmodic.

ORANGE-PEKOE, a black tea from China, so named, of which there is also a scented kind.—*Simmond's Dictionary.*

ORANGE WINE or Auranta, is an agreeable beverage, of a somewhat peculiar flavour, resembling Malmsey or Muscat. It is recommended for flavouring jellies.—*M. E. J. R.*

ORANGE ZEST, or Orange threads.

Kieh-peh, CHIN. | Kieh lo, CHIN.
The dried threads of the fruit, that cover the pulp of the sweet orange, prolongations of the endocarp.

ORAOON, a tribe found amongst the races in the Chota Nagpur territory. Their language is of the Dravidian stock. They are located in the highlands east of the Udiapur and Sargujah districts of the Chota Nagpur division. They form a considerable part of the population of the Jushpore highlands, and these Jushpore Oraon are the ugliest of the race. Thence, eastwards, the Oraon have pushed themselves into the country of the Mundah in the plateau of the Chota Nagpur district and adjoining country. They are not, at present a dominant race. They are laborious and industrious and are engaged as labourers in Bengal. The Oraon call themselves Khoonkir. They have traditions that they were once settled in Guzerat, but, on being expelled there, travelled eastwards fighting unsuccessfully on the road, and finally settled on the Rhotas hills, where some of them

seem to have remained until the mahomedans erected a fort there. There is no similarity between the language of the Oraon and that of the Mundah and their cognates, the Mundah is soft and sonorous, while the Oraon is guttural and harsh and the Oraon language of the Rajmahal hills and the Tamil have a near connection. The Oraon, when driven from the Rhotas hills, brought with them to the plateau large herds of cattle and implements of husbandry previously unknown to the Mundah. Also, the Oraon, when driven from the Rhotas hills, separated into two great divisions, one of these moving to the S. E. formed a settlement in the Rajmahal hills, and are now known as the Male or Rajmahali ; the other sought refuge to the south in the Palamow hills, and wandered from valley to valley in those ranges, till they found themselves in Burwai, a hill-locked estate in Chota Nagpur proper. From there they occupied the highlands of Jushpore and formed the settlements in the vicinity of Lohardugga, on the Chota Nagpur plateau where they still constitute the bulk of the population. The present customs of the Oraon have been derived from Mundah, and differ therefore from those of the Rajmahali people whose isolated position has preserved their ancient ceremonies. In the marriages of the Oraon, a public recognition that the couple have slept together is a part of the ceremony ; the Oraon burn their dead. They are sworn on the Doob grass. Their supreme deity is the sun, called Dhurmo, a Sanscrit word. Amongst the Rajmahali people, it is customary for the engaged couple to sleep together before marriage. They bury their dead. They swear on salt. They worship Bedo Gosain, an invisible spirit. The Rajmahali is less cheerful than the Sonthal, less industrious and does not join in the dances to which the people of the Mundah stock are so devoted. The Oraon are more lively than the Mundah, quite as industrious and the most active and nimble-footed of dancers. The Oraon are now a good deal interposed between the Kharawa and the Mundah, but though the Kharawa and Oraon are in contact, they are described by Colonel Dalton as very unlike one another in language, appearance, manners and customs. Oraon settlements predominate in the western parts of Chota Nagpur plateau and each village group has its peculiar flag. The Oraon are a very small race, but well proportioned. The young men have light graceful figures and are as active as monkeys. Those residing in isolated positions are generally black or dark and ill-favoured. They have wide mouths, thick lips, projecting maxillary processes, nostrils wide apart, no marked elevation of the nose, and low foreheads, though not, in general very receding. The Oraon who dwell

in mixed communities have more varied features and colours softer, fairer and pleasing when young and improve in appearance with civilisation. The Oraon, according to Colonel Dalton have more of the African type of feature, he has seen woolly heads amongst them and the wild Oraon have almost an ape-like physiognomy. The Jushpore Oraon, according to Colonel Dalton, are the ugliest of the race, with very low foreheads, flat noses and projecting cheek bones, and approach the negro in physiognomy and in manner, the Oraon are more like bright-hearted negroes are fond of gaiety, decorating rather than clothing his person, whether working or playing, always cheerful, and young Oraon boys and girls are intensely fond of decorating their persons with beads and brass ornaments which they discard on becoming christians. Oraon youths and maidens speedily acquired the songs and the steps of the Mundah. The Oraon have small, ill-built, untidy huts, in which the family reside. But they have in each village of old standing, a Dum-Kuria, or bachelor's hall in which all boys and unmarried men of the tribe are obliged to sleep. Any absentee is fined; in the Dum-Kuria, also, is placed all the flags, instruments used in their dancing and other festivals, and in front of it is a clear circular space for the dancing ground. In some Oraon villages, also, the unmarried girls have a house to themselves with an elderly woman to look after them—she has always a stick in hand. The Oraon have no gardens or orchards belonging to individual houses, but they have some fine trees, common property within the village, and outside, their groves of fruit trees form a beautiful feature of Chota Nagpur scenery. The Oraon have a veneration for salt; Mundah and Oraon marriages as a rule are not contracted until both bride and bridegroom are of mature age, the young people often making love and suiting themselves. In Chota Nagpur amongst the agricultural classes, and in Singbhum amongst all classes of Kols, girls have a fixed price sometimes up to 40 head of cattle; and girls often long remain unmarried, even to be old maids. When they are married, the bride clasps a mahwa tree, the groom a mangoe tree, and at the close of the ceremonies the bridesmaids pour a jar of water over the heads of each of the couple who then retire to change their wet clothes. The next morning the bridesmaids burst into the nuptial chamber and bring forth the bride and groom. In villages east of Ranchee, wholly inhabited by the Oraon, the Mundah, not the Oraon, is the language spoken. Mundah and Oraon village officers are the Bhumhar, whose head is called Mundah; —the Mahto or assessor, Bhandari, his assistant; the Pahan or priest: Gorait or messenger, and

Kotwar or Police. The Oraon according to their own traditions, were driven across the Sone by the intrusion into their native land of gangetic hindoos, and ultimately settled in Chota Nagpur, the country of the Kol tribe of Mundah or Ho. At a later period, hindoos spread, also, into this territory, reduced the more civilized Oraon to slavery, drove the wilder Kol into revolt, and eventually forced them to migrate to the southward and eastward into the land of the Bhuian. The more northerly of the eastern emigrants passed out into the low country and mixing with the Bhumij and Bhuian natives, formed the class of Tamaria. The more southerly moved into Singbhum and Kolehan, living at peace with the Bhuian pre-occupants, until the intrusion of hindoos from Marwar, who first leagued with the Bhuian against the Kol, and then with the Kol against the Bhuian, and finally appropriated Singbhum, leaving Kolehan Hodesham to the Kol or Ho, as the southern tribe call themselves. Remnants of the Kol are still found to the northward in Chota Nagpur and they appear to be also spread to the northwards towards Rajmahal.

The Sonthal tribe appears to be very widely spread. It is found in Chota Nagpur and in the skirts and valley of the Rajmahal hills. It is enumerated by Mr. Stirling in his list of the tribes of Cuttack, and, according to Captain Sherwell, its range is from Cuttack through Chota Nagpur to Rewa, thus embracing the territory of both divisions of the eastern Vindyan races.

The Male and Oraon languages are mainly Dravidian, and it is remarkable that although the Male are now confined to the N. E. extremity of the Vindhya, where the Ganges washes and bends round the chain, and are separated from the south Dravidian nations by the Kol, their language is more Dravidian than the Kol itself. The explanation is probably to be found in the circumstance of the Oraon and Male having originally formed an uninterrupted extension of the Gond tribes and dialects that extended from the Godavery to the N. extremity of the Vindhya. According to Dr. Caldwell, Oraon is an uncultivated idiom, and contains many roots and forms belonging to the Kol dialects and so many Dravidian roots of primary importance, that it is considered by Dr. Caldwell as having originally been a member of the Dravidian family of languages.

The Oraon worship the sun under the name of Dhurmi, as the creator and preserver, and offer white animals to him in sacrifice. Dara, worshipped by the Oraon and Mundah of Chota Nagpur, is a carved stick, stuck up where the great jatras are held, or in the village dancing place, and is worshipped with much revel and

wassail, with much drunkenness amongst the old, and dancing and love-making amongst the young.—*Dalton*, pp. 134, 169, 170, 171, 172, 175-179, 198; *Campbell*, pp. 22, 33, 39.

ORAZIO, a friar who travelled in Central Asia. See Sakya muni.

ORCANETE, Fr. Alkanet.

ORCHAKA, Beng. *Sonneratia acida*, Linn.

ORCHIACEÆ, Lindl., the Orchis tribe of plants comprising 7 gen., 1,990 sp., viz.:

Of these, there are about 1,700 species in British India, viz.:

Malaxiæ.....	300	Arethuseæ.....	218
Epidendriæ.....	153	Neotiesæ.....	270
Vandææ.....	487	Cypripediæ.....	23
Ophidææ.....	449		

Many of the Orchiaceæ have very beautiful flowers. Salep which consists of bassorin is obtained from a species of *Eulophia*. Orchidaceous plants are rare throughout the plains of Northern India, and in the Punjab. Only the ubiquitous *Zeuxine sulcata* occurs generally, while *Eulophia* is found locally, and only one other was found in the Trans-Indus hills to 8,000 feet. *Bolbophyllum*, species, *B. auricomum*, *Careyanum*, *flexuosum*, *fuscens*, *Jenkenstonii*, *serpens*, and *sunipia*, occur in Nepal, the Khassya hills, Burmah and Tenasserim. The most highly valued of the orchid order among the Burmese and Karens, is the sweet-scented *bolbophyllum*, which Karen youths wear in the lobes of the ear, and maidens in their hair. It abounds in almost every part of the jungles, throwing down delicate straw-coloured racemes over the rough gray bark of old *lagerstroemia*. *Bolbophyllum careyanum*, is a common orchid in the vicinity of Maulmain, easily recognized by a long leaf at the apex of a false bulb, and by its small purplish flower. Species of *Dendrobium* occur in south-eastern Asia and Australia. Dr. Wight in his *Icones*, gives thirteen, Dr. Voigt names twenty-five species, and on the Tenasserim coast, there are fifteen or more species, viz.:

album,	cambridgeanum,	macrostachyum,
alpestre,	candidum,	paxtonii,
aureum,	calceolus,	pendulum,
barbatulum,	ceruleus,	piersii,
denudans,	clavatum,	pulchellum,
fliforme,	crumostatatum,	pumilum,
graminifolium,	crysanthum,	purpureum,
heterocarpum,	densiflorum,	ramosissimum,
hynesianum,	flavum,	secundum,
humilis,	formosum,	stuposum,
jerdonianum,	gibsonii,	sulcatum,
aggregatum,	jenkinsii,	teretifolium.
bicaeratum,	longicornu,	

Of all the air plants on the Tenasserim coast, the most interesting is a *dendrobium*, the flowers of which are white, with a yellow lip, three or four inches in diameter, and exquisitely fragrant. The plant blossoms in March, and it flowers. May be seen whitening under the emerald foliage of the groves nearly six months of the year to the close of October.

ORCHIACEÆ.

The Burmese call it the silver flower. Of species of *Epipactis*, Wight gives figures of *Epipactis carinata*, and *Dalhousiæ macrostachya*. *Eria obesa*, is one of the most abundant of Tenasserim epiphytes, but the flowers are small, and have little to recommend them. Wight gives figures of *E. epiphytes*, *pauciflora*, *polystachya*, *pubescens* and *reticosa*. Air-plants possess the power of living for a considerable time suspended in the air. All plants, however, require inorganic as well as organic constituents, and although these latter elements can be supplied from the air in the form of carbonic acid, ammonia, and water, the former cannot, and in the end they all perish. There are however, two different tribes to which the name of Air-plants has been applied; of which one, containing the moss-like *Tillandsia usneoides*, which hangs in festoons from the branches of trees in the hot damp forests of tropical America, and the fragrant *T. xiphioides*, which adorns the balconies of the houses in Buenos Ayres, is called by botanists *Bromeliaceæ*; the other, abounding in species of the most different nature and appearance, is named *Orchidaceæ*. The genera, *Eulophia*, *Orchis*, *Satyrium* are believed to produce the salep of commerce, a substance largely used as a restorative and as a dietetic. *Orchis mascula*, called early orchis, male orchis, and male fool's stones, grows plentifully throughout Europe, northern Africa, Persia and the temperate region of High Asia. In Persia the roots are washed and thrown into boiling water to remove the outer skin; they are then dried, strung on cords and hung in the sun or in ovens until perfectly free from moisture. The dried bulbs are of the size of a cherry stone to that of an olive, are slightly transparent and of a horny colour, they are pounded by being soaked in cold water, until they become soft and then rapidly dried, and the powder is dissolved like other fecula, in water, milk or broth, requiring sixty parts of liquid to one of fecula. It may be used for the same purposes as sago, tapioca and arrowroot; and when good is an excellent diet article for convalescents, two drams being sufficient for a meal for an invalid. *O. morio* of Great Britain, the meadow orchis, or female fool's stones, and the *O. militaris* or man orchis, also of Britain, all furnish the salep tubers: *Orchis biflora*, *O. commelinifolia*, *O. latifolia* and *O. papilionacea* are also named. Dr. Royle was of opinion that the genus *Eulophia* furnished the salep of High Asia, Cashmere and Afghanistan, the Himalaya, the Neilgherries and Ceylon, and Dr. Bellew found an orchis at Hazarah four marches west of Karram fort at a height of 1,000 feet, some of the tubers being almost as large as a walnut. Dr. Royle names *Eulophia vera* of the Himalaya, near the Jhe-

lum, and *E. campestris* near the Kherce pass as yielding salep. There are three kinds of salep known in the bazaars of N. W. India, viz., Salep misri or Egyptian salep, the genuine salep of Kashmir, salep-kohi or salep kabuli, the mountain or Kabul salep and Simla salep and salep Hindustani, which is the worst kind.—*Mason's Tenasserim; Eng. Cyc.* See *Aerides*, *Cynabidium*, *Dendrobium*, *Epidendrum*, *Gunnia*, *Loranthus*.

ORCHILLA WEED.

Orchella, Archil,	ENG.	Rocella tinctoria,	LAT.
Orsoillo,	FR., GER.	Orchilla,	SP.
Oricello, Orcella,	IT.		

Orchilla weed is the lichen *Rocella tinctoria*, from which is obtained the dye called Orchil or Archil, by maceration in urine or other ammoniacal liquid.

ORDEAL. The earliest mention of the trial by ordeal is contained in the 5th chapter of the book of Numbers from the eleventh verse, in which the priest gave holy water to a woman to drink, imprecating her with a curse, that if guilty, her thigh should rot and her belly should swell. Trial by ordeal, though forbidden by the Koran, is to be found in some form or other throughout the mahomedan world. In Sind it is called *Toro*, and there are several forms in which it is practised. In hinduism nine ordeals were recognised: in trivial cases, a few grains of rice that have been weighed with the *salagramma* are put into the mouth of the suspected or accused person, who chews them and spits them out on a *pepul* leaf. If the person be innocent, the grain appears as if stained with blood: if guilty, the rice is dry. In the trial by *Cosha* or image-water, the accused person drinks some of the water with which an idol has been washed, and if the accused survive free from calamity through the next fortnight, he is innocent. The ordeal of the balance is applied to women, children, the aged, blind, lame and sick men, and to brahmins. After a fast of 24 hours, both of the accused and the priest, the accused bathes in holy water, prayers are offered up and oblations are presented to fire. The beam of the balance is then adjusted, the cord fixed and the accuracy of the scales ascertained. The accused then sits in the scale and, while being weighed, the priests prostrate themselves, repeat certain incantations and after an interval of six minutes the paper with the writer's deosation, is bound around the head of the accused who invokes the balance thus: Thou Oh! Balance, art the mansion of truth: thou wast anciently contrived by the deities: declare the truth therefore Oh! giver of success, and clear me from all suspicion. If I am guilty, Oh! venerable as my own mother, then sink me down: but if innocent, then raise me aloft.

The accused is then re-weighed; if he then weigh heavier, he is found guilty, but if lighter, he goes free.

In the trial by fire, the accused in India walks barefoot into a heap of burning *pipul* leaves (*Ficus religiosa*); in Siam, over a pit filled with burning charcoal. In the ordeal by boiling oil, the accused has to thrust his hand into the scalding fluid.

The hot-iron ordeal is practised. Nine circles are drawn, each 16 fingers in diameter, and each the same distance of 16 fingers apart. The hands of the accused are rubbed with unhusked rice (paddy) and all marks on them carefully noted. Seven *pepul* leaves are then bound with seven threads on each hand, and the priest gives him a red hot ball to carry as he steps from circle to circle, keeping his feet within each until he reach the eighth, when he throws the ball on a heap of dry grass inside the ninth. If his hands, which are then examined, be not burned, he is pronounced innocent.

In Japan, a reputed thief bears on his hand a piece of thin paper having the figures of three deities. On this a piece of red-hot iron is placed, and if his hand escape, he is pronounced free.

The water ordeal is in vogue in India, in Burmah and in Borneo. In India, the accused stands in water, nearly up to his waist, attended by a brahman staff in hand. A person near shoots three arrows from a bamboo bow and a man hurries to pick up the furthestmost shaft. As he takes it from the ground, another person runs towards him from the water's edge; at the same moment the accused grasps the brahman's staff and dives beneath the water. If he remain there till the two arrow-fetchers return, he is innocent, but if any part of his body appear, he is guilty. In Burmah, a stake is driven into the water, the accuser and accused take hold and together plunge beneath the water, and he who remains longer submerged is declared to have truth on his side.

In the poison ordeal, white arsenic and butter in a mixture is administered.

In the snake ordeal, a cobra and a ring are placed in an earthen pot, and the accused has to withdraw the ring.

In the idol ordeal, two images, one called *Dharma* or Justice, the other *Adharma*, or Injustice, are placed into a jar, and the accused is allowed to draw: if *Dharma* image be withdrawn he is innocent.

The Borneo *Dyaks* place two pieces of salt in the water, to represent the accuser and accused, and the owner of the piece dissolving the first loses the cause. Also, two shells are placed in a plate and lime juice squeezed over them, and he whose shell moves first, is pronounced guilty or innocent as may have been

resolved on. But the more common mode amongst the Dyaks is for the accuser and accused to plunge their heads beneath the water, and he who remains the longer is free.

The Binjara people use the branch of a Nim tree (*Azadirachta indica*.) A husband throws it on the ground and, turning to his wife, says, if thou be a true woman, lift that nim branch. In the first volume of the Asiatic Researches, is an article on the trial by ordeal as in use among the hindus. Several modes are there detailed. The trial by jury, called Panchayet, was likewise formerly in extensive usage, and, up to the close of the 19th century, was not entirely discontinued, in some districts of India. Trial by ordeal is in use on the coast of Africa: All criminal charges are tried by the Pynin or judges, who hear and weigh the evidence produced. But if there be no evidence the cause is decided by a species of ordeal called doom, which consists in administering to the person accused a certain quantity of the bark of a tree deemed poisonous. If he retain it on his stomach, he is pronounced guilty; if otherwise, innocent. The refusal to submit to this ordeal is considered as a decisive proof of guilt, and the judges proceed accordingly. There is a fire ordeal with the hindoes, among whom in both peninsulas the usage is very general, extending to buddhist Siam and Pegu. Both hands of the accused are ordered to be rubbed with rice in the husk, and well examined; then let seven leaves of the Aswatha (the religious fig-tree) be placed on them, and bound with seven threads, saying these words: "Thou, O fire, pervadest all beings; O cause of purity, who givest evidence of virtue and of sin, declare the truth in this my hand.—*Richard P. Burton's Sindh*, p. 382; *Wilk's Mysore*, Vol. i, p. 501; *Hindu Infanticide*, p. 150; *William's Story of Nala*, p. 192; *Fourth Report of the African Institution*; *Letter from Mr. Meredith on the Gold Coast*, December 1809; *Asiatic Researches*. Common in the Himalaya up to the Indus, (and found in the hills beyond it) from 3,200 to 7,000 feet. Wherever it grows in any quantity, tinder and occasionally moxas appear to be made from it, sometimes by beating up the body of the leaf with the tomentum on its under-surface (as is done with some other plants), but generally by breaking through the former and tearing off the latter to be used alone. Cloth is said to have been made from this, but Dr. Stewart nowhere found this to be the case in the Punjab Himalaya. The plant is quite small, and does not grow closely, so that a wide area would need to be searched to get any considerable quantity of the tomentum; and the process of removing the latter is a tedious one, and would probably be costly.—*Dr. J. L. Stewart, M. D. in Punjab Plants*.

ORFA, is the capital of a Turkish pashalik which extends in a north-west direction from the mouth of the Shat-ul-Arab to the rocks of Merdin, the Baghdad frontier towards Constantinople. In an east and west line, it stretches from the confines of Persia to the banks of the Khabour which separates it from the pashalik of Baghdad; Orfa is the Osrhoene of the Romans, and that part of Mesopotamia which contained the Haran of Abraham, and the famous Edessa of the Crusades.

ORGANJ, Urghanj or Jarjaniah, formerly the chief city of Khwarezin, the country now known as Khiva. It stood on both banks of the Oxus, with a bridge connecting them. It was the scene of awful devastation and massacre by the Mongols under Jenghiz in 1221, and a hundred thousand of the only class spared, the artisans are said to have been transported to Mongolia.—*Yule Cathay*, Vol. i, p. 232.

*ORIENTAL, a term in use in philology to indicate a class of languages; in geography it is applied broadly to Asiatic countries east of Europe, but in a more restricted sense to the East Indies or the countries now known as British India. In mineralogy it is applied to precious stones, varieties of corundum, the violet oriental amethyst, the green oriental emerald, the red oriental ruby, the blue oriental sapphire, the yellow oriental topaz, are all variously coloured varieties of corundum. The oriental amethyst is also of a purple colour but is an extremely rare gem. Its colour can be destroyed by heat and its purity then resembles that of the diamond. They are all found abundantly in the peninsula of India, but not of great beauty, the ruby of the N. E. of Burmah is the true oriental ruby. They are all distinguishable from the other gems of the same names which have not the prefix oriental by their greatly superior hardness and greater specific gravity. Sapphires are found in gravel and sand in the island of Ceylon and in Pegu, but they have never been seen in a matrix. They are also occasionally found in gravel in different parts of Europe, and they have been met with of a clear blue colour and crystallised in the lava of Neider Mendig, near Andernach on the Rhine. The sapphire is a remarkable instance how the mysterious chemistry of nature in the mineral kingdom produces from the same elements substances the most different in external form; this beautiful precious stone yielded by the analysis of Chenevix 94 per cent. of alumine; and Tennant found in emery, when freed from its admixture of iron, 92 per cent. of the same earth. The sapphire is, after the diamond, the most valuable of gems; it is usually dark-blue, but also occasionally colourless, and the green variety of corundum is the rarest of all gems.

Oriental emerald.

Zamarrud, AR, PERS., HIND.	Smeraldo,	It.
Emeraude,	FR. Smaragdus,	LAT.
Ismaragdon,	GR. Esmeralda,	Sp.
Prasinus,	" Pachi, Kallu.	TAM.

Emerald, the green variety of corundum, is

the rarest of all gems: it is of a beautiful green colour, unsurpassed by any gem. The finest occur in a limestone rock, at Muzo, in New Granada near Santa Fé de Bogota, 5° 28', at Odontchelong in Siberia and near Ava. It is associated with spinel.

When of a deep rich grass-green colour, clear and free from flaws, it sells at from £20 to £40 the carat. Those of lighter shade from 5s. to £15 the carat. The emerald pillars in the temple of Hercules at Tyre; the emerald sent from Babylon as a present to a king of Egypt, four cubits in length and three in breadth, and the emerald obelisk described by Herodotus, were all doubtless green jasper. The Ural and Altai mountains have latterly furnished the finest emeralds. See Precious Stones, Gems.

ORIENTAL ARBOR VITÆ, or Chinese Arbor vitæ, *Thuja orientalis*, is a native of rocky situations in Siberia and China and on the mountains of Japan.—*Eng. Cyc.*

ORIENTAL LANGUAGES, is a term applied to all the languages of Asia, whether of the Aryan, Semetic or other class. With all the oriental languages those who would acquire them, encounter their first difficulty in the variety of writing characters in use, and a second difficulty in the discordant manner in which, when a foreign character is used, or indicated by foreigners, the powers of the letters are employed. Two modes have been proposed and largely followed, of indicating by the Roman letters, the characters in use for the vernacular tongues of India. The one put forward by Sir William Jones, about the year 1788, was an analogous classification of the letters, the other proposed by Dr. John Borthwick Gilchrist, in the early part of the nineteenth century was the representation of the sounds of the vernacular letters by equivalents of similar enunciation according to the powers of the letters as given by the English people; in other words the one principle is analogy, the other pronunciation. The latter principle is well adapted for expressing the oriental characters in English letters in such a manner that English readers unacquainted with the oriental characters would be enabled to articulate the words with a very near approach to their correct pronunciation: but it is for the most part unsuitable for all others of the European nations who use the Roman letters. The principle of analogy adopted by Sir William Jones retains the original letters with certain distinguishing marks and permits the learned men of all Europe to follow the word to its source, and it has been generally followed by the learned. The most recent writer on the subject is professor Horace Hayman Wilson in his Glossary, and he considers that the characters in the

English alphabet have enabled him to represent letters in nine alphabets of thirteen different languages of British India. But, to do this he has, by diacritic points and marks, and by compound letters, increased the english alphabet from 26 to 70 characters, nineteen of the English letters having two to six forms, b, c, e, i, j, o, p and u, each two; g, h and l, each three; d and k, each four; a, r, s, t and z, each five, and n has six forms, and he has even recommended other additions.

Ὀρίανον ἡρακλειoticόν of
Dioscorides, 3, 29.

A very variable species, but is recognized by the bracts being longer than the calyxes, by the loose spikes and small flowers. Flowers white; it seldom ripens seed in Britain, and is propagated by slips and cuttings. It requires a dry and sheltered situation. It is a native of the region of the Mediterranean, Greece, and about Odessa on the Black Sea. It has an aromatic sweet flavour, and is much used as a relishing herb in cookery.

Sweet

This delicate sweet smelling plant is a native of India, very easily reared in beds or pots, either by slips from the roots, or seed. It is used for flavoring sauces, &c., the hindoos offer it at the shrines of Vishnu and Siva. It is a tree or shrub in its native country, but an annual in gardens of Europe. It is native of the north of Africa near Mascar, on hills, and of Asia, on the mountains of Kumaon. When in blossom, the plant is cut and dried for winter use, as a savoury ingredient in cookery.—*Jaffrey*; *Eng. Cyc.*

ORIGANUM NORMALE, *Don.*
O. vulgare, *Linn.*
Mirzan-josh, *ARAB.* | Marjoram, *ENG.*

This herb grows commonly in the Punjab Himalaya from 2,500 to 10,500 feet. Aitchison states that in Lahoul it is eaten as a pot-herb.—*Dr. J. L. Stewart*, M. D.

ORIGANUM ONITES, *W.* Pot marjoram.

Common marjoram, *ENG.* | Mridu-marurvamu, *TEL.*
Origanon melan, *Gr.* of *Theoph.*

An ornamental and aromatic plant, a native of Great Britain in dry uncultivated places, and of Europe, north of Africa, and of Middle Asia and America. It yields what is sold as oil of thyme in the shops, a common remedy for toothache. It is frequently mixed with olive oil as a stimulating liniment against baldness, in rheumatic complaints, and against strains and bruises. The dried leaves used instead of tea are very pleasant; they are likewise employed in fomentations. The essential oil is so acrid that it has been used by farmers as a caustic.—*Eng. Cyc.*

ORINOLI, *It.* Watches.

ORIOLE, the oriolus genus of birds: Oriole is the popular name of several birds, having their plumage of a golden yellow mixed with black. Ainsworth in defining the word Icterus quotes a passage from Pliny, as follows: A yellow bird, which if one see, being sick of the yellow jaundice, the person recovers, and the bird dies. It is also called Galgalus. In British India, the orioles are called the mango birds, from their yellow colour resembling that of the mango fruit. There are several species in the E. Indies, viz.

O. acrorhynchus, <i>Vigors.</i>	O. kundoo, <i>Sykes.</i>
O. broderipii, <i>Bonap.</i>	O. macrourus, <i>Blyth.</i>
O. ceylonensis, <i>Bonap.</i>	O. melanocephalus, <i>Linn.</i>
O. chinensis,	O. philippensis, <i>Gray.</i>
O. hippocrepis, <i>Wagler.</i>	O. tenuirostris, <i>Blyth.</i>
O. horsfieldii, <i>Bonap.</i>	O. traillii, <i>Vigors.</i>
O. indicus, <i>Brisson.</i>	O. xanthonotus, <i>Horsf.</i>

The black headed mango bird, or oriole, famous in Indian poesy, is one of the most numerous of Tenasserim songsters. It comes to the garden at early dawn, when its rich mellow notes are heard pealing far through the mango bowers. It is a large yellow bird with a black head, easily recognized. In Burmese it is called Hgnet-wa, or yellow bird. There is another mango bird, differing slightly from the preceding, and for which the Burmese have no name, to distinguish it from the other, though they are aware of the existence of the two species. Sir J. E. Tenment says in the elevations of the Kandyan country there are a few singing birds such as the robin of Nenera-ellia, Pratincola atrata, *Kelaart*, and the long-tailed thrush, Kittacincla macrura, *Gm.*, whose song rivals that of their European namesakes; but, far beyond the attraction of their notes, the traveller rejoices in the flute-like voices of the Oriole, the Dayal-bird, Copsychus saularis, *Linn.*, called by Europeans in Ceylon the "Magpie robin." This is not to be confounded with the other popular favourite the "Indian robin," (Thamnobia fuscata, *Linn.*), which is "never seen in the unfrequented jungle, but, like the cocoanut palm, which the Singhalese assert will only flourish within the sound of the human voice, it is always found near the habitations of

men. The true Orioles are found in Asia, Africa, Australia and the Archipelago, one species occurring in the S. of Europe. *O. kundoo*, *Sykes*, extends over the whole of British India up to the base of the Himalayas. It lives in large groves of trees, gardens, and avenues and feeds chiefly on fruits. Its call is a loud mellow whistle resembling pee-ho, and its French name of Lorient answers to its call. *O. indicus*, *Brisson*, the black-naped Indian Oriole, is rare, though spread throughout India, Arrakan, Pegu, Tenasserim and Malacca, and is more confined to the forest regions. *O. melanocephalus*, *Linn.*, the black-headed Oriole, inhabits the forests, gardens and groves of Central India, Bengal, Assam, Burmah, and the Malay peninsula, it is a lively and noisy bird, constantly flying from tree to tree and uttering a loud mellow whistle. *O. ceylonensis*, *Bonaparte*, occurs in Ceylon and the southern part of the peninsula of India.—*E. L. Layard*, in *Tennent's Sketches of the Natural History of Ceylon*, pp 241-42; *Dr. Mason*, *Dr. Jerdon*.

ORIOLINÆ, a sub-family of birds, comprising 2 gen., 12 sp., viz., 11 Oriolus; 1 Sphocotheres viridis.

ORIOLOUS, the Oriole genus of birds: see Oriole.

ORISPEAU OLIQUENT, Fr. Orsidue.

ORISSA, Or-Desa, Oordha des, or Utkala desa, now styled Cuttack, extends along the western shore of the Bay of Bengal on the north. It is separated from Bengal, by the Subernassika river, from which it extends southwards to the Chilka lake of the Northern Circars. It has the sea on the east and Gondwana on the west. Orissa Proper, or Cuttack, the Utkala desa of the hindoos is the north-eastern part of peninsular India. It was originally occupied by the Oodru tribe that developed into the Uria nation speaking the Uria tongue, and spread over Cuttack, Midnapore, Ganjam, Vizagapatam, Hooghly and Rajahmundry. The whole territory is sacred ground to which hindoos perform tirth or pilgrimage, but about July is the great period of assembly at Juggurnath (yoga-natha). The sun was formerly the object of worship there. Now there are three deities, Juggurnath, Balram and Sudia, mere shapeless wooden logs. The country is fertile, producing cereals and pulses, and in the arts, coarse cottons and plain filigree work. In 1834-35 the country was laid waste by inundations, and a remission was made of Rs. 1,86,942. In 1837-38, on the occurrence of a similar calamity, Rs. 5,87,146 were remitted. In 1842-43, from the early cessation of the periodical rains, Rs. 4,86,625 were remitted, and in 1866-67 rice rose in value between the 6th January and 31st March, and before the end of the year from $\frac{1}{3}$ to $\frac{1}{2}$ of the entire popu-

lation are supposed to have been swept away. From A. D. 473 to A. D. 1311, the Kessori dynasty occupied the throne of Orissa. They were succeeded by the Gungabansa who held power till 1568 when it was subdued by mahomedans. The Panji records of Orissa mention that Salivahana Saka Hara or Saka Deo Raja came from the north. A record in the Uria language, preserved in the temple of Jaganath, called the Vansavali, and Raja Charita, and supposed to have been commenced in the twelfth century, after the usual detail of the mythology, and of the early kings of India, down to Vikramaditya, gives as the first sovereign of this kingdom, in A.D. 142, Bato Kesari, who commenced the Kesari Vansa or Kesari dynasty. After an interregnum of 146 years, during which the Yavana reigned, the Kesari Vansa dynasty was restored in A.D. 473 by Jajati (Yayati) Kesari, capital Jajepur. He was a warlike and energetic prince, but it is not known who he was or whence he came. Cuttack was built in A.D. 989. In A.D. 1131, the Ganga vansa dynasty commenced with the invasion of Churang, Saranga deva, or Chor Ganga, and ended with Raja Narsinh-deo who in 1277, built Kanarak, the Black Pagoda. The Surja Vansa rajas reigned from 1451 to 1550. After them came the Zemindari races, Khurda rajas or Bhui vansas, from 1580 to 1804 when Mukund deo was deposed by the English.

The Andhra or Vrispala dynasty, of Andhra (Orissa?) or Telingana is first noticed in the Vishnu Purana which predicts that thirty Andhra Bhritiya kings will reign 456 years: Professor Wilson adds in a note that the Vayu and Bhagavata state also 30 kings and 456 years, and the Matsya has 29 kings and 460 years. The actual enumeration of the texts gives but 24 names; that of the Bhagavata, but 23; that of the Vayu, but 17. The Matsya has the whole 29 names, thus adding several to the list of 24, and the aggregate of the reigns amounts to 435 years and six months. The first was Sipraka, B.C. 21, a powerful servant of Suserman, and whom he killed and then founded the Andhra Bhritiya dynasty. The last was A. D. 428, Chandrasri (or Vijaya, last Magadha king, 300 Jones, 546 Tod) Pulomarchish, (Poulomien of Chinese, Wd.) died 648 A.D. Salomdhi, Tod, contemporary of Bop-po Rawal of Mewar, A.D. 720?) Professor Wilson arrives at the conclusion that the race of Andhra kings should not commence till about 20 years B. C. which would agree with Pliny's notice of them: but it is possible that they existed earlier in the South of India; although they established their authority in Magadha only in the first centuries of the christian era and ended in A.D. 436. Chicacole and Rajahmundry were the capitals of the territory,

which is now known as Telingana, and also the Northern Circars. Pliny speaks of the Rex Andrarum as a powerful Indian prince. The Andhra brahmins regard themselves as a distinct race. Anyanka Bhima is a prince celebrated in Orissa. He unfortunately killed a brahmin and he raised numerous temples in expiation. He also endowed Juggurnath (Yoganatha.) The Mahanadi, Brahmani, Lahundee, Borahani, Subunreka and Byturni rivers flow through Orissa. The interior is mountainous, covered with woods, but the coasts are low and marshy. Its chief bay is Balasore in lat. $21^{\circ} 28' N$. long. $87^{\circ} 4' E$. Orissa table-land rises on the other side of the Mahanuddy, in some places to 1,700 feet backed by the chain of the E. Ghauts.

Rajahmundry was the capital of the junior, or eastern branch of the Chalukya princes of Vengi, whose authority extended to the frontiers of Orissa. The kingdom of Vengi was established about A.D. 540, by the capture of the old capital of Vengipura, the remains of which still exist at Vengi, 5 miles to the north of Ellore and 50 miles to the west-south-west of Rajahmundry. About A. D. 750, Kalinga was conquered by the raja of Vengi, who shortly afterwards moved the seat of Government to Rajahmundry. According to the chronicles of Orissa, the present town of Amaravati was founded or established a subordinate seat of Government, by Surya Deva, raja of Orissa, in the twelfth century. The name is connected with the worship of Siva as Amaranatha, or Amareswara; and one of the twelve great Linga of this god, which is assigned to Ujain, almost certainly belonged to the holy city on the Kistna, as we know that Ujain possessed its own famous temple of Mahakala, and that all the other shrines of

revenue province of British India, has three revenue divisions of Balasore, Kuttak, and Puri. Orissa produces timber, diamonds, rubies and gold.

In Dr. John Shortt's Medical Topography of Modern Orissa, published in the Indian Annals of Medical Science, No. IX, we read (p. 187) of "the Coomug or Wild Goat," as being met with in the province, but the Indian Gazelle, or 'Ravine Deer' of Bengal sportsmen, which is often termed 'Goat Antelope' in the Madras presidency, must be intended. The author also mentions "the Sambre or Elk, Nilgai, Gyal, the Spotted, Four-horned, Antelope! Barking and Mouse-Deer," as very plentiful. The Gyal of Orissa is the Gour (*Bos gaurus*) or 'Bison' of Indian sportsmen, a very different animal from the true Gayal (*Bos frontalis*) of the trans-Brahmaputra hills. The Chetah, he says, is numerous. The true Chita of N. India is the Hunting Leopard.

The population of Orissa is estimated at rather above four and a half millions. The hill chiefs, of whom the Kondah rajah was the head, were all plunderers, and their ancestors are said to have emigrated to Orissa some six centuries ago from the north-west of India. Amongst the customs peculiar to this province, he says, is one, that if a man die childless, his brother, if he have one, must marry the widow. The brahmins of Orissa differ from all other brahmins, in some respects as regards their food. The people may be divided into five principal tribes. Firstly, the Ooryah who are brahminists, and inhabit the plains and valleys in the western tracts towards Cuttack; the Kol to the northward, also called Ho, are a race who are semi-barbarous; the Khond in the central part, and the Sauria in the south. These three last races believe themselves to be the aborigines of the districts they now inhabit, and of others more extensive of which they have been dispossessed by the encroachments of other tribes. The Kol are faithful, honest, and of happy ingenuous dispositions, as strikingly contrasted with the trickery and falsehood of the hindoo; they are hospitable, but very irascible and so prone to feel injuries acutely, that they frequently vent their resentment or grief in suicide, to which this untutored people are terribly addicted. The Khond, inhabit the central part of Orissa, until the middle of the 19th century, they practised the barbarous Meriah sacrifices to the deity of the earth whose votaries seek to propitiate him by the slaughter of human victims, generally children, who are stolen from neighbouring districts, and purchased by the Khond race for sacrifice, as no Khond can be sacrificed, and a victim is held acceptable unless purchased. This horrible practice, is the god of earth, and

induce him to bestow on the sacrificers abundant crops. At the period appointed by their priests a solemn feast is held, lasting two days and nights, which time is passed in the most revoltingly drunken obscenity. On the third day the hapless victim is brought out, and bound to a stake. The victims limbs are first broken, and, the priest having given the coup de grace with an axe, the whole set upon it and hew the quivering body piece-meal, each striving to carry away a bloody fragment to throw upon his own field. The British Government exerted itself strenuously to suppress this sanguinary rite, but the Khond adhered to it with obstinate pertinacity; and wherever force was employed against them, they defended their fastnesses with desperate courage.

The Sauria, who inhabit the southern part of the province, have the same superstitions as the Khond, but are considered even more savage and barbarous; so much so, indeed, that a Sauria

is said to have no hesitation in depriving a human being of life for a very trifling consideration, or at the command of his chieftain.

The dense jungles of Orissa afford secure shelter for wild animals of all kinds, and in them are to be found in numbers the elephant, the buffalo, the gayal, a mighty bull, standing eighteen hands or upwards in height, with the nylghau, tigers, bears, hogs, and all such animals as are natural to that lofty range of ghauts. Of its ornithology but little is known, but the dhanesa or rhinoceros bird is common. Venomous snakes are numerous and the boa-constrictor there attains a monstrous size. Motte, a traveller who visited Orissa in 1778, declared that he saw near Sumbulpore a monster snake which was worshipped by the Ooryah as a deity, and was believed by that simple people to be coeval with the world. It was lodged in a cavern under a huge rock, and came out once a week to receive the food which its votaries had placed in readiness, consisting of a kid and some fowls, which were picketed on an open space before its den. The boa after having swallowed these offerings is described as having retired to his stronghold leaving traces in the muddy soil, from which the traveller estimated its diameter at two feet or about the diameter of a nine-gallon cask; so that if its length were at all proportionate to such a bulk, it must have been a monster indeed. The district was visited by Captain Kittoe in 1838, when in search of coal, and he saw in the same spot a monster boa, which he was assured was the identical snake that had been seen by Motte sixty years previously; this, however, seems very problematical.

Gondi.—The large space left between Maharashtra and Orissa is in a great part of the forest tract inhabited by the Goud race. Their language, though quite distinct from the rest, is unwritten and being reckoned a jargon of savage mountaineers, is not counted among the five languages of the Dekhan.

The Juanga are a forest tribe in Orissa.

Bendkar.—A paper in the "Asiatic Researches" of 1842 notices the Bendkar, a people of Keonjur, in the Kolehan district, who form an insulated clan or tribe not exceeding 250 or 300, in number, residing entirely in a range of hills, called the Bendkar Booroo, to the north of Keonjur, and to Jamdapeer, the southern border of the Kolehan district. The country inhabited by this tribe is exceedingly wild, being in fact one mass of almost impenetrable jungle; and the social status of the Bendkar tribe is in point of civilization suitable to the wilderness in which they dwell, for they seem to be in the most unreclaimed state of barbarity—indeed far behind the Ho, Khond and Sauria, semi-barbarians as those tribes still are. The

Bandkar Booroo jungles are bounded on the north and north-west by the cultivated lands of the Ho in Kotgurh and Burpeed, but their other limits are to this day unexplored, and the deadly insalubrity of the climate may probably prove a bar to those limits being ever correctly ascertained. The first intercourse with the Bendkar tribe occurred in 1842, when the Governor-General's agent, being on one of his tours, accidentally heard of these people, and induced a small party of them to visit his camp; yet though they were kindly treated and loaded with presents by that functionary, every moment of their stay appeared in the highest degree irksome to them and they could not be tempted to return. The party consisted of three men, an old woman, a pretty young girl and a boy, no one of whom had ever beheld a European or even a well-dressed native, or seen money, or heard the word "Sahib." They seemed perfectly amazed and much alarmed at the elephants, horses, sepoy and sowars in the Agents camp; but savage tribes, and especially mountaineers, entertained a particular dread of horsemen. The Bendkar people appeared completely awe-struck at what they saw, and were delighted to get away to their own wilds again. This tribe are passably fair, and of good stature, with rather intelligent countenances. They have no language peculiar to themselves, but speak both the Ho and Oorya dialects. The goddess Kali is worshipped by them, as are other deities. They neither eat beef nor pork, and some of their religious prejudices are peculiar; for though they will drink water from the hand of a Ho, they will not eat with one, or take food cooked by a hindoo, even by a brahmin. In their marriages the bridegroom takes the bride away to his home with the consent of her parents, who contribute to the household stock of the newly married couple. They burn their dead, but do not collect the ashes as the Kol do, nor do they, like that tribe, burn the property of the deceased. These people have never been visited by an epidemic; they acknowledge no chief; but are so peaceful towards their neighbours, and so innocent of crime amongst themselves, as to render the exercise of authority unnecessary. They possess the usual arms of the other tribes, but use them, it is said, alone, for the chase. The dwellings of the Bendkar are constructed of branches and leaves, and covered with jungle grass, and their domestic habits are miserable in the extreme. Unlike the neighbouring tribes they have neither cattle, goats, sheep, or pigs, and few even possess a few head of poultry. Their ordinary food consists of edible roots which they find in the jungle with berries and wild fruits, such diet being varied and improved occasionally by the produce of the chase. Their habits are solitary

and unsociable, and their abject poverty almost surpasses belief. Their husbandry is merely scratching up the surface of the ground with an apology for a plough, drawn by a man, as they have no draught cattle. When their scanty crops are ripe, and such are raised in little plots on the hill-sides, near water-courses, they barter their maize, grain, or rice with the lowland villagers; but half their crops are devoured by wild animals ere they attain maturity. The Bendkar live rent-free, but are liable to furnish Begari at the requisition of the Keonjur rajah's dewan, or his people, or their annual pilgrimages to the celebrated shrine of Jagganath.

Urya or Oriah is the language of Orissa, and the country takes its name from the Or or Ordu tribe who seem to have come from the N. West. In the Orissa district, they appear to have had very narrow limits, viz., along the coast line from the Rasikulia river near Ganjam northwards to the Kans river, near Soro, in lat. $21^{\circ} 10'$, but in the process of migration and conquest under the Gangavansa dynasty the limits of Orissa (Ordessa) were extended to Midnapore and Hooghly, on the north, and Rajahmundry, on the Godavery, on the south. The Urya tongue is a tolerably pure dialect of Bengalee. About Ganjam, the first traces of Telugu or Teling occur, though the Urya still prevails forty-five miles south of Ganjam, on the lowlands of the sea-shore, beyond which Telugu begins to predominate. At Chicacole, Telugu is the prevailing language, in Vizianagram, Telugu is only spoken in the open country, and Urya in the mountains runs further down to the south, Telugu is spoken to within 45 miles south of Ganjam, and at Ganjam Telugu ceases. On the coast line Urya continues in the direction of Bengal as far as the Hijli and Tumlook divisions on the Hooghly. On the western side of the Midnapore district, it intermingles with Bengalee near the river Subanreeka. To the westward, the Gond and Urya languages pass into each other, and at Soncpur, half the people speak the one and half the other language. Amongst the Urya race high cheek bones seem to prevail with good features and straight hair. A great many of the Urya brahmins obtain their livelihood as cultivators, they also trade, and follow the occupations of brick-makers, brick-layers, &c. The Pana of the frontier and south of Orissa are a wild predatory tribe.—*Colburn's United Service Magazine and Naval and Military Journal*, No. cccxcv, October 1861, pp. 232-38; *Thomas' Prinsep's Indian Antiquities*, p. 241; *Wilson's Glossary; Cunningham's Ancient Geog. of India*, pp. 515, 516, 543. See Chalukya, India; Inscriptions, Manu, Mhlecha, Sri-Sampradaya, Telinga.

ORITE or Horitæ, amongst the Greeks a

barbarous people to the west of Indus called Nesteritæ, by Diodorus. General Cunningham supposes them to be the people on the Aghor river. In the bed of this river there are several jets of liquid mud, which, from time immemorial have been known as Ram-Chandar-ki-kup, or "Ram Chandar's wells." There are also two natural caves, one dedicated to Kali, and the other to Hingulaj or Hingula Devi, that is, the "Red goddess," who is only another form of Kali. But the principal objects of pilgrimage in the Aghor valley are connected with the history of Rama. The pilgrims assemble at the Rambagh, because Rama and Sita are said to have started from this point, and proceed to the Gorakh tank, where Rama halted; and thence to Tonga-bhera, and on to the point where Rama was obliged to turn back in his attempt to reach Hingulaj with an army, General Cunningham identifies Rambagh with the Rambakia of Arrian, Tongabhera with the river Tonberos of Pliny, and the Tomerus of Arrian. At Rambakia, therefore, he thinks we must look for the site of the city founded by Alexander, which Leonatus was left behind to complete. He thinks it probable that this is the city which is described by Stephanus of Byzantium as the "sixteenth Alexandria near the bay of Melane." Nearchus places the western boundary of the Oritæ at a place called Malana, which he takes to be the bay of Malan, to the east of Ras Malan, or Cape Malan of the present day, about twenty miles to the west of the Aghor river. The occurrence of the name of Rambagh at so great a distance to the west of the Indus, and at so early a period as the time of Alexander, shows not only the wide extension of hindoo influence in ancient times, but also the great antiquity of the story of Rama. He deems it highly improbable that such a name, with its attendant pilgrimages, could have been imposed on the place after the decay of hindoo influence. During the flourishing period of buddhism, many of the provinces to the west of the Indus adopted the Indian religion, which must have had a powerful influence on the manners and language of the people. But the expedition of Alexander preceded the extension of buddhism and General Cunningham therefore only attributes the old name of Rambakia to a period anterior to Darius Hystaspes. Hingulaj (Khingalatchi) is mentioned by the Tibetan Taranath, (see 'Vassilief,' French translation, p. 45,) as a Rakshasa in the west of India, beyond Barukacha, or Baroch.—*Cunningham's Ancient Geog. of India*, pp. 309-310.

ORMOCARPUM SENNOIDES, Beauv., Hedysarum sennoides, | IL. Nalla-kashina, Roxb.
Roxb., Willde.

Kanana, SANS. | Nalla kasana, TEL.

This plant is a native of the northern Circars. Its root is considered tonic and stimulant.—*O.S.A.*, p. 317.

ORMUZ, or Hormuz island is the ancient Ogyris, and is situated at the mouth of the Persian Gulf, in lat. $27^{\circ} 12'$ N. and long. $56^{\circ} 25'$ E., and is about twelve miles in circumference. In an ancient history of Persia it is recorded that Ormuz was once on fire; and indeed this island as well as that of Angar, has every appearance indicative of a former volcanic eruption, and it is thought to be an extinct volcano. It was long occupied by the Portuguese. It now pertains to the king of Oman.—*Kinneir's Geographical Memoir*, pp. 12, 13; *Palgrave*.

ORMUZ TOWN was for ages the great emporium of trade in the Persian Gulf. It was originally occupied by a colony of Arabs, and the city appears to have enjoyed centuries of peace and commercial prosperity. In A.D. 1200 the Mongols invaded Ormuz, and the inhabitants fled to a barren volcanic island, at the mouth of the Persian Gulf, which was named Ormuz, in memory of the ancient city. The king of this new Ormuz considered it prudent to send tribute to Timur. The city is described by Abdul Razak, the ambassador sent by Shah

Rukh to India in 1442, as a place which had not its equal on the surface of the globe. The merchants of Syria, Egypt, Roum, Fars, Khorrassan, Irak and Mawur-ul-nahar, as well as the inhabitants of Java, Bengal, Socotra, Tennasserim, Malabar, Guzerat and Arabia all made their way to this port, with rare and precious articles which the sun and the moon, and the rains have combined to bring to perfection. At present a few ruins, scattered amidst wild deserts of salt, on a dreary islet, alone testify to the former wealth of Ormuz.—*Markham's Embassy*, pp. 44–45; *India in the fifteenth century*, published by the Kakhuyt Society; *Clavijs*, p. 94.

ORMUZD, a name amongst the fire-worshipping Zoroastrians for the Omniscient. It is from Ahura masda, the all-knowing Lord, from Ahura, living, and Mazda wize.—*Bunsen, God in History*. See Ahriman.

ORNAMENTS.

Jewels, jewellery, ENG. | Jauhar; Zewar, HIND. PERS.

Rings for the fingers and toes, rings for the nose and ears, bracelets, armlets, anklets, nose jewels, neck-chains, a piece of gold for the forehead, ear, hair and head jewels, chains and zones of gold and silver for the waist, are ornaments in daily use amongst the men and women of mahomedans and hindoos of British India. Several of these are enumerated in Ezekiel, xvi, 11, 12. 'I decked thee with ornaments, and I put bracelets upon thy hands, and a chain on thy neck: and I put a jewel on thy forehead, and ear-rings in thine ears, &c.' Solomon also names the jewels in use where in Proverbs, xi, 22, he speaks of a jewel of gold in a swine's snout, a ring in the nose being a very common ornament among the hindoo and mahomedan women.

ORNIS, GREEK. A bird.

ORNITHOLOGY, the science which teaches the natural history and arrangement of birds. This term is derived from the Greek words *Ornis*, a bird, and *lógos*, a discourse; signifying literally 'a discourse upon birds.'

ORNITHOPTERA BROOKEANA, occurs in Borneo. It is one of the most elegant of the butterflies. *Ornithoptera cræsus* Wallace, the bird-winged butterfly, occurs at Batchian. It is 7 inches across the wings which are velvety-black and fiery orange. For *Ornithoptera darsius*, see Butterfly. *Ornithoptera remus*, the largest and most beautiful of all the butterflies, is found in Celebes.—*Wallace, Vol. i*, pp. 37, 284. See Birds.

ORONCHON. The Tunguzian tribes either are nomades keeping herds of reindeer or horses, or they subsist chiefly upon the produce of their fisheries. The reindeer Tunguzians are called Oronchon or Oroke, a word signifying reindeer-keepers, and are met with on the Upper Amur, and on Sakhalin. Among the other tribes, a tradition prevails of their having owned reindeer at some remote period; and there is one tribe along the sea coast called Orochi, or Orochon. The Manyarg and the kindred Birar, and Solon, on the Nonni, who occupy the vast prairies above the Bureya mountains, keep large herds of horses. The Goldi, Oleha, (Mangun), Gilyak, Orochi of the sea-coast, and Aino, are fishermen, but are hunters also; and the Goldi, especially those settled on the Sungari, cultivate the ground to some extent. It is, however, only the Manchu and Chinese, and the Daurian living amongst them on the Middle Amur, who till the ground to a larger extent, the Daurian doing so even at the time the Russians first appeared on the Amur. At that period their settlements extended into Dauria, whilst at the present day they are but rarely found above the Dzeya. The Oronchon of the Upper Amur numbered, in 1856, two hundred and six individuals of both sexes, roving over an area of 28,000 square miles, which would give one hundred and seventy square miles to each individual. Next come the Manyarg; their numbers, including the Birar and the Solon, on the right bank of the Amur, are about 20,000, of whom one-sixth at most are under Russian sway. The agricultural population about Aigun, estimated at from 40,000 to 50,000, is also confined chiefly to the right bank of the river, those on its left bank hardly amounting to 2,000. The Goldi occupy one hundred and fourteen so-called villages on the Amur, with three hundred and twenty houses, and 2,560 inhabitants, the Mangun forty villages, with one hundred and ten houses, and 1,100 inhabitants. The Kile on the Upper Gorin, and

Negidalze, on the Amgun, do not probably exceed 1,000 souls. The population along the Usuri is estimated by Veniukof at 1,400, of whom about four hundred are on the left bank of the river. The vast tract extending between the Usuri and the sea-coast, from Castris Bay in the north to the frontier of Korea, is very thinly populated, and it is only in the south, where there are several Chinese settlements, that the population is comparatively numerous. Veniukof reckons the population between the Usuri and the coast, north of Port Imperial, at 1,600; and that 2,500 might be the approximate population of the entire coast-region under consideration. The Gilyak on the Amur occupy thirty-nine villages, having one hundred and forty houses, and 1,680 inmates. The population of Southern Sakhalin, up to about 49° of north latitude, was calculated by Mammia Rinso at 2,850, in four hundred and thirty-eight huts, which would allow 2.1 square miles to each inhabitant, if we assume a similar population for the northern (Russian) part of the island. Or, arranging this population according to tribes, we obtain a total of 23,500.

Oronchon of the Upper Amur..	260
Manyarg and Birar	3,000
Daurian, &c.	2,000
Goldi on the Amur and Usuri ..	3,560
Oleha (Mangun) on the Amur ..	1,100
Negidal and Kile (Samager) ..	1,000
Orochi of the sea-coast	1,000
Oroke on Sakhalin	1,000
Gilyak on Lower Amur and Sakhalin ..	2,180
Aino on Northern Sakhalin ..	1,000
Chinese on the Usuri, &c. ..	100

The banks of the Upper Amur, down to the mouth of the Dzeya, are in the occupation of the Tunguzian tribes of the Oronchon and Manyarg (Monagir, Manegre), the principal difference between whom is, that the chief domestic animal of the former is the reindeer (Oronchon reindeer-keeper), and of the latter the horse. The horses are small, but strong and of great endurance. Before going on a long journey the Manyarg with a view of keeping the horse in working condition, keeps his horse for a day without food, and on his return also the poor beast is made to undergo five or six days' abstinence.

The Oronchon originally lived in the province of Yakutsk, whence they voluntarily emigrated to the banks of the Amur in 1825, and occupied there part of the territory of the Manyarg, whom they compelled to withdraw further down the river. There are two tribes of Oronchon. One of them, the Ninagai, occupies the left bank of the Amur, between the rivers Oldoi and Amazar, and the country up to and beyond the crest of the Stanovoi mountains. In 1856 it mustered sixty-eight males

and sixty-six females, and twenty-seven of the former paid annually five shillings and five pence of tribute each, or in lieu thereof twelve squirrel skins, to the officer commanding the post of Gorbitza. The other tribe, the Shologon, occupy the right bank of the Amur, down to the Albazikha rivulet. They number seventy-two individuals of both sexes, including forty males, of whom seventeen had to pay to the commandant of Ust Strelka a tribute of six shillings and four pence each. They owned eighty-two reindeer. The Manyar, as stated above, occupy the Amur below the Oronchon, but in spring and summer they ascend it for the sake of fishing, to the Ignashina and Sester, leaving their horses below the Albazikha. They also dwell in the valley of the Dzeya, and generally speaking, the whole of the prairie region down to the Bureya mountains, their horses find forage; whilst the Oronchon, on account of their reindeer, are confined to the mountainous districts. The Birar residing along the Bureya river are a sub-tribe of the Manyar, and the Solon, north of Mergen, are probably related. The Manyar and Oronchon are rather small and of spare build. Their arms and legs are thin, a feature most striking in their half-naked children, whose bellies are very protruding. The face is flat, but the nose, in many instances, large and pointed. The cheeks are broad, the mouth is large, and the lips are thin, the eyes very small and sleepy-looking, and generally of black or reddish-brown. The hair is black and smooth, the beard short, and the eyebrows very thin. The Manchu features frequently found among the Manyar are traced by Maack to the officials who annually collect the tribute, and whom their women freely visit. These Tunguzians lead a wandering life. During spring and the beginning of summer, they generally reside on the banks of the river, engaged in fishing, but in the autumn and winter they retire to the interior of the country to pursue the chase. In these migrations the rein-deer or horse carries the scanty property of its owner. The only other domestic animal is the dog. The Solon is a nomadic tribe, allied to, if not identical with, the Manyar, and occupy the country north of Mergen. They claim to be descendants of the ancient Sushi, by whom was founded the dynasty of the Gin. The word Solon signifies "Shooters." They are indeed expert hunters, and even their women mount on horseback and pursue the game. Besides horses, they have dogs for hunting, also sheep, oxen and camels. The Daurian dwelling on the Upper Sungari, in the neighbourhood of Tsitsikar, are well made, especially the women, and dress like the Manchu in China. The secre-

taries of the Mandarins who are sent to this part, are privileged by a letter from the Khan to select any women or young girls whom they may fancy. Some of the men whose wives had been taken in this manner, still persist in considering it a special favour to have such fine gentlemen as brothers-in-law. Others, though discontented, are compelled to conceal their chagrin from fear of punishment and disgrace.

The Tunguzians of the Lower Amur are the Goldi, Mangun and Orochi tribes, and exhibit a great similarity in outward appearance, customs and manner of life.

The Tunguzian tribes are the Goldi and Mangun, along the Amur, Sungari and Usuri; and the Orochi along the sea-coast from Castries Bay to about 44° N. lat. The Goldi inhabit both banks of the Sungari below the town of Sansin, the Usturi below the Dobikhu and the Amur to the village of Niunguya below the Gorin. Maack calls the Goldi living along the Amur down to Nyungya "Kileng;" and those about the mouth of the Usuri, "Hod-seng." Below the Goldi the banks of the Amur are occupied by the Mangun or Olcha as far as the village of Kadema, below the Russian settlement of Irkutskoi. These Tunguzians have the usual Mongol features, prominent cheek bones, and small oblique eyes. The nose is not in all cases flat. The eyebrows are more defined and arched. The mouth large, the lips thick and of a dull red colour. The complexion is fair and ruddy. The colour of the hair and eyes is black, but occasionally grey eyes are seen. The size of the head is large compared to that of the body.

The Gilyak inhabit the banks of the Lower Amur, below Pul, and the northern portion of Sakhalin, their limits on the island being on the west coast in the village of Pilyavo, 50° 10' N. lat.; and on the east coast 50° 30' N. lat. There are several tribes of these Gilyak, those of the mainland, the Smerenkur of the west coast of Sakhalin, and the Tro of the east coast, but the distinction between them is trifling. Nor do they differ much in outward appearance from their Tunguzian neighbours. The features are still Mongol, the nose is rather flat, the eyes are small, the lips are voluptuous, the eyebrows bushy, and the beard is stronger than the Tunguzian. They do not shave the head, but wear the hair tied up into a thick tail or in tresses. The Russians describe their women as frights, but tastes are not always the same, and Rimso, the Japanese, says they are very comely, and doubly attractive on account of their daily ablutions. Their dress does not vary much from that of the Tunguzians. They wear large boots of seal-skin or sometimes cotton and a blouse of Chinese pattern. The use of fish-skins is much more restricted. If we may credit

the statement of Rimso (Mamia-Rinso) polyandry prevails among the Smerenkur Gilyak, and the women are treated with the greatest indulgence. Only those however skilled in the use of the needle can expect to get married.—*Klaproth, Asia Polyglotta; Maack, Travels on the Amur; Tronson (Barracouta Bay); Furet, Letter sur l' Archipel. Japonais (Jonquiére Bay) La Perouse Pfitzmaier's Vocabularium der Aino Sprache, Vienna, 1851 quoted in Ravenstein's Russians on the Amur, pp. 338 to 391; Latham.*

OROND SHAH, see Persian kings.

ORONTES, the modern Assey. See Lebanon.

OROPHEL, Sp. Orsidue.

OROPHEA, a genus of middle-sized trees of Ceylon, O. coriacea, grows at Dimboola and Raxawa, in the central province, at an elevation of about 3,000 feet; O. obliqua, *Hf. et. T.* in the Galle and Ratnapoora districts, at no great elevation, and O. zeylanica, *Blume*, in the Central province, at an elevation of 2,000 to 3,000 feet; woods unknown.—*Thw. En. Pl. Zeyl.*, p. 8.

OROPIMENTI, Sp. Sulphuret of arsenic.

OROTSKO, occupy the interior of Sakhalin and its eastern coast. They are few in number, their language differs from that of the Aino, and according to Schrenck, they are Tunguzians. They do not shave the head but allow the hair to fall over the shoulders, or tie it up in a tail which hangs down behind. Their women plait or curl the hair, and according to Mamia Rinso, the Japanese traveller are very good looking. They moreover possess the art of making themselves agreeable to the male sex, wash the face and body, and comb the hair. They wear large ear-rings. The Orotsko have no permanent habitations, but dwell in yurts like the Orochon of the Upper Amur. Their store-houses are also similar, and are left standing when the owner removes. The only domestic animal of this tribe is the reindeer, and a man owning twelve of them is considered well off. Reindeer carry burthens or draw the sledge.—*Ravenstein's Russians on the Amur*, pp. 398-99.

ORPELIO, It. Orisidue.

ORPHEUS, see Yavana.

ORPIMENT, Eng., Fr.

Tsz'e-hwang,	CHIN.	Opmerment,	GERM.
Ter-sulphuret of Arsenic,		Rausch-gelb,	"
Yellow sulphuret of "		Hartal,	HIND.
Tri-sulphide of "		Orpimento,	IT.
Oropimento,	SP.	Auri-pigmentum,	LAT.

This is of a heavy liver-yellow colour. It is obtainable in all the bazars of India and is found in the Chinese provinces of Honan, Yunnan and Kansu, also in Cambodia. It is used as a paint, also in medicine.

ORR, Charles Adam, an officer of the Madras, afterwards of the Royal, Engineers who built the

great canals or anicuts across the rivers Godavery and Krishna. On quitting India the following order was issued in the Public Works Department, April 25, 1871. The Right Honorable the Governor in Council desires to place on record an expression of the high value attached by Government to the services rendered to the State by Colonel Orr during an honorable career of about 40 years' duration, and especially in the Public Works Department, as a talented projector and able and energetic executive officer, and for the last seven years as the confidential adviser and organ of Government in the important branch of the public service to which he has been attached. As a principal executive officer on the Irrigation Works in the Godavery delta, and as the designer and constructor of the similar works in the Kistna delta, Colonel Orr has perpetuated the memory of his professional ability.

ORRIS ROOT.

Ussul-us-sosun,	AR.	Iris de florence,	FR.
Ussul-ul-manjunie,	"	Violen wurzel,	GER.
Isra,	"	Kewra-ki-jar,	HIND.
Peh-chi,	CHIN.	Beg-banafsha,	HIND.
Florentine iris,	ENG.	Ireos,	IT.

In India, an excellent kind of orris root is sold in the bazars under the name of Beg-banafsha, literally, violet root. In Europe, this is the root or rhizome of the Iris florentina: and of the German and pale Turkey iris obtained from the south of Europe and Asia Minor. It is tuberous, oblong, about an inch thick, white, odour like that of violets, taste when dry, bitter. An inferior description of orris root is imported into Bombay from the Persian Gulf, which is prodrable in most bazars. An Iris is cultivated in India, the root of which are used as the orris root. Orris root is used by perfumers, and in medicine.—*O'Shaughnessy*, 655.

ORSEDUE.

Khater goud,	DV.	Oliquant,	FE.
Orsidue,	ENG.	Fittergold,	GER.
Manheim gold,	"	Orpello,	IT.
Dutch gold,	"	Oropel,	SP.
Oripeau,	FR.		

An article resembling gold leaf, made of copper and zinc, and largely used in ginselling dolls, toys, images, &c. It is made up into books, and in this state is packed in casks and cases for exportation from Manheim in Germany, where it is chiefly manufactured.—*Faulkner*.

ORSEILLE, Fr., Ger. Orchilla weed.

ORTHANTHERA VIMINEA, *Wight*.

Apocynaea viminea, *Wall*.

Matti,	BRAS.	Lanebar,	TR. INDUS.
Mowa,	TR. INDUS.	Khip, Kip,	SIND.

A twiggy leafless plant, one of the Asclepiadeæ, not uncommon about Delhi, and some other parts Cis-Indus, occasionally in the Sivallik tract and Trans-Indus. Dr. Royle found it growing at the foot of the Himalayan mountains. It attains a height of ten feet, and is

ORTHOPTERA.

remarkable for the length and tenacity of its fibres. It grows luxuriantly along the foot of the mountains; and its long, straight, leafless, slender, and wand-like stems, point it out as seemingly well-suited for rope-making. The fibres are well fitted for cordage, near Delhi, after four or five days steeping, its fibre is extracted for making rope. In Sind, also, it appears to be this plant of which unsteeped stalks are made into ropes for Persian wheels, which are said to be very durable, as they do not readily rot from moisture.—*Royle's Himalayan Botany*, p. 274; *Royle's Fib. pl.* p. 1306; *Dr. J. L. Stewart, M.D., Punjab Plants.*

ORTHOCERAS, a genus of molluscs: mineralized Orthoceratites, under the name of Saligramma, are worshipped by the hindoos. See Saligramma.

ORTHOMASDES, see Greeks of Asia.

ORTHOPTERA, *Linn.*, an order of insects, grass-hoppers, crickets, &c. The families of this order of insects seem to have been differently arranged by authors:

<i>Fam. Forficulidæ, Steph.</i>	<i>Harpax, Serv.</i>
<i>Forficula, Linn.</i>	<i>Schizoccephala, Serv.</i>
<i>Fam. Blattidæ, Steph.</i>	<i>Mantis, Linn.</i>
<i>Panesthia, Serv.</i>	<i>Fam. Phasimidæ, Serv.</i>
<i>Polyzosteria, Burm.</i>	<i>Acrophylla, Gray.</i>
<i>Corydia, Serv.</i>	<i>Phasma, Licht.</i>
<i>Fam. Mantidæ, Leach.</i>	<i>Ambulatoria.</i>
<i>Empusa, Illig.</i>	
<i>Fam. Phasimidæ, Phasma semiarmata, Westw.</i>	

Himalaya, 2 inches; wingless, dirty brown colour.

P. bicoronata, Westw. Himalaya, 2 inches; rusty brown colour.

P. graciosa, Westw. Penang, 3½ inches; head conical above crowned with long spines.

Bacteria sarmentosa, Westw. Sylhet, 10½ inches; dirty brown.

B. virgea, Westw. Sylhet, 6 inches; reddish brown.

Phasma hilare, Westw. Assam, 2½ inches; of a fine green colour.

P. maculicollis, Westw. Assam, Sylhet, male 1½ inches; female nearly 3 inches.

P. bufo, Westw. Philippines; wingless, brown.

P. mesoplatum, Westw. Philippines, 2½ inches; wingless, brown granulate and spined.

P. draconium, Westw. Philippines, male 1½ inches; female 2½ inches.

P. deplanatum, Westw. Philippines, 2½ inches; wingless.

P. luteo viride, Westw. Assam, 3 inches; wingless luteous green.

P. curtipes, Westw. Penang, 4 inches; buff-brown.

P. filum, Westw. Penang, 2½ inches; filiform.

P. uniforme, Westw. Penang, 3½ inches; wingless, cylindrical.

P. geniculosum, Westw. Penang, 3½ inches; elongated, cylindrical, wingless.

P. despectum, Westw. Sylhet, 4½ inches.

P. lacertinum, Westw. Assam, 3½ inches.

See Saltatoria.

Fam. Gryllidæ, Leach, Locustariæ Latreille.

Phanoptera perlaria, Westw. Penang, 4 inches; dull luteous grey.

Magalodon ensifer, Brulle. Sumatra, 3-3½ inches; fulvous red.

ORTOLAN.

Pseudophyllus, 4 tuberculatus, Westw. Penang, 4½ inches; opaque brown.

Acanthodis imperialis, White. Assam, Sylhet, 4½ inches; body black.

Acanthodis donovani, Donov. East Indies, male 2½ female 3½ inches; brown.

Phylloptera sanguinolenta, Westw. Sumatra, male expansion 1½ inch, fem. 2½ inch.

P. 8. maculata, Westw. Sumatra, expanded wings 4½ inches.

Phyllium, Illig.

Fam. Gryllidæ, Steph.

Acheta, Linn.

Platydictylus, Brull.

Steirodon, Serv.

Phyllophora, Thunb.

Acanthodis, Serv.

Phanoptera, Serv.

Phymateus, Thunb.

Truxalis, Linn.

Acridium, Geoffr.

Another arrangement is

ORDER III—Orthoptera, Oliver.

ORTHOTOMUS LONGICAUDA, *Gmel.*, the tailor-bird, in its curiously fashioned nest, displays marvellous skill and care, it is plentiful in the groves and gardens of India. The male is larger and has a longer tail than the female, but both are yellowish white below and olive-green above. The call of the male is a frequent repetition of whee-u, and the male birds in a garden vie with each other.

ORTOLAN.

Emberiza hortulana, Linn. *Miliaria pinguescens, Frisch*

" *buchanani, Blyth.*

Hortulanus, Gesner.

Green headed Bunting, Eng. Ortolano, Ir.

Garten-ammer, Ger. Gerste-kneu, Netherlands

Fell-ammer, Tordino berluccio, Venice.

Jann-johara, Hind.

The ortolan of Europe is occasionally seen in the west of India. In Europe they are caught in great numbers, are fattened for the table and are considered a great delicacy. In India, the social lark, *Calandrella brachydactyla*, and the *Pyrrhuloxia grisea* are popularly

called ortolans. A kind of lark called an ortolan was found by Dr. Hooker abundant in the Parwah district. He says this is not, however, the European delicacy of that name, though a migratory bird; the flocks are large, and the birds so fat, that they make excellent table game. At this time they were rapidly disappearing, to return from the north in September.—*Hooker's Him. Jour., Vol. i, p. 998.*

ORTOSPANA, the Sanscrit Urddhasthana, identified with the Bala Hisar of Kabul.

ORTOUS, a Tartar people occupying a poor and wretched country. Although the Tartars are perpetually moving from one place to another, they are obliged to remain within the limits of their own kingdom, and in dependence on their own master, for slavery still exists among the Mongol tribes, although in a very mild form. Mongolia is divided into several sovereignties, the chiefs of which are tributary to the emperor of China, though their relations with him are rather uncertain and fluctuating. Sometimes it appears as if he had no right to displace any reigning chief or king; at others, as if his will were all-powerful; but in case of dispute the matter is, in fact, settled only by force. In the several states, the families that are connected by any ties of kindred with the sovereign constitute a kind of nobility. They are called Tai-tsi and are distinguished by wearing a blue ball on their caps, and it is from amongst them that the chiefs choose their ministers. These are only three in number, and are called Toutzelaktsi, that is to say, "men who held," and, as a symbol of this dignity, they wear a red ball. All Tartars who do not belong, within any degree, to the princely family, are in fact slaves—that is, they are absolutely dependent on the will of their masters, but their mode of life is precisely the same, and if the slave enters the tent of the master, he never fails to offer him the customary courtesies of milk, tea, and pipes. The Mongols marry very early, under the absolute authority of the parents, and the affair is settled without the slightest reference to the wishes of the persons principally concerned. The girl has no portion; on the contrary, it is the young man who must take the wedding gift to the family of his future wife; wedding gift, indeed, it can scarcely be called; it is simply the price of the wife, and this expression is constantly used in speaking of the transaction: "We have sold our daughter to such a family," they will say, and when the contract is being drawn up, they will bargain and haggle and raise or lower the price, just as they would in any other purchase. When it has been agreed how many horses, oxen, sheep, pounds of butter, pieces of stuff, skins of brandy, &c., they will give, the terms are written down before witnesses, and the girl

becomes the property of her purchaser. A plurality of wives is not opposed either to the laws, the religious faith, or the customs of the country; but the first wife is always most respected, and remains mistress of the household. Perhaps, in the present state of the country, this practice so opposed to the true happiness of families, may present a kind of barrier to excessive corruption; for, as there are immense numbers of the Lamas on whom celibacy is imposed, many disorders would otherwise result from the multiplicity of young girls that would be left without support. Divorce is very frequent among the Tartars, and the husband is not required to assign any cause to justify his putting away his wife, but simply takes her back to her parents. As he forfeits of course, in such a case, the price he has paid, it sometimes happens that the parents are able to make a profit by the transaction, by selling the same article twice over. The women in Tartary are not kept in a kind of imprisonment as they are amongst most Asiatic nations; but they go and come as they please, take rides on horseback, and pay visits freely from tent to tent. They have nothing of the soft and languishing manners of the Chinese women; on the contrary, there is an appearance of vigour and independence about them, which harmonizes well with their active habits and nomadic life; and this effect is perhaps assisted by the simple, and somewhat masculine character of their dress—a long green or violet robe, confined at the waist by a girdle, a sort of jacket or waistcoat over it, and large leather boots. But they wear also on their hair and girdles ornaments of silver, coral or beads.—*Huc's Recollections of Journey, p. 113.*

ORTYGIS, the little bastard quail.

ORUKZYE. Their country extends from the Sepah tract (which adjoins the Afreedee hills) round the north-western corner of the Kohat district, and then nearly onward to the top of the Meeranzye valley (which belongs to Kohat) till it joins the country of the Zymoosht Affghans. The tribe is one of the largest on the N. W. frontier, and numbers 20,000 fighting-men, most of whom are good hill soldiers. The Orukzye hills stretch a long distance to the west. In the interior of these hills, there is the cool table-land of Terah, where the clansmen resort in the summer with their cattle, and in the winter return to the pasture grounds of the lower ranges near the British frontier. The sections of the tribe that have come in contact with the British are the Shekhan, the Mishtee, and the Raabcuikhel. The portions of the Kohat district adjoining the Orukzye hills are the sub-divisions of Samilzye, Hungoo and Meeranzye. Up to the year 1855, this tribe, though occasionally committing petty

depredations, and known to be capable of mischief, if so inclined, gave no positive trouble. The Zymoosht Affghans are a small, but brave tribe, numbering about 5,000 fighting-men, some of whom are well-mounted. They inhabit a valley leading from western Meeranzye onward, towards the crest of a range called the "Powar Kothul." Their country of right belongs to the Cabul kingdom. They were usually ready to combine for mischief with the Tooree and Orukzye, and to threaten Meeranzye; they hold some land in the plains, which holding affords some pledge for their good behaviour. See Khyber.

ORUPU-LINGI MARAM, MALEAL. A Malabar tree that grows to about twelve feet high, and ten inches in diameter: it is very close-grained and durable.—*Edge, Forests of Malabar and Canara.*

The Oryza genus of plants belongs to the natural order of Grasses. It is the name by which rice was known to the Greeks and Romans, and which has been adopted by botanists as the generic name of the plant yielding that valuable grain. The Greek name would appear to be derived from the Arabic Aruz, and this is allied to Uri, the Telinga name of cultivated sorts; but the Sanscrit names are Unnoo, Dhanya, and Vrihi; the wild kind being called Nivara, while that of the great tanks is called Arizee in the Tamil language. The European names are evidently all derived from the same sources, but the name Paddy is applied to the rice in its natural state, or before being separated from the husk. The natives of India call it Dhan in this state, as well as the plant, and the rice itself is called Chauwul. The genus Oryza has two glumes to a single flower; paleæ two, nearly equal,

adhering to the seed; stamens six, and styles two. Dr. Roxburgh describes two species; one, *O. sativa*, distinguished by its diffuse panicle; the other, *O. coarctata*, has the panicle contracted, the valvules of the calyx subulate, and the leaves culm-clasping. This species is a native of the delta of the Ganges, and was first discovered there by Dr. Buchanan in 1796, but was not found to be applied to any use. The common rice, *O. sativa*, unlike many long cultivated grains, is still found in a wild state in and about the borders of lakes in the Rajahmundry Circars of the peninsula, though never cultivated, because the produce is said to be small compared with that of the varieties in cultivation. The composition per 100 parts of several rices was as under:

		Born bazi	Bro	Buri	Mala
Moisture,	13.50	13.00	13.10	12.80	12.90
Nitrogenous matter,	7.41	7.44	7.12	8.24	7.24
Starchy matter,	78.10	77.83	78.70	77.80	78.56
Fatty or oily matter,	0.40	0.70	0.49	0.64	0.60
Mineral constituents, (ash.)	0.59	1.23	0.66	0.52	0.70

In the East Indies, rice is used for food for man, beast, and bird; for the manufacture of starch, and the distillation of spirits, &c. Its varieties are as numerous as its uses. There are in several provinces three distinct crops; the first, grown on somewhat high ground, is the early crop, sown for the most part in June and reaped in August and September. The Burmese recognize nearly a hundred varieties of rice, but their principal distinctions between the different kinds are, the hard grain rice, soft grain rice, glutinous rice.

The 'Natsung' rice of Burmah is the hardest grain, and is the rice principally exported to Europe. The 'Meedo' is the chief of the soft grain varieties. It is much preferred by the Burmese to the hard-grained sorts, and it is certainly superior in taste when cooked; but the hard-grained rice is chiefly purchased by the merchants for export, as it keeps better, and the soft-grained rice is too much broken by European machinery in cleaning. Latterly, on the Continent of Europe this last objection appears to have been overcome, and a greater demand is consequently springing up for the 'Meedo' rice for the markets of foreign Europe.

The 'Koung-nyeen,' or hill rice, is called 'glutinous' rice by Europeans, from the property it possesses, when cooked, of the grains all adhering in a thick glutinous mass. It is the chief article of food with the Karen and other hill tribes, but is not much eaten by the inhabitants of the low swampy plains, where the common rice is grown.

Very many varieties of rice are grown in Oudh. A heavy soil and plenty of water

suits them best. There are five kinds which are considered among the best. 'Mihee' and 'Basee' are foremost. The peculiarity in the cultivation of these two kinds is, that they are transplanted and placed about 5 inches apart. And, by this method, if the soil is good, they grow to the height of an ordinary-sized man, and produce a much larger quantity than if otherwise treated. The odour and flavour of these two kinds, when cooked, are superior to those of any other kind. They are only used by those who can afford to buy them. As the labour in cultivating them, is dearer than the other sorts, the three other varieties which are considered good are the 'Bateesa,' the '—' and the 'Phool-birinj.' They are sown broad-cast in June, and left so, and they are the kinds mostly used by natives. The first two mentioned, when new, sell for 10 or 12 seers per rupee, and become dearer according as they become older. The other three kinds sell for about 19 seers per rupee, and are dearer if older. Some consider 'Phool-birinj' the best, as it swells in boiling, and has an agreeable odour.

Where the soil is low and good, and water abundant, throughout the Panjab, especially in the upper part of the Jullundur Doab rice is grown. It is also abundantly grown throughout the Siwalik tract and up the valleys to an elevation in places of 6,000, or even nearly 7,000 feet. In Peshawur the varieties of rices are called doaba, shugha, zafrani, jyotshi, kaneri, and lukh, or coarse rice. The chief varieties grown may however be stated. Rice without the husk is called brinj or chawal; whilst paddy or unhusked rice is called chhona (Panjabi), or dhan (Hindustani). In the plain districts the coarse rice commonly grown is called munji; other rices met with in the bazaar, of second and third quality, are begami and samoja also soln pat: a fourth class, is the red-skinned wheat called sathi, also "sharbuti" and chinwa lal; this is inferior.

In Mysore, rice is extensively grown in the wet lands irrigated by the canals of the rivers Cauvery, Capila, Hemavety, Lutchan Terta, and Penaar—of Talapirige or fountain heads—and under tanks. Naggur and Astagram divisions have proportionally the largest produce of paddy. It is exported from one part of Mysore to another; but except to the Neilgherries, and a portion to the western coast from Nuggur and North Astagram, little goes out of the territories. There are many varieties of paddy, as 1 Dodda Bhaira, 2 Chik-ka Bhaira, 3 Karoo, 4 Doddidi, 5 Keubat-ti, 6 Put Rajanna, 7 Marabe Kanti, 8 Muragi Jel-li, 9 Krishna nila, 10 Kapile San-na, 11 Jeerige Sempa, 12 Sittabbogam, 13 Sukhadass, 14 Yalak-ki Rajana, and different others. Indeed almost every village in

India has a variety of this grain peculiar to the locality. The ryots do not try to preserve paddy for a length of time, as it rapidly loses in weight.

The ardent spirits prepared from rice are called

The No or glutinous rice of China contains much dextrine and is rounder in the grain: the best of the Chinese glutinous rice of China is from Kiang-su: it is preferred for making congee, dumplings, wine, but is not so digestible as common rice. Rice is the food of the greatest number of the human race. The inhabitants of N. and S. America, on the S. of Europe, of N. Africa, of the south and east of Asia, all largely use it. It is the most easily digestible of all vegetable substances, but its bulk is objectionable.—*Smith, Ainslie, p. 217; Dr. J. L. Stewart, Panjab Plants, p. 257; Powell's Hand-book, pp. 250-51; Madras Exhibition Juris Reports; Catalogue Exhibition of 1862; Simmonds.* See Rice.

OSCAN, see India.

OSCILLATORIA RUBESCENS, M. Ehrenberg, while navigating the Red Sea, observed that the occasional red colour of its waters was owing to enormous quantities of a new animal, which has received the name of *Oscillatoria rubescens*, and which seems to be the same with what Haller has described as a purple conferva swimming in water; Dr. Bonar, in his work entitled "The Desert of Sinai," records:—Blue I have called the sea; yet not strictly so, save in the far distance. It is neither a red nor a blue sea, but emphatically green,—yes, green of the most brilliant kind I ever saw. This, he adds, is produced by the immense tracts of shallow water, with yellow sand beneath, which always gives this

green colour to the sea, even in the absence of verdure on the shore or sea-weeds beneath. The blue of the sky and the yellow of the sands meeting and intermingling in the water, form the green of the sea; the water being the medium in which the mixing or fusing of the colours takes place." It is, however, also supposed to be from the *Trichodesmium erythraum*, a filamentous alga, that the Red Sea is imagined to have obtained its name. It is described as of a blood-red colour, often covers large areas, and appears and disappears somewhat capriciously. It has as synonym *T. ehrenbergii*. *T. hindii*, also of a blood-red colour, has been found off the west coast of South America under the microscope. The *Trichodesmium* seems like sheaves of minute fibres. Dr. Collingwood however mentions that he had never seen red *Trichodesmium*, or any tint of red. He had seen it yellowish brown. He had seen the Indian ocean red from myriads of minute red crustacean, and in the Formosa channel from red gelatinous worms, but never by *Trichodesmium*.—*Collingwood, Naturalist*.

OSHEK NAPU, MALAY. *Tragulus javanicus*, *Pallas*.

OSHOKO, URLA. A tree of Ganjam and Gumsur of extreme height 50 feet, circumference 3 feet, and height from the ground to the intersection of the first branch, 8 feet. Scarce in Gumsur, but abounds in Bodogoda, where it is burnt for firewood. The flowers are offered at the shrines of the hindoo divinities. The bark is used medicinally, in diarrhoea.—*Captain Macdonald*.

OSHTERANEE. South of the Sheorancee hills, on the conterminous of the Dehra Ishmael Khan and Dehra Ghazee Khan districts, there dwell the small Pathan tribe of Oshteraneec, mustering about 1,000 fighting-men. They are brave and pugnacious, but not pre-

datory. They dwell chiefly in the hills, and are so far independent; but many of them possess and cultivate lands in the plains at the foot of the hills, and consequently within British territory. Before annexation they used to be quite as violent as their neighbours, especially during the continuance of a deadly feud with the Kusrancee. The quarrel was, however, composed by Major Edwardes before annexation. But subsequently they never signalized themselves by attacks on British subjects, or raids on property, and have evinced a good and friendly disposition. On the border of the Oshterancee hills, and nearly opposite to Dehra Futeh Khan, is the Vooch or Korah pass, faced by the British out-posts of Doualwalla and Vehoa. This point is of some topographical importance, as constituting the boundary line between the Pathan and Belooch tribes. The Belooch tribes extend along the lower half of the Derajat frontier. They are less warlike and interesting, but even more predatory. The Pathans are almost entirely independent; few of them are British subjects. The head-quarters of Belooch tribes and the majority of the clansmen are generally in the independent hills, beyond the British territory, the boundary line of which runs along the base; but a large number of each tribe also hold lands in the plain and are British subjects. All the tribes are at feud with each other; they not only fight in the hills, but they carry their contests into the plains; they attack all villages in the plains, except those belonging to their own tribe. The men of the plains usually resist the attacks with spirit at the time, but they are not allowed to retaliate afterwards, as they used to do under the Sikh rule, and as they would do still, were they not prevented by the British government. It is to guard British villages and people from their constant aggression that the strong cordon of military posts has been fixed along the base of the Suleemance range. Raids and forays are not, however, entirely repressed, and even the posts are sometimes attacked. The marauding parties were 50, 100, 200, 300, occasionally even 500 strong. They are often mounted and will fly if hotly pursued for 15, 20 and even 30 miles. Many of the villages and much of the cultivation is close to the hills and in front of the posts, so that the plunderers can, in the shortest time, carry off their booty to the hills before the detachment comes.—*Records of Government of India*.

OSHADEESHA, SANS., from *oshudhec*, medicine, and *eesha*, a lord.

OSHUM, see Kattywar.

OSIR, BENG., HIND. *Andropogon muricatum*

OSIRIS, a god of the ancient Egyptians. According to some authors, Amun, the king;

Neph, the divine spirit; Phthali, the creative power; Khem, the reproductive power; Thoth, the divine intellect, and Osiris, the Goodness of God, were all one and the same being. Osiris worship was the oldest and most sacred part of the Egyptian religion. Osiris was the essential personification of divine goodness. The black Osiris of the Egyptians was also styled Scirius, also Sirius, also Bacchus. Every good man, when dead, in some manner took upon himself the character of Osiris. Many cities claimed the honour of being his burial-place; particularly Philæ, Saïs, Busiris, and Taposiris. At Memphis he became united to Pthah, and was called Pthah-sokar-osiris; and also to the bull Apis, and then became Osiris-apis or Serapis, who was afterwards the chief god of Egypt. Isis, his queen and sister, held rank before him, and was the favourite divinity of the country. She had the characters of all goddesses in turn. She was sometimes the mother, sometimes the queen of heaven, sometimes Hecate, the goddess of enchantments. Horus their son had a hawk's head and wears the crown. He was the avenger of his father's death. But he sometimes appears with the sun on his head, as Horus-Ra, or Arocris, the elder Horus, and he is not then the son of Isis. They had another son Arrubis, with a jackal's head, whose office was to lay out the dead body and to make it into a mummy. He was worshipped particularly by Ombos. The wicked god Tymphon is in form of a she-bear or hippopotamus, walking on its hind legs. He was the author of evil, and he killed his brother Osiris. Nephthys was the sister and companion of Isis. Of this family the trinity is sometimes Isis, Osiris, and Nephthys.

The early religion of the Egyptians was, no doubt, sun-worship. This symbol they personified and worshipped, and endowed with the divine attributes of a deity, possessing, at the same time, the sensual appetites of humanity. Thus another personification was necessarily introduced and worshipped, as the goddess, or female nature, from whom, by the fecundizing power of the solar orb, everything possessing either animal or vegetable life was produced. This caused a third personified deity, typical of the essence of the power and energy of both. Thus Osiris, the great emblem of the solar body; Isis, the symbol of æther, the natural parent and spirit of the universe, comprehending and pervading the whole creation; and Orus or Horus, the symbol of light (usually described as a winged boy standing between Osiris and Isis), are the three great deities of the Egyptian mythology, who have radiated, like the hindoo triad, into a multiplicity of forms and names, either as their various attributes were displayed, or according to the motions of the two

great luminaries, of which Osiris and Isis, (in one of her forms) were the personified representations. Plutarch makes Osiris to signify the active principle or the most holy Being; Isis, the wisdom or rule of his operation; Orus, the first production of his power, the model or plan by which he produced every thing, or the archetype of the world. The attributes of Osiris, under his several forms, correspond with those of Jupiter, Sol, Bacchus, Pluto, Oceanus, &c. He will accordingly assimilate with the hindoo god Siva in his majestic and vindictive characters, as well as with Yama, with Indra, Rama, and Varuna. The goddess Isis (called also Isha, the woman) is termed the mother of the gods, and like the hindoo Parvati (Bhavani or Durga), the goddess of a thousand names. The Greek and Roman writers make her the same as Juno, Minerva, Diana, Proserpine, Venus, Ceres, Hecate, &c., &c. She thus corresponds with the three great sacti of the hindoo triad. As the unarmed Minerva, she is the goddess Suraswati; as Ceres and Venus she is the hindoo Lakshmi, the goddess of fecundity and beauty; as the Olympian Juno, she is the mountain-born goddess, Parvati; as Vesta or Cybele, she is Bhavani, as Bellona, Durga, and as Hecate and Proserpine, the terrific and sanguinary Kali, under her numerous vindictive and destructive forms. Orus, or Horus, is the emblem of light, whose parent is the solar orb. He is thus the son of Osiris; and, as light, flows through all ether or space of Isis. He is the Roman Cupid, and, as such, may be compared with the beauteous Camadeva, the hindoo god of love.

Osiris was identified with the sun and Isis with the moon. The conquests of the Hercules Belus of Cicero, who is supposed to be the Osiris that invaded India, extended only up to the Indus.—*Fraser's Magazine*, June 1868; *Sharpe's History of Egypt*, Vol. i, p. 101; *Upper and Lower Egypt*; *Cole's Myth. Hind.*, p. 255. See Baal, Bacchus, India, Kali, Puranas.

OSMAN-KHEYL. Towards the lower extremity of the Swat valley, a formidable range of hills bounding the valley runs for many miles from east to west, nearly parallel to the British frontier; and at the eastern extremity of this range stands the Mora mountain. Between this range and the frontier, however, intervene two tracts, named Rancezye and lower Osman-kheyl, both quasi dependencies of Swat. The best of the passes leading into Swat is one named Mullakund, which opens from Rancezye. A little further to the eastward of Rancezye, also, there are some passes, leading into the Loondkhor valley, which belongs to British Eusufzye. These latter passes are not available for passage from Swat to British territory, because leading into Loondkhor, they can be stopped by any party holding

that valley. The passes viâ Rancezye and Osman-kheyl, if the people of those tracts accord a passage, lead straight on to the British plains of Hushtnuggur. Above the Loondkhor valley, just beyond the British frontier, is the strong village of Pullee. The sub-divisions of the Peshawar district, adjoining the tribes above described, are Loondkhor or north-west corner of Eusufzye, and then Hushtnuggur. Rancezye and Lower Osman-kheyl tribes, are subordinate to Swat.

OSMAN, see Kajar, Othman.

OSMANLI TURKS, see Mesopotamia.

OSMELIA *gardneri*, *Thw.*

Casearia paniculata, *Gardner's MSS.*

A moderate-sized tree of the Central Province of Ceylon, at an elevation of about 3,000 feet.—*Thwaites' Enumeratio Plantarum Zeylanicæ*, Part i, p. 20.

OSMUNDACEÆ, *R. Br.* An order of plants comprising 1, gen., 4, sp., viz. 4, *Lygodium*.

OSPANAH, *HIND., PUSHTU, IRON.*

OSPREY, *Pandion haliaetus*, of universal distribution; the Australian only differing but slightly. Common in India and migratory in the far north.

OSPIROMENUS OLEFAX, *Commerson.*

Both at Pinang and at Malacca, this fish has been successfully naturalised though in the former place it is not numerous, but confined to a few ponds. They become tame so as to appear on the approach of their feeder, and will rise to flies, beetles, and certain flowers, particularly a large Hibiscus. Among themselves they are pugnacious. Many years ago several living ones were imported, and placed in a tank in the Calcutta Botanical Gardens, where they appeared to thrive. Little however, having been bestowed on their preservation, but a solitary one survived in 1841.

OSRHOENE of the Romans, see Orfa, Sarug or Serug.

OSSARA REWUND, *ARAB., PERS.* Gamboge.

OSSETES, see India.

OSSETONG, *Bur.* Alkanet.

OSTEOCOLLA. An inferior kind of glue, manufactured from bones. In Gurief, a fine boiled fish-glue is prepared, perfectly transparent, having the colour of amber, which is cast into slabs and plates. The Ostiaks also boil their fish-glue in a kettle.

OSTEO-GENEIOUS, *Bleeker*. Syn. of *Arius militaris*, *Linn.*

OSTERANI, see Bozdar, Oshterance.

OSTIAK. On the river Ket, is a tribe called by the Tongusians Gosetiyasek or Ostiak, who possess a number of scattered habi-

tations in the woods on each side of the Ket. They hunt the tiao, and pay a fixed tribute of the skins of this animal. The Ostiak regard it as a crime to marry a woman of the same family or even of the same name. The same custom prevails among the Circassians and the Samoyeds.—*Staunton's Narrative*, pp. 74-75; *Pallas*, Vol. iv, p. 96; *Lubbock's Origin of Civil*, p. 97.

OSTRICIL.

Thar-ud-jamal,	AR.	Struthio camelus, <i>Linn., LAT.</i>
Autruche,	FR.	Shutr-murgh, <i>PERS.</i>

This is the only species of the genus *Struthio*: it inhabits Central and Southern Africa. It runs with great speed, aided by its wings which are not sufficiently developed for flight. The length between each stride, when at full speed is not unfrequently from 12 to 14 feet, moving with a velocity that puts the horses swiftness to nothing. They feed on the sprouts of the Acacia mimosa and on the pulp of the Naras. When hunted by horsemen, the latter surround the troop of Ostriches and drive them from one to another gradually narrowing their circle. In the height of the hot weather, the Ostrich makes but little effort and a single horseman suffices to catch them. The Ostrich imitates the lap-wing and Oyster catcher in its stratagems to mislead those who approach its nest or its young. It hatches its own eggs but reserves a few for the food of its young. Its usual cry is a short roar, but when at bay it hisses like a gander. Their long wing feathers are sold at from £ 1 to £12 the pound, from 70 to 90 feathers go to the pound; the thinner the quill and the longer and more wavy the barbs, the more it is prized.—*Hurtwig*.

OSTRICH or Estridge.

OSGRAMMA, see hindoo.

OSYRIS PELTATA, *Roarb., W. Ic.*

Macaranga roxburghii, *Walk.* | *Pha-oun*, *BURM.*

This is found in Tavoy.—*Wall*.

OSYRIS WIGHTIANA, one of the Santalaceæ, the Lotul, a small tree with twiggy erect growing branches; in flower and fruit most of the year. The fruit when ripe is of the size of a small sloe, of a yellow colour, with a mark on the top like a "blueberry." It is sweet and very pleasant when tasted, and is deservedly ranked amongst the wild fruits by Col. Sykes.—*Riddell*. See Lotul.

OTAHEITE GOOSEBERRY, *Cicca disticha*.

OTIDIDÆ.

OTAHEITE SUGAR-CANE, Eng. Sac-charum violaceum.

OTARIA JUBATA, the maned Sea Lion, is 11 feet long, has an erect curly hair tuft at its neck, with a mane flowing completely round its breast, but other parts of its body have only smooth hair or bristles.—*Hartwig*.

OTHELAPII, Heb. Bat.

OTHMAN. Usman or Osman, the 3rd kalif.

OTHMAN, the founder of the Turkish empire, from his activity in warfare, he was named Ilderim or Yelderm signifying "lightning." He opposed Timur who, in 1403, defeated him at Angora, took him prisoner, and, according to report, confined him in an iron cage. He died soon after. The Turkish race, from Ertoghul's son, Othman, has been called the nation of the Ottoman Turks and the Osmanli. See Ertoghul, India, Turkey.

OTHMAN-KHEIL, see Affghan.

OTHMANZYE, see Affghan, Waziri.

OTIDIDÆ, the bustard family of birds, comprise the genus *Otis* and three sub-genera, also species of *Houbara*, *Eupodotis*, and *Sypheotides*.

Eupodotus Edwardsii, *Gray*, Indian bustard.

Otis nigriceps, *Vigors*, | *O. lucionensis*, *Viellot*.
Gould, *Sykes*, *Jerdon*.

Toklar, solun,	HIND	Burra chirath,	HIND.
Guganbher,		Batt-meka,	TEL.
Hookna, Gurayin,	"	Batt-miyaka,	"

Length $4\frac{1}{2}$ to 5 feet, weight 26 to 28 lbs. Not found in the valley of the Ganges, Bengal, Bahar or the Malabar Coast, but is spread over other parts of India. *Eupodotis nuba*, *Ruppell*, *E. ludwigi*, *Ruppell*, *E. caffa*, *Licht.*, *E. denhami*, *Children*, *E. arabs*, *Linn.*, and *E. kori*, *Burchell*, occur in Africa.

Houbara macqueenii, *Gray*, *Hardw.*, *Gould*.

O. marmorata, *Gray*, *Hardw.*

Tilaor, female,	HIND.	Obarra,	HIND.
-----------------	-------	---------	-------

The Indian houbara bustard is 25 to 30 inches long; and weighs $3\frac{1}{4}$ to $3\frac{1}{2}$ lbs. It is found throughout the plains of the Panjab and upper Sind, occasionally crossing the Sutlej and the Indus lower down, but it does not occur east of Delhi. It is much hawked both in the Panjab and Sind, the falcon used being the charragh or *Falco sacer*.

Sypheotides bengalensis, *Gmelin*. Bengal florikin.

<i>O. deliciosa</i> , <i>Gray</i> , <i>Hardw.</i>		<i>O. himalayana</i> , <i>Vigors</i> .
Charras, choraj,	HIND.	Dubar of Nepal.
Charaz,	"	

Length 24 to 27 inches, weight $3\frac{1}{4}$ lbs. It occurs in all the north of India from Calcutta to the Himalaya.

Sypheotides auritus, *Lath.*, Lesser, common or black florikin.

Otis auritus, *Latham*, *O. fulva*, *Sykes*.
Jard., *Jerd.*, *Blyth*.

Grossetrappu,	"	Abu-tarda,	SP.
Acken-trapp,	"	Nil-naray,	TAM.
Jungli-kabut,	HIND.	Batt-miaka,	TEL.

Various species of this genus of birds are to be met with in many parts of India, but the *O. tarda* is more rarely seen, in the lower and southern tracts of the peninsula, than in the more northern regions. In Mysore, which, from its great elevation, is much colder than other countries of the same latitude, the bustard is still common. The bustards live generally in open countries, preferring plains or wide-spreading extensive downs dotted with low bushes and underwood-localities which give them an opportunity of deservying their enemy from afar.—The bustards are found in Europe, Asia, and Africa; but not in America.—*Ainslie's Mat. Med.*, p. 296; *Eng. Cyc.*, pp. 697, 701; *Jerdon's Birds of India*, Vol. iii, p. 606.

OTOLITHUS. On the Malabar Coast, excellent isinglass is obtained from two species of *Otolithus*. One, perhaps the *O. biauritus*, *Cantor*, is named in Malayalim "Sille korra," it grows to a large size and is highly prized for the isinglass it yields; the *O. ruber*, also yields good isinglass. *Otolithus versicolor*, *Cuv.* and *O. ruber*, *Cuv.*, the perche pierre of Pondicherry, called there "panan," is fifteen inches long, and caught in abundance all the year, being esteemed as food. The isinglass obtained from North America in the form of long ribbons, is produced, according to Dr. Mitchill, by *Labrus squeeateague*, at New York, called weak fish, which is about fifteen inches in length, and above six pounds in weight, forming one of their most abundant fish and furnishing the supply for their tables. One

another states that its thick silvery swimming bladders are pressed, and another that the sounds of the Hake (*Merlucius vulgaris*) are also pressed between iron or wooden rollers to form thin isinglass. The *Labrus squalatus* is *Otolithus regalis* of Cuvier (the *Johnius regalis* of Bloch,) of the tribe *Sciaenoides*. These are allied to the Perches, but have more variety and a more complicated structure in their natatory bladders; almost all are good for eating, and many of superior flavour.

Otolithus, sp., perhaps *O. biauritus* of Cantor.

Sille-kora. MALAYALUM.

This fish grows to a large size. It is found on the Malabar Coast, and is highly prized for the isinglass it yields.

Otolithus biauritus, Cantor. Total length, 3 feet. Inhabits Sea of Penang, Malayan peninsula, Singapore, Lencavay, Tenasserim Provinces and according to Jerdon, the Malabar Coast, where it is called Sille-kora, in Malayalam. The air-vessel is nearly one-half of the total length, and in shape might be compared with an elongated antique urn with two handles. From the anterior part of each of the latter proceed five branches, four of which give off smaller ones to each side, and the fifth is tortuous and smaller than the rest. It yields a large quantity of isinglass, which in the Chinese market is considered to be of the best quality, and fetches 40 to 50 Spanish dollars per pecul.

Otolithus ruber, Bloch and Schneider.

Jaran-gigi, MALAYALUM.

The total length of this fish is 2 feet 6 inches.

Otolithus versicolor, Cuv. and Val. The total length of this fish is only $6\frac{1}{2}$ inches. It inhabits the Sea of Penang. Its air-vessel is $\frac{1}{4}$ of the total length.

Otolithus versicolor, Cuv. and Valen : Russell 109.

Panna, TAM.

Jerdon says this fish is one foot long and very common at Madras.—Cantor, p. 1046.

OTONO, a city alderman of Japan. In Japan, a city is divided into wards. For the ten wards there is one Lord Mayor, who every morning receives the Otono or Alderman, hears the cases of minor importance, and decides upon them with the alderman summarily. The Otono post up the public notices in their quarters, and take care of all the poor and sick in their wards.—Hodgson's *Nagasaki*, p. 228.

OTTAGAM, TAM. Camel. Ottagam mi-ir, TAM. Camel's hair.

OTTO OF ROSES.

Atr. Gulab-ka-atr, AR. : GUZ. | Atr-i-Gul, PERS.
HIND.

Otto of Roses, is a perfume obtained by the distillation of rose leaves. It is manufactured

in France and in Turkey, and from the latter is largely imported into British India. It is also largely made in Hindustan. Dr. Jackson mentioned that in the early part of the 19th century around the station at Ghazee-pore there were about 300 beegahs, or about 150 acres of ground laid out in small detached fields as rose gardens, most carefully protected on all sides by high mud walls and prickly pear fences, to keep out the cattle. These lands, which belong to zemindars, are planted with rose trees, and are annually let out at so much per beegah for the ground, and so much additional for the rose plants—generally five rupees per beegah, and twenty-five rupees for the rose trees, of which there are 1,000 in each beegah. The additional expense for cultivation would be about 8-8; so that for rupees 30-8 you have for the season per beegah of 1,000 rose trees. If the season is good this beegah of 1,000 rose trees should yield one lac of roses. Purchases for roses are always made at so much per lac. The price of course varies according to the year, and will average from 40 to 70 rupees. As soon as the roses come into flower the zemindar and cultivators of the rose gardens, as well as intending purchasers, meet in the city, and according to the demand and expected produce, a neric or market rate is established, and purchasers then enter into agreement with the cultivators for so many lacs of roses at such a price. This agreement is considered binding, and the cultivator is obliged to deliver the quantity at the contract rate; when that is completed another can be made, but this latter is always at a much higher rate. The rose trees come into flower at the beginning of March and continue so through April. In the morning early the flowers are plucked by numbers of men, women, and children, and are conveyed in large bags to the several contracting parties for distillation. The cultivators themselves very rarely manufacture. The native apparatus for distilling the rose-water is of the simplest construction; it consists of a large copper or iron boiler well tinned, capable of holding from eight to twelve gallons, (shaped like the earthen hoondahs in which the gomastahs send in their opium) having a large body with a rather narrow neck, and a mouth about eight inches in diameter; on the top of this is fixed the head of the still, which is nothing more than an old deghchee, or cooking vessel, with a hole in the centre to receive the tube or worm. This tube is composed of two pieces of bamboo, fastened at an acute angle, and it is covered the whole length with a strong binding of corded string, over which is a luting of earth to prevent the vapour from escaping. The small end, about two feet long, is fixed into the hole in the centre of the head, where it is well-luted

with flour and water. The lower arm or end of the tube is carried down into a long-necked vessel or receiver, called a bhubka. This is placed in a hundee of water which as it gets hot is changed. The head of the still is luted on to the body, and the long arm of the tube in the bhubka is also well-provided with a cushion of cloth, so as to keep in all vapour. The boiler is let into an earthen furnace, and the whole is ready for operation.

There is such a variety of rose-water manufactured in the bazaar, and so much that bears the name, which is nothing mixture of sandal oil, that it is impossible to lay down the plan which is adopted. The best rose-water, however, in the bazaar may be computed as bearing the proportion of one thousand roses to a seer of water; this perhaps may be considered as the best procurable. From one thousand roses most generally a seer and a half of rose-water is distilled, and perhaps from this even the attar has been removed. The boiler of the still will hold from eight to twelve or sixteen thousand roses. On eight thousand roses from ten to eleven seers of water will be placed, and eight seers of rose-water will be distilled. This, after distillation, is placed in a carboy of glass, and is exposed to the sun for several days to become puckah or ripen, it is then stopped with cotton, and has a covering of moist clay put over it; this becoming hard effectually prevents the scent from escaping. The price of this will be from twelve to sixteen rupees. This is the best that can be procured.

To procure the attar or otto, the roses are put into the still, and the water passes over gradually as in the rose-water process; after the whole has come over, the rose-water is placed in a large metal basin, which is covered with wetted muslin tied over to prevent insects or dust getting into it; this vessel is let into the ground about two feet, which has been previously wetted with water, and it is allowed to remain quiet during the whole night. The attar is always made at the beginning of the season when the nights are cool; in the morning early the little film of attar which is formed upon the surface of the rose-water during the night is removed by means of a feather, and it is then carefully placed in a small phial; and day after day as the collection is made it is placed for a short period in the sun, and after a sufficient quantity has been procured it is poured off clear, and of the colour of amber, into small phials. Pure attar, when it has been removed only three or four days, has a pale greenish hue, by keeping it loses this and in a few weeks' time it becomes of a pale yellow. The first few days' distillation does not produce such fine attar as comes off afterwards, in consequence of the dust or little particles of dirt in the still and the tube

being mixed with it. This is readily separated from its sinking to the bottom of the attar, which melts at a temperature of 84°. From one lac of roses it is generally calculated that 180 grains, or one tolah, of attar can be procured; more than this can be obtained if the roses are full-sized, and the nights cold to allow of the congelation. The attar purchased in the bazaar is generally adulterated, mixed with sandal oil or sweet oil; not even the richest native will give the price at which the purest attar alone can be obtained, and the purest attar that is made is sold only to Europeans. It sells at from 50 to 90 rupees the tolah. Native stills are let out at so much per day or week, and it frequently occurs that the residents prepare some rose-water for their own use as a present to their friends, to secure their being provided with that which is the best. The natives never remove the calices of the rose flowers, but place the whole into the still as it comes from the gardens. The best plan appears to be to have the calices removed, as by this means the rose water may be preserved a longer time, and is not spoiled by the acid smell occasionally met with in the native rose-water. It is usual to calculate 100 bottles to one lac of roses. The rose-water should always be twice distilled; over ten thousand roses, water may be put to allow of sixteen or twenty bottles coming out; the following day these twenty bottles are placed over eight thousand more roses, and about eighteen bottles of rose-water are distilled. This may be considered the best to be met with. The attar is so much lighter than the rose-water, that previous to use it is better to expose the rose-water to the sun for a few days, to allow of its being well-mixed, and rose-water that has been kept six months is always better than that which has recently been made.

At the commencement of the rose season, people from all parts come to make their purchases. There are about thirty-six places in the city of Ghazeepore where rose-water is distilled. The distillers generally put a large quantity of sandal oil into the receiver, the oil is afterwards carefully removed and sold as sandal attar, and the water put into carboys and disposed of as rose-water. At the time of sale a few drops of sandal oil are placed on the neck of the carboy to give it a fresh scent, and to many of the natives it appears perfectly immaterial whether the scent arise solely from the sandal oil or from the roses; large quantities of sandal oil are every year brought up from the south and expended in this way. The chief use the natives appear to make of the rose-water, or the Sandal Attar as they term it, is on the occasion of their festivals and weddings. It is then distributed largely to the guests as they arrive, and sprinkled in profusion in the apartments. A large quantity

of rose-water is sold at Benares, and many of the native rajahs send over to Ghazepore for its purchase. Most of the rose-water as soon as distilled is taken away, and after six months from the termination of the manufacture there are not more than four or five places where it is to be met with.

The value of the roses sold for the manufacture of rose-water may be estimated at 15,000 rupees a year, and from this to 20,000, and from the usual price asked for the rose-water and for which it is sold, it is estimated there is a profit of 40,000 rupees. The natives are very fond of using the rose-water as medicine, or as a vehicle for other mixtures, and they consume a good deal of the petals for the conserve of roses, or Gooleund, as it is called.

Other perfumed oils are manufactured without resorting to distillation. The layers of the jasmine, or other flowers, four inches thick and two inches square, are laid on the ground and covered over with layers of sesamum or any other oil-yielding seed. These are laid about the same thickness as the flowers, over which a second layer of flowers like the first is placed. The seed is wetted with water, and the whole mass covered with a sheet held down at the end and sides by weights, and allowed to remain for eighteen hours in this form: it is now fit for the mill, unless the perfume is desired to be very strong, when the faded flowers are removed and fresh ones put in their place. The seeds thus impregnated are ground in the usual way in the mill, and the oil expressed having the scent of the flower. At Ghazepore, the jasmine and bela are chiefly employed: the oil is kept in dubbers, and sold for about Rs. 2 a seer. The newest oils afford the finest perfumes. The process here described is the same as that pursued at Bombay. In Europe, a fixed oil, usually that of the bean or morunga nut, is employed. Cotton is soaked in this and laid over layers of flowers, the oil being squeezed out so soon as impregnated with perfume.—*Monthly Bombay Times*, 25th Nov. to 24th June 1850. See Ak.

OTTAWA, see Hindoo.

OTTER, a name for two distinct animals, the land-otters, *Lutra vulgaris*, *Lutra nair*, *Lutra leptonyx*, and *L. canadensis*, and the sea-otter, *Enhydra marina*. Both are caught for their fur: of the former, Great Britain receives about 20,000 skins a year. The latter, more like the seal in its habits, is obtained in much smaller numbers, but being the royal fur of China is highly valued there and in Russia. The otter, the crocodile, the kingfisher and the cormorant, share with man the produce of the waters.

Lutra leptonyx Horsf., *Blyth*. Clawless otter. *Aonyx horsfieldii*, *Gray*. *L. indigitata*, *Hodgson*. *sikimensis*, *Hodg.*
Chiusam, *Bhot*. *Suriam*, *Lepch*.

This otter is found throughout all the Himalaya, south and east to Calcutta, Arrakan and the E. Archipelago. Length of head and body 24 inches, tail 13 inches.

<i>Lutra nair</i> , <i>F. Cuv.</i>	Common Indian otter.
<i>L. chinensis</i> , <i>Gray</i> .	<i>L. tarayensis</i> , <i>Hodgson</i> ,
<i>L. indica</i> ,	<i>Ell.</i> , <i>Bly.</i>
<i>Nir-nai</i> ,	<i>Can.</i> <i>Jal-marjar</i> :
<i>Ud</i> ; <i>Hud</i> ; <i>Ud-nai</i> ; <i>Hind.</i>	<i>Jal-manjer</i> , <i>Mahr.</i>
<i>Ud-billai</i> ,	<i>Saglahu</i> , <i>???</i> <i>Panj.</i>
<i>Pani kutta</i> ,	<i>Sag-i-abi</i> , <i>Pers.</i>
<i>Udur</i> ,	<i>Neeru-kuka</i> , <i>Tel.</i>
<i>Anjing-ayer</i> ,	<i>Kashmir</i> , <i>Malay.</i>

Found from the Indus to the E. Archipelago. Length 46 inches, of which tail is 17. It frequents marine lagoons and rivers. It is very easily domesticated, and in Bengal it is trained to drive fish into the nets. In the Panjab and N. W. Himalaya the skins of the *Lutra nair* are used for fur caps and posteens. It is extensively tamed and trained along the course of the Brahmaputra, as cormorants are trained in China.

Lutra vulgaris, *Erseleben*, *Blyth*. Hill otter.
L. monticola, *Hodgson*.

This is the common otter of Europe and is found in the interior of the Himalaya. Length, head and body 20—22 in., tail 12 to 13 in.

Lutra auro-brunnea, *Hodgson*. A small sized otter of the Himalaya.

Lutra barang, *Raffles*. An otter of the Malay peninsula.

Lutra simung, *Raffles*. An otter of Sumatra and Borneo.

In the museum of the Bengal Asiatic Society there is a specimen of an otter from Algeria, which (externally at least) is undistinguishable from the common otter of Bengal.—*Jerdon's Mammals*, pp. 86—89; *Horsfield's Cat.*, pp. 115—120; *Powell's Hand-book*; *Blyth*.

OTTONE, *It.* Brass.

OU, *Hind.* *Hordeum ægiceras*.

OUBA-CHAMPA, *Beng.* *Sphenocarpus grandiflorus*.

OUCHI, see Kirghis.

OUCHTERLONY, Captain, Madras Engineers; wrote report on Nellore, Cuddapah and Guntur—Madras, 1841. Statistical and Meteorological report of the Neilgherry Hills, 1848.—Bombay Almanac, 1850. Account of Chinese war, &c.—*London*, 1844.

OUCHTERLONY, Sir David, a general officer of the Bengal army, who, for eight days, defended Delhi against the Mahratta Jeswunt Rao Holkar, repulsing repeated assaults though with open breaches, till on the night of the 15th October 1804 on the approach of Lord Lake, Holkar withdrew. From that time, the Moghul emperor of Delhi became a stipendiary of the British. The Nepal war which ended on the 12th March 1816, was successfully conducted by Sir David Ochterlony, but there fell General Gillespie who relieved Vellore when it was

seized by rebels in 1808, and who had distinguished himself in Java in August and September 1811. Several tracts in the mountain valleys of the Himalaya were then ceded to the Indian government. Sir David Ouchterlony lives in the memory of the people of Northern India, as one of the greatest of the English conquering chiefs, and he was the very last of the British leaders who endeared himself, both to the army which followed him and to the princes who bowed before the colossal power of his race. He was long employed in conducting negotiations with Runjit Singh.

OUDEYPUR or Oudeypore, is the capital of Mewar, and is often used to designate the Mewar country. The Oudeypore family is the highest in rank and dignity among the Rajpoot chiefs of India. The ruling chief is considered by hindoos to be the representative of Rama, the ancient king of Ayodhia, by one of whose descendants, Kanaksen, the present dynasty was founded about A. D. 144. The States of Doonpurpore, Sirohi, and Pertabgurh are offshoots from it. Sivajee, the founder of the Mahratta power, and the Bhonsla family also claimed to be descended from the house of Oudeypore. No state in India made a more noble and a more desperate resistance to the mahomedans. It is the boast of the family that they never gave a daughter in marriage to any of the mahomedan emperors, and they for many years ceased to intermarry with the other Rajpoot families who had made such alliances. The rana Umra, who succeeded to the State in A. D. 1700 formed an alliance with the rajahs of Jeypore and Jodhpore for mutual protection against the mahomedans. It was one of the conditions of this tripartite alliance that these chiefs should regain the privilege of marriage with the Oudeypore family on condition that the sons of the Oudeypore princesses should succeed in preference to children by other wives. The quarrels to which this stipulation gave rise, led to the conquest of the country by the Mahrattas, at whose hands Mewar suffered more cruel devastations than it had ever been subjected to by the mahomedans. The rana Umra was succeeded in 1716 by Sangram Sing II, who was followed in 1734 by Juggut Sing II. On the departure of Nadir Shah, the peishwa having received from Mahomed Shah the cession of the chouth or fourth part of the revenues of the empire, he demanded this tribute from Oudeypore in common with the other states which had been tributary to the emperor; and, in 1736, Bajee Rao peishwa concluded a treaty with Juggut Sing II, by which the rana agreed to pay annually Rs. 1,60,000 on account of chouth. It became thereafter the custom for the redress of any real or supposed wrong, to call in the aid of the Mahrattas, who thus obtained a firm footing in

Mewar, became the referees in all disputes and the virtual rulers of the country. On the withdrawal of the British influence from Rajpootana in 1806, under the policy of non-interference which had been introduced by Lord Cornwallis, Oudeypore was laid waste by the armies of Sindia, Holkar, and Ameers Khan, and by many hordes of pindaree plunderers. To such distress was the maharana reduced, that he was dependent on the bounty of Zalim Sing, the regent of Kotah, who gave him an allowance of Rs. 1,000 a month, and was exposed to the insults of his own feudatories, the more powerful of whom had retired to their forts and were bent only on their own preservation. In this state of degradation maharana Bheem Sing was found in 1817, when the British government entered on its general scheme of alliances for the suppression of the pindarees. By the treaty the British government agreed to protect the territory of Oudeypore, and to use its best exertions for the restoration of the territories it had lost when this could be done with propriety. This clause has furnished the Oudeypore state with never-failing cause of complaint particularly with respect to the district of Neembhara. The hill districts of Oudeypore to the south and south-west are inhabited by wild and turbulent tribes of the Bheel and the Grassia under Rajpoot chiefs owning a nominal allegiance to Oudeypore, holding the right of property in the land over which the maharana has no power, and levy black mail on neighbouring villages and a tax on the passage of goods and travellers, for whose safety they are considered responsible. Various injudicious attempts to interfere with the prescriptive rights of these tribes drove them to revolt, and necessitated the employment of British troops for their coercion. It was found that without the constant supervision of British officers permanent peace could not be restored. Accordingly it was proposed in 1838 to raise a Bheel corps to be stationed in these districts. Since the formation of the corps the outbreaks of the Bheels have been suppressed; but there has been a constant struggle between the native government seeking to oppress the Bheels and the superintendent of Kherwarra to protect them. In 1861 the cost of the corps was reduced to about Rs. 98,000.—*Captain Brooke's History of Mewar; Aitcheson's Treaties, Engagements and Summits, Vol. iv, pp. 4 to 7.* See India, Mewar, Oudeypore, Rajpootanah.

ODDH, a province of British India, the capital of which is Lucknow: Until the 6th May 1856, it was ruled over by a king the titular vizir of the Moghul empire, but the last king was then dethroned during the administration of Lord Dalhousie. Oudh lies between Nepaul and the N. W. Provinces of British India. It contains no mountains. In the Gondah dis-

strict, the boundary is on the ridge of the first range of low but abrupt hills of the Himalaya; elsewhere it is in the plains and is a part of the alluvial valley of the Ganges and of some of its tributaries. It consists of 12 revenue districts, in 4 divisions, with an area of 24,060 square miles and a population of 11,232,368. The higher castes of mahomedans are thus classified:—

Sayed 51,679	Pathan, Khandan,	
Shaikh, Milki, Ma-	Rohilla 191,880	
lik, Kuraishi 166,561	Mogul 26,672	

The following are mahomedan converts from higher castes:—

Bhale Sultan ... 1,699	Rajpoot 6,775
Khanzada ... 2,093	Mewatce 2,140

The higher castes of hindoos are thus given:—

Brahmin 1,397,880	Kashmiri 219
Bengali 128	Marwari 74
Jat 10,845	Punjabi 93
Jain 56	Sikh 4,752
Kshatriya 662,946	Saraok 4
Kyath 148,923	Vaishya 241,466
Khatri 13,374	

Of the lower hindoo castes the most numerous are these:—

Aheer . 1,167,499	Kahar 288,263
Bhunya . 143,362	Koree 360,178
Bhat . 63,200	Kurnee 764,422
Barheire . 134,814	Lohar 122,573
Chumar . 1,030,467	Lodha 350,937
Dhobee . 161,004	Malce 107,732
Parsee . 649,741	Murao 406,363
Telee . 213,999	Nao 220,759

Aborigines.

Dom ... 14,925	Paharia & other ... 30
Nat ... 13,093	

There are thirty orders of religious mendicants, amongst whom are,

Gosain ... 40,999	Byragi 6,230
Jogi ... 8,642	Sad'hu 9,923

There were 3 Arabs, 90 Abyssinian Negroes, 150 Iraki (Turkish Arabia), 185 Jews, 29 Persians, and 10 Turks. Eleven aboriginal castes are entered varying from 14,925 Dome and 13,093 Nat to 30 Pahare and others. Thirty orders of religious mendicants are given.

The Oudh province is a part of the alluvial valley of the Ganges and some of its tributaries. The rivers descend from the hills first in a southerly direction and then turn eastwards. The belts of forest come down between them, and are situated on the higher land between the streams. The Turrai stretches all along the frontier of the province immediately below the forest, and is low and moist. It is more or less settled and cultivated, but the crops are poor and the country is unhealthy, at the first, and there are great difficulties in the way of bringing the soil under cultivation. Throughout this district there are large grassy plains where numerous herds of cattle are kept, and it is interspersed with old water-courses,

the former beds of the rivers now forming jheels and swarming with alligators. In the Baraich and Kheree districts, where the turrai fades into the drier land, are two tracts, known as Dhowrera and Nanpara, which have an excellent breed of draught cattle. In the centre of this tract there are a few jheels, especially in the lower part of Seetapoor, in Lucknow, and Barabunkee, where the soil is more clayey and the crops more irrigated and finer, but its general character is as described. The Oudh forests are in three divisions. The 1st, or Khairigarh division, lies between the rivers Soheli and Mohana. The trees which are reserved in the Oudh forests are Shorea robusta, Dalbergia sissoo, Cedrela toona, Ebony, Diospyros melanoxylon, Conocarpus latifolia, Terminalia tomentosa, Acacia catechu, and Nauclea cordifolia. Of these, Shorea, Cedrela, Ebony, Conocarpus and Terminalia are found in the higher forest, called Bhabar or, locally, Domar. The other trees are found on the lower ground or turrai. There is a very small tract under sissu reserved for the use of the gun carriage agency at Futtehghurh. The principal rivers of Oudh are the Rapti, the Babai, the Girwa, the Kauriali, the Molana, the Soheli, the Sarda, the Ul, the Katna, the Gumti, the Sai and the Ganges. Of these all, except the Ul, Katna, Gumti and Sai, are hill streams descending from the Himalaya and subject to the sudden freshes which characterize the hill streams. The Rapti is a rapid river navigable for boats up to Bhinga. It is used for rafting timber in the rains. It is a second class river, and swarms with crocodiles. The Babai is rapid and shallow in its upper course, and useless for navigation and for rafting. The Girwa where it enters British territory, is a mountain stream with a great fall, rushing in rapids and pools over a stony and sandy bed. It is useless for navigation. It is a branch of the Kauriali, from which it issues by percolation, and to which it is re-united lower down. The Kauriali, is the largest of the affluents of the Ganges. Its discharge is 13,082 cubic feet per second. It is more than twice the size of the Ganges where it leaves the hills, and is navigable for boats throughout the year within British territory. This is the river which is called Karnali in the hills: Kauriali, after it enters the plains to its confluence with the Sarju a little below Bhartapur; Gogra thence to Fyzabad; Sarju, about Adjudia; and Dewa or Gogra again below this down to its confluence with the Ganges at Revelganj near Chupra. The Mohana is the boundary of the British territory from Gwari Ghat to its confluence with the Kauriali, rather more than half its course in the plains. It is a shallow and rapid stream, not navigable, but timber is floated down it in the rains to

the Kauriali. This river swarms with crocodiles, both the magar or broad-nosed, and the guriel or long-nosed species. The Sarda is a river about the size of the Ganges where it leaves the hills; nine miles below, its discharge is 6,416 cubic feet per second. It is the boundary between British territory and Nepal out of Oudh. It has lost the character of a hill stream and flows in a sandy bed. The Gumti is a river rising in some rice fields, from which its head waters appear to trickle. Its water is sweet and its banks are cultivated throughout the province. It is navigable throughout the greater part of its course in Oudh; but it is extremely tortuous, and the navigation is impeded at Sultanpoor by rocks. There are no lakes, though some of the Jheels are very extensive sheets of water. The country between the Gumti and the Ganges is well supplied with them. They lie in two parallel elevated hollows, on either side of the Sadi, and about midway between that river and the Gumti and Ganges respectively. They are drained by lateral nale, or branches which fall mainly into the Sai, and which cause the occasional floods in that river after heavy rain. They are a striking feature of the country, stretching in a continuous series, on both sides of the Sai, from the Shahjehanpoor boundary to that of Jounpoor and Allahabad, and often connected when the rain has been heavy. The Oudh jheels are covered with all kinds of wild fowl and some of them are fairly stocked with snipe. In the turrail, marshes are numerous. They are covered with long grasses and are the favourite lair of tigers after the hot weather has set in. In density of population Oudh stands at the head of all the provinces of India. It contains 474 to the square mile, or 514 if the more barren part of its area be left out. The proportion of mahomedans to hindoos is 10·7 per cent. to 89·3. The mahomedans are the most numerous and powerful in the central districts of Lucknow and Barabunkee. Their settlements there were mostly effected in the 13th, 14th and 15th centuries, and they have generally continued to hold the lands they first acquired. Of the 55 talukdars of these two districts, 34 are mahomedans; 23 belong to Barabunkee and 11 to Lucknow. The first mahomedan invasion of this province took place in the 11th century of the christian era when Sayad Salar Masa'ud, a relative of the great Mahmud of Ghuzni, fought his way into Oudh at the head of a large army. The history of his invasion, his first success and his final defeat and death at Bariach are told in the Mirat-Masa'udi. Of the whole native population of 11,198,095, so many as 6,542,870, or 58·4 per cent., are agricultural and 4,655,225, or 41·6 per cent., non-agricultural. Native

christians and éurasians generally return themselves as Europeans. As in every other province where the people have been carefully numbered, the population of Oudh has proved to be far more than the official estimate. It was taken at six millions on annexation, in 1855, it was estimated at eight millions up to the year 1872 and then it proved to be 11,220,747, or 465 to the square mile, making Oudh the most thickly inhabited of the ten provinces of India. As there are 1,774,355 inhabited houses, of which only 21,902 are of masonry, this gives more than six inhabitants to each. But Oudh is a far more fertile country than the North-West which has 359 to the square mile, and if the number to each house can be explained there is every reason why 465 per mile should be correct. The following shows the population according to sex and age in each of the twelve districts:—

District.	Children under twelve years.				
		Wom.			Total
Lucknow	347,667	319,175	170,462	144,974	992,278
Barabunkee	283,364	283,512	166,857	141,454	875,587
Oonao	236,511	231,199	136,207	118,237	725,154
Roy Bareilly.	236,132	260,892	153,587	132,655	783,266
Sultanpoor	281,647	312,794	164,895	151,327	930,663
Pertabgurh	286,944	301,664	168,477	159,178	936,263
Fyzabad	456,382	465,459	283,681	235,106	1,441,228
Gondah	354,414	354,627	250,210	209,211	1,168,462
Baraich	256,146	237,337	150,779	130,378	774,640
Seetapoor	317,113	282,676	180,372	153,284	833,445
Hurdul	316,210	278,659	184,744	151,584	931,377
Kherree	263,803	222,952	136,079	115,770	738,604
Total.	3,636,333	3,654,546	2,186,330	1,843,538	11,220,747

Lucknow is the most populous, and Barabunkee and Fyzabad come next. Kherree and Baraich stands lowest, for there waste lands abound. The following are the results according to the respective creeds,

Christians.	
European (non-military).....	5,446
Mixed and Native	985
Mussulmans.....	1,195,879
Hindoos, Buddhists, Jains and	
Aborigines	10,002,731

There are no Parsees in Oudh. As in every previous census, we learn, from this, how comparatively few the mahomedans are, and that too, in a province long ruled by a mussulman family. Christianity has evidently much to do in Oudh, where, indeed, it had not been regularly preached during more than ten years. As to the occupation of the people 6,543,296 are agriculturists and 4,677,451 non-agriculturists. The proportion of the latter is large but doubtless it includes all labourers. Oudh province has several revenue divisions, Lucknow, Khyrabad, Banswara and Bairaitch.

Kherree is the extreme district of Oudh at the foot of the hills on the Nepaul border.

Tharoo, are inhabitants of the forests, a wild, uncultivated, and extremely superstitious race, and assign to themselves a mythological beginning. Their villages are divided into certain circuits, marked off by the Bhurra of Bheonhar, a self-created superior, whom these people believe to be inspired by Bhowanee, and to whom they submit in every occurrence of their domestic lives. A Bhurra is indispensable at every birth, marriage and death, directs all religious ceremonies, and has supreme influence in the circuit to which he belongs. He has, however, to prove his inspiration before the assembled villagers by one of two methods, either by drawing seven times the flame from a lighted to an unlighted wick without bringing the two in contact, or by calling upon Bhowanee, who is supposed to descend upon him, when the Bhurra begins to dance and jump about violently, and convinces the assembled crowds of superhuman powers by his movements and gesticulations. The bodies of the Tharoo that die in advanced years are burned, but those of the young are buried; also, though their widows are allowed to re-marry, a man may not marry the widow of his younger brother.

The woods of Oudh are as under :—

Neem (*Melia azadirachta*), plentiful.

Peepul, (*Ficus religiosa*), in various parts.

Mulserree, (*Mimusops elengi*), in various parts.

Toon, (*Cedrela toona*), Lucknow. Spontaneously in the northern parts of Oudh. It is the best for furniture of a high polish.

Bahera, (*Terminalia bellerica*), grows spontaneously in the Terai. Not a very large tree : used for all purposes. From its fruit, blacking is made.

Jamun, (*Eugenia jambolana*), all over Oudh, is a large-sized tree, and bears a black astringent small fruit, about the size of a large olive, which the natives eat. Used for various kinds of wood-work.

Asna or Asan, (*Terminalia tomentosa*), spontaneously in the Terai jungles; durable and elastic, for many purposes preferable to sal.

Am, (*Mangifera indica*), cultivated largely.

Kaitha, (*Feronia elephantum*), in various parts of Oudh not extensively. The fruit of this tree is used for the same purposes with that of *Ægle marmelos*; but the latter is preferable.

Bael, (*Ægle marmelos*), all parts of Oudh, extensively. The fruit is extensively used dry in powder, and also for making sharbet, for bowel complaints.

Bair, (*Zizyphus jujuba*), various parts of Oudh. Used principally for native clogs.

Arar, (*Ailanthus excelsa*), extensively all over Oudh. Principally used for sword scabbards.

Gooler, (*Ficus glomerata*), all over Oudh. Used for furniture. Some of the lac of commerce is gathered from this tree; the fruit is eaten by natives.

Mhowah, (*Bassia latifolia*), all over Oudh. From the seeds oil is extracted, and from the fruits or flowers spirits are distilled.

Saul, (*Shorea robusta*), grows spontaneously and extensively in the Terai. The timber is durable, generally used for building purposes, bridges, &c.; and is considered the best for such works.

The ancient Ayodhya, (*i. e.*, the Invincible) was the capital of the modern Oudh, and is celebrated in all hindoo poetry as the ancient capital of Ramachandra, founded by Ikshwaku, the first king of the solar dynasty. Like other capitals, its importance must have risen by slow degrees; yet, making every allowance for exaggeration, it must have attained great splendour long anterior to Rama. It was for many years the sovereignty of the princes of the solar line. The remains of the ancient city are still to be seen at the town of Oudh, situated on the banks of the Ghogra, seventy-nine miles from Lucknow and adjoining Fyzabad. Overgrown greatness characterized all the ancient Asiatic capitals, and that of Ayodia was immense. Lucknow, the present capital, is traditionally asserted to have been one of the suburbs of ancient Oudh, and so named by Rama, in compliment to his brother Lakshman. In the Ramayana (Book I, chap. v), it is thus described: On the banks of the Sarayu is a large country called Kosala, gay and happy, abounding with cattle, corn and wealth. In that country was a famous city called Ayodhya, built formerly by Manu, the lord of men. A great city, twelve yojana in extent, the houses of which stood in triple and long-extended rows. It was rich, and perpetually adorned with new improvements. The streets were well-disposed and well-watered. It was filled with merchants of various descriptions, and adorned with abundance of jewels; crowded with houses, beautified with gardens and groves of mango trees, surrounded by a deep and impregnable moat, completely furnished with arms. In the Sakuntala, (Act vi), Ayodhya is called Saketala. The country of which Ayodia was the capital, and Rama monarch, is termed in the geographical writings of the hindoos, Koshula; doubtless from the mother of Rama, whose name was Koshulya. The first royal emigrant from the north is styled, in the Rana's archives, Koshula-pootra, 'son of Koshula.'

Vishwamitra was the son of Gadhi (of the race of Kausika), king of Gadhipoora, and cotemporary of Umbaraesha, king of Ayodyha or Oudh, the fortieth prince from Ikshwaku, con-

sequently about two hundred years anterior to Rama, and probably about one thousand four hundred years before Christ.

It is related that the king Vishwamitra, defeated and disgraced by a powerful priest, like a serpent with his teeth broken, like the sun robbed by the eclipse of its splendour, was filled with perturbation. Deprived of his sons and array, stripped of his pride and confidence, he was left without resource as a bird bereft of his wings. He abandoned his kingdom to his son, and like all hindoo princes in distress, determined, by penitential rites and austerities, to obtain brahminhood. He took up his abode at the sacred Poshkur living on fruits and roots, and fixing his mind, said, "I will become a brahmin." By these penances he attained such spiritual power that he was enabled to usurp the brahmin's office. The history of his wanderings, austerities, and the temptations thrown in his way, is related. The celestial fair were commissioned to break in upon his meditations. The mother of love herself descended; while Indra, joining the cause of the brahmins, took the shape of the kokila, and added the melody of his notes to the allurements of Rembha and the perfumed zephyrs which assailed the royal saint in the wilderness. He was proof against all temptation, and condemned the fair one to become a pillar of stone. He persevered "till every passion was subdued," till "not a tincture of sin appeared in him," and gave such alarm to the whole priesthood, that they dreaded lest his excessive sanctity should be fatal to them: they feared mankind would become atheists. "The gods and Bramha at their head were obliged to grant his desire of brahminhood; and Vashista, conciliated by the gods acquiesced in their wish, and formed a friendship with Vishwamitra.

The identity of Saketa and Ayodhya has, in General Cunningham's belief, always been admitted. The ancient city of Ayodhya or Saketa is described in the 'Ramayana' as situated on the bank of the Sarayu or Sarju river. It is said to have been 12 yojana or nearly 100 miles in circumference, for which should probably be read 12 kos, or 24 miles—an extent which the old city, with all its gardens, might once possibly have covered. At the present day, the people point to Ram Ghat and Guptar Ghat as the eastern and western boundaries of the old city, and the southern boundary they extend to Bharatkund, near Bhadarsa, a distance of 6 kos. The present city of Ajudhya, which is confined to the north-east corner of the old site, is just two miles in length by about three quarters of a mile in breadth; but not one-half of this extent is occupied by buildings, and the whole place wears a look of decay. There are enough

mounds of ruins, covered with broken statues and sculptured pillars, such as mark the sites of other ancient cities, but only a low irregular mass of rubbish heaps, from which all the bricks have been excavated for the houses of the neighbouring city of Faizabad. This mahomedan city which is two miles and a half in length by one mile in breadth, is built chiefly of materials extracted from the ruins of Ajudhya. The two cities together occupy an area of nearly six square miles, is just about one-half of the probable size of the ancient capital of Rama. In Faizabad the only building of any consequence is the stuccoed brick tomb of the old Bhao Begum, whose story was dragged before the public during the famous trial of Warren Hastings. Faizabad was the capital of the first nawabs of Oudh, but it was deserted by Asaf-ud-doulah in A. D. 1775.

The founder of the last Oudh dynasty was Sadut Khan, who was appointed subadar of Oudh in the voluptuous reign of Mahomed Shah. He was succeeded by his son-in-law Sufder Jung, who died in 1753, and was succeeded by his son Shuja-ud-Dowla, who was created vizier by the emperor Shah Alam. He was defeated at Buxar in 1764 and retreated to his own dominions. He then sought aid from the Mahrattas but was again defeated, and he then threw himself on the generosity of the British. Shuja-ud-Dowla died in 1775 and was succeeded by his son. It was during his reign that the interview took place with Warren Hastings, from which the treaty of 1781 resulted. Asaf-ud-Dowla died in 1797 and his reputed son Mirja Ali succeeded, only to be displaced for Sadut Ali's eldest son Shuja-ud-Dowla with whom a treaty was made in 1812. He died 11th July 1814, and was succeeded by his eldest son Ghazi-ud-Din Hyder. Hitherto, the family, were styled vizier, but in 1819 was raised to the dignity of king. His son Nasir-ud-Din Hyder succeeded him, but died in 1817, and was succeeded by his uncle Mahomed Ali, who died in May 1842, and was succeeded by his son Anjud Ali, who, on the 13th February 1847 was succeeded by Wajid Ali. His misgovernment was such that after repeated warnings, he was dethroned in Feb. 1856, the British government then assumed the sovereignty of Oudh and the king was pensioned on twelve lacs yearly. In the course of the connection of the British with this family, the family lent several large sums to the British.—*Tod's Rajasthan*, Vol. i, pp. 29 to 215; *Williams' Story of Nala*, p. 114; *Aitchison's Treaties*, &c.; *Annals of Indian Administration*; *Catalogue Exhibition of 1862*; *Cunningham's Ancient Geog. of India*, p. 408. See British India, India, Infanticide, Khaki, Kush, Purbia, Solar race: Surya vansa, Sakya muni, Vishnu.

OUGEIN, a city in the western side of the peninsula of India, also called Ujjayini, Visala, and Pashpakarandini. It is the ancient Avanti, a city noticed in verses 28 and 31 of the Meghaduta.—*Williams' Story of Nala*, p. 116; *Captain Edward Warren*. See Inscriptions, Jaysinha, Junagurh, Ujein, Vicramaditya.

OUGEINIA DALBERGIOIDES, *Benth.* Syn. of *Dalbergia ougeinensis*, *Roxb.*

OUIGUR or **Uigur**, the most ancient of the Turkish tribes, formerly inhabited the part of Chinese Tartary, which is now occupied by a mixed population of Turk, Mongol and Kalmuk. The great Ouigour horde in Eastern Turkistan, are Turk, and they became mahomedans in A.D. 966. The Chinese call them Hoieke, Oihor, and Hoai-Hoai. Towards the close of the 8th century, the emperors of the Tang dynasty deported about a million of Ouigour families, from the neighbourhood of the Kashgar, and settled them at Kan-su and Chen-si. About A.D. 966, these families embraced mahomedanism, and under their chief Satook, they conquered Transoxiana, and carried away captive an immense number of Turks, of the Turghai tribe. In 972, the majority of these captives were allowed to return to their homes, but many remained, and they were styled Turghani or Tunghani, signifying remnant, and corrupted into Dungen, but known to the Chinese as Ouigour or Hoai-Hoai. They are all mahomedans, but dress like Chinese. They are abstemious, religious, quarrelsome, using the knife, but honest and fond of trade. The people of Asia, who inhabit the countries which extend northwards to the Russian frontiers, westwards to the Caspian sea, and southwards to Afghanistan are for the greater part descendants of Turks, and it would be more proper to give to all these countries, the general name of Turkestan dividing it into,

1st, Northern or Russian Turkestan, comprehending in it the three hordes of the Kirghis nation.

2ndly, Southern Turkestan, inhabited by the Khivan, Turkoman and Kara-kalpak and including also great Bucharia, Kokand, and Tashkend.

3rdly, Eastern Turkestan, comprising Little Bucharia, which is subject to China.

The Chinese and Manchoo call by the name of "hoei hoei," all the mahomedan tribes who live under their dominion. This word, therefore, has ceased to designate a nation. As the Ouigour Hoei-hoei, called simply Hoei-hoei under the Mongol dynasty of Yuan, were mahomedans, this phrase is applied by the Chinese to all those of the same religion, in the same manner as the Russians are often called Greeks, because they are of the Greek church. The inhabitants of the towns of Little Bucharia are

in part descendants of the ancient Ouigour Hoei-hoei, and consequently Turks, in part Sarti, or Bucharians who are scattered as merchants all over Central Asia, and who are Persians. There are many of them at Peking Hang-tcheou-fou, Canton, and other commercial cities of China. Their mother tongue is Persian but they also speak the oriental Turki, which is the general language of Turkistan, and the most diffused in little Bucharia. The Ouigour writing character was the original source of those still used by the Mongol and Manchu, and was itself almost certainly derived from the old Syriac character through the Nestorians. The modern Tartar characters are written (and it is presumed, read) in vertical lines from top to bottom of the page, the lines succeeding each other from left to right. What Ouigour meant with Mongol authors is doubtful, but the people and language so called by the Western Asiatics, were Turkish. Captain Valikhanoff speaks of the language now in use at Kashgar as being Uigur, but it is not clear whether he means that this term is known to the natives.—*Russians in Central Asia*, p. 67; *Yule Cathay*, Vol. i, p. 206; *Timkowski's Journey to Peking*, Vol. i, pp. 6, 378-79.

OUK-CHIN-YA.—? *Diospyros melanoxylon*.

OUK-GUAY, **Burm.** This tree is found all over the Tenasserim provinces, but it is scarce, and yields a perishable short grained wood. It is not heavy and floats in water when seasoned. Its maximum length is 15 feet and maximum girth $1\frac{1}{2}$ cubits.—*Captain Dancer*.

OUK-KYI-NE, **Burm.** A tree of Moulmein, wood used in ordinary house building.—*Cal. Cat. Ex.* 1862.

OUK-KHYIN-ZA, **Burm.** *Diospyros*, *sp.*

OUK-SHEET, **Burm.** *Egle marmelos*.

OULA, a much prized grass, which grows plentifully on the banks of the Longari, a river of Manchuria, in which the Tartars envelope their feet, in lieu of stockings.

OUILOUS, **Turk.** A tribe.

OUM SILLING or **Sillcung**, a river of Gowhatty.

OUNDI, **Mahr.** *Calophyllum inophyllum*, *Linn.*

OUNGKA, see *Simiada*.

OUNG-MAI-PHYOO, **Burm.** *Clitoria ternatea*.—*Linn.*; *Roxb.*; *W. & A.*

OUN-THUAY, **Burm.**? A white, soft, wood met with in Amherst, where it is employed for common carpentry purposes. It is not subject to injury from insects.—*Captain Dancer*.

OUPH, **Heb.** A fowl, a bird.

OUR-CHAKA, **Beng.** *Sonneratia acida*.

OURGA is the first town reached on this side the desert, and it takes forty-five days to go from Kalgan to Kiakhta. Mr. W. A. Whyte left Tien-tsin on the 16th October 1869, and

OVAL-LEAVED FIG-TREE.

Pekin on the 20th; on the 24th he was at Kalgan, and on the 27th he was at the desert to Gobi. Seventeen days afterwards he was at Kurin (the Ourga of Mr. Grant's journey); then, entering Siberia, he passed the rivers Boro and Cara on the ice, on the 15th, on the 17th Kiakh-ta was reached; at this season of the year, although the cold is almost unendurable, there is no rain to aggravate the distress of a journey. The Mongols share in the superstition of sailors that whistling brings on a gale. See Kalkas.

OURIANKAI, are poor Samoiede and Turkish tribes who inhabit the countries situated on the Upper Jenisei, and the rivers which flow into it; they are commonly called the Chinese Soioue. — *Asia Polyglotta*, pp. 146, 224; *Klaproth in Timkowski's Journey to Peking*, Vol. i, p. 174.

OURMIA, a lake in Persia, with saline water; it is stated by Dr. Marcet to contain no lime, although of a specific gravity of 1165·07, and abounding in sulphates and muriates. This appears very remarkable in an inland sea nearly 300 miles in circumference, situated in a volcanic country. On referring to the works of travellers, it appeared that the streams flowing into it abounded in lime, which is deposited in large quantity in the form of a beautiful travertine. The lake of Ourmia, like that of Loonar, contains potash, which Dr. Carter did not detect in the springs running into the latter. — *Carter's Geological Papers on Western India*, p. 32.

OURU GADDI, or Avuru gaddi, also Ouru vatti veru, TEL. *Andropogon muricatus*, Retz., Br. 1164.

OUSELEY, Major, wrote on Washing of gold-dust at Hera Khond. — Bl. As. Trans., 1839, Vol. viii, 1057. Course of the Nerbudda. — Ibid, 1845, Vol. xiv, part 1, 354. Antiquities of Jerguja. — Ibid, Vol. xxii, part 1, 65.

OUSSOURI. The province of the Amoor consists of all the territories situated on the left bank of the Amoor from the confluent of the rivers Schilka and Argoune, or from the limits of the Transbaikalian provinces and of Yakoutsk, descending the Amoor to the confluent of the river Oussouri and to the new confine of the maritime province.

OUSTAJALU, see Kazzilbash.

OUTCH, see Kabul, Khetri.

OUTCRY, the term in India for a public sale by auction.

OUTRAM, General Sir James, a distinguished soldier of the Bombay Army in the early and middle part of the 19th century.

OVA, LAT. Eggs.

OVAL-KAI, TAM.? *Dillenia speciosa*.

OVAL-LEAVED FIG-TREE, ENG. *Ficus benjamina*, Linn.

OVIS AMMON.

OVAL-LEAVED NICKER-TREE, ENG. *Guilandina bonduc*. — Linn.; W. & A.

OVEN.

Tandur, Hind. | Tannur, HAN. OVIS, of this genus of mammals, Mr. Blyth considers that there are fourteen species. M. Gervais reckons six species. Mr. Hodgson regards the sheep as essentially an alpine animal. The Kirghis breed has a great tail, of 20 vertebral bones, so loaded with fat, that a truck is occasionally made to carry it. The Karakool breed has a fine, curled, black, and valuable fleece. Gestation lasts 144 to 150 days. — Darwin.

OVIS AMMON, Linn.

O. argali, Pallas. O. hodgsoni, Blyth. O. ammonoides, Hodg.

Hyan; Nuan; Nyan, Tib. | Niar; Nyund; Gnow, Tib.

On the Tibetan side of the Himalaya. Ovis ammon of Pallas, stands from four to five feet high, and measures seven feet from nose to tail. It is quite a Tibetan animal, is seen as high as 18,000 feet and is seldom seen below 14,000 feet except when driven lower by snow. Measurement of a male of five years, according to the markings on the horns, 6 ft., 5 in., viz.:
From nose to base of horns, ... Ft. 1 In. 1
Thence to insertion of tail, ... " 5 " 1
Tail to end of hair, ... " 0 " 3
Circumference of horn at base, ... " 1 " 4½
Length on the curve, tips broken, ... " 2 " 10½

Winter pelage, above deep brown, interspersed with grey, with a distinctly marked darker dorsal line, passing (as in *O. montana*) in a narrow stripe through the disc on the croup; even to the tip of the tail. Sides mixed hoary or slaty grey brown; disc on the croup well defined and dirty white, the hair appearing as if rubbed. The throat and neck beneath to the breast, white, sprinkled with scattered brown hair; the hair long, bushy and pendent; and from 6 to 7 inches in length, while that of the back is barely 2 inches, except on the dorsal line, where it is 3 inches, and on the ridge of the neck above 3½ inches. Tail, above, brown, whitish at the sides, naked beneath. Under parts dirty white; medial line blackish, outside of the limbs with a dark list; lips, whitish; face paler brown than the body.

Front surface of horns, ... 3½ inches wide.
Inner lateral surface, ... 6 inches wide.

Measurement of the bare skull of a male seven years old.

Length of face to base of horns, ... Ft. 1 In. 1
Length of horn on the curve, ... " 2 " 10
Basal circumference, ... " 1 " 4½

These horns are weathered and much broken at the tips, and were probably about 3 feet 3 inches long.

Description of a female, 6 years old by the marking of the horns, total 5 feet, 6½.

Nose to base of horns, ... Ft. 0 In. 10½
Thence to insertion of tail, ... " 4 " 5
Tail, ... " 0 " 3
Length of horns on the curve, ... " 1 " 4½
Basal circumference, ... " 0 " 8

In the female, the colouring is lighter than that of the male, having more grey; and the throat and foreneck are slaty instead of white, and devoid of the long pendent frill which graces the other sex; the dark dorsal line, which in the male runs in a narrow stripe through the pale disc, ends in the female at the commencement of the disc, and the tail and croup are of the same canescent fawn colour; the disc is far more extensive than that of the male. Along the ridge of the neck above, from the base of the horns to about 10 inches beyond them, there is a mane of true woolly hair $6\frac{1}{2}$ inches long, gradually fading into the crisp quilly hair of the dorsal line. There is no dark list down the outside of the limbs, but the colour is pale fawn.

Front surface of horns, ... 1 $\frac{1}{2}$ Ins. broad.
Inner lateral surface, ... 3 "

In both sexes there is a beautifully soft inner coating of fine pushmeena wool of a pale mouse colour. The above measurements were taken with care, and although the male appears somewhat superior in size to Mr. Hodgson's, the general correspondence is evident enough.

male over all		Ft. 5 In. 11 $\frac{1}{2}$		Ft. 6 In. 5
to base of horns,		1 "	0 "	1 "
basal circumference		1 "	3 $\frac{1}{2}$ "	1 "
female over all,		5 "	6 $\frac{1}{2}$ "	5 "
to base of horns,		0 "	11 "	9 "
basal circumference		0 "	8 "	10 $\frac{1}{2}$ "

Ovis Ammon, Pallas; *Ovis montana*, Desmarest; *Ovis nivicola*, Eschscholtz, is distinct from *Ovis montana* of North America and Mr. Blyth refers to it, though with considerable hesitation, the horn in the Museum of the Royal College of Surgeons, London, for which was suggested the provisional name *sculptorum*.

Dr. Adams says, the argali, or *Ovis ammon*, is more plentiful on the northern ranges. A few remain about the Tooskee lake and neighbouring hills during summer; the majority, however, migrate to Nobra as the snow melts. He had seen enormous horns of the *Ovis ammon* on the chaits, where the finest are to be procured. These cairns are mostly made up of horns of tame yak, wild sheep, and goats, which are piled up in the shape of a cone, with stones, pieces of quartz, pebbles, and sticks, to which rags are attached. They are considered to be the abodes of spirits, and when a Tartar arrives at one, he walks round it several times, repeating a prayer, of which the everlasting "Om mani padmi om" forms the chief part. An adult male argali stands about 12 $\frac{1}{2}$ hands high at the shoulders.—*Hooker, Vol. i, p. 244; Adams; Blyth in Bengal, As. Soc. Journ.; Naturalist in India.*

OVIS AMMONOIDES, Hodgson.

Ovis ammon, Pallas. | *C. Hodgsonii*, Blyth.

Ovis ammonoides, Hodgson, was dedicated to Mr. Hodgson as *Ovis hodgsonii*, some time before the publication of the name *ammonoides*

in the 'Proceedings of the Zoological Society' for July 1840 was intended.

OVIS ARIES, the common sheep, is subject to great variety, and many of its forms have been raised to the rank of species. Dr. Gray, in the 'British Museum Catalogue,' enumerates no less than 33 varieties of this species, as under:

(a). The Spanish sheep, *Ovis hispanicus*, Linn.; called also the Merino sheep and the British Middle-wooled sheep.

(b). The common sheep (*Ovis rusticus*, Linn.; *O. gallica*, Desm.; *O. brachyurus*, Pallas; *O. leptura*, Schreb.); the hornless sheep (*O. anglicana*, Linn.) Of this variety there are numerous forms, such as the Muggs sheep and Shetland sheep, the Southdown sheep, the Old Lincoln sheep, the Romney marsh sheep, the Cobwold sheep, the New Leicester sheep, the Cheviot sheep, the Old Teeswater sheep, the improved Teeswater sheep, the Dunky sheep, the Zetland and Orkney sheep, the Welsh mountain sheep, the soft-wooled sheep of Wales, the Wicklow mountain sheep, the Kerry sheep, the Exmoor sheep, the black-faced sheep, the black-faced Heath-sheep, and the Rass or Roosh (*Ovis polii*, Blyth.)

(c). The Barwall sheep (*Aries barwal*, Hodgson); *Ovis barwal*, Hodgson; *O. ammonoides* var. 1, Gray. It inhabits Nepaul.

(d). The Huniah sheep (*Ovis hunia*, Hodgson), the Hunia, or black-faced sheep of Tibet. Also a native of Nepaul.

(e). The Cago (*Ovis cagia*, Hodgson); the Kago, or tame sheep of Cabul region; the Cago sheep of Gray. A native of Nepaul.

(f). The Seling, a native of Nepaul.

(g). The Curumbar sheep of Mysore.

(h). The sheep called Garar in India.

(i). The Dukhun sheep.

(j). The Shlaymbliar sheep of Mysore.

(k). The broad-tailed sheep (*O. laticaudatus*, Erxl., Geoff., Mem. Egypt, Lesson, Comp. Buffon, x, 812; *O. laticauda platyceros*; Arabica, Linn.; *O. Turcica*, Charlet; *O. cauda abesa*, Ludolf.) It is a native of Barbary. There are several forms of this variety, of which the following are most prominent:—The fat-rumped sheep (*O. steatopyga*, Pallas; the Tartarian sheep of Bewick); the Persian sheep (*O. A. caudatus*, Geoff.); the fat-tailed sheep (*O. A. macrocerus*, Schreb.); the Aora fivel, or Abyssinian sheep; the Bucharian sheep, (*O. bucharica*, Pallas; the Tibetan sheep, (*O. Tibetanus*, Fischer); the Cape sheep, (*O. capensis*, Erxleb.) the sheep of Belkah.

(l). Many-horned sheep (*O. polyceratus*, Linn.) It is also called the four-horned Ram, and the Dumba sheep. It is a native of Nepaul.

(m). The puchia, or Hindustan Dumba (*O. puchia*, Hodgson.)

(n). *Caprovius vignei*, this genus embraces the Sha or Koch. It is the mountain sheep of the north of India, and is found in Tibet.

Caprovius argalis, the Argali, is the *Ægoceras argali* of Pallas, and often confounded with the former. It is a native of Siberia. Dr. Gray says of this species—"The Nyen or Bambhera, or wild sheep, seldom or never crosses the Hemachal, the Indian side of which range is the special habitat of the Nahoor, while to the north and west beyond Tibet, *C. argali* is replaced by other species, so that Tibet may be considered as the special habitat of one species (*Ovis ammonoides*), and the plateaux north of Tibet as far as the Altai of another (*Ovis ammon*), cited as types of the true ovine form; and it may be added, that the six sorts of tame sheep of Tibet and the sub-Himalayas, all without exception exhibit the essential characters of that form. There are several species that may be confounded under this head: the Siberian Argali is found in the most northern part of that country, and it is probably different from the Himalayan animal; but Mr. Blyth had not been able to discover any difference between the specimen received from Mr. Hodgson and those which were sent from Siberia by the Russian naturalist.

Pseudois Nahoor, the Nahoor, Nervate or Sua, is a native of Nepaul.

Several wild types of *Ovis aries*, *L.*, the domestic sheep, are strongly suspected to occur; but none of those above enumerated; unless, to a partial extent, *O. vignei*, though even this is very doubtful—*Eng. Cyc.*

OVIS BURRHEL, *Blyth*. It would seem, that Mr. Blyth was wrong in assigning to this a loftier altitude of haunt than that of *O. nahoor*. Captain Smith has informed him that *O. burrhel* and *O. nahoor* keep always in separate flocks, and are never seen on the same feeding ground; the Burrhel seldom ascending above 16,000 feet elevation, while the Nahoor goes much higher: both bleat like domestic sheep. Near the Boorenda pass, the Burrhel is much more plentiful than the Nahoor, but the latter is far more extensively diffused over the Himalaya generally. At the close of summer, when the snow is nearly melted away, a very nutritious grass grows abundantly under a thin coating of snow, and both species become exceedingly fat by feeding upon it, *i. e.*, in the months of August, September and October. At this time they can only be compared to the prize animals exhibited at the Smithfield shows, and they run with considerable difficulty, though still being far from easy of approach. In winter, when snowed in, they actually browse the hair off each other's bellies, many together having retired under the shelter of some overhanging rocks, from which they come out wretchedly poor. They produce

one or two young, (commonly two,) in June and July. *Ovis burrhel* is deficient in the sub-orbital sinuses, and the same deficiency occurs in *Ovis nahoor*.—*Beng. As. Soc. Jour.*, No. clixvii, April 1847.

OVIS CALIFORNIANA, *Douglas*, from California, description cited from 'Zoological Journal'; and the horns fully described by Mr. Blyth, and figured in Taylor's plate, fig. 5. An unquestionable species.

OVIS CYCLOCEROS, *Hutton*; *Sclater*; *Blyth*.
O. vignei, *Blyth*; in part.
Uria; Urial, PANJAB. (Koch; Kuch, PANJAB.
Panjab wild sheep.

Found over all the Salt Range of the Punjab, the Sulimani range, the Hazara, Peshawar. Mr. Blyth has pointed out that Captain Hutton's *Ovis cycloceros* had been priorly named by him *Ovis vignei*.—*Blyth*.

OVIS CYLINDRICORNIS, *Blyth*. A species of the Caucasus. This is the least satisfactorily established of all the species in Mr. Blyth's monograph: resting on a communication from Colonel Hamilton Smith, relative to a species which must have been very different from either of those known to Mr. Blyth though described from memory only by Colonel H. Smith one of the most experienced of zoologists in the history of the Ruminantia.

OVIS GMELINI, *Blyth*. A sheep of Armenia. Identified with a species long ago rudely figured by the younger Gmelin, and the horn by Pallas; and Gmelin's description of the habits quoted, with further original information. Head figured in Taylor's plate, No. 9.

OVIS HODGSONI. Syn. of *Ovis ammonoides*.

OVIS MONTANA, *Desm.* Syn. of *Ovis ammon* of Pallas.

OVIS MONTANA, the Rocky mountain sheep of N. America.

OVIS MUSIMON, *Lin.* The Moufflon sheep of Corsica and Sardinia. Described by Mr. Blyth from life and a further notice given in J. A. S., x., 878. "The Argalis and Moufflons (not to mention the Tragelaphi)," writes Mr. Hodgson, "seem to form two striking groups among the wild sheep. The Himalaya Nahoor is a complete Moufflon; hence Mr. Blyth asked if the Corsican animal is, like the Himalayan, devoid of suborbital sinuses." In reply to this the Prince of Canino states that it is so devoid: but Mr. Hodgson was mistaken in approximating the Nahoor and Burrhel to the Moufflon of Corsica. These two Himalayan species, instead of being "complete Moufflons," are (so far at least as their horns are concerned) unlike *O. musimon* and form a little group per se, unless *Ovis cylindricornis* should prove to range with them; and the Moufflon is quite excluded from his definition of "round-horned" sheep, for which group Mr. Blyth presumes the appellation

(Pseudois is proposed). Their being "furnished with a well developed tail," will not exclude the Californian Argali, the tail of which is described as "eighteen inches long!" Mr. Ogilby long ago remarked the absence of suborbital sinuses in *Ovis nahoor*; and the group formed by *Ovis nahoor* and *Ovis burriel* was distinctly indicated in Mr. Blyth's monograph (vide J. A. S., x., 867), being estimated there, as he still thinks, at its true value. Should it prove that *O. musimon* is really devoid of the facial cavities, the value of this character would fall to a mere specific distinction; for, however the wild sheep may be arranged into minor groups, the *O. vignei* (which has the sinuses) could scarcely be placed in a different sub-division from *O. musimon*. And to the same group must be referred *O. gmelini* and *O. ophion*, though altogether perhaps forming a subsection of it. Both in *O. gmelini* and *O. vignei*, we find indications of affinity with the African *O. tragelaphus*.

OVIS NAHURA, *Hodgs., Blyth.*

O. nahoor, Hodgson | *O. burriel, Blyth.*

Blue-wild-sheep, Eng.	Nervate,	NEPAL.
Burriel: Bharal, HIMALAYA.	Wa; War,	SUTLEJ.
Bharur, "	Na; Sna, LADAK,	TIBET.
Menda (male) "		

Valley of the Sutlej, Sikim, Bhotan. Described from specimens, amongst which was a hornless female; and first clearly established as distinct from *O. ammon*.

OVIS NIVICOLA, *Eschs.* Syn. of *Ovis Ammon* of Pallas; Kamtschatka.

OVIS OPHION, *Blyth.* Founded on the coloured figure and description, by MM. Brandt and Ratzeburgh, of a specimen in the Berlin Museum.

OVIS POLII, *Blyth.* Rass: Roosh of Pamir, found on the plains of Pamir at 16,000 feet. Founded on a magnificent frontlet and horns brought by Lieutenant Wood from the Pamir steppe; combined with the notice quoted from Marco Polo, which refers undeniably to the same animal. Of the distinctness of this superb species, there can be no doubt whatever; and the frontlet is figured in Taylor's plate, figs. 1 and 2. *Ovis Polii*, *O. ammonoides*, *Capra himalaica*, *C. jemblaica*, were sent to the Paris Exhibition of 1855.—*Paris, E. J. R.*

OVIS PROBATION, *Ogilvy,*

Ixalus probation.

described from a hornless specimen.

OVIS TRAGELAPHUS. *Pallas,* Aoudad of the Moors, found on the Atlas mountains of N. Africa. A well-known species. Described from specimens, observed both alive and in museums.—*Ben. As. Journ., April 1847.*

OVIS VIGNEI, *Blyth.*

O. montana, Cunningham, | Indian wild sheep, ENG.
Gha; Gha-poo Tibet, Ladak.

Found in the Hindu Koosh, the Pamir range, west from Ladak to the Caspian-sea. The Indian

wild sheep, occupies a wide range in the Himalaya. It is more like a deer than the moufflon of Europe. It is active, courageous and described from a coloured figure taken from life, and from two pairs of horns, the distinctness of which from those of all the other species is most obvious. A skin of this animal was described by Pennant as the "Bearded sheep," but was confounded by him with *O. tragelaphus*; and there is a brief notice and very passible figure of the species, taken from an animal killed in the vicinity of Persepolis, in Lieutenant Alexander's 'Travels from India to England,' &c., (1827.) It again appears as the "Wild sheep of the Hindu Koosh," described by Capt. Hay, J. A. S.; ix., 440; and as *Ovis cycloceros*, *Hutton*, "Calcutta Journal of Natural History" II, 514, and pl. XII, being again noticed by the latter gentleman in J. A. S., xv, 152. It may be observed that Capt. Hay remarks this species to differ from *O. tragelaphus* "in having a lachrymary sinus; and Capt. Hutton also described "a moderate-sized lachrymal sinus, which appears to secrete, or at all events contains, a thick gummy substance, of good consistency, and of a dull greyish colour. The Affghan and Belooch hunters," he adds, "more especially the latter, make use of this gum, by spreading it over the pans of their matchlocks, to prevent the damp from injuring the priming." We may, therefore, rest satisfied of its existence in this species.—*Blyth in Journal of the Bengal Asiatic Society.*

OW-AH-N-CHU, see India.

OWES, Rus. Owies, POL. Oats.

OWL.

Ghughu, HIND.

The owls of India, are the nocturnal tribe of the order Raptores, or Birds of prey, comprising:

Sub-fam. Buboninae, 1 *Nyctæa*; 4 *Bubo*; 2 *Asio*; 2 *Scops* and 3 *Ketuvia*.

Sub-fam. Atheninae, 1 *Ninox* *scutatus*; 3 *Athene*.

Sub-fam. Syrninae, 3 *Syrnium*, *S. indrani*; *S. sinense* and *S. nivicolium*.

Sub-fam. Strigiinae, 1 *Phodilus*; 2 *Glaux*.

The Indian owl (*Athene brama*) is numerous in the Ceylon jungles.

The Himalaya owl (*Athene cuculoides*) is common in the woods and jungle, and is diurnal in its habits so far that Adams killed one at mid-day with a rat in its talons, the bird is, however, most often seen at dusk. Its favourite food consists of mice, shrews, and large coleopterous insects.

The pretty pigmy owl (*Athene brodiei*) is often found in bushes. It is a diminutive little creature, little more than half the size of the last. Its call is measured, and composed of two notes frequently repeated. Its egg is white, and generally laid in the hollow of a tree, without any preparation whatever.

Of the nocturnal accipitres of Ceylon the most

remarkable is the brown owl, *Syrnium indraneae*, *Sykes*, which, from its hideous yell, has acquired the name of the "Devil-bird." The Singhalese regard it literally with horror, and its scream by night in the vicinity of a village is bewailed as the harbinger of impending calamity. There is a popular legend in connection with it, to the effect that a morose and savage husband, who suspected the fidelity of his wife, availed himself of her absence to kill her child, of whose paternity he was doubtful, and on her return placed before her a curry prepared from its flesh. Of this the unhappy woman partook, till discovering the crime by finding the finger of her infant, she fled in frenzy to the forest, and there destroyed herself. On her death she was metamorphosed, according to the buddhist belief, into an ulama, or Devil-bird, which still at nightfall horrifies the villagers by repeating the frantic screams of the bereaved mother in her agony. Mr. Blyth wrote to Sir J. E. Tennent, as to the *Syrnium Indraneae*, *Sykes*, from Calcutta that there are some doubts about this bird. There would appear to be three or four distinguishable races, the Ceylon bird approximating most nearly to that of the Malayan Peninsula.

The owls are arranged by Naturalists under the family Strigidae of the order Raptores, and are sub-divided into the sub-families Striginae, Syrninae, Asioninae, Buboninae and Surninae. The typical owls of which the Barn owl of Europe, *Strix flammea* is, the type, are nocturnal in their habits and are often called Screech owls from the unearthly screechings with which they call.

The Indian Screech owl, *S. javanica*, *de Wurm.* of a pale yellow buff colour is found throughout Ceylon, India, Burmah and Malaya. It differs somewhat from the Barn owl of Europe. It roosts during the day, comes forth at dusk and hunts entirely at night, living on rats, mice, shrews, &c. It breeds in holes of trees and buildings. Its Hindi, Tamil and Telugu names, Karaya, Karail, Buri churi, HIND., Chao-pitta, TEL., and Chao-kurani, TAM., mean evil-bird, and death-bird.

The Grass owl, *St. candida*, *Tickell*, above of a tawny yellow colour, is found sparingly throughout the greater part of India. It lives almost exclusively in long grass, from which it rises heavily, flies a short distance and drops suddenly into the grass.

The *Otus brachyotus* frequents similar localities.

St. capensis, *Smith*, is from the Cape of Good Hope.

The Bay or chestnut coloured Screech owl, the *Phodilus badius*, *Horsfield*, occurs in Nepal, Sikkim, Burmah, Malaya and the E.

Archipelago. The natives believe it is on good terms with the tiger.

The sub-family Syrninae, comprise the Hooting owls. They are birds of rather large size, living in woods and groves, and nocturnal in their habits. The *Syrnium indraneae*, *Sykes*, the Brown wood owl, is 19 to 21 inches long, is found in Ceylon, throughout British India, Burmah and Malaya. It is of nocturnal habits. It is the devil-bird of Ceylon.

Syrnium newarensis, *Hodgson*, is the Nepal Brown wood owl, two feet long, occurs in Ceylon, S. India, Central Nepal, N. W. Himalaya, and the Malayan peninsula.

The Mottled Wood Owl, is the very beautifully plumaged *Syrnium sinense*, *Latham*, of a richy tawny yellow colour, found in wild wooded districts throughout India, but not yet found in Ceylon and Burmah. It has a loud harsh dissonant hoot.

Syrnium seloputo of Burmah and Malaya, has even more beautiful plumage.

Syrnium leptogrammica, *Temm.* is from Borneo.

Syrnium niviculum, *Hodgson*, is the Himalayan wood owl, mottled dark-brown and fulvous. It is found above 7,000 feet up to the snow line in the Himalaya.

The sub-family Asioninae, has the genus *Otus*.

Otus vulgaris, *Fleming*, the long-eared owl of Europe, Afghanistan, Kashmir and Nepal, frequents woods and feeds on mice, moles and beetles.

Otus brachyotus, *Gmelin*, is the short-eared owl of great part of N. America and over all the old world, in India is found in long grass, hunting chiefly at night, though it flies well by day. In India, it is migratory, coming in at the beginning of the cold weather and leaving about March. Its call is a double or treble hoot, not unlike that of the hoopoe.

The sub-family Buboninae, comprises the genera *Urrua*, *Huhua*, *Ketupa* *Ephialtes* and *Scops*, the great Horned owls, or Eagle owls, also the small *Scops* owls.

Urrua bengalensis, *Franklin*, the Rock-horned owl, 22 inches long, is found throughout Afghanistan, India and Ceylon, wherever it can get rats, birds, lizards, snakes, crabs and large insects, generally in broken rocky ground but also in dense groves or gardens. Its cry durgoon durgoon, is a loud solemn hoot.

Urrua coromanda, *Latham*, is the Dusky-horned owl, 24 inches long, found in all India. It frequents thick groves and forest jungle.

Huhua nipalensis, *Hodgson*, the Forest Eagle owl, of a dark-brown colour, and 22 inches long, occurs in Nepal, S. India and Malaya.

Ketupa ceylonensis, *Gmelin*, the Brown Fish owl, 21 to 23 inches long, is found throughout Ceylon, India, Burmah, perhaps to China,

frequenting forests, groves and gardens, coming forth at dusk to feed, generally making its way to a tank, brook or river, occasionally uttering its dismal cry, a repulsive laugh like haw-haw, hawho. It is said to kill even cats.

Ketupa flavipes, *Hodgson*, the Tawny Fish owl, is confined to the Himalaya. It is constantly found on the banks of rivers and flies well by day.

Ketupa javanensis, *Lesson*, and *K. ceylonensis*, extend from Ceylon and Arrakan to Java.

Ephialtes pennatus, *Hodgson*, the Indian Scops owl, is supposed by some to be the *S. zorca* of Europe. It is found throughout India and Ceylon, the Himalaya, Burmah and China.

Ephialtes lempigi, *Horsfield*, is the Large Scops owl, of all India, Ceylon, Burmah, Malayana and China, found in forests.

Scops rufescens, *Horsfield*, a large owl of Malayana, Japan, Celebes and Philippines.

Scops gymnopus, *Kaup*, is said to be from India.

The sub-family *Syrniinae* has the genera *Athene*, *Glaucidium*, *Ninox*, *Syrnium*.

Athene brama, *Temm.*, the Spotted owlet of Ceylon, India, Panjab, Burmah, Persia and all Asia, is found in dense forests. It is an earthy grey-brown colour, each feather with a white spot. It is 8 or 9 inches long.

Athene radiata, *Titchell*, the Jungle owlet, of all India; is probably the *Athene cuculoides* *Philips*, of N. W. Provinces.

Athene malabarica, *Blyth*, the Malabar owlet, 8 inches long, of Travancore, Cochin and S. Provinces of Malabar.

Athene castanoptera, *Horsfield*, Malayana.

Athene castanopus, *Blyth*, Ceylon.

Athene cuculoides, *Vigors*, the Large-barred owlet 9½ or 10½ inches long occurs in the Himalaya, Panjab, Assam, Arrakan, Tenasserim to China. It feeds on mice, rats, beetles.

Glaucidium brodiaei, *Burton*, the Collared pigmy owlet, is found at from 3,000 to 4,000 feet throughout the Himalaya. It is 6½ inches long.

Ninox scutellatus, *Raffl.*, the Brown Hawk owl, 12 inches long, is found in the wooded parts of all India, extending into Burmah, Malayana, China and Japan, also said to occur in Madagascar. It frequents the skirts of the thick forests also.

Ninox borneensis *Schlegel*, and *N. japonica*, *Schlegel*, of Borneo and Japan.

The horror of the owl's nocturnal scream has been equally prevalent in the west as in the east. Ovid introduces it in his *Fasti*, L. vi, l. 139, and Tibullus in his *Elegies*, L. i, El. v, says, Pliny, lxi, c. 93, doubts as to what bird produced the sound; and the details of Ovid's description do not apply to an owl. Mr. Mit-

ford, of the Ceylon Civil Service, regards the identification of the Singhalese Devil-bird as open to similar doubts: he says, the Devil-bird is not an owl. I never heard it until I came to Kornegalle, where it haunts the rocky hill at the back of government house.

The unpleasant laugh of the fish-owl of Ceylon (*Ketupa ceylonensis*) is known, no sound grates harsher on the ear, or is more calculated to bring back recollections of hobgoblins, than the loud hollow voice of this fine bird, nor is it less startling to creep through the bush and come suddenly on an individual moping at mid-day on a branch overhead, flashing his large orange eyes full on your face, as with out-stretched wings he snaps his bill, or hissing defiance makes straight off to the nearest cover, pursued by crested bulbuls, jays, &c. This species is not often seen, its mid-day haunts are in impassable parts of the jungle.—*Tennent's Sket. Nat. Hist. of Ceylon*, pp. 246-47; *Adams, Naturalist in India*; *Jerdon's Birds of India*.

OWOSCHTSCH, Rus. Fruit.

OX, the ox is one of the Bovinae, a sub-family of the family Bovidae, of the order Ruminantia. The order may be briefly shown as under:—

Ruminantia.

Cervidae.	Bovidae.	Hemitragus.
<i>Cervus.</i>	<i>Antilopinae.</i>	<i>Capra</i>
<i>Rucervus.</i>	<i>Portax.</i>	<i>Ovis.</i>
<i>Rusa.</i>	<i>Tetraceros.</i>	<i>Bovinae.</i>
<i>Axis.</i>	<i>Antelope.</i>	<i>Bos.</i>
<i>Cervulus.</i>	<i>Gazella.</i>	<i>Gavæus.</i>
<i>Moschus.</i>	<i>Caprinae.</i>	<i>Bubalus.</i>
<i>Meminna.</i>	<i>Nemorhædus.</i>	

The Bovinae, called cattle, also horned cattle, have always horns in both sexes, usually inclining upwards or forwards, with a large and broad muffle, a moderately long tail, no eyepits, but with four mammae. The sub-family Bovinae is divisible into three groups, the Bison-tine or bisons, the Taurine or oxen, and the Bubaline or buffaloes.

The *Bisontine* group comprise the bison of Europe and N. America, the Musk ox of Arctic America and the Yak or *Poephagus grunniens* of Central Asia. The true bison of Europe, *Bison urus* or the Aurochs, has a broad forehead, long limbs and shaggy mane. The Yak called in Tibetan Brong-Dhong, in Hindi, the Ban-chowr or wild bull, is found wild on the northern side of the Himalaya, but it has been domesticated and called the Chaori-gao.

The *Taurine* group has been sub-divided by Blyth into the Zebu or humped domestic cattle, the Taurus, humpless cattle with cylindrical horns, and Gavæus, humpless cattle with flattened horns, peculiar to South-eastern Asia. They have all thirteen pairs of ribs. It is to the Zebus that the common humped cattle of India belong: they have run wild in Mysore, near Nellore, in Oudh, Mozuffurnuggur, Rohilkund and Shahabad. Near Nellore, the country they

frequent is much covered with jungle and intersected with salt water creeks, and marine-lagoons, and the cattle are as wild and wary as the most feral species. They are of large size and their horns are long and upright. The genus *Taurus* contains the cattle of Europe with cylindrical horns, including the feral race of Chillingham. The flat-horned *Taurines* of Blyth include the genera *Gavæus*, *Gavæus gaurus*, *Jerdon*, the Gaur or gauri-gao of all India, the Py-oung of the Burmese; also the Gayal or Mit'hun, the *G. frontalis*, compared with the Gaur, a heavy clumsy-looking animal of the hilly tracts to the East of the Burramputer and at the head of the valley of Assam, the Mishmi hills and their vicinity and probably extending North and East into the borders of China. It is extensively and easily domesticated and has bred with the common Indian cattle.

The Ban-teng or Burmese wild cow, *Gavæus sondaicus*, the Tso-ing of the Burmese, extends from Chittagong through Burmah, and the Malayan peninsula, into the larger islands of the E. Archipelago. This species resembles the Gaur more than the Gayal and it wants the dew-lap. The young and the female are red.

The *Bubaline* group, the buffaloes of the genus *Bubalus*, have large, almost horizontal, angular horns, inclining backwards and sometimes downward, with a large and spare muffle and thirteen pairs of ribs. The wild buffalo, the *Bubalus arni*, is largely domesticated and used for all the purposes of an agricultural population. But it is found in the north and east of Ceylon, from the Godavery to Midnapore and Raepore, in the plains of Lower Bengal as far as Tirhoot, and Oudh to the Terai and Bhootan, inhabiting the margins of forests, in the most swampy sites. It lives in large herds, but in the rutting season the most powerful males lead off and appropriate several females. They rut in autumn and the female gestates ten months, producing one or two in summer. The domestic buffalo, is often lean and angular; they are used for draught and as milch cattle. But the wild buffalo is uniformly in high condition, and the bull is of such power and vigour as by his charge frequently to prostrate a well-sized elephant. There is an African species, *B. brachyceros*, *Gray*, and a Cape buffalo, *B. cafer*, with horns so large as nearly to cover the forehead. In the E. Indies the buffalo is generally used in ploughing up the muddy lands in which rice is grown often for carriage, rarely for draught for long journies. The Binjara and other migratory grain merchants who even yet, (1873) travel over several hundred miles of India, collecting grain and carrying salt, invariably use the bullock, never the buffalo.

Oxen are used by the peasantry of the East Indies both in ploughing and in tempering the mud in the wet paddy fields before sowing the rice; and when the harvest is reaped they "tread out the corn," after the immemorial custom of the east. The wealth of the native chiefs and landed proprietors in Ceylon frequently consists in their herds of bullocks, which they hire out to their dependents during the seasons for agricultural labour; and as they already supply them with land to be tilled, and lend the seed which is to crop it, the further contribution of this portion of the labour serves to render the dependence of the peasantry on the chiefs and headmen complete. From their constant exposure at all seasons, the cattle in the E. Indies, both those employed in agriculture and those on the roads, are subject to devastating murrains that sweep them away by thousands. So frequent is the recurrence of these calamities, and so extended their ravages, that they exercise a serious influence upon the commercial interests of the colony, by reducing the facilities of agriculture, and augmenting the cost of carriage during the most critical periods of the coffee harvest. A similar disorder, probably peripneumonia, frequently carries off the cattle in Assam and other hill countries on the continent of India; and there, as in Ceylon, the inflammatory symptoms in the lungs and throat, and the internal derangement and external eruptive appearances seem to indicate that the disease is a feverish influenza, attributable to neglect and exposure in a moist and variable climate: and that its prevention might be hoped for, and the cattle preserved by the simple expedient of more humane and considerate treatment, especially by affording them cover at night. The labour for which they are best adapted, and in which, before the opening of roads in India, these cattle were formerly employed, is in traversing the jungle paths of the interior, carrying light loads as pack-oxen in what in Ceylon is called a "tava-lam," a term which, substituting bullocks for camels, is equivalent to a "caravan." The persons engaged in Ceylon in this wandering trade are chiefly Moors, and the business carried on by them consists in bringing up salt from the government depôts on the coast to be bartered with the Kandyans in the hills for "native coffee," which is grown in small quantities round every house, but without systematic cultivation. An ox will work well seven years if taken care of.

The *Gavæus sondaicus* is found in Burmah, Siam, Java and Borneo. In Ceylon, to every herd of cattle there is a sacred bull who is supposed to exert an influence over the prosperity of the flocks; his horns are ornamented with tufts of feathers, and frequently with small bells, and he invariably leads the great herd

OXALIS CORNICULATA.

to pasture. On starting in the early morning from the cattle kraal the natives address the bull, telling him "to watch over the herd; to keep the cows from straying, and to lead them to the sweetest pastures, so that they shall give abundance of milk," &c.—*Tennent's Sketches of Nat. Hist.*, pp., 50, 53; *Jerdon: Mammals*.

OX and Cow-Hides, see Leather, Skins.

OXALIC ACID.

Sauerk-leesaure, GER.

A vegetable acid, found in considerable quantity in sorrel and rhubarb. It is used in calico-printing, and by straw-hat makers. It is an object of considerable importance in Switzerland, where it is prepared from the juice of wood-sorrel. Oxalic acid is obtainable from the salt in the leaves of gram, *Cicer arietinum*, the genera *Oxalis*, *Rumex*, *Acetosella* and other plants. Accidents have frequently occurred from its being administered instead of Epsom salts, which it resembles in appearance.—*Faulkner, Taylor, Waring, Royle*.

OXALIDACEÆ, *Linull.* The Wood-sorrel tribe of 3 gen., 7 sp., viz., 2 *Averrhoa*, 4 *Biophytum*, 1 *Oxalis*.

OXALIS ACETOSELLA, *Linn.*

Wood sorrell. | Common wood sorrell.
Tshah-tsang-ts'au, CHIN. | Tsau-mu, CHIN.

A small perennial plant with a subterranean root-stock, consisting of many scaly joints; has a pleasant acid taste, dependent on the presence of oxalic acid, and is frequently used in salads; its flavour approaches near to that of lemons or tartaric acid, with which its medicinal effects also correspond, as it is esteemed a refrigerant anti-scorbutic and diuretic. The expressed juice evaporated and set in a cool place, affords a crystalline salt, which may be used whenever vegetable acids are wanted. It is sold in the shops under the name of Essential Salts of lemons, and is employed to take iron-moulds and ink-spots out of linen.—*Smith, Waring*.

OXALIS CORNICULATA, *Linn.*

<i>Oxalis monadelphæ</i> , <i>Roxb.</i>		<i>Oxalis pusilla</i> , <i>Salis.</i>
Hemembab, AR.		Procumbent oxalis, ENG.

Yellow-wood sorrel, DUT.		Pullachinta; Pulli-
Indian sorrel, ENG.		chinta kura, TEL.
Horned wood sorrel, "		Pulla chanchali, "
Three-leaved "		

It has a decumbent stem, branched and rooting; the leaves are ternate with obcordate leaflets; oblong stipules united to the base of the petioles, the peduncles are two-flowered, and shorter than the leaves. It is a native of Europe, particularly in Spain, Italy and Greece, as well as in Japan, Mexico, North America, and England. The flowers are yellow. The flowers of

the North American plant are larger than the European. This species is common all over India. It possesses exactly the same properties, and yields the same products as the European sorrel. The small leaves, tender shoots, and flowers, are given in electuaries by the hindoo as a cooling medicine in fevers, the extent of two tea-spoonsful daily. The very sour stem of this plant is imported from Delhi: into Ajmir, and is used to cure flatulent indigestion. In peninsular India, it is a common weed on lawns and in gardens, and is used by the natives in making chatney and in curries, it is a good substitute for lime juice or tamarind imparting a peculiar acid taste. It is one of the vegetables of Southern India.—*Ainslie's Mat. Med.*, p. 256; *O'Shaughnessy*, p. 257; *Gen. Med. Top.*, p. 153; *Irvine; Jaffrey*.

OXALIS MONADELPHA, *Roxb.*, and *Oxalis pusilla*, *Salis.* Syns. of *Oxalis corniculata*, *Linn.*

OXALIS ROSEA, a tuberous rooted plant, from the Cape of Good Hope, easily cultivated at the commencement of the rains; the small tubers should be allowed to remain in the pots in which they have grown and be carefully removed into fresh earth after the rains have set in, and if well attended to, will readily spring up, and produce abundance of rose-coloured flowers.—*Riddell*.

OXALIS SENSITIVA, *Linn.*

Biophytum sensitivum, *Roxb.*, *DC. Wight*.

Bun maranga, BENG. | Toda vadi, MALEAL.

Common in India and Java, the plant beaten up and mixed with gingelly oil is given in gonorrhœa; and mixed with butter is applied to wounds and boils.—*Useful Plants*.

OX-GALL.

Niu-tau,	CHIN.	Fel-bovis,	LAT.
Bile of the Ox,	ENG.	Pittam,	TAM.
Pit,	HIND.	Pittamu,	TEL.
Fel-tauri,	LAT.		

An inert substance but used by Asiatics medicinally.

OXIDE OF CALCIUM, Lime.

OXIDE OF LEAD. Massicot or Murdar sang. The manufacture of this was introduced at Jagadri by Kashmiri and Bakal, two attah sellers, &c., who came from Jellalabad; they manufactured it in secret, and would not let others know the process. This is said to be made at Lahore and Jagadri, and it might be well employed in making lead plaster (strapping) with some of the country oils; other preparations of lead also might be manufactured from it.—*Powell's Hand-book, Econ. Prod. Punjab*, pp. 113, 114. See Lead, Massicot.

OXIDE NOIR DE MANGANESE, Fr. Manganese.

OXLEYA XANTHOXYLA. This tree is a native of Australia, and attains a height of 100 feet. The wood is yellow, and employed

for building boats. It is called yellow-wood.—*Eng. Cyc.*, p. 892; *Hogg's Vegetable Kingdom*.

OX-TAIL. In Indian wars, the ox-tail and umbrella were not unfrequently placed over some chief of consequence, to divert attention and protect the king from danger: in Shakspeare's description of the battle of Bosworth field, Richmond, in assaulting the gallant Usurper, exclaims, "Three have already fallen who wore that crown."—*Tod's Travels*, p. 201.

OXUS.

Amu,

PERS. | Ab-i-ma,

PERS.

A river of Central Asia, which rises on the west side of the table-land of Pamir, but there are still some doubts as to its actual source, and Colonel Yule alluding to such, asks is there a great Wakhsh branch of the Oxus coming from those regions, and if so where does it join the Panja or river of the Sirikul? To the first question, says he, I would answer in the affirmative. The very name Wakhsh appears to be that from which the classical and Chinese names of the combined stream (Oxus, and Potsu or Fatsu) are derived. It is also spoken of both by Hiwen Thsang and by Edrisi, and by the latter is described as a very great river, though he evidently regards the Panja river of Lt. Wood as the chief source. From the accounts given of the methods anciently in use to convey goods from India to the Black Sea, Pliny (*lib. vi c. 4*), particularly describes one route—"Having arrived at Bactra," (modern Balk,) he observes, "the merchandise then descends the Icarus (Jehon river) as far as the Oxus; and thence are carried down to the Caspian. They then cross that sea to the mouth of the Cyrus (the Kur), where they ascend that river; and, on going on shore, are transported by land for five days, to the banks of the Phasis (Rion), where they once more embark, and are conveyed down to the Euxine."

When the mighty Roman empire was blotted out, not only the trade with India but India itself was completely lost to the western world. But after some centuries, when the Genoese engaged in commerce and navigation, a new trade route had been opened up between India and Europe. The merchandise from the western part of India was now carried up the river Indus as far as it was navigable and then across country, through Samarcand, to the river Oxus, down which it was shipped to the Caspian Sea. In like manner the merchandise from China and the Moluccas was shipped across the Bay of Bengal, and up the rivers Ganges and Jumna, and then carried overland to the Oxus. Samarcand was then a great emporium, and the merchants of India, Turkey and Persia met there to exchange their wares. The ships sailed across the Caspian to the port of Astracan, at the mouth of the Volga. Thence the goods

were carried up the river to the city of Novgorod in the province of Reizan, (a city that must have been considerably to the south of the famous Nijni Novgorod of to-day,) then overland for some miles to the river Don, where they were loaded on barks and carried down stream to the sea of Azoff, and on to the port of Caffa, or Theodosia, in the Crimea. Caffa belonged at that time to the Genoese and they came there in their galliasses to fetch Indian commodities, which they distributed throughout Europe. A glance at a map will show what a costly and roundabout route this must have been, yet the merchants of those days made use of the rivers wherever they could. In the reign of Commodus, emperor of Armenia, a better route was discovered, the merchandise being transported from the Caspian Sea through Georgia to the city of Trebisond, on the Black Sea, whence it was shipped to all parts of Europe. This was doubtless the origin of the connection of the Armenians with the trade of India. So highly was this route approved of that another Armenian emperor is said to have actually begun to cut a canal, 120 miles in length, from the Caspian to the Black Sea for the greater convenience of the trade, but the author of this scheme was slain and the enterprise fell through. The northern half of Central Asia consists of the Kirghiz desert, which is mountainous and rugged on the east, and full of saline steppes on the west. In the midst of the southern half lies the sea of Aral, on the western side of which, up to the Caspian Sea on the west, there stretches a broad tract of desert. But it is in a fertile tract that the conquests of Russia were made between 1864 and 1868. After long years spent in fortifying posts, in 1864, Russia made a sudden irruption into the upper valley of the Jaxartes, and in that year took three forts of Kokand, viz., Aoulietta, Turkestan and Chenkend. In the spring of 1865, the chief of Kokand fell in battle, and in June 1865, the city of Tashkend was stormed. On the 20th May 1866, they fought and won the battle of Irdjar, against the Bokhariotes, and later in the year captured the forts of Oratepe and Juzak, within 40 miles of Samarcand. On the 13th May 1868, a great battle was fought under the walls of Samarcand, and the city surrendered, and later in the year Bokhara yielded. At a short distance to the west of Yarkand and Kashgar, the great interior depression of Chinese Tartary terminates, and the boundary ranges coalesce in the elevated table-land of Pamir, from the western part of which the Oxus rises. The Oxus, is wild and unruly in its course. From its source on the Sar-i-kul to its embouchure, it is not all navigable but only from Char-jui. It has many dangerous sand-

banks miles in length. The Oxus is known in Bendelesh as the river Vah. It is frozen over every winter from Kerki to its mouth. It is supposed to have left its former bed. The Greeks, speaking of the Jaxartes and Oxus, asserted that both these rivers disembogued into the Caspian. From this an opinion has been entertained, that in ancient times, the sea of Aral formed a part of the Caspian. Humboldt, however, does not admit this, and holds, in spite of the recent formations of the Ust-Urt, the isthmus between the two seas, that the connection could never have existed. The first allusions to the existence of the sea of Aral, are made by European travellers in the sixteenth century. The Russians, however, had long been aware of the existence of the "Blue" sea, as they called it and into which the river Syr or Jaxartes discharged itself on the east, and it was only with the subjection of the Kirghiz steppes, after 1840, that reliable accounts were received respecting the sea of Aral, which covers an area of about 23,000 square geographical miles. From the large body of water discharged into it by the Amu-Daria (Oxus) and Syr-Daria (Jaxartes), the lake, although brackish, is not so salt as the waters of the ocean. The Syr-Daria takes its source in several streams in the snowy Belur-Tag or Bolar-Dagh, a mountain range, extending on the Western confines of Chinese Turkistan. The Syr, after passing the Karatau range, pursues its course first in a north-westerly direction, and then westerly to the sea of Aral, and divides into a considerable number of branches and irrigating canals, without receiving into itself a single rivulet. Part of the Syr, from its source to the Kara-Uziak branch, is called the Djaman-Daria (bad river), probably on account of its being tortuous along that part of its course, and not so broad, deep and rapid as in other parts. Its breadth is not uniform. In the Kokan dominions, it attains 400 fathoms; in Russian territory both above and below Kara-Uziak, it is from 50 to 100 and even 250 fathoms broad. As the Djaman-Daria, however, it is considerably smaller than at other parts not exceeding in some places 30 fathoms. The depth of the river, like its width and current, also varies. Generally speaking, the Syr flows through a deep and steep-banked hollow, the depth at about one fathom from the shore being above a man's height, and then progressing from one fathom to five and six fathoms. The river Emba, Yemba or Jem, after a westerly course of 300 miles, falls into the Caspian in 47° N., 53° 15' E. The country south of the Emba, consists of a table-land which separates the Caspian and Aral, and rises to an average elevation 620 feet. This table-land known as the Ust-Urt,

is about 240 miles in length, and extends the whole width, 160 miles between the two seas. The entire east side of the plateau forms a bold coast line along the western shores of the sea of Aral, and at its S. E. corner it turns abruptly to the W. N. W., the angle thus formed at the S. W. corner of the sea of Aral being known as "the Tchink." The Ust-Urt is, in fact, the S. W. continuation and extremity of the great steppe of the Kirghiz Kaisaks, this portion forming part of the territory of the Lesser Horde. South of the Ust-Urt, and of the sea of Aral, is the khanat of Khiva, including the desert plain of Kharesm, and the oasis of the same name, as also the rich, well-watered plain of Merv, 37° 28' N., 62° 10' E. This region, also known in older geographies as Turan, is bounded, according to Captain Abbott, on the S. by an irregular curving line extending from the river Attreck, which debouches into the S. E. angle of the Caspian, in 37° N., 54° E., nearly to Herat, where it turns N., and becomes the eastern boundary of the khanat. The eastern boundary follows an imaginary line corresponding pretty closely with the 63° meridian, crossing the Oxus, or Amu-Daria, about 90 miles W. of Bokhara, and is thence prolonged northward till it intercepts the Syr or Jaxartes, about 120 miles from its mouth. The area comprised within these boundaries is about 450,000 square miles, the surface of which is singularly uniform. With the exception of the banks of the Oxus, and the oasis of Merv, the entire country presents an unbroken waste, unrelieved by mountains, rivers, lakes or forests. The Ust-Urt, is nominally part of the Khanat of Khiva, but the extreme cold of winter, and the intense heat of summer make it almost uninhabitable. The geological formation of this khanat is principally red sand-stone on the south, gradually changing into a firm clay resting upon lime-stone. The volume of the various rivers depends upon the season, the melting of the snows of the Hindoo Koosh, in which the Amu or Oxus rises, causing that river to overflow its banks in many places during the autumn. In some of the older maps, a dried river course is represented as occasionally filled from the Oxus, and finding its way across the desert of the Kharesm, till it reaches the Caspian at Balkan Bay, 39° 40' N. There is nothing intrinsically improbable in this diversion, as the sea of Aral itself is known to be 117 feet above the level of the Caspian. The dominant race, in Khiva, are Usbec Tartars, to which tribe the latest dynasty of Khans belongs and the population is variously estimated by Balbi at 800,000, by Fraser at 1,500,000, and by Abbott, 2,600,000. Nearly the whole of the settled population of the Khanat of Khiva is concentrated on the left bank of the

Oxus or Amu-Daria. The town of Kungrad extends along the left side of the Khan canal and the river Oxus or Amu-Daria. Between the right bank of the canal and the river runs a broad earthen wall, about three miles in length, and at a short distance off, between it and the river, is a second wall, both extremities of which abut on the river, thus forming, with the river bank, an oblong square. Khiva is situated on a fertile plain near the Oxus, in $41^{\circ} 22' 40''$ N., by $60^{\circ} 2' 57''$ E., and is about half a mile square, containing about 1,500 houses, clay built and arranged in narrow streets, with a population of about 12,000 permanent inhabitants. Immediately to the eastward of the khanat of Khiva is that of Bokhara, with limits more difficult to define than those of Khiva, owing to its incessant political fluctuations. When Burnes first visited Bokhara, the khan claimed the entire territory from the Hindoo-Koosh, including Balkh (the ancient Bactria) and Andku, or Ankoï, where Moorcroft died, to the basin of the Syr-Daria or Jaxartes or from 35° N. to $45^{\circ} 31'$ N. while the Eastern boundary, in the absence of precise geographical data has been variously stated at 68° to 70° E. The Eastern frontier is, in fact, coterminous with the khanat of Kokan, and the western boundary of what is variously known as Chinese Turkestan, or little Bokhara, of which the chief towns are Yarkend and Kashgar. But, since 1849, the advance of Russia along the valley of the Syr-Daria or Jaxartes and the incursions of the Kirghiz of the Middle horde on the one hand, and of the Kokanians on the other, made the basin of the Syr-Daria anything but a desirable acquisition, and the khan of Bokhara ceased to assert his sovereignty beyond the parallel of 41° N. The extent of the Bokhara khanat was therefore estimated at about 230,000 square miles, with a population estimated by Irving (1809), at 3,600,000, by Burnes at 1,000,000, by Fraser at 2,500,000 and by Balbi (1826), at 1,200,000. Fraser, however, speaks of the city of Bokhara as containing 120,000 houses alone, and doubts if any other Eastern city, except some of the Chinese capitals, contains so large a population; and as the soil is argillaceous in the plains, and the valleys have long enjoyed, in the East, a reputation somewhat resembling that of temple in Thessaly. It seems probable that the larger estimates are the more likely to be correct. The territory is intersected from S. E., to N. W. by the Oxus, or Amu-Daria, the only other river of importance being its tributary, the Kholik, or Sogd, whence the ancient name Sogdiana given to the district of which Samarcand is the present capital. The eastern portion of the khanat of Bokhara is entirely occupied by mountains. Of these the

chief are the Kish range, between Kish, 39° N., 67° E., and Samarcand, a spur of the little known Kara-Dagh chain. In this exceedingly rugged, precipitous system of mountains, occurs the celebrated Derbend or Koluga Pass, ("the Iron Gate"), leading from Kish, S. E., and forming the sole means of communication with Hissar and thence to Afghanistan. A still loftier range commences to the N. E. of Bokhara, and runs eastward to the borders of the khanat of Kokan where it converges at right angles to the Bolor or Belur Tagh. This is called the Ak-Dagh, or "white mountains," and seems to mark the northern boundary of the celebrated high-lying table-land of Pamir, on the west side of which the Oxus takes its rise. Lieutenant Wood, penetrated thither on the 19th February 1838, in mid-winter. On reaching a spot elevated 14,400 feet above the level of the sea, some of his escort refused to proceed further; upon which he pushed forward with the remainder through deep, new-fallen snow. As he neared the head waters of the Oxus, the ice became weak and brittle. After quitting the surface of the river, he travelled about an hour along the right bank, and then ascended a low hill which apparently bounded the valley to the east, on surmounting this at 5 p. m. of the 19th February 1838, he stood on the Bam-i-Duniah, or 'Roof of the World', while before him lay stretched a noble frozen sheet of water, from whose western extremity issued the infant Oxus. This fine lake lies in the form of a crescent, about 14 miles long from east to west by one mile in average breadth. On three sides it is bordered by swelling hills about 500 feet high, while along its south bank they rise into mountains 3,500 feet above the lake, or 19,000 feet above sea-level covered with perpetual snow, from which never-failing source the lake is supplied. From observations made at the west end, he found the latitude to be $37^{\circ} 27'$ N., $73^{\circ} 40'$ E., and the elevation, as deduced from the boiling point of water, 15,000 feet. Recent authorities since the visit of Lieutenant Wood have, however, established that there is no affluent of the Syr-i-Daria, which takes its rise so far south as Lake Sir-i-kol, the immense ranges of the Belur and the Ak-Dagh intervening. The khanat of Kokan, which comprises almost the entire valley of the Syr-i-Daria or Jaxartes and its various confluents; partly in consequence of the nomade half-savage hordes which form its northern population, partly from its geographical position, it has been among the very earliest to come into direct collision with Russia. From the north shore of the sea of Aral, there extends eastward a series of steppes, inhabited principally by the Kirghiz-Kasaks, who are divided into Lesser or Western, Middle, and

Great Hordes, the latter being the farthest to the east, and extending indeed as far as the great Lake Balkash, and the banks of the Ili, and the limits of the khanat are now said to extend as far north as the Ala-Tau, or Algon-ski range in South-Western Siberia (Lat. 48° North), in which parallel the Sar-i-su, a river which falls into the Teli-kul Lake, may be said to mark its limits eastwards. From this point the boundary line at latest accounts, extends to the banks of the Syr-i-Daria, where the Russians have erected the fort of Perovsky on the right bank, facing the Kokanian town of Ak-mesjid. The western includes a considerable sweep of land yet further west than the city of Khojend, the Cyropolis or Alexandria Ultima of classical writers. The entire length of this extensive territory may be roughly stated at 950 miles by an average breadth of 360, or about 345,000 sq. m., the whole surface being exceedingly mountainous, and forming in part the west buttress of the great central table-land of Asia. The whole region is intersected by immense streams, all flowing towards the Syr-i-Daria or Jaxartes, the majority of which, however, lose themselves in the numerous extensive lakes which here begin to stud the surface of the country, and possess no visible outlet. Kokan includes within its boundaries a number of considerable towns, besides the capital of the same name (a comparatively modern town), Khojend which numbers 30,000 inhabitants, Andijan the former capital, a little to the eastward of the present capital, Tashkend with a population said to amount to 100,000. Of the amount of population under the sway of the khan of Kokan, Nazarof reckons the standing militia at no fewer than 50,000 horsemen, and there is every reason to believe that the district watered by the Syr-i-Daria is well populated. The time occupied by caravans between Kokan and Bokhara is about six weeks. There is but little communication between Kokan and Little Bokhara, the Thian Shan interposing an almost insurmountable obstacle. Eastern Turkestan, Chinese Turkestan, or Little Bokhara, since about the middle of 18th century has belonged to the Chinese Empire. On the east it gradually merges in Mongolia, somewhere to the east of the great saline basin of the Lob-nor. The northern boundary is Dzungaria. The western is the khanat of Kokan including the precipitous Eastern front of the table-land of Pamir, and it is shut off from Little Thibet and Thibet Proper, to the south and south-east, by the eastern half of the Hindoo-Koosh, and the western chain of the great Kuen-Lun, over which the most frequented pass is that of Kara-Korum, 18,604 feet above sea level, connecting Ladak with Yarkand by the headwaters of

the Shayok, which, rising from a glacier not far from the pass itself, falls into the Indus after a westerly course of 320 miles, just above the town of Iskardo, 35° 10' N., 75° 28' E. The entire territory of Little Bokhara, assuming it to extend as far as the meridian of 90°, thus including the great Lake of Lob, is sterile in the extreme, but relieved by large and fertile oases—a feature common to the continuation of the desert eastward where it becomes the great Desert of Gobi or Shamo. Of the various oases, the most important and best known are those of Kashgar, Yarkand, and Khotan. Of these, the first named lies at the foot of the southern spurs of the Thian Shan range, and consists of a well-watered tract, on the principal river of which, called by the same name, is the city of Kashgar. This was, for many centuries, the seat of an independent prince; but, since the rebellion of 1826, has been reduced by the Chinese authorities to a secondary position in the district of Ili, of which Yarkand is the capital, and to which Khotan has also been attached. Kashgar city is in 39° 25' N., and 74° E. (approximately): and the river on which it is situated, after a course of 300 miles unites with that of Yarkand to form the Tarym, which, after a further course of 250 miles, falls into the great Lake of Lob-nor. Both these streams are famous for the splendid specimens of jasper and jade-stone which are found in their beds. Yarkand is the capital of the Chinese district of Ili, and is situate in 38° 10' N., and 76° 30' E., on a river of the same name. It is walled, but with extensive suburbs, and has a population variously estimated at from 40,000 to 200,000. It has belonged to China since 1757, and is governed by mahomedan and Chinese officials alternately. The environs are highly cultivated, producing wheat, barley, rice, fruits, and silk, and there is extensive pasturage. Yarkand is known to the Chinese by the name of Ja-lo-kiang. Khotan lies to the eastward of Yarkand, and lies in an oasis said by the Chinese to be about 1000 li. or 350 m. in circumference, immediately to the north of the Kara-korum Pass. It is watered by a great number of streams, almost all of which flow into the Lob-nor. It contains the six cities of Khotan, Yurun-Khash, Kara-Khash, Djira, Keria and Takhubin, each of which is governed by a hakim, whose united votes constitute what is called the Council of Khotan. Khotan city is situate in 37° N. and 80° 35' E., a position which very nearly corresponds with the site assigned to it as immediately to the N. E. of the Kara-korum Pass. It is the Ili-tchi or Hotaen of the Chinese, and is supposed to contain about 50,000 inhabitants. It was originally a hindoo colony, supposed to

have been founded about the second century ; but the magnificent buddhist temples and monasteries were all destroyed by the mahomedan conquerors. The northern portion of Little Bokhara, under the shadow, as it were, of the Ala-tagh, is the district of Aksu, one of the most fertile of the provinces into which the Chinese have subdivided their acquisitions here after the revolt of 1826. The products are various, consisting chiefly of lentils, wheat, barley, millet, apricots, grapes, and melons, and cotton is also said to grow here of fair quality. The capital of the same name, is situate in lat. $41^{\circ} 9' N.$, $78^{\circ} 40' E.$, and according to Timkowski, is the seat of a Chinese ambassador or viceroy. The population of the town is estimated by Moorcroft at about 25,000 and of the entire district at 130,000. The natives of the district are renowned for their taste in dressing hides and manufacturing cotton goods, and it is stated that there are mines of copper and one of rubies in the immediate neighbourhood. The *Turkoman* country, south of the Oxus or Turkistan, stretches from Balkh to the shores of the Caspian, filling up the space between that sea and the Aral. On the south it is bounded by hills, the continuation of the Hindu Kush, and the Paropamisus of the ancients, and a line drawn from Balkh to Astrabad on the Caspian will separate the country of the Turkoman from that of the Affghans and Persians. On the south-eastern shore of the Caspian, the country is mountainous, but in all other places it is a flat sandy desert, into which the mountain streams, the Murghab and the Tejend, fall, and are absorbed and never force their passage to the Oxus. Ignorance and poverty reign supreme in Mawar-un-nahar, the modern Bokhara, Khiva and Kokan, which formed the richest and most enlightened region of the east in the fourteenth and fifteenth centuries. The libraries of Samarkand, Tashkend, Ferganah (in the khanat of Kokan), Khiva and Bokhara, with the observatory at Samarkand, irrecoverably perished under the merciless hand of Tartar vandalism, which consigned to perdition all knowledge save that of a religious character. Asia seems to have been so called from the great Asi race of Central Asia, whose name of Asi is said by Remusat to have been applied by the Chinese almost promiscuously to the nations between the Jaxartes and Oxus, as far south as Samarkand, and in one of his quotations it is applied to people of Khojand, and in another to people of Bokhara. Central Asia has a hardy peasantry, dwelling in the mountain region with its vast upland downs, well suited for summer pasture, partly descendants of the original inhabitants, and in part of the many migratory races who have

swept through the country. At the foot of the mountains, in the tracts of surpassing fertility, Turk, Bokhariot, Kalmuk, Kirghiz, Ouigur, Manchu, Chinese, Armenian and Indians dwell in the well-watered plains. Beyond these, in every direction, is the pathless desert, which has been tenanted by pastoral nomades ever since the earth was peopled. From the Vendidad opening chapters there seems in ancient times to have been a great kingdom in Central Asia. An eastern branch, with its primæval seats on the Oxus. The Iranian people, who were settled between the Oxus and the Jaxartes, as early as the time of the Judges of Israel, still held their ground in the country, under the names of Tat, Tajik, Sert, Galsha and Parsiwan ; a primitive and not impure Iranian population might be found in almost every district from the Indus to the Jaxartes, and throughout the valleys of the Oxus. The Paropamisan chain, which bounds the Kohistan on the west, extends three hundred and fifty miles from east to west, and two hundred from north to south. The whole of this space is a maze of mountains, and though it affords a habitation to the Aimak and Hazarah, it is so difficult of access, and so little frequented, that no precise accounts of its geography are to be obtained. It is certain, however, that the range of Hindoo Koosh is there no longer so lofty as to be conspicuous among the mountains by which it is surrounded, and that no continued line of perpetual snow can any more be traced. The eastern half of this elevated region is inhabited by the Hazarah, and is cold, rugged and barren ; the level spots are little cultivated, and the hills are naked and abrupt. The western part, which belongs to the Ainak, though it has wider valleys and is better cultivated, is still a wild and poor country. The northern face of these mountains has a sudden descent into the province of Balkh ; their acclivity is less on their other extremities, except perhaps on the west or south-west. On the north-west they seem to sink gradually into the plain which borders on the desert. The slope of the whole tract is towards the west. To the north of this, extending eastwardly and to the west, are the elevated plains of Tartary, the Asiatic dominions of Russia, Chinese Tartary, and China, and the regions occupied by several Turkoman nations. To the south is India with its two peninsulas and its archipelagoes on the east, with the dominions of Persia and Turkey in Asia and Asia Minor, and the peninsula of Arabia on the west. The Caspian is an inland sea with Russian territory on the north and west, and Persia on the south. According to Strabo (lib. xi.) all the tribes east of the Caspian were called Scythic. The Dahæ were next the sea ;

the Massa-getæ and Sacæ more eastward, but every tribe had a particular name. All were nomadic; but of these nomades, the best known are the Asi, the Pasiani, Tachari, Sacarandi, who took Bactria from the Greeks. The Sacæ made irruptions into Asia, similar to those of the Cimmerians, and possessed themselves of Bactria and the best district of Armenia called after them Saca-senæ. Of the first migrations into India of the Indu-Scythic Getae Takshak and Asi, that of Sehesnag from Sehesnagdes (Takshac from Techaristhan) six centuries before Christ, is the first noticed by the Purana. About the same period a grand irruption of the same races conquered Asia Minor, and eventually Scandinavia, and not long after the Asi and Tachari overturned the Greek kingdom of Bactria. The Romans felt the power of the Asi, the Catti and Cimbri from the Baltic shore, Colonel Tod (*Vol. i, p. 49.*) supposes the Asi and Tachari to be the Aswa and Takshac or Toorshka races of the Purans of Sacadwipa. The Dahæ to be the Dahya, now extinct, one of the 36 royal Rajput tribes, and he supposes them to be the descendants of Baldeva and Yudishtra, returned under different appellations. The country on the east is still occupied by the Turkoman race, The geography of the Vedic hymns confirms the theory that the Arian race migrated from Central Asia about seventeen centuries before Christ, entered India by the north-west, dwelt during the earliest Vedic portion in the Punjab, and migrated or fought their way into Hindustan and Central India during the five centuries that succeeded. From the frequent mention of the Suraswati and other rivers, we learn that the Punjab was at one time the locality of the Vedic Arians. The fathers of the Arians originally inhabited Iran proper, the Land of Pleasantness, and they left it only in consequence of a convulsion of nature, by which a great alteration in the climate was caused. When the climate was altered by some vast disturbance of nature, the Arians emigrated. They did not, however, follow the course of the Oxus, or they would have come in the first instance to Bactria, and not to Sogd. Their course, therefore, was more northerly. Its present climate is precisely what the record describes it to have been when the changes produced by the above commotion took place. It has only two months of warm weather. In the course of the Arians, after their expulsion from the primeval country between Sogdiana and the Sutlej, they formed, by the conquest of fourteen countries, as many kingdoms in the whole of the eastern part of Central Asia and India proper, in the country of the Indus and its confluent. In the intervening countries, they passed amongst the Turanians (Scythians

and Turcomans), and there is evidence that the inhabitants whom they found in India were likewise Turanians. The main direction of these travellers was southerly, and on the southern bank of the Caspian is a group, the nucleus of the Arian Media. Amongst the Arian hindoo, the sacrifice of a horse, the Aswamed'ha, seems to have been practised in their religious rites. There are two hymns in the Rig Veda describing the rite, and which leave no doubt, that in the early religion of the race, this sacrifice, as a burnt offering to the gods, was had recourse to. It was even then, however, falling into disuse, and was existing as a relic of an ante-vedic period, imported from a foreign region, possibly from Scythia, where animal victims, and especially horses, were commonly sacrificed. And in still later times, the Aswamed'ha consisted in certain ceremonies ending in the liberation of the horse, as throughout southern India is still practised with a bull or cow, many of which are met with in every village, freed or let loose in the name of Siva or Vishnu. The Aimak who graze their flocks in the Parapamisus, are brave and relentless, and Afghans when travelling, whether, proceeding from Balkh, Kabul, Kandahar or Herat, never enter into the mountain districts of these intrepid nomadic tribes. One of the Aimak tribes is known as the Feroz Kohi after the city of that name about 63 miles from Teheran. Timur, exasperated at the depredations which they committed, transported the whole of them into the mountains lying between Persia. According to Prof. A. Vambéry, the Uigur are the most ancient of the Turkish tribes, and formerly inhabited a part of Chinese Tartary, which is now occupied by a mixed population of Turk, Mongol and Kalmuk. They were the first who reduced the Turkish language to writing, borrowing the characters from the Nestorian Christians, who came to their country as early as the fourth century of our era. The manuscripts of this language, written in the characters mentioned, afford, therefore, the most ancient and valuable data in investigating the history of Central Asia—nay of the whole Turkish race. But these monuments are of great scarcity; he believes he has collected all that has been discovered of the Uigur language, though the Uigur had a literature, and were very fond of books at a time when the western world was involved in ignorance and barbarism. The most valuable manuscript he obtained bears date 1069, and was written in Kashgar; it treats of ethics and political subjects, and forms a kind of manual of advice to kings how to govern with justice and success. It reveals the social condition of this people, and forms the basis of the later regula-

tions by which all Turks are governed. He believes that the Tartars of ancient time were not such barbarians as they now are. Since the year 1864, Russia has been making great progress in absorbing the kingdoms of Central Asia. In their operations, the Russians used only 2,000 and 3,000 men, and never had more than 15,000 in all Turkestan. Many emeralds come from Russia, Siberia, and Central Asia to India.

The parent country of the Jat seems to have been the banks of the Oxus, between Bactria, Hyrkania and Khorasmia. In this position, there was a fertile district, irrigated from the Margus river which Pliny calls Zotale or Zothale and General Cunningham believes this to have been the original seat of the Jat, the Iatii of Pliny and Ptolemy and the Xanthii of Strabo. The term Jat is only their tribal name, the general name of their horde is Abar. Taking these two names, their course from the Oxus to the Indus may be dimly traced, in the Xanthii of Strabo, the Iatii of Pliny and Ptolemy, the Xuthi of Dionysius of Samos, who are coupled with the Arieni, and in the Zuthi of Ptolemy, who occupied the Karmanian desert, on the frontier of Drongiana. Subsequently, the main body of the Iatii seem to have occupied the district of Abiria and the towns of Pardabathra and Bardaxema in Sind, or southern Indo-Seythia, while the Panjab or northern Indo-Seythie was chiefly colonized by their brethren of the Medes. Turan was formerly the appellation by which all the countries between the Jaxartes and the Oxus in one direction, and the Caspian and boundaries of China in another, were known to the natives of Persia. The countries north of the Hindu Kush, which lie in the valley of the Oxus and its tributary rivers, from Balkh upwards, have no general designation. Eastwards of that city lies Kunduz, the Mir of which subdued all the smaller provinces and it has another dependency, Badakhshan, further eastward. To the north of this territory are the hill states of Wakhan, Shughnan, Darwaz, Kulab and Hissar, whose rulers claim a descent from Alexander the Great. To the eastwards of Badakhshan lies the plain of Panir inhabited by the Kirghis and beyond the Belut Tagh mountains are Chitral Gilget and Iskardo, which extend towards Kashmir. South of Badakhshan is the country of the Siah Posh Kafir, who occupy a great part of the range of Hindu kush and a portion of Belut Tagh. It is bounded on the north-east by Kashgar, or Badakhshan, and on the north-west by Koon-dooz in Balkh. On the west it has Inderab and Khoost, also in Balkh, and the Kohistan of Cabul; and on the east it extends for a great distance towards the north of Kashpir, where

its boundary is not distinctly known. The whole of this Alpine country is composed of snowy mountains, deep pine forests, and small but fertile valleys, which produce large quantities of grapes, wild and cultivated, and flocks of sheep and herds of cattle while the hills are covered with goats. Grain is inferior both in importance and abundance. The common kinds are wheat and millet. The roads are only fit for men on foot and are often crossed by rivers and torrents, which are passed by means of wooden bridges, or of swing-bridges made on ropes of withy or some other pliant tree. All the villages are described as built on the slopes of hills, so that the roof of one house forms the street leading to the one above it, and this is said to be the constant practice of the country. The people have no general name for their nation. Each tribe has its peculiar name, for they are all in separate tribes, though not according to genealogy, but to geographical position, each valley being held by a distinct tribe. The mahomedans confound them all under the name of Kafir or infidel and call their country Kaffiristan. They also call one division of them Siahposh (black vested) or Tor, both epithets being taken from their dress, for the whole of the Kafir are remarkable for their fairness and beauty of complexion: but those of the largest division wear a sort of vest of black goat-skins, while the other dresses in white cotton.—*Porter's Travels*, Vol. i, p. 112; *Fortnightly Review*, July 1868; *Dr. Jackson, in Transactions of the Bengal Asiatic Society*, Vol. viii.; *Russians in Central Asia*, Captain Valikhunof and M. OXYCANI, see Kabul.

OXYCARPUS COCHINENSIS, see Hebradendron.

OXYDRACEÆ, a tribe mentioned by Strabo, Arrian, Curtius, Stephanus and other travellers. Burnes, Masson and Ferrier, met with tribes who claim a Grecian descent. According to Burnes the Mir of Badakhshan, the chief of Darwaz in the valley of the Oxus, and the chiefs eastward of Darwaz who occupy the provinces of Kulab, Shughnan, and Wakhan, north of the Oxus; also the hill states of Chitral, Gilgit and Iskardo, are all held by chiefs who claim a Grecian descent. The whole of the princes who claim descent from Alexander are Tajik who inhabited the country before it was overrun by Turki or Tartar tribes. The Tajik, and mahomedans, regard Alexan-

der as a prophet. The Badakhshan family are fair but present nothing in form or feature resembling the Greek. They are not unlike the modern Persian and there is a decided contrast between them and the Turk and Uzbek. General Ferrier on reaching Gazergah was much surprised to find there a small encampment of persons in the Uzbek dress, but whose configuration of features clearly indicated quite another origin. In conversation with him, they stated that they were the descendants of the Yunani (Greeks) whom Alexander the Great, Sikander Roomi, had left in these countries; and when he heard this he recollected that Marco Polo, and after him Burnes, as well as other writers on oriental history, mentioned the existence of Macedonian tribes which had settled on the north-west frontier of Chinese Tartary, and, from the replies he received to the numerous questions he put to these people, he was convinced of the existence of the real descendants of the ancient Greeks in those countries. These Yunani are not isolated and dispersed here and there but united in tribes, occupying a considerable tract of country; nothing, however, either in their language or their habits, betrays their origin. They are mahomedans, and have the reputation of being somewhat fanatical, and are not held in much consideration by the Tartars, amongst whom they are settled, but they are respected, for, like their ancestors, they are brave, and the consequences of their hatred are terrible to those who are the objects of it. Burnes, while admitting the existence of the descendants of these Greeks in Central Asia, appears to doubt whether some of their chiefs are, as they affirm, the descendants of Alexander, for the historians of the son of Philip assure us that he left no heir to reap the fruits of his immense conquests. Alexander built a city in his route eastwards towards the Indus to which he gave his own name, but the name it now bears, and its particular site have been lost. It was called Alexandria near the Caucasus, and Rennel points to Baniian as the quarter in which he would place it. General Ferrier mentions that the fortified town of Herat, is supposed to have been founded by Alexander the Great but he does not quote his authority. This city, he tells us is a quadrangle of $3\frac{1}{2}$ miles long on the north and south sides, and rather more on the east and west. Its extent would be immense if all the suburbs were included, particularly those stretching to the west of the town beyond the Darwazah-i-Irak. After the death of Alexander the Great, Persia, as well as Syria, fell to the lot of Seleucus Nicator, who established the dynasty of the Seleucidae. Antiochus Soter succeeded Seleucus Nicator and in the reign of his successor, Antiochus Theos, Arsaces, a Scythian, who came from

the north of the Sea of Azoff, induced the Persians to throw off the Greek yoke, founded the Parthian empire, and made Rhages his capital. This was likewise the period of the foundation of the Bactrian kingdom by Theodotus the governor of it, who finding himself cut off from Syria by the Persian revolution, declared his independence. Arsaces is called Astel by eastern writers, and is said to have been a descendant of the ancient Persian kings. When he gained the kingdom it is said he promised to exact no tribute and merely to consider himself as the head of a confederacy of princes, united for the double object of maintaining their independence and freeing Persia from a foreign yoke. This is the commencement of that era of Persian history called by eastern writers, Mulook-ut-Tuaif, or commonwealth of tribes. In A.D. 906, Rhages was taken by Ismail, founder of the Samanee dynasty. It ceased then to be a seat of empire, and in A.D. 967, became the capital of the house of Shemgur, a race of petty princes who maintained a kind of independence, while the dynasties of Saman and Dilemee divided the empire of Persia. In A.D. 1027, Rhages was the last conquest of Mahmood of Ghuzni.—*Smith's Dictionary; Malcolm's History of Persia, quoted in Ferrier's Journeys, pp. 65, 162-63.*

OXYDULOUS IRON, see Loadstone.

OXYLOPHUS. The crested cuckoos during the rainy season are parasitical upon the nests of the Sat-bhai.

OXYLOPHUS, a genus of Batrachians, viz.

2ND SUB-CLASS, BATRACHIANS.

Tailless Batrachians—Batrachia Salienta.

Tailed Batrachians—Batrachia Gradientia.

Burrowing Batrachians—Batrachia Apoda.
Order Batrachia Salientia.

Opisthoglossa.

Fam. — Ranidae.

Oxyglossus lima, *Tach.*, Bengal, Siam.

Rana tigrina, *Daud.* Syn. brama, vittigera, rugulosa, Ceylon, S. India, Calcutta.

„ crassa, *Jerdon*, S. India, Ceylon.

„ cutipora, *D. & B.* S. India, Ceylon.

„ vittigera Weig, Syn. assimelis, agricola, altilabris, Ceylon, India, Burmah.

„ kuhlii, *Schl.* Syn. cyanophlyctis liebigii, gracilis, malabarica, flavescens, curtipes, niligirica Himalaya, India, Ceylon.

Hoplobatrachus ceylonicus, *Pet.* Ceylon.

Pyxicephalus breviceps, Syn. fodiens, pluvialis, sphaerotheca, strigata, tomnopterna lalandii, *Tach.*

„ rufescens, *Jerdon*, Malabar, Bengal.

„ breviceps, *P.* lividus, *Blyth.*

OXYKANUS, or Portikanus, king of

OXYLOPHUS MELANOLEUCOS. The edolio or black and white crested cuckoo has a piping well-known call, and in the evening, sports like a swallow.

OXYMURIATE OF MERCURY. Bichloride of Mercury.

OXYMEL OF COPPER, useful application to chronic sores.

OXYRIA RENIFORMIS, the mountain sorrell is found in the Sutlej valley between Rampur and Sungnam at an elevation of 6,000 to 8,000 feet. Used as a native remedy.—*Cleghorn's Punjab Report*, p. 67.

OXYSTELMA CAUDATA, Ham., *Rheede*. Syn. of *Pentatropis microphylla*, W. & A.

OXYLOBIUM CORDIFOLIUM. An ornamental plant easy of culture, in any common soil; the colours of the genus are yellow, orange and scarlet.—*Riddell*.

OXYSTELMA ESCULENTUM, Roxb., Br.

<i>Asclepias rosea</i> , Roxb.		<i>Periploca esculenta</i> , Orr.
Gharat, Gani of Ravi.		Pala kura, Tel.
Chiru pala, TEL.		Pinna pala, "
Dudi pala, Nela pala, "		Se'pa chettu, "

A twining, perennial, deciduous plant, flowers in the rains, large white, with a slight tinge of of rose colour, and streaked with purple veins; texture thin and delicate. Common in India on the banks of rivulets, used by the natives in decoction as a gargle in apulous ulcerations of the mouth, and in sore throat: cattle eat the roots. A slender climber not uncommon in the arid tracts of the central and southern Punjab. The fruit is eaten.—*Roxb.*; *Fl. Ind.*, Vol. ii, p. 40; *Riddell*; *Royle*; *O'Shaughnessy*, p. 457; *Dr. J. L. Stewart*, M.D.

OXYURA CRYSANTHEMOIDES. Mountain sorrel. Native of Britain, and North America, cultivated in any garden soil.—*Riddell*.

OYOTMANIS, JAV. Liquorice root, OYSTER.

Inoceramus. Syn. of *Catillus*, fossil, 40 sp.

Pinna, rec., 30 sp., fossil, 50 sp.

Sub-genus.—*Trichites*, fossil, 5 sp.

The oyster is a well-known and diffused mollusc or shell-fish. At Kottiar, near Trincomalie, the edible oysters are of prodigious size. The shell of one of these measured a little more than eleven inches in length, by half as many broad, thus unexpectedly attesting the correctness of one of the stories related by the historians of Alexander's expedition, that in India they had found oysters a foot long. Pliny says: "In Indico mari Alexandri rerum auctores pedalia inveniri prodidere," Darwin says, that amongst the fossils of Patagonia, he found "a massive gigantic oyster, sometimes even a foot in diameter." The shells of the *Taclabo*, or gigantic Philippine oyster, are used as fonts in the churches of that group. The fish of the Kima cockle, frequently weighs thirty or forty pounds. Some of the shells measure three feet across, are several inches thick, take a fine polish, and form valuable articles of the trade to China. It is reported that one was found weighing 278 pounds. The pearl oyster is the *Meleagrina margaritifera*.—*Faulkner*; *Pliny's Nat. Hist. lib. xxxii*, ch. 31; *Tennant's Sketches of the Nat. Hist. of Ceylon*, p. 371; *Walton's Preliminary Discourse*, p. 70; *Forrest's Voyage to New Guinea*, p. 43; *Rumph. tab.*, 47, and born 80; *Da Costa, Conchyll*, Vol. vii, p. 4; *Chemnitz, Vols. vii, ix*, p. 495; *Gmelin*; *Linn.*; *Syst.*, p. 3,300; *Bonap.*, Vol. i, pp. 83, 84; *Argenville*, p. 23; *Dampier's Voyage to New Britain*, in *Harris*, Vol. i, p. 124; quoted in *St. John's Indian Archipelago*, Vol. i, p. 137; *Woodward's Fossil Shells*. OZIUS, a genus of the crustacea.

Ozium tuberculosus, Edw. Indian Ocean.

" *truncatus*, Edw. Australia.

" *guttatus*, Edw. N. Holland.

" *frontalis*, Edw. Tranquebar.

P, in the English language, is the twelfth consonant and the sixteenth letter, and is pronounced by closely shutting the lips and opening them suddenly with an explosive emission of breath, as in part, pop, prop. When an initial or a final, as in imp, play, it gives an abruptness of sound to the consonant next it. P, b, f, m, and v, are all labial letters, and are convertible in various tongues. Ph, in representing the sounds of the Indian alphabets, is to be regarded as a simple aspirate as in up-hill, and not as an f, though this also occurs, in the Mahrati, where p'hul, Hindi, a flower becomes fool and pathar a stone, fattar. The Tamil letter p — represents ph, as well as b and bh. The letter p, therefore, is, in Eastern tongues, transmutable into f and b.

PA, SANS., a prince or chief.

PAAK, DUK., GUZ., HIND. Shark's fins.

PAAK-MARAM or Camughu, TAM. Areca catechu.

PAAK SHENGERF, DUK. Cinnabar.

PAAKU, TAM. Betel-nut, Areca-nut, or Penang-nut.

PAAL, a land measure in the Eastern Archipelago, $\frac{1}{2}$ of a statute mile.

PAAN, HIND. Rhus cotinus.

PAARD, DUT. Horse.

PAARLEN, DUT. Pearls.

PAB, HIND. A ferment for beer, &c.

PABBA, MAHR. Chickrassia tabularis, Ad.

PABBASA CHETTU, TEL. Trichaurus erides, W. & A., p. 143; W. Ill., p. 24. Common in the affluents of the Krishna in Masulipatam. The same name is probably applied to Tamarix gallica.

PABE, HIND. Of Chenab, Populus ciliata.

PABEYAN, MALAY. Custom House.

PABHA also Pubha, MAHR. Chickrassia tabularis.

PABHI-HILLS, hills to east of Jhelam.

PABKA, HIND. The copper receiver of a still, kept cool in water; in this the spirit accumulates.

PACE, the measure of the Romans.

PACHA, MALAYA. Aucklandia costus. Falconar.

PACHAK, HIND. Aucklandia costus the 'kut' and 'pachak' of the natives of India; it is often called orris root in North-west India.—Royle's Manual, p. 618.

PACHAKU, TEL. Cinamomum iners Rein.

PACHAN, HIND. Malcolmia strigosa.

PACHETE HILLS. Length 105 miles; breadth 95, lie between 22° 56', 23° 54', 85°

46', 87° 10'. Imperfectly known. North part described as marked by hills from 400 to 600 feet. About 23° 35', 85° 50', a mountain conjectured at from 2,500 to 3,000 feet. Near the centre of district, some hills about 900 feet. Formation generally primitive, of either granite gneiss, or sienite. Coal is found near Jeria, 23° 44', 86° 25'; and iron-ore exists at a short distance. The chain unites the north extremities of the west and east ghauts, and forms the base of the triangle on which rests the table-land of South India. By the Moguls, the country to the north was called Hindoostan, and that to the south the Deccan.

PACHCHA, TEL. Yellow; green; hence Pachcha adavi molla, Jasminum chrysanthemum, R., Vol. i, p. 99. J. revolutum, W. Ic. 1258, SANS. Hema pushpika, W., 979.

Pachcha botuku, or Bottu kuru chettu, Cordia polygama, R., Vol. i, p. 594.

Pachcha chamanti, or Chamanti, Chrysanthemum roxburghii, Desf. Pyrethrum indicum, R., Vol. iii, p. 436. Yellow variety.

Pachcha janumu, Crotalaria, sp. SANS. Sanapushpa, W., 827.

Pachcha jonna, TEL. Sorghum vulgare, Pers. var.

Pachchaku chettu. Cinnamomum iners, Reinw.; W. Ic., 122, 130; Rheede, Vol. i, p. 57. This name has been assigned on inspection of the leaves sold in the bazaar under the Telugu name, which have all the appearance of those of the wild cinnamon tree.

Pachcha manu? TEL. Conocarpus acuminatus, Roeb.; Royle.

Pachcha mula goranta or mulu goranta. Barleria prionitis, L.; R., Vol. iii, p. 36; W. Ic., 452; Rheede, Vol. ix, p. 41, SANS. Kurantakah, W., p. 232.

Pachcha nirulli. Allium tuberosum, R., Vol. ii, p. 141. SANS. Latarkah, W., 716. Common at Vizagapatam.

Pachchani padmamu. TEL. Nelumbium, sp? N. luteum, the only yellow species, is a native of N. America. The name may refer to a poetical or mythological kind.

Pachcha pedda goranta, Lawsonia alba, Lam. So called perhaps from its property of staining the skin, and to distinguish it from various species of Barleria.

Pachcha pesulu, or pesulu, Phaseolus mungo, R., Vol. iii, p. 292, a. chlorospermus. Green gram or harya mung.

Pach chari, Dalbergia paniculata, R., Vol. iii, p. 277; Cor., p. 114; W. & A., 819.

PACHUNDA.

Pachcha vadambaram, *Justicia dentata*, Klein, *J. ecboium*, *R.*, p. 114; *Rheede*, *Vol. ii*, p. 20.

Pachcha vasa, *Acorus sp.*?

Pachcha vatti veru, *Andropogon sp.*

Pachcha yava, or *Yava*, *Hordeum hexastichon*, *L. ; R.*, *Vol. i*, p. 358. Sans. Syn. of Tokma "Unripe barley," *W.*, p. 386.

Pachcha yirugudu, *Dalbergia, sp.* A species with orange or greenish flowers, perhaps *D. rimosa*, *R. ?* The Sans. Syn. is *Kapila*. This word as well as *Pachcha* both signify yellow or greenish color, *W.*, p. 188.

PACHI, or *Nachu*, *Blyxa octandra*, *Rich. Vallisneria oct.*, *R.*, *Vol. iii*, p. 752.

PACHI, HIND. *Saccharum officinarum*.

PACHI KALU, TAM. Emerald.

PACHIMAN, TEL. *Conocarpus acuminatus*, *Roxb. ; Royle*, properly *pachha manu*.

PACHI MANU, properly *pach'cha manu* *Anogeissus acuminatus*, *Wall.*—*Conocarpus ac.* *R. ii*, 433.—*W.* and *A.* 977.

PACHISI, HIND. An Indian game, played with cowry-shells on a board or cloth. The game is usually played by four persons, each of whom is supplied with four wooden or ivory cones, which are called "got," and are of different colours for distinction. Victory consists in getting these four pieces safely through all the squares of each rectangle into the vacant place in the centre,—the difficulty being, that the adversaries take up in the same way as pieces are taken at backgammon. Moving is regulated by throwing "cowries," whose apertures falling uppermost or not, affect the amount of the throw by certain fixed rules.—*Tr. Hind.*, *Vol. ii*, p. 8.

PACHMARHI. A plateau in the Hoshangabad district, round which the Chauradeo Jata Pahar and Dhupgarh hills stand sentinel; it is about 3,500 feet high, or 2,500 feet above the plain in which Sohagpur lies; and its average

degrees lower than that of the valley. There are some interesting ancient temples at Pachmarhi. The jungles lying all about the base of the range bear the same name, and are very dense to the East and West of it, though, having a great profusion of fine timber, do not apparently furnish beams of equal scantling with those situated on a lower level. The difficulties to be contended with in clearing a path for the transport of the timbers to the Kanhan are very great: and that stream, even in the monsoon, presents so many rocky barriers, as to render it doubtful whether the beams could even then be navigated in rafts to Kamp-tee; and the expense of land carriage would put the obtaining of beams from this source out of the question.

PACHUNDA, MAR. *Capparis divaricata*.

PACHYRHIZUS ANGULATUS.

PACHONTI, HIND., MALEAL. *Isonandra acuminata*, *Lindl.*

PACHRANGI, HIND., a kind of sugar cane.

PACHUKU, or *pachaka*, SANS. He who cooks; from *puch*, to cook.

PACHUNA.

PACHWAI, an intoxicating liquor forming an item to revenue.

PACHWANS, HIND., a small wedge in a plough.

PACHYCORIDÆ, a family of insects, of the Order Hemiptera, which may be thus shown,

PACHYMA COCOS.

Tsein-a-pho-ta-roup, BURM. | *Fuhling*, CHIN.

This fungus, is used in China as a diet article and as a medicine. It occurs in the form of large tubers, varying in size up to a peck measure, has a corrugated, blackish-brown-skin, and consisting internally of a hard starchy substance, of a white colour but sometimes tinged with pale red or brown, especially towards the outside. They are found connected with living fir plantations or on the sites of old ones, and they are exported to India and elsewhere, as China root *Fu-shin*, is another kind mentioned in books. It occurs in many parts of China, in Japan and in Shantung and in S. Carolina, where it is called Indian Bread. In China it is ground up, mixed with rice flour, and made into small square cakes which are hawked about all but in the early morning. They are regarded as beneficial in dyspeptic complaints.—*Rev. Dr. Frederick Porter Smith, M.B., Medical Missionary ; Chinese Mat. Med.* See *Smilax, Chinensis*.

PACHYRHIZUS ANGULATUS, see *Dolichos*.

PACHYGLOSSÆ, see Chameleons.

PACIFIC OCEAN. The western Pacific is filled with the innumerable islands of the Eastern Archipelago. The Islands of the East Pacific extend from the east of New Guinea and the Philippines, to within two thousand five hundred miles of the western coast of America, and from about the 22° of north to the 47° of south latitude. The languages spoken over this vast area are, probably, nearly as numerous as the islands themselves. The language with variations, is spoken by the same race of men from the Fiji group west to Easter Island eastward, and from the Sandwich island north, to the New Zealand islands south. It has been called the Polynesian. The whole number of Malayan words in the Maori dialect of the Polynesian, as they are exhibited in Williams' Dictionary, only amount to 85. Mr. Crawford in his *Malay Gram. and Dic.*, Vol. i, p. 7, considers that a certain connexion of more or less extent exists between most of the languages which prevail from Madagascar to Easter Islands in the Pacific, and from Formosa, on the coast of China to New Zealand. Thus, over 200 degrees of longitude and seventy of latitude, or over a fifth part of the earth's surface. In this are innumerable islands of the Indian Archipelago, from Sumatra to New Guinea, the great group of the Philippines, the Islands of the North and South Pacific, and Madagascar. It is inhabited by many different and distinct races of men, as the Malayan, the brown Polynesian, the insular negro of several varieties, and the African of Madagascar. Of these, the state of civilization is so various that some are abject savages, while others have made a respectable progress in the useful arts, and have even attained some knowledge of letters. He is of opinion that the leading race in the Archipelago is one and the same, but the languages are many, with more or less intermixture of some principal ones throughout. In Borneo, he says, there are at least 40 languages; in Celebes and its islands at least 10; in Flores 6; in Sumbawa 3; in Sumatra and its islands not fewer than 10; and even in civilized Java with its islands, 3. It is the same in the Philippine islands, and in Lucon alone, there are three. He says that in the Eastern Archipelago, no languages exist derived from a common stock, or standing to each other in the relation of sisterhood, as Italian, Spanish and French, do to each other; or as Gaelic does to Irish, or Armorican to Welsh, or Scotch to English. The only dialects that exist are of the Malay and Javanese languages, but they consist of little more than differences in pronunciation, or the more or less frequent use of a few words. In the Polynesian Islands alone, real dialects of a

common tongue do exist, but there the number of words common to such dialects and to the languages of the Archipelago, is so trifling that it refutes at once the notion of a common origin. In Malay, the most familiar words for the head, the shoulder, the face, a limb, a hair or pile, brother, house, elephant, the sun, the day, to speak, and to talk, are all Sanskrit. In Javanese, Sanskrit furnishes words for the head, the shoulders, the throat, the hand, the face, father, brother, son, daughter, woman, house, buffalo, elephant, with synonyms for the hog and dog, the sun, the moon, the sea, and a mountain. In the language of Bali, the name for the sun in most familiar use is Sanskrit, and a word of the same language is the only one in use for the numeral ten. It is on the same principle that Mr. Crawford accounts for the existence of a similar class of Malayan words in the Tagala of the Philippine although the whole number of Malayan words does not exceed one-fiftieth part of the language. Head, brain, hand, finger, elbow, hair, feather, child, sea, moon, rain, to speak, to die, to give, to love, are examples. Some personal pronouns are found in the Polynesian dialects, where, in a vocabulary of five thousand words, a hundred Malayan terms do not exist. A sentence of Malay can be constructed without the assistance of Javanese words, or of Javanese without the help of Malay words. These two languages can be written or spoken without the least difficulty, without a word of Sanskrit or Arabic. The Malay and Javanese, although a large proportion of their words be in common, are distinct languages, and their Sanskrit and Arabic elements are extrinsic and unessential. When this test is applied to the Polynesian languages we find an opposite result. A sentence in the Maori and Tahitian can be written in words common to both, and without the help of one word of the Malayan which they contain, just as a sentence of Welsh or Irish can be constructed without the help of Latin, although of this language they contain, at least, as large a proportion of words as the Maori or Tahitian do of Malayan. Mr. Crawford is of opinion that the Malay and Javanese languages furnish the stock of the widespread words which are common to so many tongues in the Archipelago and which have been chiefly derived from the languages of the two most civilized and adventurous nations of the Archipelago—the Malays and Javanese, and he uses the word Malayan for whatever is common to these two people. The history of the nations along the southern borders of Asia, has in every era exercised some influence on the Archipelago, and the importance of the international influences of the Archipelago itself, may be supposed from the circumstance that while some writers have

derived Malayan civilization from an original source in Menangkabau, others have referred it to Java, and others to Celebes, whilst two of the ablest, Mr. Marsden and Mr. Crawford have, as will have been seen above, busied themselves in endeavouring to exhume a great nation whose civilization preceded the Javanese, the Malayan, and the Bugis, and impressed itself more or less not only on the Archipelago but over all Polynesia. In the Pacific ocean, a westerly current fills the whole breadth of the tropical zone, from the coast of America to that of Australia and the Indian Archipelago. The cold Peruvian stream flows with great rapidity along the shores of Chili and Peru, and takes a westerly direction on reaching the neighbourhood of the line. It has everywhere a remarkably low temperature comparative to the latitude. After the current has assumed a westerly direction, its mean temperature does not exceed 20.5° R., but as it advances towards the west, its temperature gradually rises to 27° or 28° R. On the western banks of the Pacific, the equatorial stream divides into several branches. Part of its waters flow to the south, a greater quantity penetrates through the channels of the south Asiatic Archipelago, into the Indian Ocean, the remainder turns to the North-east, on the confines of the Chinese sea, leaves the eastern coast of the Japanese Islands and then spreads its warm waters under the influence of north-westerly winds over the northern part of the Pacific. Then the Japanese stream plays here the same part as the Gulf stream in the Atlantic and exerts a similar, though less mighty influence, over the climate of the west coast of America as it is neither so large nor so warm and having to traverse a wider ocean, in higher latitudes, naturally loses more of its heat during the passage. No trace of a written character has been found in the wide extent of the islands of the Pacific. Most of them are, probably, too small to have furnished a population, at once sufficiently numerous and concentrated, to generate the amount of civilization requisite for the purpose. In the great islands of New Zealand, with their comparatively energetic race of inhabitants, the discovery of letters would, most probably, have been made, as among some rude nations of Sumatra, had the civilization necessary not been precluded by the absence, as in the smaller islands, of the larger animals for labour, and of all the cereal grasses for food. Otaria stelleri, the sea lion of Steller, is found on all the coasts and islands of the Pacific, from 51° N. lat. to the extreme south, but chiefly in Prebelow Island St. Georges. It is hunted by the Aleuth, who use its tawny bristled hide for a boat covering and articles of clothing. Va-

su, in the Fiji islands, although translated "nephew", does not imply a mere relationship, but a peculiar right, descending to chiefs from their mother, to demand from other districts, often (as in this case) of superior political power, property of any kind as presents. In this sense it does not, therefore, admit of a simple translation.—*Crawford's Malay Gram. and Dic.*, Vol. i, pp. 1-141; *Mr. Logan in Journal Indian Archipelago from 1848 to 1858*, p. 774; *Hartwig; Captain Elphinstone Erskine's Islands of the Western Pacific*, p. 448. See Archipelago, India.

PACKHAN BED, HIND., of Kangra, A root obtained from Thibet, believed to be an antidote for opium, and used as such in cases of poisoning by that drug, either in powder, in doses of 15 grains, or in infusion.—*Cat. Ec.*

PACKING MATERIALS. The leaves of the Pandanus, of the Bauhinia bhojputra, and B. racemosa are so used, also those of the Pandanus.

PA-CO-HU-HUEI-IIIAM, CHIN. Star Anise, Illicium anisatum,

PACORUS. See Greeks of Asia.

PACOURYNVA. See Clusiacea.

PADA, BURM. Mercury.

PADÆL, an ancient pastoral people tributary to Darius supposed to have been somewhere in India, and on the banks of the Ganges, who according to Herodotus, (Thalia iii, c. 99,) eat their aged relatives, see Batta.

PADAH, see Varaha mihira.

PA-DAING, BURM. Herbertianum.

PA-DAING KYET THWON, BURM. Scilla indica, *Roxb.*

PA-DAING-PHYU, BURM. Datura alba, *Rumph.*

PADAL, Pathadi, Pardhan or Desai is a Gond tribe who are the bards or religious councillors of the upper classes of Gonds. From these has sprung a half caste tribe, who speak Maratha, and occupy themselves in spinning thread and playing on wind instruments.

PADAL or Sammu, HIND., Bignonia suaveolens.

PADARA, HIND., of Ravi. Coriaria nepalensis.

PADALHI, an umbellifer, the root of which is used.

PADALLI, HIND. Heracleum, *sp.*

PADALON, a country lower than the earth.

PADAM is the term by which the races designate themselves, whom the Assamese name Bor and Bor Abor. The Bor occupy the mountains to the north of the Brahmaputra river, in about lat. $27^{\circ} 12'$ N., and long. 94 to 97° E., on the west or right bank of the Dihong river, on the southern face of the Himalayas on the borders of Thibet and China. They dwell to the south of the Bor Abor and their chief town is Membu.

Higher up are the Bor Abor, whose capital is Semong, of about 300 houses, they are polyandrous, it being not uncommon for an Abor woman to have two husbands, brothers, living under one roof. They do not eat beef, but hunt, and eat the flesh of, the buffalo. They are more powerful than the Bor. Their bachelors live in the Morang, a large building in the centre of the village for the reception of strangers, and in this custom they resemble some of the Archipelago races. They sacrifice to deities of the woods and hills. Numbers of these people are also found on the shores of the two great northern branches of the Brahmaputra river. When first known they made periodical descents on the plains. Bor means tribute, hence Abor free from tribute, and the Padam are so arranged, into the payers of and non-payers of tribute. They carry bows and arrows some of which are poisoned. Their dress is made of the bark of the Udhal tree: Bor is also said to mean "great," and we find the term of Bor Khampti employed. The Bor Abor is the more distant, the more independent and stronger portion. The Bor Abor lie on the higher hills and the similarity of their language to the Abor is not known. Considerable numbers of these people are also found on the shores of the two great northern branches of the Brahmaputra river. The Bor Abor race dwell on the north of the Abor, occupying the mountains on the north of the Brahmaputra river in lat. 28° N. and long. 95° E. to the west of the Dihong river. The British government make money-payments to the Bor Abor, Dophla, Meri and Aka, to abstain from levying black mail in Assam.—*Indian Annals; Latham's Descriptive Ethnology; Aitchison.* See Abor, India.

PADAM, HIND., also Padma, SANS. *Nelumbium speciosum, Willd.*

PADAM or Pajja, HIND. *Prunus padus* or *Cerasus puddum*. This cherry tree grows to no very great height; wood reddish, soft, light, subject to worms, splits if exposed to the sun, coarse-grained; used by zemindars for ordinary house building and for agricultural implements; bears a bitter fruit. *Powell's Hand-book, Vol. i, p. 541.*

PADAN ARAM, see Babel.

PADANG ISLANDS, seven in number, lie on the west coast of Sumatra.

PADANG, MALAY. A plant, probably the *Pandanus odoratissimus*, used in the Archipelago for making mats.

PADAR—*Anemone obtusiloba*.

PADARI, TEL. *Bignonia suaveolens, Roxb.*

PADA-VALLI also Pada-kelengoo, MALEAL. *Clypea burmanni*.

PADAVALUM, MALEAL. *Tricosanthes cucumerina, Linn.*

PADA-VARA, MALEAL. *Morinda umbellata*.

PADAVETTU, see Hindoo.

PAD BAHERA, HIND. A mushroom of the Panjab, is said to produce insensibility.—*Powell's Hand-book, Vol. i, p. 381.*

PAD-DAING-PHU, BURM. *Datura fastuosa, Mill., Roxb.*

PADDAM, HIND. *Cerasus puddum, Prunus puddum*, bird cherry.

PAD-DAN, BURM. In Amherst, a timber used for making drums and musical instruments. It is a kind of red sanders wood.—*Cat. Br. 1851.*

PADDA-NELLA-KURA, TEL. *Premna latifolia*.

PADDA PATSEROO, TEL. *Mimosa procera*.

PADDI, MALAY. Rice in husk.

PADDI, GOND., MHAR. *Sus indicus, Schinz.*

PADDICARA, TEL. Alum.

PADDICARUM, TAM. Alum.

PADDLING CRABS, see Crabs.

PADDMA, see Krishna, Namam, Serpent.

PADDU-KAI, TAM., Bed.

PADDY, ANGLO-MALAY.

Bhatt,	GUZ., HIND.	<i>Oryza sativa,</i>	LAT.
Padi,	MALAY.	Nellu,	TAM.
Unhusked rice,	ENG.	Vadlu,	TEL.

PADDY BIRDS, an egret; so named from padi, Malay rice, because they often seek rice fields. See Birds, Cranes.

PADDY-FIELD DEER of Ceylon is the *Axis oryzus* of Kelaart.

PADE NARRAYAN, TAM. *Poinciana elata*.

PADEWAIKAN. The trade with New Guinea and the Eastern Islands, (commonly called the Bugis trade) and the Trepan fishery on the North Coast of Australia, are carried on chiefly in vessels called "Padewahkan." These leave Macassar and the other parts of Celebes, for the Eastern Islands during the westerly monsoon, returning with the south-east trade wind.

PADEEN, a race dwelling near the Indus, whom Herodotus describes as hunters, and eating raw flesh, it is most probable he had heard of the class termed Pardi, the hunters and fowlers to this day of India, but whose abode, like their occupation, is unrestricted.—*Tod's Travels, p. 147.*

PADI, TAM., KARN. In Madras a measure of capacity, = $\frac{1}{8}$ th of a marcal, containing 93.752 cubic inches or about 3 lb. 6 oz. of water.

PADIVIL KOLOM, a round tank of Ceylon of great dimensions.

PADIL, also Purrul, MAR. *Stereospermum suaveolens*.

PADKA, the engraving of the soles of two feet, on the top of a tombstone, to mark the tomb or samdi of a Gosain. It is also called Charnpad.

PAD KI TOOR, HIND. *Cajanus indicus*, Spreng.

PADLU, HIND. *Marlia begonifolia*.

PADMA. The *zostera*, a sea weed of the eastern seas: species of *Padma* and *Sargassum* are met with in the eastern seas.—*Colingwood*.

PADMA-WAN, the sacred lily lake of the hindoos.

PADMINI, daughter of Hamir Sank, the Chohan rajah of Ceylon, in the 13th century. She was very beautiful, and was married to Bhim-si, uncle of the young prince Lakum-si of Chitor, and protector of the kingdom during his minority. In 1275 Bhim-si was lured into the camp of Alla-ud-din, who had conducted a long unsuccessful siege and there made prisoner, but was promised release if he would deliver up Padmini. Padmini, after consultation, feigned compliance, and was sent out with seven hundred covered litters, each of which contained an armed warrior. At the last interview allowed to the husband and wife, Bhim-si escaped under the cover of the warriors and Alla-ud-din retired. He returned however in A.D. 1303, and the Mewar people despairing of success, resolved on the rite of Johar. In this all their wives to the number of several thousands were led to subterranean fires, Padmini closing the train. Her name is hallowed in Rajput song, her beauty, accomplishments, and destruction.

PADMO-GOOLANCHIA; BENG. *Cocculus tomentosus*.

PADOMAN, MALAY. A Compass: the word is also written Paduman, Panduman, Panduman.

PADOUK, BURM. *Pterocarpus dalbergioides*, also *Pterocarpus indicus*. Padouk affords a fine timber for many purposes, and from its large size and even texture has been brought into general notice. Several experiments have been made in the ordnance department of Madras to ascertain its fitness for gun carriages. As a substitute for teak, should it be found to answer for the above stated and other purposes, it would be valuable, and from its large size, its even grain, rendering it susceptible of a high polish, and beauty of colour and pattern, it appears to be well suited to the manufacture of articles of furniture.

PADOUK TOUNG KHA GAI, BURM. *Pterocarpus*.

PADRI, an Indian term given to the religious teachers, of all faiths, to the protestant and romish clergymen, and in Sumatra to the mahomedan teachers of Achin. These last are chiefly Malays of the Menangkabao States, of the interior of Sumatra, who for many years opposed the advance of the Dutch, but are now chiefly congregated in Achin, as the last hope of their race.

PADRI, TAM., MALAYAL. the *Bignonia chelonoides* tree, which is about twenty feet long and eight inches in diameter; it produces a small white flower in shape like the *fusca*, or rather the snow-drop, which has a most powerful fragrance, they are prescribed in infusion as a cooling drink in fevers. The leaves, if steeped in a portion of lime-juice, make a most grateful and cooling drink. This is one of the sacred trees, and considered the property of the pagoda; and the flowers are held sacred for the purpose of decorating the dancing-girls' heads on days of ceremony.—*Edlye, M. & C.* See Padari, also Padri maram.

PADRIAR, HIND. *Bauhinia variegata*.

PADRI MARUM, TAM. *Stereospermum suaveolens*, also *MALEAL.* *Bignonia chelonoides*.

PADRIUN, HIND. *Elæodendron Roxburghi*.

PADSHAH, HIND., PERS. A king, equivalent to the Arabic sultan; Padshahi, royal, Padshah-Zada a prince.

PADSHAHIPUR, a town of the Delhi district in the North-west Provinces.

PADSHAH SALEP, a commercial term for a drug lately imported from Bombay into England. Its source is unknown and supposed by Dr. Birdwood to be the root *Asparagus adscendens*.

PADUA GURUWA. A small community of untraced origin in the mountains of Uda-kind, in western Uvah, in Ceylon, who profess mahomedanism, but conform to Kandyan customs, *Ten*.

PADUANG, MALAY, trading vessels in the Archipelago.

PADUL, MAR. *Stereospermum chelonoides*, *Bignonia*, *suaveolens*, *Roxb.*

PADUNA, HIND. *Tulipa stellata*.

PADVALAM, MALEAL. *Trichosanthes cucurmerina*.

PAD-WASSAL, HIND. *Allium cepa*.

PAD-ZAHR, PERS. Bezoar stone.

PÆ, BURM. *Corypha umbraculifera*, also *C. taliera*?

PÆDERIA FÆTIDA, Linn., W. & A. Roxb.

Psychotria volubilis, Roxb.

Apocynum fætidum, BURM.

Gandho-bhadhuli, BENG. | *Savirela chettu* **TEL.**
Gandhali, HIND.

Grows in Bengal and Peninsular India. It has a fætid smell and the roots are used as an emetic.

PAE-JAMA, HIND. Trowsers.

PÆONIA ARBOREA. These beautiful flowering plants, the herbaceous species of which are so generally cultivated in England, and thrive best in the conservatories, are not known in Western India. Of the other species, *P. brownii* and *P. californica* are remarkable for being the only species inhabiting America; they are natives of California and of

the country to the northward, and have little beauty: the first exists in English gardens, but is extremely rare. The rest of the genus consists entirely of European and Asiatic plants, which, according to De Candolle, form fifteen species; but there can be no doubt that the greater part of these supposed species are mere varieties, chiefly of *P. officinalis*, *P. albiflora*, *P. tenuifolia*, and *P. peregrina*. All these plants are liable to produce flowers, which, by the conversion of their numerous stamens into petals, are generally extremely beautiful: they have, however, no smell, or not an agreeable one. Being quite hardy, growing readily in any kind of soil, and easily multiplied, either by seeds or by division of the roots, they are generally favourites in gardens. All the species have an acrid principle concentrated in their roots and seeds, which are accordingly emetic and cathartic in moderate doses. They were formerly in great repute as a medicine; and Dioscorides, whose *Haovia* was probably both *P. officinalis* and *P. peregrina*, gives no fewer than sixteen names, by which it was known.—*Riddell; Eng. Cyc.*

PEONIA CORALLINA. Ud-Salap, HIND. The Peonia of Dioscorides. Its root occurs as irregular, flattened, woody masses, with a brownish epidermis and fibrous with numerous fissures radiating from the centre. It is used by natives for weakness, palpitation and asthma, and to fasten round the neck of children to prevent asthma. Root believed to be antispasmodic and to stimulate the secretion of milk and menses. It is said to become more efficacious the longer it is kept.—*Powell's Hand-book*, Vol. i, p. 325.

PEONIA MOUTAN is a shrub, of which several varieties, with beautiful whitish flowers stained with pink, are now in British gardens. Of these the most showy is that called *P. papaveracea*, which has a broad crimson stain at the base of each petal. If grown on the north side of a wall, or in a situation where it is but little exposed to the sun in the early part of the day, this species will bear the open air of England without protection: but it sprouts so early in the spring, if exposed to the sun, that it is very liable to be cut off by the late frosts of England. It is a native of China and is abundant. On the road, says Fortune I met a number of coolies, each carrying two baskets filled with moutans (tree-peonies) in full flower, which were being taken to the markets for sale. When I reached the gardens I found many of the plants in full bloom, and certainly extremely handsome. The purple and lilac-coloured kinds were particularly striking. One, a very dwarf kind, and apparently a distinct species, had finely cut leaves, and flowers of a dark velvety purple, like the Tuscany rose of our gardens.

This the Chinese call the "black" moutan, and I believe it is the same which Dr. Lindley has described in the Journal of the Horticultural Society, and named *Peonia atro-sanguinea*. Another kind, called the "tse," or purple, has double flowers of a large size; this is probably the variety reported to have 1,000 petals, and which is said to exist only in the garden of the emperor. The third is called the "lan," or blue; this is a lilac variety, with flowers of the colour of *Wistaria sinensis*. There are others of various shades of purple, perfectly distinct from those, and equally fine. The double whites are also numerous and handsome. The largest of these Dr. Lindley has named *P. globosa*, but there are four or five others nearly as large and double. Some of them have a slight lilac tinge, which gives a richness to the colour. The most expensive is one called "wang," or yellow, by the Chinese: it is a straw-coloured variety, rather pretty, but not so handsome as some of the others.—*Fortunes' Wanderings*, p. 321.

PAEPI, SINGH. *Carica papaya*, Linn.

PAEROO, MALEAL. *Dolichos sinensis*.

PAET THIAN, *Spathodea stipulata*, Wall.

PAEUR-KU-SIMO, a river that enters the Baikal lake from south-east.

PAFLU, HIND. *Marsilea quadrifolia*.

PAGAI, HIND., MAHR. State soldiers, household troops.

PAGADAPU CHIETTU or Errapurugudu, TEL.

Melanthesea rhamnoides, Bl.—*W. Ic.*

Phyllanthus vitis idaea, R. iii, 665.

P. reticulatus, Poir.—*Rheede*, v, 44.

The same name is also given to some other sp. with red berries as *P. turbinatus*, &c., and likewise to *Sethia Indica*, the Telugu name of which Roxb. assigns to *M. turbinata*.

PAGADA TIGE, TEL. Literally "Coral-twiner," syn. *Vidruina*, W.

PAGAN, a Burmese town. Captain Yule found the details of the architecture at Pagan in Burmah of hindoo origin; and it is known that Anoratha, or Anoratha Saumen, when he established buddhism in Pagan, built all its pagodas and temples after the exact models of those then existing in Thatung, or Satung, of the same size, and in the same order. Such is the testimony of Talaing tradition, and he believes of Tailing history. The name of this town is also written Paghan and it was a royal city about A.D. 700.

The Gauda-Palen is a buddhist temple at Paghan, signifies the throne of Gaudama. Height 180 feet. It is cruciform in plan. It is very conspicuous in approaching Paghan from the southward. Gauda-palen has numerous pinnacles and a tall central spire, it is seen glistening with its white stucco like plaster, far down the Irrawaddy river, rising like a dim vision of Milan cathedral. It is compact in

structure and elevated in proportion to its bulk. It has a massive basement with porches and rising above in a pyramidal gradation of terraces crowned by a spire "htee." From the top of the terrace, just below the spire, is a fine prospect of the vast field of ruined temples stretching north-east and south-west.

The "Ananda," temple, another buddhist temple of Paghan, is supposed to have been built about the time of the Norman conquest. Ananda means the "Infinite" and hence it goes by the name of the infinite temple. The plan of the building is a square of nearly two hundred feet, having on each side a projecting vestibule which converts it into a perfect Greek cross. These vestibules are lower in perpendicular height than the body of the temple, which rises to 35 feet in two piers of windows. Above this, rise six successive terraces, diminishing as they ascend, connected by carved converging roofs, the last terrace just affording space enough for the spire which crowns the edifice. The gilded htee caps the whole at a height of 168 feet above the ground. The outer corridor is roofed with a continuous flying buttress, abutting on to the massive outer walls.

"Thaipinyu," or omniscient, is the second great temple of Paghan and is stated to have been built about A.D. 1100. It forms a massy square edifice of 200 feet on each side, rising to a height of 210 feet from the ground. The characteristic of the "Thaipinyu" is the elongation of the building, before any considerable diminution of spread takes place, and also the position of the principal shrine which stands high above the ground. There is first a spacious two storied basement similar to that of the Ananda, then two receding terraces, but here the usual gradation is interrupted. The third terrace instead of rising by terraces, like the others, projects at one leap aloft to a height of some fifty feet in a truly massive and stupendous cubical donjon elongated again, at the top by a renewal of the pyramidal gradation of terraces and the usual culminating spire. See India, Karen, Kocch, Yau.

PAGAN TRIBE, see Joboka, Malay.

PAGARA MALI, TAM. *Nyctanthus arbor-tristis*.

PA GAU GYEE, also Paga-theing, BURM. *Alpinia nutans*, Roxb.

PAGGER, JAV. A bamboo enclosure.

PAGGI, HIND., from Pag, a foot, a village servant in Guzerat who traces thieves by their foot prints. See India, Kattyawar.

PAGHELAMALLI, or Pagara mali, TAM.

Keysur,	DUK.	<i>Nyctanthus arbor tristis</i> ,	LAT.
Pogbadamullay,	TEL.		
Singhur,	HIND.	<i>Sephalica</i> ,	SANS.
Sorrowful nyctanthus,			

This plant has a peculiarly delicate and

delightfully smelling flower ; its corol is white and the tube of a dark orange colour for which last it is much prized by the dyers.—*Ainslie's Mat. Med.*, p. 159.

PAGHIMAR, north of Kabul.

PAGO, see Jakun.

PAGODA, a hindoo or buddhist temple : also a coin in India, of value Rs. 3½. Bartolomeo says that the name is obtained from Bhagavada, the name of a goddess, whose figure was on the coin. An attempt has also been made to derive the word from mahomedan authority, imagining that anti-idolatrous people to have called the temples of the hindoos by the debasing but accurate, appellation of but-gada : from but, an idol, and gada, a temple. Bartolomeo says, the coin being impressed with the goddess Bhagavada, is therefore, so called, pagoda being a corruption or abbreviation. De la Loubere, in his account of Siam, who that this is a corruption of two Persian words, Boot Khana signifying an idol temple. It may also have been applied by the Portuguese in the S. of India from Deh and gopa. Some of the hindoo and buddhist temples are magnificent. The whole exterior of many of the largest of the Burmese pagodas, is gilt. In the capital, some of the most beautiful and elaborate khyoungs or priests' houses are covered with the richest and most ornate gilding from top to bottom ; and in some cases the cost of gilding alone, for a single building, has exceeded £10,000 sterling. On the occasion of festivals, also, it is a prevailing custom among the Burmans to attach to their pagodas leaves of gold, even when the building generally is not gilt, which is the origin of the little patches of gilding seen on the temples near every village of any size or wealth. The most costly pagoda in British India is that built by Bimul Sah. It is on a spur of the Aravalli. The site cost sixty lakhs to level, and took fourteen years in building at a cost of eighteen crores of rupees, perhaps in all twenty millions sterling. The more celebrated of those of Peninsular India, are at Achaveram, Chellambrum, Conjeveram, Jagarnath, Seringam, Tripati, Trivadi, Verdachellum, and Wariore.—*Moor*, p. 346 ; *Oldham in Yule's Embassy*, p. 344 ; *Howell* ; *Thurlow*. See Dagoba, Bhagavada, Deligopa, Serpent, Shooway Dagon.

PAGODA, a Madras gold coin equal to three rupees and a half, now uncurrent, but was about 52½ grains weight. 80 pagodas' weight is, a "seer" (cutcha) of 24 rupees' weight. This corresponded with the average weight of the old native rupee of 175 grains ; but since the introduction of the "Company's rupee" of 180 grains, the "pagoda weight" is 54 grains generally.

PAGODA THRUSH, *Acridotheres pago-*

Carum, is probably the bird referred to in Lalla Rookh :—

"Mecca's blue sacred pigeon, and the thrush
Of Hindustan, whose holy warblings gush
At evening from the tall pagoda's top."

PAGODALITE, or Agalmatalite.

PAGO MALAY, see Johore.

PAGRANA, a group of fishes of the family Sparidæ.

PAGRI or Pag, HIND. A head-dress, a turban, closely folded.

PAGRUS, a genus of fishes belonging to the family Sparidæ, with four or six strong concave teeth in front, supported by similar conical teeth behind them, with two rows of rounded molar teeth on each side of both jaws.—*Eng. Cyc.*

PAGUMA LANIGER, Gray. The Martes laniger, *Hodys.*, an animal of Tibet and the snowy Himalaya.

PAGUMA TRIVIRGATA, Gray.

Viverra trivirgata, Reinwardt, *Mus. Leyd.*
Paradoxurus trivirgatus, Gray.

In Burmah, this animal is very common, and occasionally enters houses in the towns in pursuit of rats. When young it is easily domesticated, and valuable as a rat-catcher. It does not appear to have been seen in Arracan.—*Mason.*

PAGUNAI, HIND. *Rubus lasiocarpus*.

PAGURIANS, or Hermit crabs Paguridæ.

PAGURIDÆ, or Pagurians, a tribe of the apterurous section of the Anomurus family of Crustacea, composed of a considerable number of species, the greater part of which are remarkable for the more or less complete softness of the abdomen, the want of symmetry in the appendages of this part of the body, the shortness of the two posterior pairs of feet, and many other characters. Modern writers recognise several genera of this family. The Pagurus of Aristotle is not a Hermit-crab; but he describes three kinds of Hermit-crabs under the name *Kapktivov*. They are termed *Kapkivas* by Oppian, Ælian, and Galen. A great resemblance exists among all the Paguri, properly so called, not only in the details of their organisation, but in their habits. The cephalo-thoracic portion of their body is shorter than the abdominal portion. Hermit crabs or paguri, have stout claws and have a shield in front, but have a long soft and utterly defenceless tail. They occupy empty Natica and Neritina shells.

Pagurus cristatus, *Edws.* New Zealand.

" *deformis*, *Edws.* Mauritius, Seychelles.

" *punctulatus*, *Edws.* Indian Ocean.

" *affinis*, *Edws.* Ceylon.

" *sanguinolentus*, Q. & G.

" *setifer*, *Edws.* New Holland.

" *clibanarius*, *Edws.* Asiatic Seas.

" *crassimanus*, *Edws.* South Seas.

" *tibicen*, *Edws.* South Seas.

Pagurus elegans, Q. and G. New Ireland.

aniculus, *Edws.* Mauritius.

gonagrus, *Edws.* China.

pilosus, *Edws.* New Zealand.

frontalis, Q. and G. New Holland.

gamianus, *Edws.* Cape of Good Hope.

miles, *Edws.* Coasts of India.

custos, *Edws.*

diaphanus, *Edws.* "Oceanica."

" *hungarus*, *Fabr.* India, Naples.

Cenobita of Latreille is a genus of the Paguridæ and in the opinion of M. Milne-Edwards, establishes the passage between the Paguri, properly so called, and Birgus. *Cenobita rugosa*, in length about 3 inches, is found in the Indian Ocean. There are three other species.—*Eng. Cyc.*; *Milne Edwards.*

PAGU TULLU, in Chittagong, *Bambusa baccifera*, also *Beeshâ rheedii*, *Kunth.*

PAHALGAM, see Kashmir.

PAHAL or Chaupan Pal, of Kashmir, are shepherds who tend the flocks of other people, there are, besides, several wandering tribes who seem distinct from the settled population.

PAHANG, on the east coast of the Malay peninsula, in lat. 3° 31½' N., was formerly a place of great trade: the river is small. The southern part of Pahang is inhabited by the same tribe of Binua who are found in Johore. Some of them indeed have habitations which can scarcely be called houses. In the forests of Pahang are numerous tribes of the Jakun, who are as white as Europeans: they are small, but very good looking; and the Malays form a party and beat the forest in order to catch these poor creatures. They take their captives to Pahang or to Siam, where, on account of their whiteness and comeliness, they sell them at a high price. The marriages of the Jakun are ordinarily celebrated about the months of July and August when fruits are plentiful. The bridegroom frequents for some time the house of his intended, and when he has obtained her consent, he makes a formal demand to the father. A day is then appointed; and an entertainment is prepared, more or less solemn, according to the means of the two contracting parties, and their rank in the tribe. When the day of the marriage is arrived, the bridegroom repairs to the house of the bride's father, where the whole tribe is assembled. The dowry given by the man to his intended is delivered, and must consist at least of a silver or copper ring, and a few cubits of cloth: if the man is not poor, a pair of bracelets, some other ornaments, and several articles, as of furniture for the house of the new family, are added. Sometimes the woman presents also some gifts to her intended. Then the bride is delivered by her father to the bridegroom, and the solemnity of the wedding begins. Others state that amongst some tribes there is dance, in the midst of which the bride elect darts off into the forest,

followed by the bridegroom. A chase ensues, during which should the youth fall down, or return unsuccessful, he is met with the jeers and merriments of the whole party, and the match is declared off. This story was related a little differently by a European who inhabited Pahang many years, who said that during the banquet a large fire is kindled, all the congregation standing as witnesses: the bride runs round the fire followed by her groom. See India, Jakun, Kedah or Quedah.

PAHAR, HIND. A hill.

PAHARIAH, of the Sonthal pergunnah, are arranged into two tribes, those who live in the Rajmahal hills, and the Naiga Pahariah on the plains to the west. The former live by grain crops reared on the slopes of the hills, and by bartering in the plains the hill bamboos, and the grass and timber which grow in luxuriant profusion in every direction. The Pahariah are given to great lying and drunkenness. The Bhagulpoor Hill Rangers were principally composed of this people. But since Mr. Cleveland's settlement in the beginning of this century many of them receive pensions. The other body, the Naiga Pahariah, have more than all the vices of their tribe on the hills, but are worse off, having no right of forest or well wooded hills and readily take to brigandage. Both the Pahariya tribes are low in the social scale. The Sonthal and Male or Rajmahali are regarded by Mr. Logan as a displaced portion of the prior inhabitants of the country. The Male and Kol tribes are supposed by him to resemble the coarser Binua tribes of the Malay peninsula, more than the Burmans, the Malays, or other Indonesian tribes. But the same type as the Male and Kol are found amongst Malays and Burmans, although generally softened, and the short and turned up nose caused by it are Binua, as also is the small stature and the vertical, turned up head. The Male or Rajmahali are described as mostly very low in stature, but stout and well proportioned. There are many less than 4 feet 10 inches and perhaps more under 5 feet 3, than above that standard, but 5 feet 3 inches is about the average height of the men. Their nose is flat and their lips thick, though less so than the Kafirs of Africa, but their lips are thicker than those of the population of the neighbouring plains. Buchanan Hamilton says that the features and complexion resemble those of all the rude tribes whom he had seen on the hills from the Ganges to Malabar, that is on the Vindhya mountains. Their noses are seldom arched and are rather thick at the points, owing to their nostrils being circular. Bishop Heber says that the Male nose is rather turned up than flattish, but they are not so diminutive as the noses of the Tartar nations, nor flattened like those of the African Negro.

Their faces are oval and not shaped like a lozenge, as those of the Chinese are. Their lips are full, but not at all like those of the Negro; on the contrary their mouths in general are very well formed. Their eyes, instead of being hid in fat and placed obliquely like those of the Chinese, are exactly like those of the Europeans. Their women, though hard worked, are far from having harsh features. Bishop Heber says that the Malay or Chinese character of their features is lost, in a great degree, on close inspection. The Male head like that of the Kol has more of an elongated oval than that of a lozenge shape. The forehead is not narrow and the lateral projection of the zygomata is comparatively small. Nothing is said respecting the shape of the back of the head, a very important point in comparing Turanian tribes; the Male, or Hill man is described by Captain Sherwell as much shorter than the Sonthal and of a much slighter make. He is beardless or nearly so, is not of such a cheerful disposition, nor is he so industrious.—*Cal. Review*, Dec. 1860; *Mr. Logan in Jt. In. Arch.* See India, Kol.

PAHARI ARAND, HIND. *Jatropha curcas*, purging nut.

PAHARI GAJAR, HIND. *Eryngium planum*.

PAHARI KIKAR, HIND. *Acacia farnesiana*.

PAHARI-PIPAL, HIND. *Thespesia populnea*, Lam., also *Populus ciliata*.

PAHARI PODINA, HIND. *Mentha viridis*, Linn.

PAHAURA, or P'haura, HIND. A hoe.

PAHKALI. According to the Akbarnamah this district was 30 kos long and 25 broad. During Akbar's reign it was ruled over by sultan Husain Khan, a descendant of the Karlugh which tribe was left in Pahlavi by Timur on his return from India to Turan. The district after a short resistance was annexed by Akbar in the 35th year of his reign.—*Cal. Rev.*, Jan. 1871.

PAHLAVI, a term applied to an ancient language of Persia. The origin of the word is said to be Balkavi or pertaining to Balkh and softened into Pahlavi. The term Pahlavi now applied to the official language of the Sassanian dynasty, Dr. Haug traces to Pahlav-parthia, and holds that from the memory of Parthian rule in Persia, everything connected with antiquity was called pahlavi, i. e., ancient. The term Huzvaresht as applied to Pahlavi, he explains as a mode of writing and pronouncing a foreign word, generally Semitic, being written, and its Persian equivalent pronounced in its stead. Dr. Haug deciphered the Hajjabad, Naksh-i-Rajab and other Pahlavi inscriptions, and shows that in the Pahlavi languages, the Semitic ele-

ment far out-weighs the Iranian. The Iranian verbal terminations, found in the Pahlavi MSS. are entirely wanting in the earlier Habbad inscription. The Pahlavi, of the MSS. is, as written, a Semitic language with an admixture of Iranian words and a prevailing Iranian construction, and as read, a purely Iranian tongue. From using the Huzvaresli mode, the Persians came by degrees to write their words as they pronounced them, and thus the Semitic words of the Pahlavi had disappeared from modern Persian as early as the time of Firdusi. In discussing the origin and age of Pahlavi it cannot be supposed that the Sassanian kings, very zealous promoters of Persian ascendancy and restorers of the Zoroastrian religion, would adopt for their official language a Semitic dialect not then existing in Persia. Dr. Haug, therefore, looks to an earlier period of Persian history, and shows reason for concluding that Pahlavi is identical with that form of the Assyrian language which was spoken at Nineveh, whence it spread, with the Assyrian rule, over all the subject provinces, and among others over Iran. An old Pahlavi-pazend glossary, was edited by Destur Hoshengji Jamaspji Asa, revised and enlarged, with an introductory essay on Pahlavi by Dr. Martin Haug, Ph. D. It comprises the text of the Sassanian Farhang, and a Pahlavi-English glossary arranged as an alphabetical index according to the Roman character, and an important essay on the Pahlavi language by Dr. Haug. The essay comprises a history of the researches made in Europe into the Pahlavi language and literature.—*Times of India*. See Bactria.

PAHLIDAR, HIND. A rifle barrel in facets, not round.

PAHLE, LEP. *Felis uncia*, *Schreber*.

PAHLWAN or Phailwan, HIND. An athlete a wrestler.

PAHOL, SIKH. The ceremony of initiating a Sikh, in his faith.

PAHU, HIND. *Parrotia jacquemontiana*.

PAHWAR, HIND., PJI. Generic name for the tract of country and districts between the Jhilam and Indus rivers.

PAI, BURM. Lablab vulgare, *Savi*. DC. Indian kidney bean.

PAI, TAM. A spirit, a demon; a goblin, a devil. See Pais-achi.

PAI, BURM. *Melilotus officinalis*, *Linn*.

PAIDI CHETTU, or Medi chettu, TEL. *Ficus glomerata*, *R*.

PAIDI PATTI or Pamidi patti, TEL. *Gossypium acuminatum*, *R*. iii. 186—*W*. III. 27—*Royle*, III. i. 98. Paudi means "gold," hence "excellent" this species being much prized by brahmins for making the sacred thread and for the wicks of temple-lamps. It is generally

found in back-yards and gardens and is known by its coarctate seeds.

PAIDI TANGEDU or Nuti kasinda, TEL. *Cassia sophora*, *L*.

PAIERA, MALEAL. *Oryza sativa*, *Linn*.

PAIGHIAMBAR, HIND. Prophet.

PAIGHAMBRI GAHOON, HIND. A huskless or pearl barley in Gugaira; black or purple barley is called the same, literally, prophet's wheat, a fine wheat without husk.

PAIGHIAMBARI GUL, HIND. *Arnebia echinoides*.

PAIGUL, TAM. A Mat.

PAIJAMA, HIND. Trowsers, lit., leg dress.

PAIKASHIT, HIND. Cultivators, persons who having no land of their own, cultivate other peoples' land on terms agreed on.

PAIK, hindoo village milita, called Paik, Shet-sanadi and halab, in different parts of the country.—*W. E*.

PAIK HIRAN, BURM. *Crotalaria juncea*, *Linn*.

PAI-KUMITI-KAI, TAM. *Cucumis colocynthis*, *Linn*.

PAIL, HIND. A rich loamy soil irrigated.

PAILE MARUM, TAM. *Careya arborea*.

PAI-LEN-MWAE, BURM. *Trichosanthes anguina*, *Linn*.

PAIIL, a measure of capacity, $\frac{1}{8}$ of a kurawa.

PAINA-SCHULLI, MALEAL. *Dilivaria ilicifolia*.

PAINA, bracelets worn by native women of India.

PAIN GANGA, an affluent of the Godavery river. The town of Chanda is built on its bank.

PAINI MARAM, TAM. Gum resins.

PAINI-SANTA, HIND. A plough driver's whip and goad.

PAINJNI, HIND. Part of a cart.

PAIN-NAI, BURM. *Artocarpus laccucha*, also *Artocarpus integrifolia*, *Linn*.

PAI-HOON, BURM. One of the Leguminosae.

PAI-KYET-SOO, BURM. One of the Leguminosae.

PAI-NOUNG-NEE, BURM. *Canavalia gladiata*.

PAI-TIAN-TA, BURM. One of the Leguminosae.

PAI-BYA, BURM. One of the Leguminosae.

PAI-NAI-THA, BURM. One of the Leguminosae.

PAI-NOUK, BURM. One of the Leguminosae.

PAI-BE-SAT, BURM. One of the Leguminosae.

PAI-NOUNG-NEE, BURM. *Canavalia gladiata*, *D. Cand.*, *Roxb.*, *W. & A*.

PAINSADI, also Painsi, HIND. Broad cotton cloth, 500 threads in the web.

PAINSAAR, HIND. Part of the treddle in a loom.

PAINTED BAT, *Kerivoula picta*, *Jerd.*

PAINTED JUSTICIA, *Justicia picta*.

PAINTED POTTERY. Specimens of this ornamented pottery were sent from India to the London Exhibitions.

PAINTED SNIPE, *Rhynchæa bengalensis*.

PAINTING OF PORTRAITS, is an art which in India and China has attained to a high excellence.

PAIRAHAN, HIND. An under shirt.

PAIRHARA, HIND. Anklets.

PAIRAMMAVARU. Amongst the non-Aryan races of the S. of India, the goddess of small-pox. See Hindu or Hindoo.

PAIROODAGARADOO, TAM. Agriculture.

PAIRU, TAM., see Hindu or hindoo.

PAI-PA SOON, BURM. *Cyamopsis psoraleoides*, *D. C. W. & A. W. Ic.*

PAISACHA, SANS. Demoniac; a demon.

PAISACHI PRAKRIT, differs not much from Magadhi.—*Hind. Theat.*, Vol. ii, p. 215.

PAISHKUSHI, or Pesh-kush, PERS. It literally signifies "first fruits," or rather that which is first extracted.—*Malcolm's Central India*, Vol. ii, p. 60.

PAITHAN, on the Godavery, is the Tagara of the author of the Periplus, which supplied the sindones for the roman market, Colonel Tod supposes Tagara to be from Tak-nagara, the city of the Tak, or Takshac.—*Tod's Travels*, p. 297.

PAI-TOO, CHIN. Usually called a triumphal arch; ornamented buildings common in every part of China; some of stone, and others of wood. Most of them have been erected at the public expense.—*Baron Macartney's Embassy*, Vol. i, p. 24.

PAI-YEN-KHIYUNG, BURM. *Cajanus indicus*, *Spreng.*

PAJANELLI also *Aulantha*, *MALBA.* *Calosanthus indica*.

PAK, HIND., PERS. Pure, holy, clean.

PAK, HIND., of Jhelum, a square sail of a boat.

PAKANA, or Pakani, HIND., of Kaghan. *Rubus lasiocarpus*.

PAKAN-BED, HIND., or Pathan-bed, *Gentiana*, *sp.*; also *Saxifraga ligulata*.

PAKANG, see Sakai, Pahang.

PAKANRAS, HIND. A sweetmeat.

PAKAR, HIND. *Ficus venosa*.

PAKA-SHASANA, SANS. From paka, a giant, and shas, to govern.

PA-KA-THAN, BURM. A timber in Amherst, Tavoy and Mergui, of maximum girth 2 cubits and maximum length 12 feet. Abundant, but widely scattered all-over these provinces inland. When seasoned it floats in water. It is used by Burmese to make addles,

oars, &c.; is a tough, durable, good wood, but too widely scattered to be easily obtained, unless such a large quantity be ordered as would repay a search in the forest.—*Captain Dance.*

PAK-CHAN, see Mergui.

PAKENATTI, a peaceful and harmless migratory race, found in Mysore and the Telugu country, who, about the beginning of the 18th century were driven from their houses by oppression.

PAKFONG, the white copper of the Chinese, an alloy of 40.4 parts of copper, 31.6 of nickel, 25.4 of zinc, and 2.6 of iron.—*Simmond's Dict.*

PAKHA, KHAS. *Chamærops khasiana*.

PAKHA, HIND. Ripe; complete; perfect. See Pakka.

PAKHALL, a lake, distant about 140 miles from the Nizam's capital, in a north-easterly direction. This reservoir, which is picturesquely situated in the heart of a pretty dense forest, has a magnificent spread of water, taking in a circumference of about 50 miles, its shelving margin being girded by a chain of low wooded hills and undulations. One in particular deserving special notice, situated on the south-east side, of considerable height and clothed with arborous verdure, constitutes a striking foreground to the picture, well worthy the pencil of the artist. The advantages here presented by nature, in steep natural ridges, have, at some remote period in the past, been made subservient to the formation of a huge embankment, by which means the capacity of the lake was considerably enhanced, and the existence of old weirs and sluices unmistakably indicate the quondam flourishing condition of the land in the vicinity. When Mr. Blanford visited some of the remote parts of the Nizam's district, it was learnt after much trouble that there were thick beds of coal in the valley of a nullah not very far from Pakhall in the Warungal district. The place is often visited by wild elephants. The engineer put down trial borings in a place called Ballarpur, and the result was that beds of more than fifty feet thickness were found. At a place called Wurroa, a coal-pit was commenced, and a sufficient amount of information was obtained to enable the searchers to go on with their work. Dr. Oldham had a consultation with the Chief Commissioner of the Central Provinces on the subject of connecting the valley by rail with Bombay, and if this line of railway were completed, the great cotton and coal producing lands of Central India would be accessible to the nearest Indian seaport to Europe. The coal is of poor quality, breaks very rapidly on exposure and is therefore very wasteful. The coal from a place known as Saster is said to be very durable. Dr. Oldham is of opinion that there is yet a very large area of the Nizam's

dominions under which workable coal can be found, and which will prove valuable at some future day.

PAKHA MARTIANA, see *Chamærops khasiana*.

PAKHAN-BED, often applied to *Saxifraga ligulata*.

PAKHAR, HIND. *Ficus venosa*.

PAKHA RITCHIANA, see *Chamærops khasiana*.

PAKHTAWAR, HIND. *Abelia triflora*.

PAKHTO, PUSHTU or AFGHAN. The spoken language of the Affghan people.

PAKHUR, HIND. *Lonicera quinquelocularis*.

PAKKĒ or Pakki chettu, or Prakke chettu, TEL. *Tamarix gallica*, L.—*β. Indica*, R. ii, 100.

PAKINATI WANLOO, TEL. The head of the village authorities, the Reddi or Patail. See *Bara baluti*.

PAKISER—? see *Cock*.

PAK LEAK LOW, called also Poo-toy, a small island, $1\frac{1}{2}$ mile distant from the Grand Ladrone.

PAKKA, HIND. Often written pucca, ripe, complete, perfect and satisfactory. Used of buildings, means made of stone or brick and mortar, as opposed to mud; pakka plaster, plaster made of lime.

PAKKAH OSPANA, HIND., of Bajaur, Hammered iron.

PAKLI, see *Kashmir*.

PAKO-G'LING-GANG, or G'linggang, MALAY. *Cassia alata*, Linn.; *W. & A.*

PAKOOR, BENG. *Ficus venosa*.

PAKORES, see *Greeks of Asia*.

PAK-PATTAN, or Ajudhan, an ancient city in the Punjab, on the high bank of the old Sutlej, 28 miles from the present course of the river. Its foundation is assigned to a hindoo saint, or raja, of the same name, of whom nothing else is recorded. This part of the Doab is still known as Surat-des, a name which recalls the Sura-kousē of Diodorus, and the Sudrakæ and Oxudrakæ of other Greek writers. The Kathæi of Sangala are stigmatized in the Mahabharata as "thieving Bahika," as well as "wine-bibbers, and beef-eaters." They are also called by a variety of names, as Madra, Bahika, Aratta, and Jarttikka, and not even once by their own proper name, which, as we know from Alexander's historians, was Kathæi, and is preserved in the Kathi of the present day. General Cunningham therefore looks upon many of the ethnic appellations which the Greeks have handed down to us as mere nicknames, or abusive epithets applied by the brahmanical Arians to their Turanian neighbours. Pliny places the limit of Alexander's career in the territory of the Sudrakas, "in Sudracis expeditio Alexandri termino," and the altars on the opposite bank of the Hy-

phasis, or Bias river. On a general review of all the data, General Cunningham thinks that the site of Alexander's altars must be looked for along the line of the present course of the Sutlej. To this point, therefore the territory of the Sudrakæ, or Surakas must have extended in the time of Alexander. For many centuries Ajudhan was the principal ferry of the Sutlej, where the two great western roads from Dera Ghazi Khan and Dera Ismail Khan met the first via Mankera, Shorkot and Harapa; the second via Multan, and at this point the great conquerors Mahmud and Timur, and the great traveller Ibn Batuta, crossed the Sutlej. The fort is said to have been captured by Sabaktagin in A.H. 367, or A.D. 977-78, during his plundering expedition in the Punjab; and again by Ibrahim Ghaznavi, in A.H. 472 or A.D. 1079-80. On the invasion of Timur, the mass of the population fled to Bhatner, and the few people that remained were spared out of respect for the famous saint Farid-ud-din Shakar-ganj, whose shrine is in Ajudhan. From this saint the place derives its modern name of Pak-pattan, or the "Ferry of the Pure One," that is of Farid whose latter days were spent at Ajudhan. By continued fasting his body is said to have become so pure that whatever he put into his mouth to allay the cravings of hunger, even earth and stones, was immediately turned into sugar, whence his name of Shakar-ganj, or "Sugar-store." This miraculous power is recorded in a well-known Persian couplet:—

Sang dar dast o gohar gardid
Zahr dar Kamo Shakar gardid.

From a memorial couplet we learn that he died in A.H. 664, or A.D. 1265-66, when he was 95 lunar years of age. But as the old name of Ajudhan is the only one noted by Ibn Batuta in A.D. 1334, and by Timur's historian in A.D. 1397, it seems probable that the present name of Pak-pattan is of comparatively recent date. Colonel Yule says Abu Ajudin or Pak Pattan (the Pure or Holy Ferry) is a town on the right bank of the Sutlej valley, about half way between Bhawalpur and Firuzpur, the site of a very sacred mahomedan shrine, for the sake of which Timur on his devastating march spared the few persons found in the town.—*Cunningham's Ancient Geography of India*, pp. 214-219; *Yule Cathay*, Vol. ii, p. 406.

PAKRA, HIND. *Tribulus lanuginosus* and *terrestris*.

PAKRAIR, a river of Rewah.

PAK SHANGHARF, DUK. Cinnabar.

PAKSHUBUT, HIND. *Populus nigra*.

PAKSI, MALAY. A bird.

PAKU, MALAY. Nails.

PAKU TUNDU SUMAT, *Cycas circinalis*, L.
PAKU, see Karen, Tin.

PAKUA, HIND. *Euonymus fimbriata*.

PAKUNG-BA, in Munnipore, the personal deity or ishta-deva of the rajah. It is a snake, from which the Munnipore family claim descent. When it appears it is coaxed on to a cushion, by the priestess in attendance, who then performs certain ceremonies to please it.

PAKU MARAM, TAM. *Areca catechu*, Linn., Roxb.

PAKUR, BENG. *Ficus venosa*, Ait.

PAKURA, HIND. *Nyctanthus arbor-tristis*.

PAKUSH-ASANI, see Indra.

PAKYA, MAHR., of the Ghats, *Pteromys petaurista*, Pallas; Bly.

PAKYOTH, the wild gourd of Scripture, *Citrullus colocynthis*, Schw., grows in many parts of India, on the sandy lands of the peninsula, Dekkan, Guzerat, Kaja, Delhi. Dr. Burn states colocynth of two kinds occur in Guzerat, the cucumis colocynthis, and C. pseudo-colocynthis. The colocynth of commerce is the dried fruit, peeled and unpeeled, and is brought from the Levant, North of Africa and South of Spain. Colocynth is useful for protecting shawls and feathers against their inroads.

PAJA, HIND., of Kotgurh, also Pajjai *Cerasus puddum*, *Prunus puddum*, bird cherry. Seta pajja, HIND., is *Rhamnus virgatus*.

PAJANELLI or Aulantha. TAM. *Calosanthos indica*.

PAL, a tent.

PAL, a local term for long defiles, the residence of the mountaineers, their chiefs are called Indra Pati, in Bhaka, put. Pal is also the term for a community of any of the aboriginal mountain races; its import is a 'defile,' or 'valley,' fitted for cultivation and defence. It is probable that Poligar may be a corruption of Paligar, or the region (gar) of these Pal; Palita, Bhilita, Philita, are terms used by the learned for the Bhil tribes. Maina or Myna, Maira, Mairete, all designate mountaineers, from Mair or Mer, a hill.—*Tod's Rajasthan*, Vol. i, p. 381, Vol. ii, p. 350.

PAL, TAM. Milk.

PALA, MAL. *Alstonia scholaris*.

PALA, BURM. *Elettaria cardamomum*.

PALA, HIND. Frost.

PALA, see Inscriptions.

PALA—? In Penang, a tall thin tree; wood used for planks.—*Col. Frith*.

PALA, TAM. *Cluytia patula*, Roxb.

PALA, a dynasty of Gaur, one of whom, named Abhaya Deva, reigned A.D. 1439.

PALA CAMUDI, MALAY. *Cacalia sonchifolia*.

PALACH, HIND. Cotton or down of *Populus ciliata*.

PALA CHETTU, TEL. *Mimusops hexandra*, R. ii, 238; Cor. 15—*W. Ic.* 1587. SANS. Syn. Kshirika. The name is also applied to *Wrightia antidysenterica* in the Rajahmundry hills and according to Beddome to *Holorrhena antidysenterica*, in the upper Godavery valley.

PALA CHUKKANDERU, TEL. *Hemidesmus indicus*, R. Br.—*W. Ic.* 594; *Contr.* 63—*Rheede*, x, 34. Br. 594, "a plant called Country Sarsaparilla." Chukka is a spot or mark referring to the pale mark down the centre of the leaf in some varieties.

PALA CODIJA also Manoopala, TEL. *Wrightia antidysenterica*. Connessi bark.

PALA INDIGO, indigo made from the *Wrightia tinctoria*.

PALAEORNIS, a genus of birds of the family Psittacidae, of which the following species may be named:

P. alexandri.	bengalensis.
P. barrabandi.	bitorquatus.
erythrocephalus.	pondicerianus.
flavitorquis.	panthosomus.
malaccensis.	torquatus.
papuensis.	

P. calthorpe, *Layard, Blyth*, J. A. S. xviii, 800, xix, 334, "common at Newera Elia and lower down." (*Kelaart*.)

PALA DANTAM, TEL. *Ehretia laevis*, R. i, 597; Cor. 56—*W. Ic.* 1382.

PALA GARUDA, TEL. *Alstonia scholaris*, R. Br.—*W. Ic.* 422—*Rheede* 1, 45.

PALA GUNDA, TEL. *Maranta ramosissima*, Walk.—Grows wild in all the hill forests. Under the name of Palagunda or hill Arrow root, the Madras Revenue Commissioner, Mr. Elliot, sent a small supply of a starch from the Rajahmundry district, to the Exhibition of 1851.

PALA GURUGU, TEL. *Holostemma rheedianum*, Spreng.—*W. Contr.* 55; *Ic.* 597—*Ascl. annularia*, R. ii, 37—*Rheede*, ix, 7.

PA-LAH, BURM. *Elettaria cardamomum*, Wh. & Mat.

PALAK, also Palak-joohi, BENG. HIND. *Rhinacanthus communis*, also *Justicia nasuta*, and *Ixora undulata*.

PALAKH, HIND. *Ficus venosa*, Ban pala, is *Pyrus Kumaonensis*, Bissahri-pala is *Diospyros lotus*.

PALAK, HIND. *Beta vulgaris*: Jangli palak, is *Rumex acutus*.

PALAK, HIND., of Salt Range, is *Ficus glomerata*.

PALAK, HIND. *Spinacea oleracea*, a vegetable spinach, also *Beta bengalensis*.

PALA KURA or Chiru pala, HIND. *Oxytelma esculentum*, R. Br. Heyne, where the Sans. syn. Jivaka and Jivantika, *W.* 352, do not seem to be correct referring properly to sp. of *Terminalia* and of *Orchids*, &c.

PALALU, of the Northern Circars, agricultu-

ral labourers who are regarded as slaves to the ryots, and are hereditarily attached to and transferrable with the land. *The Agari* of Cuttack are said to be domestic slaves.

PALAM, JAV. *Mangifera indica*, Linn.

PALA MALLE TIVVA, TEL. *Vallis dichotoma*, Wall.—*W. Ic.* 438—*Echites dich.*, R. ii, 19, the Konda Doralu call it Putta podara yarala. See Poda putra.

PALA MARAM, also Patta, TAM. *Mimusops hexandra*.

PALA MARAM, the Malayala name of one of the jungle fruit trees of Malabar and Canara. It produces a fruit which the natives use medicinally, but as a timber it is of no value.—*Edye, Forests of Malabar and Canara*.

PALAMEDEIDÆ, a family of birds,

Sub-fam. Parrinæ, 2 gen., 2 sp., viz., 1 *Metopidius*; 1 *Hydrophasianus*.

Fam. Gruidæ, 1 gen., 1 sub-gen., 3 sp., viz., 2 *Grus*, 1 *Anthropoides*.

PALA MARAM, TAM. *Wrightia tinctoria*.

PALA MARAM, also Palak, also Palavay-raynoo, TAM. *Nerium tinctorium*.

PALAMOW, a district in W. Bengal, in which coal has been discovered. The district is very mountainous.

PALAMPORE, or Palang posh, HIND., a bed cover.

PALAMOUD, an alimentary substance used by the Turks and Arabs, and very much esteemed. It consists of acorns which have been burned to destroy the bitterness, dried, and toasted, and reduced to powder, with sugar and aromatics added.—*Simmond's Dict.*

PA-LAN, BURM. *Bauhinia diphylla*, Buch.

PALANDOK, MALAY. *Tragulus kanchil*, Gray.

PALANDOO, — ? Onions.

PALA NELA GUMMUDU, Batatas pentaphylla, Ch., *W. Ic.*, 834. Sans. Kshiraka, *W.*

PALANG, HIND. A Bed.

PALANG KELANGU, TAM. *Curcuma zedoaria*, Roxb.

PALAPATTA, MALEAL. *Wrightia antidysenterica*, R. Br. The bark.

PALANG POSH or Palampore. The former term is composed of two Persian words, literally "bed-cover." These are manufactured in the district of Cuddalore, at Ponnary, also at Sydapett in the out-skirts of Madras but, especially in the town of Masulipatam, the last always of a superior kind and in various sizes, $5\frac{1}{2}$ to 6 cubits in breadth and 7 to 8 long, and are sold from 6 Rupees to Rs. 15 according to size. The Cuddalore, Ponnary and Sydapett fabrics are of ordinary quality, and are sold at from Rupees 2 to 7 each.

PALANKEEN or Palanquin, a litter or covered carriage borne on men's shoulders. Palanquin-bearing is rather a Chinese than an

Arian fashion. It has almost wholly ceased to be used in India.—*C.*, p. 53; *Simmond's Dict.*

PA-LAN-TOUNG WÆ, also Toolæ pha-do BURM. *Costus argyrophyllus*, Wall.

PALA NUGA, TEL. A cucurbitaceous plant; *Lagenaria*, sp.

PALA PANDU, TEL. *Mimusops hexandra*.

PALA-PATTA, MALEAL. *Wrightia antidysenterica*; Connessi bark.

PALAR RIVER rises on the Mysore table-land, lat. $13^{\circ} 20'$, long. $78^{\circ} 2'$ runs S.E., 55 m., E. 87 m. S. E., 48 m. into Bay of Bengal. Length about 220 miles, running past Vellore, Arcot and Chingleput. It receives the Pony, 40 m.; Sheyaroo, 90 m. The entrance of the Palar, near Sadras, is contracted by a bar or narrow ridge of sand, inside of which the river becomes of considerable width. Kanchipura is the true Sanskrit name of Conjeveram, on the Palar river, a large straggling town of great antiquity, and still called Kanchi by the people. As Dravida was bounded by Koukana and Dhara-kata on the north, and by Malakuta on the south, while no district is mentioned to the west it seems certain that it must have extended right across the peninsula, from sea to sea. During the pilgrim Hwen Thsang's stay at Kanchipura, about 300 Buddhist monks arrived from Ceylon, which they had quitted on account of political disturbances consequent on the death of the king. Hwen Thsang must have arrived in Kanchipura, about the 30th of July, A. D. 639, and according to Turnour's list of the kings of Ceylon, raja Buna Mugalan, was put to death in A. D. 639. From the information furnished by these monks, the pilgrim drew up his account of Seng Kia-lo or Ceylon, which he was prevented from visiting by the disturbed state of the country. From Malayakuta he returned to Dravida (Conjeveram), and then proceeded to the north-west for 2000 li or 333 miles, to Kong-kien-na-pu-lo, or Konkanapura. Annagundi is a remarkable old site, and was the capital of a Yadava dynasty of princes before the foundation of the modern city of Vijayanagar on the southern bank of the river.—*Cunningham's Ancient Geog. of India*, pp. 548-49, 552; *Report of the Royal Sanitary Commission*.

PALARI, SINGH. Boa-wood.

PALARI, PORT. See Pali.

PALAS, BENG., HIND., MALEAL., SANS. *Butea frondosa*. When a hindoo died at a distance, it was customary to burn vicariously an article of clothing along with a bundle of leaves of the *Butea frondosa*. This vicarious rite is called Palasavidhi. It is from the abundance of the Palas tree on the field that the name of Plassey was given to the battle fought by Clive in 1757.—*Wilson*. See Hindu or hindoo.

PALA SAMU, or *Moduga chettu*, *Butea frondosa*, *R.*

PALA SAMUDRA, or *Samudra pala*, *TEL.* *Argyrea speciosa*, *Sut.*

PALAS GUM, or *Pulas gond* or *Dhak ka gond*, is the produce of *Butea frondosa*, in ruby red, transparent grains of irregular tears. Much uncertainty long existed regarding the origin of the astringent gum kino, of which there are several kinds. The East Indian, African, Australian and American varieties, are ascribed to different trees. Kino generally occurs in shining grains, of a rich ruby red colour, nearly all soluble in alcohol, and readily pulverisable between the fingers. It also occurs in small and shining, brittle, angular fragments of a deep-brown colour, which appears to be a natural exudation of some one plant, from the uniformity of its appearance. The gum of *Butea frondosa* from India, at one time acknowledged by the Dublin College has no doubt been sometimes imported as kino. Botany Bay Kino, produced by *Eucalyptus resinifera*, or *Brown Gum Tree*, was at one time acknowledged by the Edinburgh College. A Jamaica, and a Columbian Kino, are mentioned; and an extract of *Rhatany* is sometimes enumerated with them. But a genuine kino has been supposed to come from the west coast of Africa. The best is now imported into Great Britain from Bombay. Kino seems to have been first introduced into European practice by Dr. Fothergill, in 1757, who states, in a paper in *Med. Obs. and Enq.* i, 358, that he was indebted for information respecting it to Dr. Oldfield, and that the substance was obtained from the river Gambia, whence he called it *Gummi rubrum astringens Gambiense*. Previous to this, Moon, in his travels into Africa, mentions a red gum as issuing from incisions in trees, and which he mistook for Dragon's blood. Mungo Park discovered that the tree which yielded this substance was called *Pao de Sangué* (Blood tree) by the Portuguese. His specimens were determined by Mr. R. Brown to belong to *Pterocarpus erinaceus*,—a tree which has since been well figured and fully described in the *Flore de Senegambie*, was introduced into the E. P. 1774 as *Gummi Kino*, and into the L. P. 1787 as *Resini Kino*, the name is derived from the Indian term *kini*, applied to a similar exudation from the bark of *Butea frondosa*, of which the Sanscrit name is *Kini-suka*, because this *Butea* gum had been sent as Kino to the above Society from Bombay. An old specimen in the India House is marked *Gum Cheena*. Dr. Pereira, several years since, found this "in the warehouse of an old drug firm in London a substance marked *Gummi rubrum astringens*," which he was told had formerly fetched a very high price. It is, however, very

distinct from the kino of commerce, which, Dr. Royle was inclined to think was the produce of *Pterocarpus marsupium*. Dr. Pereira states that what he calls East Indian Kino is always regarded in commerce as genuine Gum Kino, the produce of the Malabar coast, from Anjarakandy, a farm within a few miles of Tellicherry, formerly one of the East India Company's plantations, under the superintendence of Mr. Brown, and visited by Dr. Buchanan, in January 1801. Gum kino is used medicinally as an astringent and in India to dye cotton cloth of a nankeen yellow.—*Mysore*, ii, p. 544; *Waterston*; *Faulkner*; *Himal. Bot.*, p. 195, and *Proc. Royal Asiatic Soc.*, p. 50, May 1838.

PALASII, or *Balsaces*, also *Balas*, the 18th Sassanian king, A.D. 484.

PALA UTAN—? In Penang, a wood of light brown colour, from a large tree; only used for planks.—*Col. Frith*.

PALAVA. *Manu*, speaking of the Palava tribe of *Kshatrya*, who had neglected to reverence brahmans, styles them *Dasya*, whether they speak the language of the *Mlechcha* or that of the *Arya*, and the people to whom he there alludes seem to have been Medes occupying the valley of the Indus.

PALAVARANI, or *Palava renu*, *TEL.* the Palay wood, of the English, *Wrightia antidysenterica*, a light, yellow, hard-wood.

PALAVESIUM, a Maraver of a servile family, who made himself celebrated for his robberies and outrages from Madura round to Quilon, during the latter period of the mahomedan Government of *Seringapatam*. He has been, since his death, worshipped as one of the Demons of the Shanars of *Tinnevely*, and was most feared of all their devils. Thousands of persons are called after his name.

PALAWAH, *Burm.* A beautiful red, but heavy, wood of British *Burmah*. A cubic foot weighs lbs. 52. In a full-grown tree on good soil the average length of the trunk to the first

branch is 45 feet, and average girth measured at 6 feet from the ground is 6 feet. It sells at 12 annas per cubic foot.—*Dr. Brandis' Cal. Cat. Ex.* 1862.

PALAWAN. The south western-most island of the Philippine group, is a long narrow strip of land extending nearly south-west and north-east 250 miles, forming the eastern boundary of the China Sea, from latitude $8^{\circ} 13'$ to $11^{\circ} 17' N$. The northern extremity is a narrow peninsula about 60 miles in length, consisting of a mass of limestone rock, rising precipitously from the sea from 200 to 300 feet in height, which the native inhabitants climb readily in search of edible birds' nests, their chief occupation. It is along the eastern coast of the island that ships proceed when ships are bound up the China Sea late in the seasons, when the north-east monsoon is expected and derives from this the name of the Palawan passage.—*Journ. Ind. Arch.* See Balabac Island, India, Monsoon.

PALEMBANG, is on the Eastern Coast of Sumatra. Its ancient name was Banca Palembang. During the British occupation of Java, the sultan of Palembang caused all the Dutch in the town to be massacred, thinking that by this summary method he would be enabled to rid himself entirely of European influence ;

but the British government at Batavia, horror-struck by the atrocity of his conduct, for the purpose of evincing their displeasure at the crime, and their determination to punish it, despatched a force under the command of Colonel Gillespie, who, in the execution of this duty performed one of the most gallant exploits upon record. The force consisted of several vessels of war, and a large body of troops. On ascending the river, a battery of one hundred large guns flanked by armed vessels, surrendered without firing a shot, and the sultan, terrified at the approach of the British, fled into the interior with his treasure. With the news of his flight, the British commandant was informed that the Malays had risen, and were slaughtering the Chinese and other foreign settlers. Colonel Gillespie, anxious to put a stop to these frightful outrages, embarked with a small number of grenadiers in a few light boats, leaving orders for a larger force to follow immediately. When the little party approached the town, darkness had already set in, and the shrieks and outcries plainly evinced that the work of carnage was continued. The Colonel and his party, which consisted of ten persons himself included, landed undisinayed among a vast multitude of blood-thirsty wretches who, paralyzed at the boldness of the action, allowed their opponents to enter the place, where they were soon afterwards joined by a small reinforcement. At midnight, about three hours after the arrival of the first party, the main body of troops entered the place, and a town defended by forts and batteries mounting two hundred and fifty pieces of cannon, was taken possession of without the loss of a single life. The following day saw order restored, and a new sultan was soon afterwards placed upon the throne. Notwithstanding the numerous languages in the Archipelago, the written characters are only eight or at most nine in number. The Javanese alphabet like all others in the Archipelago is written from left to right, each letter is distinct and unconnected, and the writing is perpendicular and not slanting. It is the character used for the Javanese proper, the Sunda, the Bali, and it is believed the Lombok and including Palembang in Sumatra, it is current among twelve millions of population. But in prior times, other characters to the extent of twelve in number, have prevailed in Java. See Sumatra.

PALEMONIDÆ, a family or tribe of Macrurous Decapodous Crustacea. They belong to Milne-Edward's family of Salicoques, or Shrimps, and his tribe Palemonians. The body is laterally compressed, but the abdomen never sharp. Thorax large, carapace armed in front with a great sabre-like rostrum, nearly always dentated above. Antennæ the first pair

often with three terminal filaments. All the feet are slender, and the first two pairs are generally didactylous, whilst the last three pairs are never didactylous. The abdomen is of great size. The genera are, Gnathophyllum, Hippolyte, Rhynchocinetes, Pandalus, Lysmata, and Palemon.

Rhynchocinetes typus.—Length about 2½ inches. It is a native of the Indian Ocean.

Palemon.—(Fabr.) The Prawn. The species of this useful and delicious genus are numerous. M. Milne-Edwards records seventeen, besides the Indian *Palemon brevimanus* and *P. Coromandelinus* of Fabricius. Some of the species which are found in warm climates attain to a considerable size: such are the *P. Carcinus* of the Indian seas and the Ganges, which attains to nearly a foot in length, and the *P. Jamaicensis* of the Antilles, which is from 10 to 12 inches long. The prawns generally inhabit sandy bottoms near the coasts, but some are found at the mouths of rivers, and far up. They mostly boil red. *Palemon natator*, *Edws.* Ind. Ocean, on Gulf weed.

- " *brevimanus*, *Edws.*
- " *coromandelianus*, *Fabr.*
- " *longirostris*, *Edws.* Ganges mouth.
- " *carcinus*, *Edws.* do.
- " *ornatus*, *Edws.* Amboyna, Waigyou.
- " *lamarrei*, *Edws.* Bengal coasts.
- " *tranquebaricus*, *Fabr.* Tranquebar.
- " *hirtimanus*, *Edws.* Mauritius.

Alpheidae.—The shrimps are stouter in their forms than those of the preceding division, but they are not depressed as the Crangonidae are; the genera are *Atya*, *Hymenocera*, *Alpheus*, *Pontonia*, *Antonomea*, *Curidina*, *Nika*, and *Atkanus*.

Alpheus (Fabr.)—Carapace advanced above the eyes, forming above each of those organs a small vaulted buckler. They are found in the seas of warm climates. Some species are found in the Mediterranean, but the greater part in the seas of the Antilles or in the Indian Ocean.

Pontonice (Latr.)—Carapace short and convex: the front with a short but robust and inflected rostrum; the eyes are cylindrical, projecting, and very moveable.

P. macrophthalma.—Asiatic seas.

Stenopus (Latreille).—Pencœde of Milne-Edwards: Body not compressed laterally, and teguments comparatively soft. Carapace terminated anteriorly by a small rostrum.

Stenopus hispidus.—*Palemon hispidus*, *Oliv.*, Indian Ocean.

Acetes. (Milne-Edwards).—Analogous to *Sergestes* in its conformation, but placed at a distance from all the animals of the same order by the absence of the last two pairs of feet. *A. Indicus*.—*Eng. Cyc.*

PALEMPORE, a kind of Indian dimity, of elegant patterns, used for bed coverlets. They are sometimes flowered with gold, made of

silk, and worked in shawl and other patterns of coloured woven cotton. This is a Tamil corruption from the two Persian words *Palaug-posh*, literally, bed-cover.—*Simmond's Dict.*

PALENGA ZEYLANICA, *Thw.*

Palenga-gass. SINGH.

A tree 40 to 50 feet high, of the Ambagaw-mowa district in Ceylon, at an elevation of about 3,000 feet.—*Thw. En. Pl. Zeyl.*, p. 287.

PALERI AMMA, a deity of the non-aryan races of the Peninsula. See Hindoo.

PALERU, *Tæl.*, *Tribulus lanuginosus*, *Linn.*

PALESTINE, gets its name from Philistine, a race who inhabited a tract bordering on the Mediterranean sea. It was also called Canaan. Palestine was originally inhabited by a number of tribes, Kenite, Kenizzite, Kadmonite, Hittite, Jerezzite, Jebusite, Amorite, Canaanite, Girgashite, Hivite, Phœnician and Philistine, who were descended from Canaan the son of Ham.

The desert coast of the Mediterranean Sea, between Gaza the frontier town of Palestine and Pelusium or Shur the frontier town of Egypt, was called by the Hebrew writers the desert of Shur. It was thinly peopled by a race of Arabs named Amalekites. In Palestine itself, Ptolemais, Diospolis, Antipatris, Ælia, have all completely disappeared, and the old names, which existed before these high-sounding titles were conferred—Akka (Acre), Lydd, Kefer-saba, Jerusalem, have re-established themselves as firmly as if they had never been displaced. Sebaste and Neapolis have, however, succeeded in maintaining themselves, and preventing the return of Samaria and Shechem. Palestine now has about 400,000 people, chiefly Arabs, and Arabic is the ordinary tongue spoken. The Christians of many hostile sects are next numerous, with a few Jews, who have migrated from Europe to die in Palestine. Palestine is described in Deuteronomy as "The land whither thou goest is not the land of Egypt, but a land of hills and valleys." The Lebanon is a mountain of Palestine, comprehends the two ranges of Libanus and Anti-Libanus. Lebanon is the most elevated part of the chain. The range of the Lebanon, extends between the 33rd and 36th degree of north latitude, from the river Assey (the ancient Orontes) to its southern limits, bounded by the Letani, or Leontes of old. It is inhabited by a variety of different tribes, who from time immemorial have found a refuge in its fastnesses.—*Sharpe's History of Egypt*, Vol. i, p. 105; *Galton's Vacation Tourists*, p. 337; *Robinson's Travels in Palestine and Syria*, Vol. i, p. 18; *Deut.* xi, 10-11. See Kedron, Wadi-Araba, Lebanon, Jerusalem.

PALGHATCHERRY, 10° 46'; 76° 40', in the Karnatik, near the right bank of the Ponani, about 800 feet, is a town in Coimbatore

in a gap or pass, leading to the western coast. The gap of Palghat is the only break in the western chain of mountains from the Ner-budda and Taptee to Cape Comorin, and through it the railroad passes. It is a great gap in the peninsular chain between the southern slopes of the Nilghiri mountains and the northern face of those of Travancore. The S. W. monsoon blows through and does not deposit its moisture though the atmosphere is humid and the Salem hills intercept the N. E. monsoon. The Palghat ghats are in length about 200 miles, from the gap of Palghatcherry nearly to Cape Comorin. Elevation from 4,000 to 7,000 feet with a spacious table-land, 4,740 feet. A peaked summit, 6,000 feet. Another 7,000 feet. Varragherry mountains 5,000 to 6,000 feet. Near Cape Comorin, in the extreme S., 2,000 feet. The W. brow of the ghats is, with little exception, abrupt; on the E. side the declivity is gradual. Such a conformation would indicate a volcanic disturbance along the W. precipitous face.

PALGONDA, see Nicolo-di-Conti.

PALHARA, HIND. One of the Solanaceae.

PALI, TAM. Irambu in Malabar, Palari in Portuguese, is the Ceylon Iron-wood. It grows to about thirty feet in height, and twenty inches in diameter. It is very useful for stocks of anchors, piles for jetty-heads, beams in store houses and places where strength is required; for such purposes it will be found useful and durable: it may be obtained in great quantities at a very moderate rate.—*Edge, on the Timber of Ceylon.*

PALI, TAM. *Isonandra acuminata*, Lindl.

PALI, see Pyrope.

PALI, an ancient language in India which has long ceased to be spoken, but is still used in the buddhist scriptures of Ceylon, Burmah, and Siam. The Pali tongue in Singhalese is called Mungata; and in Burmese Magada-basa. Pali, was the language used by Buddha. Pali, Bali and Magadhi are synonyms for the Pali tongue. The Rupasiddhi, is the oldest Pali grammar now extant, and its author Buddhapriya compiled it from the ancient work of Kachha-yana. A quotation from the latter is given in the Rupasiddhi apparently in the original words. According to this account, Kachha-yana was one of the principal disciples of Sakya, by whom he was selected for the important office of compiling the first Pali grammar, the rules of which are said to have been propounded by Tathagata himself. This statement seems highly probable; for the teacher must have soon found the difficulty of making himself clearly understood when each petty district had a provincial dialect of its own, unsettled both in its spelling and its pronunciation. A difficulty of this kind could

only be overcome by the publication of some established rules of speech, which should fix the wavering pronunciation and loose orthography of a common language. This was accomplished by the Pali grammar of Kachha-yana, compiled under Sakya's instruction; and the language, thus firmly established, was used throughout India by the buddhist teachers, for the promulgation and extension of the practical doctrines of their faith. In the buddhist works of Ceylon, this language is expressly called Magadhi, or the speech of Magadha; and as this district was the principal scene of Sakya's labours, as well as the native country of himself and of his principal disciples, the selection of Magadhi for the publication of his doctrines was both natural and obvious. Learned men have, however, entertained diverse opinions as to the Pali. Professor H. H. Wilson has remarked, that there are several differences between the language of existing buddhist inscriptions and the Magadhi of Pali grammars; but these differences are not such as to render them unintelligible to those whom Priyadasi addressed in his Pillar edicts in the middle of the third century before Christ. Professor Wilson admits that the Pali was most likely selected for his edicts by Priyadasi "that they might be intelligible to the people," but he is of opinion that the language of the inscriptions was rather the common tongue of the inhabitants of upper India than a form of speech peculiar to a class of religionists; and he argues that the use of the Pali language in the inscription is not a conclusive proof of their buddhistical origin. But as opposed to this view, it is a well known fact that the brahmans have never used any language but Sanscrit for their religious writings, and have stigmatised the Magadhi as the speech of men of low tribes. In their dramas, also the heroes and the brahmans always speak Sanscrit, while the use of Magadhi is confined to the attendants of royalty. Professor Wilson has, however, identified the Magadhi with Prakrit, the use of which, though more honorable, was still confined to the principal female characters, but the extensive employment in the dramatic works of the brahmans of various dialects, all derived from one common stock, seems to prove that they were the vernacular language of the people. In this vernacular language, whatever it was, whether the high Prakrit of the Saurasenas, or the low Prakrit of the Magadhas, we know certainly that the Vinaya and Sutra, or the practical doctrines of Sakya, were compiled, and therefore also promulgated. Cosma, in Prinsep's Journal, p. 503, has used the term Prakrit as comprehending all the written and cultivated dialects of Northern India. Prakrit means "common" or "natural," in contra-distinction to the "artificial" or "re-

finer Sanscrit. In the opinion, however, of Turnour, the celebrated Ceylon scholar, the Pali is a "rich and poetical language, which had already attained its present refinement at the time of Gotama Buddha's advent," (B.C. 588). According to Sir William Jones, it is "little more than the language of the brahmins, melted down by a delicate articulation to the softness of Italian." To Major Cunningham it seems to bear the same relation to Sanscrit that Italian does to Latin, and a much nearer one than modern English does to Anglo-Saxon. The nasal sounds are melted down, the compounds are softened to double and even simple consonants, and the open vowels are more numerous. It is the opinion of all European scholars that the Pali language is derived almost entirely from the Sanscrit, and in this opinion he fully coincides. Messrs. Burnouf and Lassen, who jointly formed a Pali grammar, state, as the result of their labours, that Pali is almost identical with Sanscrit, and Professor Lassen at a later date, when more conversant with the Pali books, states authoritatively, that the whole of the Prakrit language is derived from the Sanscrit. Turnour also declares his conviction that all researches tend to prove the great antiquity of Sanscrit. Professor Wilson and James Prinsep are likewise of the same opinion. This conclusion seems self-evident, for there is a tendency in all spoken languages to suppress dissimilar consonants, and to soften hard ones: as in the Latin Camillus for the Tuscan Cadmilus, and the English farthing for the Anglo-Saxon feorthing; or, as in the Pali assa, "a horse," for the Sanscrit aswa, and the Pali majha, "middle," for the Sanscrit madhya. There is also a natural inclination to clear away the semi-vowels and weaker consonants, as in the English King, for the Anglo-Saxon Kyning, or as in the Pali Olakita "the seen" (i. e. Buddha) for the Sanscrit Avalakita; and in the Pali Ujeniya, a "man of Ujain," for the Sanscrit Ujjayaniya." It is always therefore easy to determine between any written languages, that resemble each other, which of the two is the original, and which the borrowed: because letters or any syllables are never added, but, on the contrary, are always suppressed or curtailed in the process of time. The Pali is, therefore, without doubt, derived from the Sanscrit, and must, moreover, have been a spoken language for many centuries. For the publication of his esoteric theories regarding the origin of the world, and the creation of mankind, Sakya made use of the Sanscrit language only. But the perfect language of our day, perhaps, owes much of its refinement to the care and sagacity of that Great Reformer: for it seems highly probable that Katyana, the inspired saint and lawgiver who corrected the

inaccuracies of Panini's Sanscrit grammar, is the same as the Kachhayano who compiled the Pali grammar, during the life-time of Sakya. Katayana's annotations on Panini, called Nartika, restrict his vague rules, enlarge his limited ones, and mark numerous exceptions to others. These amended rules of Sanscrit grammar were formed into memorial verses by Bhartrihari, whose metrical aphorisms, entitled Karika, have almost equal authority with the precepts of Panini, and emendations of Katayana. According to popular tradition, Bhartrihari, was the brother of Vikramaditya, the author of the Hindoo Samvat, which dates from B.C. 57. The age of Katayana is unknown; but as he flourished between the date of Panini, in about 1100 B.C., and that of Bhartrihari, in 57 B.C., there is every probability in favor of the opinion that he was one of the disciples of Buddha. But this identification of the two greatest grammarians of the Sanscrit and Pali languages rests upon other grounds besides those mentioned above. Colebrooke, Wilson, and Lassen have all identified the commentator on Panini with Vararuchi, the author of the Prakrit grammar, called Prakrita prakassa, or Chandrika. Of Vararuchi nothing more is known than that his work is the oldest Prakrit grammar extant, and that his body of rules includes all that had been laid down by earlier grammarians regarding the vernacular dialects. This identification is still more strikingly confirmed by the fact that Kachhayano is not a name but only a patronymic, which signifies the son of Kachho, and was first assumed by the grammarian himself. If, therefore, Vararuchi Katayana is not the same person as Kachhayano, he must be posterior to him and of the same family. We shall thus have two Katayanans of the same family living much about the same time, each of whom compiled a grammar, which is much more improbable than that the two were one and the same person. The probable identity of the two great grammarians seems to offer an additional reason for considering Sakya Muni as one of the chief benefactors of his country. For we must not look upon Sakya Muni simply as the founder of a new religious system, but as a great social reformer who dared to preach the perfect equality of all mankind, and the consequent abolition of caste, in spite of the menaces of the most powerful and arrogant priesthood in the world. We must regard him also as a patriot, who, in spite of tyrannical kings and princes, had the courage to incite his countrymen to resist the forcible abduction of their wives and daughters by great men. To him the Indians were indebted for a code of pure and practical morality which inculcated charity and chastity, performance of good works, and abstinence from evil, and general kindness to

all living things. To him, also they owe the early refinement and systematic arrangement of their language in the selection of the learned Katyayana as the compiler of the Sanscrit and Pali grammars. The Pali books examined and abstracted by Mr. Turnour, consist of the Pitakattayan, the Attha-katha, and the Mahawansa. The first is, quasi, the gospel of buddhists. It is stated in the Mahawansa, that the Pitakattayan was brought to Ceylon by Mahindo, the son of Asoka, in the eighteenth year of his father's reign, that is, in B.C. 306, in the exact Pali form in which it now exists.—*Prinsep's Tibet, Tartary and Mongolia*, pp. 148-49; *Cunningham's Bhilsa Topes*. See Buddha, Inscriptions, India, Khunniara, Lat, Mon, Sanskrit, Siam, Swastika, Talieng or Mon, Topes, Turnour.

PALI is said to mean separated, proper. The Scythic Pali may be the shepherd invaders of Egypt.

PALIA MANKENA, TEL. *Urena sinuata*.

PALIBROTHA, the ancient name of Pataliputra at the confluence of the Sone river with the Ganges. Its most celebrated king was Sandracottus. Few places in India are so old, and recall to mind so many associations, as the Pataliputra of the hindoos, the Palibothra of the Greeks, and the Potolitse of the Chinese, all referring to the city which is known in our day under the name of Patna. The name of Pataliputra does not occur either in Menu or the Mahabharat, the capital of ancient Magadha, having in those ages been Rajgriha. It was in the middle of the sixth century before Christ that Ajatasutra founded the city of Pataliputra. 'This prince,' says Lassen, appears to have long had the intention of conquering Vasali, for it is recorded that his two ministers, Sunitha, and Vasyankara founded, in the village of Patali, a fortress against the Vriggi, this took place a short time before the death of Buddha. Under the ancient name of Pataliputra, the place stands before the eyes of the modern traveller as the capital of the Nandas, of Chandragupta, and of Asoka, as the scene where were played those outwitting Machiavellian policies between Rakshasa and Chanakya, which form the subject of the drama of Mudra Rakshasa and Chanakya, where Megasthenes had arrived on an embassy from Seleucus and resided many years leaving behind a record that possesses no ordinary claims upon our attention, whence Asoka issued his famous edicts about buddhism, identified by General Cunningham with the modern Besarh, 20 miles

north of Hajipoor. It is from the writings of Megasthenes that we learn that 'Palibothra was eight miles long and one and a half broad defended by a deep ditch and a high rampart with 570 towers and 64 gates, a state of grandeur, of which not a tithe is possessed by the present city. In the time of the mahomedan conquest, the capital of Behar is said to have been removed to the town of that name, and its rajah to have become so degenerated as to abscond from his capital. As described by Ralph Fitch, Patna in the end of the sixteenth century was a large city, but contained only houses of earth and straw. Of the towers and gateways spoken of by Megasthenes, or of the lofty pillars, columns, and turrets of the Suganga palace mentioned by the hindoo dramatist not a trace exists surviving the ravages of time and war. Mahomedans now form a large part of the population of Patna, and a hundred thousand of them assemble at the Emanbarah to celebrate the Mohurram. Patna is the only remaining place where the number of mahomedans is strong and influential. At Patna is a monument over 150 Englishmen massacred in cold blood by Sumroo under the orders of Meer Cassim. It is a tall slender column of alternate, black and yellow stone that lifts its head about 30 feet high in the old English burial ground at Patna.—*Bunsen, Vol. iii, p. 520; Tr. of Hind., Vol. i, pp. 113-19*. See Chandragupta, India, Megasthenes, Scylax.

PALIER-MANKENI, TEL. *Urena sinuata*.

PALI KI JHAR, DUX. *Ehretia buxifolia*.

PALINURUS, the name given by Fabricius to a genus of Crustacea which forms the tribe of Langoustiens in the system of M. Milne-Edwards, being the fourth of his family of Cuirassed Macrurians, and characterised by the existence of antennæ of the ordinary form and the absence of didactylous pincers. It is also regarded as the type of a family of the Palinuridæ. The Palinuri, or Sea-Crawfish, have the body nearly cylindrical. Their carapace is nearly straight from before backwards, very convex transversely, and presents about its anterior third part a deep transverse furrow, which is directed forward on each side and separates the stomachal from the cardial and branchial regions, the only ones which can be well distinguished. *Palinurus fasciatus* has the antennular ring armed above with two conical rather large teeth situated near its anterior border. Carapace armed with a small number of spines, and slightly granular, or only dotted on its posterior half; lateral tooth of the anterior border of the carapace small; no spines on the median line of the stomachal region; median tooth of the anterior border of the epistome very large. Length about a foot. It is a native of the Indian ocean.

Palinurus vulgaris, is the common Sea-Craw-Fish, or Spiny Lobster; Langouste of the French. Length about 18 inches. Weight sometimes from 12 to 15 lbs. It inhabits the seas of Europe, and is common on the rocky coasts of Britain especially in the south and on the like coasts of France, especially in the south and west.

Palinurus lalandii, *Edws.* Cape Good Hope.

PALITA-KANDIL-LAMPU, *ANGLO-MALAY.* Lamp.

PALITANA, or Palit'hana, or the abode of the Pali, is the name of the town at the foot of the sacred mount Satrunjya (signifying victorious over the foe) the Jain temples on which are sacred to Budhiswara, or the Lord of the Buddhist. Palit'hana seems derived from the pastoral (pali) Scythic invaders bringing in their train the buddhist faith which appears not indigenous to India. Palestine, which, with the whole of Syria and Egypt, was ruled by the Yksos or Shepherd-kings, who for a season expelled the old Coptic race, may have had a similar import to the Palit'hana founded by the Indo-Scythic Pali. The hill of Shatrunjya at Palitana in the Gohelwar district at the mouth of the Gulf of Cambay, is dedicated to Adinath, the first of the 24 hierophants of the Jains. Each temple contains images in marble of Adinath or of some other of the Tirthankara and perhaps no fabric of human workmanship in India, is more calculated to arouse wonder, admiration and lasting remembrance, than Palitana in its unique and mysterious perfection. No fabric of human workmanship in India, is more wondrous than Palitana, or Palit'hana, 'the dwelling of the Palli,' situated at the eastern base of Satrunjya, which rises nearly two thousand feet, and is between two and three miles in ascent, taking the sinuosities of the route into account.—*Moor*, p. 253; *Tod's Travels*, p. 275. See Hindoo, Inscriptions, Karli, Khandagiri, Krishna, Lat.

PALLA, *TEL.* *Mimusops hexandra*, *Roeb.*

PALLADIUS, a European traveller in Persia, a few years before the Chinese Fa Hian.

PALLADIUS, was the author of a tract *De Moribus Brachmanorum*, written about A. D. It was embodied in the *Pseudo-Callisthenes*, published by Muller (*Script. de Alex. Magno*, pp. 103-4.) In it there is an account of the Bisades, the gatherers of pepper. They are described as "a dwarfish and imbecile race who dwell in rocky caves, and from the nature of their country are expert at climbing cliffs, and thus able to gather the pepper from the thickets. These Bisades are pygmies, with big heads and long straight unclipt hair. Sir J. E. Tennent applies this to the Veddahs of Ceylon. But, there is nothing, in the passage to fix it to Ceylon, and Muller points out, that the Besidæ are mentioned by Ptolemy (vii, 1) as a people, otherwise called Tiladæ, who live north of Mæandrus (a mountain chain on the east of Bengal,) "dwarfish and stumpy and platter-faced, but white in complexion." Lassen however, in his map by Kiepert, locates them as a Bhotiya race in the Himalaya near Darjiling in the Garo and Kasia hills north of Sylhet.—*Yule Cathay*, Vol. i, pp. 144-145. See Scholastikos, Veddah.

PALLAN, Pallar or Puller, are a low caste or slave race attached to the Vellala agriculturists of the south of India. The Mallar are the agricultural labourers of the Pallar tribe.—*Wils. Glossary*. See Paraiyah.

PALLE, *TAM.* *Mimusops hexandra*, *Roeb.*

PALLEGOUX. A Bishop of the Romish church, long resident in the Malay peninsula, who wrote on Siam. "Some years ago" he says, "a great drought, had dried up all the ponds in the neighbourhood of Ayuthia:

during the night, torrents of rain fell. Next day, going for a walk into the country, he was surprised at seeing the ponds almost full, and a quantity of fish leaping about! 'Whence have these fish come?' I inquired of a labourer: 'yesterday there was not one.' He replied they were come under favour of the rain. In 1831, when fish were uncommonly cheap, the Bishop of Siam poured fifty cwt. into his ponds: but, in less than a month, nine-tenths escaped during a rain that fell in the night. There are three species of this wandering fish, called Pla-xon, pla-duk, pla-mo. The first is voracious, and about the size of a carp; salted and dried, it can be preserved for a year: it is very abundant, and is exported to China, Singapore and Java, and is a particularly wholesome and health-giving fish. Sir J. E. Tennant thinks that the fish here alluded to by Sir John Bowring is the *Anabas scandens*, Cuv. (*Perca scandens* *Dubbof*, Kawa-ya also Kawhoya Singh. Pannei eri, (Tam.,) which Dr. Hamilton Buchanan says is most tenacious of life; he had known boatmen on the Ganges keep them for five or six days in an earthen pot without water and daily to use what they wanted, finding them as lively and fresh as when caught. The *Platycephalus clavulatus*, P. insidiator and P. carbunculus can all sustain life for some little time out of water. Mr. Layard, once encountered several of the *Anabas*, travelling along a dusty gravel road in the mid-day sun.—*Bowring's Siam*, Vol. i, p. 10; *Ann. Nat. Hist. May. 1853, Pallegoix, Siam*, i, 144.

PALLI, a servile tribe in the south of India, bondsmen or slaves of brahmin proprietors.—*Wilson*.

PALLIA, HIND. A funeral monumental pillar, amongst the Rajpoots. See Rajpoots.

PALLIKONDA, or Polikonda, 12° 55'; 78° 57', in the Karnatik, near the right bank of the Palar. Dak bangalow, 841 feet.—*Rob. Schl.*

PALLIWAL. Next to the lordly Rajpoots, equalling them in numbers and far surpassing them in wealth, are the Palliwal of Jessulmir. They are brahmins, and denominated Palliwal from having been temporal proprietors of Palli, and all its lands, long before the Rah-

tor colonized Marwar. Tradition is silent as to the manner in which they became possessed of this domain: but it is connected with the history of the Pali, or pastoral tribes, who from the town of Palli to Palit'hana, in Saurashtra, have left traces of their existence; and Colonel Tod was inclined to the opinion that all the ramifications of the races figuratively denominated Agnicula, were of Pali origin: more especially the Chohan, whose princes and chiefs for ages retained the distinctive affix of Pal. The Palliwal brahmins, as appears by the annals of Marwar, held the domain of Palli when Seoji, at the end of the twelfth century, invaded that land from Canouj, and by an act of treachery first established his power. It is evident, however, that he did not extirpate them, for the cause of their migration to the desert of Jessulmir is attributed to a period of a mahomedan invasion of Marwar, when a general war-contribution (dind) being imposed on the inhabitants, the Palliwal pleaded caste, and refused. This exasperated the raja; for as their habits were almost exclusively mercantile, their stake was greater than that of the rest of the community, and he threw their principal men into prison. In order to avenge this, they had recourse to a grand "chandi" or act of suicide; but instead of gaining their object, he issued a manifesto of banishment to every Palliwal in his dominions. The greater part took refuge in Jessulmir, though many settled in Bikaner, Dhat, and the valley of Sind. At one time, their number was calculated to equal that of the Rajpoots. In the early part of the 19th century almost all the internal trade of the country passed through their hands, and it was chiefly with their capital that its merchants traded in foreign parts. They were the Metayer of the desert, advancing money to the cultivators, taking the security of the crop; and buying up all the wool and ghee (clarified butter), which they transported to foreign parts. They also rear and keep flocks. They were then subject to the visits of the Maldote, Tejmalote, and other plunderers. The Palliwal never marry out of their own tribe: and, directly contrary to the laws of Menu, the bridegroom gives a sum of money to the bride. It will be deemed a curious incident in the history of superstition, that a tribe, brahmin by name, at least, should worship the bridle of a horse. When to this is added the fact, that the most ancient coins discovered in these regions bear the Pali character and the effigies of the horse, it aids to prove the Scythic character of the early colonists of these regions, who, although nomadic (Pali), were equestrian. There is little doubt that the Palliwal brahmins are the remains of the priests of the Palli race, who, in their pas-

toral and commercial pursuits, have lost their spiritual power.

Pokurna Brahmins are a singular brahminical tribe, of whom it is calculated there were, about A.D. 1820, fifteen hundred to two thousand families in Jessulmir. They are also numerous in Marwar and Bikaner, and are scattered over the desert and valley of the Indus. They follow agricultural and pastoral pursuits chiefly, having little or no concern in trade. The tradition of their origin is singular: it is said that they were Bildars, and excavated the sacred lake of Poshkur or Pokur, for which act they obtained the favour of the deity and the grade of brahmins, with the title of Pokurna. Their chief object of emblematic worship, the khodala, a kind of pick-axe used in digging, seems to favor this tradition.

Jut or Jit here, form a great part of the agricultural population: There are also various other tribes.

The Castle of Jessulmir, is erected on an almost insulated peak, from two hundred to two hundred and fifty feet in height, a strong wall running round the crest of the hill. It has four gates, but very few cannon mounted.—*Tod's Rajasthan, Vol. ii, pp. 284-287.*

PALM. The term applied in Southern India to the bars of iron, manufactured from Cutties.

• **PALMS.** The palm trees or palm tribe of plants, belong to the Order *Cocoaceæ*, the *Palmaeæ* of Lindley. They grow alike in the Eastern and in the Western Hemispheres, but are rarely beyond 35° south and 49° north. Particular species of palms are confined to their own peculiar localities but *Cocos nucifera*, *Acrocomia*, *Sclerocarpa* and *Borassus flabelliformis* are spread over many lands. The number of species scattered over the world amount to over 1,000. Of these, not a few love the humid banks of rivulets and streams; others cling to the sea shores, and some ascend into Alpine regions. Some collect into dense forests, others spring up singly or in clusters, over the plains. The chief palms are,

Many of the palms, in tropical countries, are conspicuous for their lofty pillar-like stems, surmounted by apparently inaccessible fruit or gigantic foliage, and are remarkable for the many useful purposes they are calculated to fulfil; they furnish many of the necessities, comforts, and luxuries of life, and we come more or less in contact with them in almost every action of daily life. In household economy, parts of them are formed into spoons, and cups, and ladles and lamps, and hats, and clothes, and combs, hammocks, bow strings, fishing-lines and fish-hooks. The light rafters of the houses are obtained from the straight cylindrical trunks of the Java Palm (*Leopoldinia pulchra*) and the date or palmyra trees. In general they adhere to the soil by clusters of strong simple roots which not uncommonly form a hillock elevated above the surface of the ground. Their trunks are solid, harder on the outside than the centre, and are sometimes, as in the cane-palms, coated by a layer of siliceous matter; they are usually quite simple, growing exclusively by a single terminal bud, called in the *Areca* its cabbage, and eaten as a delicacy when boiled; but in the *Hyphæne*, or doom-palm, they are regularly forked. In the majority of the order the stem is cylindrical, but in some it is thickest at the base, and in others swollen in the middle; occasionally it is defended by strong hard spines, but is more frequently unarmed, and marked by rings which indicate the places whence the leaves fall off. The leaves, called fronds by Linnaeus, are alternate, with a very hard epidermis and a distinct petiole, from the base of which a coarse network, called reticulum, sometimes separates next the trunk; they are usually either pinnated or fan-shaped, but are occasionally nearly split in two; their veins are parallel, the spaces between them plaited, and the whole size sometimes very great, as in the fan-palm, in which specimens have been seen as much as 18 or 20 feet in breadth. The flowers appear in paniced spikes from the inside of hard dry spathes, which are often boat-shaped, and although small, they are sometimes so extremely numerous that each panicle will weigh many pounds. They are generally hermaphrodite, but often monœcious, dioecious, or. polygamous. The calyx and

corolla consist each of three pieces, which are either distinct or more or less united. The stamens vary in number, from 3 to a large multiple of that number, and bear 2-celled linear anthers, which open along their inner face. The ovary consists of 3 carpels, which are sometimes distinct, sometimes consolidated, and occasionally in part abortive, so that the ovary is only 1-celled. The ovaries are almost always solitary, and erect in each cell, but sometimes two are present, which in that case stand side by side; they are orthotopous in some genera and anatopous in others. The styles are very short, the stigmas simple. The fruit varies extremely in its consistence and appearance. Sometimes it is 3-celled, often 1-celled; in such species as the coconut it is a kind of drupe covered by a coarse fibrous rind; in others it is a soft sweet eatable pericarp, as in the date; in others its surface is broken up into lozenge-shaped spaces, as in the *Sagus*, whose fruit looks as if covered with scale-armour. The seed is single, either solid or hollow, and consists principally of albumen of a fleshy, oily, horny, or cartilaginous texture, within which is lodged a very small cylindrical embryo at some part of the surface distant from the hilum. Palms appear to prefer a soil in some measure salt, although many species are inhabitants altogether of inland districts and even of high mountains. Their geographical limits appear to be within 36° N. lat. in America, 44° N. lat. in Europe, 34° N. lat. in Asia, and 38° S. lat. in the southern hemisphere; and, according to Von Martius, their powers of migration are extremely small; none of them have been able to cross the ocean without the aid of man. This, however, is not applicable so far as regards the coconut, the keeled fruit of which sails to the most distant shores. Their favourite stations are on the banks of rivers and water-courses, and the sea-shore, some species scattered singly and others collected together into large forests. There is scarcely a species of this order in which some useful property is not found. The coconut, the date, and others, are valued for their fruit; the fan-palm, and many more for their foliage, whose hardness and durability render it an excellent material for thatching; the sweet juice of the palmyra, the date, the coconut, and *Arenga* palms, when fermented yields wine; the centre of the sago-palm abounds in nutritive starch; the trunk of the *Iriarteia* or *Ceroxylus* exudes a valuable vegetable wax; oil is expressed in abundance from the oil-palm and from the coconut palm; an astringent matter resembling dragon's blood is produced by *Calamus draco*; many of the species contain within their leaves so hard a kind of fibrous matter, that it is

employed instead of needles, or so tough that it is manufactured into cordage; and finally, their trunks are in some cases valued for their strength and used as timber, or for their elasticity, or their flexibility, as in the cane-palm. The fruit of some is edible, of others abounding in oil, the sap of a few forms a pleasant beverage, and may by evaporation yield sugar or be fermented into a spirit. The stems of some species are gorged with farinaceous matter, which may be separated as a starch-like powder or granulated into sago. The broad leaves, from their great size and hard surface, are useful for thatching the cottages of the poor, or for making umbrellas for the rich. The narrow-leaved kinds are plaited into mats and baskets, or smoothed so as to be fit for writing on; while the leaves of several, when in a young and tender state, are eaten, both raw and in a cooked state, and are hence called cabbage palms. Some abound in strong unyielding fibre, while others form wood which is applicable to all the purposes of timber. Hence, several are valuable articles of culture in the countries where they are indigenous, or where the soil and climate are suitable for their growth—as, for instance, the date palm in Arabia and Africa, the oil palm in the West of Africa, the cocoanut in India and its Islands, together with the Betel-nut, Palmyra, and talipat palms; while the sago, the Ejoo, and the betel-nut palms flourish in the moist warm climates of the Malayan Peninsula and of the Indian Archipelago. The palms abound chiefly in the tropical parts of South America, as well as of the Old World; but a few species extend to rather high latitudes, as an *Areca* to lat. 38° S. in New Zealand, and a *Sabal* (*Chamaerops*, Auct.) to lat. 40° N. in North America; while the dwarf palm, a native of the North of Africa, is now at home in the South of Europe. There even the date palm is grown in a few sheltered situations; though it is in the hot and dry soil of Arabia and Africa that it attains the greatest perfection, and furnishes a principal part of the diet of its inhabitants, as well as an article of commerce. *Phoenix sylvestris*, a variety or species of the same genus, is common in most parts of India. A *Chamaerops* is found in Nepal, and one on the Khasya Hills, at elevations of from 5,000 to 8,000 feet; while *C. Ritchiana* is found in the Khybur Pass, and probably all along the mountainous range from Afghanistan to Sind. But it is in far southern latitudes and in a different climate that the cocoa and the betel-nut palms are objects of extensive culture; as well as the sago palms, of which the ejoo or gomuto of the Malays the *Arenga saccharifera* of botanists, is one abounding in sap,

which can be used as palm wine or converted into sugar; yielding at all times strong and durable fibre. The older trees when cut down yield sago, as do *Sagrus rumphii* and *S. laevis*, especially abundant in and near Sumatra. The latter is remarkable among palms for throwing up young plants around it in the same manner as the plantain. Both kinds of sago tree are strongly recommended for cultivation—the *Arenga* on low coasts near the sea, but the species of *sagrus* even on the edges of the marshes which abound in such situations. It is no doubt to some one of these sago trees that Sir John Maundeville alludes, when he says: “in that land grow trees that bear meal, of which men make bread, white and of good savour; and it seemeth as it were of wheat, but it is not quite of such savour. And there are other trees that bear good and sweet honey; and others that bear poison. And if you like to hear how the meal comes out of the trees, men hew the trees with an hatchet, all about the foot, till the bark be separated in many parts; and then comes out a thick liquor, which they receive in vessels, and dry it in the sun, and then carry it to a mill to grind, and it becomes fair and white meal; and the honey and the wine, and the poison, are drawn out of other trees in the same manner, and put in vessels to keep.” The leaves of many palms are employed for thatching, for making chattahs or umbrellas, punkahs and hats. The stems of *Licuala acutifida* afford the well-known walking sticks known by the name of “Penang Lawyers,” those of *Licuala peltata*, the *Uhattah-pat* of Assam, are in universal demand in that valley. Scarcely a single ploughman, cow-keeper or cooly, but has his *Jhapee* or *Chattah*, made of *Uhattah-pat*. But the leaves of this palm are coarser than those of another, the *Tokapat* of the Assamese, which has been named *Livistona Jenkinsiana*, by Griffith. Col. Jenkins says that this species of palm is an indispensable accompaniment of every native gentleman's house, but in some parts it is rare, and the trees are then of great value. The leaves are in universal use throughout Assam, for covering the tops of dhoolies or palkees, and the roofs of khel boats; also, for making the peculiar hats, or rather umbrella-hats (*jhapee*) of the Assamese. For all these purposes the leaves are admirably adapted, from their lightness, toughness and durability. To the above list of useful Indian palms, we might easily add some, such as *Zalacca macrostachya*, used for making baskets and for tying Nipa leaves as well as, mention the native names of others employed for many of the same purposes as the foregoing. The Chinese are said to make cables of palm leaves. The *Areca*

vestiaria is so called from clothing being made from its fibres, and *Rhapis cochinchinensis* is employed for thatching, &c. *Lodoicea Seychellarum* is the palm yielding the formerly much famed "Cocos de Mer" or "Double Cocconut,"—for a specimen of which, in the Mauritius collection, a Prize Medal was awarded at the Exhibition of 1851; its leaves are formed into baskets and flowers. The palms prove the great value of these plants to the regions where they are indigenous—yielding flour and sugar, milk and honey-like fluids, demulcent drinks and fiery spirit, fibre for cordage and for clothing, leaves for thatching and for plating, as well as wood for a variety of purposes. There is little doubt that some may yield the fibre which so abounds in their leaves, sufficient easily to be useful to the paper-maker.—Further information on the various Palms of Eastern and Southern Asia, the cocconut palm, palmyra, *Corypha*, *Caryota urens*, *Arenga saccharifera*, will be found under these several heads. This natural order of plants is one of the largest, the most beautiful, as well as the most useful of the whole vegetable kingdom. They are almost exclusively plants of tropical countries. They belong, systematically speaking, to the endogens or monocotyledons, the same great division which comprises the grasses, sedges, lilies, orchids and screw-pines, and most of them attain the size and assume the aspect of trees. Palms having arrived at the proper age, flower every year until they die, or only once during the whole course of their existence, and have sometimes from 200,000 to 600,000 flowers on a single tree. The fruits are almost of every colour, and a single spathe of the Seje palm of the Orinoco bears as many as 8,000 of them. The common cocconut is one of the largest of the fruits and the double cocconut of the Seychilles measures about four feet in circumference and probably surpasses all others in dimensions. There are not less than 1,000 known species of this useful plant. Palms are associated with the most sublime truths of christianity, and in our every day life we speak of our "palmy days," and "carrying off the palm," as happy and excellent times and seasons of rejoicing. Various of their products are largely made use of by the inhabitants of the countries in which they grow, and are exported to nations thousands of miles away, who employ them for many purposes, useful and economic. The sweeper of the crossings of London, holds in his hand a broom, the fibrous portion of which was cut by the wild Indians of Brazil from the stems of a palm: the gentleman who prides himself on his Penang Lawyer, is but carrying a young plant of the *Licuala acutifida*. The knob of

the ladies parasol, is formed from a *Coquilina*, turned into that shape. The chip hats, so extensively worn on fine summer days, are made of the leaves of a Cuban palm (*Thrinax argentea*). Heaps of dates are to be seen in all the shops of Europe which were gathered by the Bedouin Arabs, or on the borders of the great desert of Sahara; and cocconuts, grown on the shores of the Indian Ocean, in the myriads of islands which form its Archipelago, or on the shores of the Caribbean sea, are sold in every city of the colder regions of the world, where they are ever beheld with unabated curiosity. The cordage and rigging of the ships, and the thick mattings used on stair cases in England, spun and woven, are from the husk of the cocconut, and many articles of furniture are made from the woods of palms. Toys and ornaments are made from the kernels of the vegetable Ivory palm. The stearic candles so well known are composed of the fatty substance extracted from the oil palm and the cocconut. The sago which ministers so powerfully to the recovery of the sick, and which is seen in such varied guise on our tables, is the pith of palms that flourish in many tropical regions, the famous Betel-nut dentifrice formed of the charcoal of that nut, colored with dragons blood, is the produce of two palms, and the toilet soaps of Europe are made from palm oils. Everywhere we meet with numerous products of palms, either in a raw state, or turned by the ingenuity of man to some useful purpose: and millions of people who never saw a palm are benefitted by the products of these useful trees. But if this be felt in remote regions of the cold north, in the tropical regions of Asia, Africa, America and Australia, where these elegant members of the vegetable kingdom flourish in all their native splendour, the inhabitants derive from them many of the necessaries, comforts, and luxuries of life, and come more or less in contact with them in almost every action of daily life. In household economy, parts of them are formed into spoons, and cups, and ladles and lamps, and hats and clothes, and combs, and hammocks, and bowstrings, and fishing lines, fish-hooks. The light rafters of their houses are obtained from the straight cylindrical trunks of the Java Palm (*Leopoldinia pulchra*), the date and palmyra tree. The roof is thatched with the leaves of palms. In one region, the door of the house is made of the split stems of the Pashiuba palm, (*Iriarteia exorrhiza*), and in another the thickly matted leaves of the cocconut and palmyra serve as a door for the gardens and parterres. The harpoon for catching the cow fish, is formed of the blackwood of the Pashiuba barriguda (*Iriarteia ventricosa*.) The people eat the fruits the

produce of many of this tribe of trees, and in the palm-wine and arracks from the various plants, they enjoy palatable refreshing and stimulating drinks.

The *Chamærops Khasiana*, the fan-palm, the *pakha* of the Khassya, grows on the cliffs near Mamloo on the Khassya hills: it may be seen on looking over the edge of the plateau, its long curved trunk rising out of the naked rocks, but its site is generally inaccessible: while near it grows the *Saxifraga ciliaris* of English gardens, a common plant in the north-west Himalaya, but extremely scarce in Sikkim and the Khassya mountains. This species of *Chamærops* is very closely allied to, if not identical with *P. Martiana* of Nepal, which ascends to 8,000 feet in the western Himalaya, where it is annually covered with snow: it is not found in Sikkim, but an allied species occurs in Affghanistan, called *P. Ritchiana*. The dwarf palm of Southern Europe is a well known species. There are upwards of twenty kinds of palm in the Khassya district, including *Chamærops*, three species of *Areca*, two of *Wallichia*, *Arenga*, *Caryota*, three of *Phoenix*, *Plectocomia*, *Licuala*, and many species of *Calamus*. Besides these there are several kinds of *Pandanus*, and the *Cycas pectinata*. The palms of the Khassya hills amount to fourteen, of which the *Chamærops* and *Arenga* are the only genera not found in Sikkim.

In the West Indies, where the *Oreodoxa oleracea*, the edible cabbage tree, grows, its green top is eaten both raw and cooked. The betel-nut palm, *Areca catechu* grows throughout the East Indies, and produces the betel-nut which the people largely use as a masticatory along with the betel-leaf, and its nut also yields a kind of catechu. In the mountains of Malabar, the poorer people use the nut of the *Areca dicksonii* as a substitute for the betel-nut. The *Arenga*, the *Gomuti* palm of the Eastern Archipelago, yields sago, sugar, palm-wine and black horse-hair-like fibres, from which cordage and cables are made. A single tree yields about lbs. 150 of good sago meal, and its sap is boiled down into a thick syrup, and allowed to concreate. Horse-hair-like fibres surround the petioles of the leaves, and the sap is largely used as a palm-wine. The palm-wine from the *Caryota urens* of the Peninsula and the Moluccas is a valuable product. It is fermented and drank as an intoxicating beverage, and is distilled to obtain a spirituous liquid. The best trees, during the hot season, will yield 100 pints of sap in 24 hours. The pith of the trunk in old trees is made into sago, and baked as bread or boiled in the form of a thick gruel. The different species of *Calamus* furnish the canes and ratans of commerce. They are largely used in the East-

Indies as the linings of bedsteads, chairs, as screens, to form ladders, and cables. The *Sagus lævis*, *Rumph.*, of the Eastern Archipelago, and *S. farinifera* *Gærtn.*, of the Malay peninsula and the Archipelago, both yield the sago of commerce; the people of the Moluccas live almost wholly on the pith of the latter tree. The leaves of the Tali tree of Ceylon and the Moluccas, the Tali-pat or great fan-palm of Ceylon, the *Corypha umbraculifera*, are of great value as a thatching material, and the leaves of the tara palm of Bengal, the *Corypha taliera*, are used as a book to write on, with the steel styles, and they are also used to tie the rafters of their houses. The species of the date palms, the genus *Phoenix* yield several useful products. *P. sylvestris*, the wild date palm, grows abundantly throughout British India. Its fruit is of little value but its juice is largely used as a palm-wine, and is boiled with sugar, which is extensively exported to other countries. The date tree is met with in almost every part of British India, it flourishes most congenially, and is found plentifully in the alluvial soils which cover the south-eastern portion of Bengal proper, excepting only such tracts as suffer entire submersion annually from the overflow of their rivers, as is common in portions of the Dacca, Mymensing, and Sunderbun districts. The extent of country best suited for its growth, and over which it is found most plentifully as above indicated, may therefore be taken as within an area stretching east and west about 200 miles, and north and south about 100 miles, and comprehending by a rough estimate about 9,000 square miles within an irregular triangular space. When not stunted in its growth by the extraction of its juice for sugar, it is a very handsome tree, rising in Bengal from 30 to 40 feet in height, with a dense crown of leaves spreading in a hemispherical form from its summit. These leaves are from 10 to 15 feet long, and composed of numerous leaflets or pinules about 18 inches long. The trunk is rough, from the adherence of the bases of the falling leaves; this serves to distinguish it at a glance from the smooth-trunked coconut palm, which in its leaves only it resembles. The fruit consists more of seed than of pulp, and altogether is only about one-fourth the size of the Arabian kind brought annually to Calcutta for sale, and when fresh imported, a rich and favourite fruit there. This inferiority of the Indian fruit may no doubt be attributed to the entire neglect of its improvement there from time immemorial, and perhaps, in some measure, to the practice of tapping the trees for their sap, so universally followed in every part of British India, to obtain the palm-toddy. The process of tapping and extracting the juice commences about the 1st of November and

terminates about the 15th of February. Some days previously, the lower leaves of the crown are stripped off all round, and a few extra leaves from the side of the tree intended to be tapped. On the part thus denuded, a triangular incision is made with a knife, about an inch deep, so as to penetrate through the cortex, and divide the sap vessels; each side of the triangle measuring about 6 inches, with one point downwards, in which is inserted a piece of grooved bamboo, along which the sap trickles, and from thence drops into an earthen pot suspended underneath it by a string. The pots are suspended in the evening, and removed very early the following morning, ere the sun has sufficient power to warm the juice, which would cause it immediately to ferment and destroy its quality of crystallizing into sugar. The cutting being made in the afternoon, next morning the pot is found to contain from a full-grown tree, 10 seers of juice, the second morning 4 seers, and the third morning 2 seers of juice; the quantity exuding afterwards is so small that no pot is suspended for the next four days. Daily at sunrise, throughout the goor season, the toddy-drawer may be seen climbing his trees, and collecting at a convenient spot beneath them, the earthen pots containing the juice yielded during the past night. Under a rude shed, covered with the leaves of the date tree itself, and erected under the shade of the plantation, is prepared the boiling apparatus to use for the goor season. It consists of a hole about 3 feet in diameter, sunk about 2 feet in the ground, over which are supported by mud arches four thin earthen pans of a semi-globular shape, and 18 inches in diameter; the hole itself is the furnace, and has two apertures on opposite sides for feeding in the fuel, and for escape of the smoke. The fire is lit as soon as the juice is collected, and poured into the four pans, which are kept constantly supplied with fresh juice as the water evaporates until the whole produce of the morning is boiled down to the required density. As the contents of each pan becomes sufficiently boiled, they are ladled out into other earthen pots or jars, of various sizes, from 5 to 20 seers of contents, according to local custom, and in these the boiled extract cools, crystallizes into a hard compound of granulated sugar and molasses, and is brought to market for sale as goor. The subsequent processes by which the goor is deprived more or less of its molasses and impurities are too long to be detailed.

In Arabia, the people of the Nejd, as Wallin informs us, believe that the more the date palms are watered, the more syrup will the fruit produce; they, therefore, inundate the ground as often as possible. At El Jauf, where the date is peculiarly good,

the trees are watered regularly every third or fourth day.

The stem of *Phoenix farinifera* contains fecula which is used as food, in times of scarcity, its leaflets are wrought into mats, and the common petioles are split into three or four and used to make baskets. Its fruit is edible. Walking sticks are made of the trunks of the *Ph. paludosa*, and the trunks are used as rafters and the leaves for thatch. The palm oils from the *Elaeis guineensis* the oil palm of the West Indies and from the cocoanut palm of the East Indies are extensively used in the West and East. The *Elaeis guineensis* also yields an excellent palm wine. The numerous uses to which the Cocoanut Palm are applied are familiar to all who have not even seen it. It grows on the shores of all the East and West Indies, and the leaves furnish thatch for dwellings, materials for buckets, baskets and fences, and make excellent torches. The juice of the flower stem, is fermented into palm wine, distilled into arrack, or made into sugar. The fruit when green is filled with a liquid albumen, which is largely drunk as a refreshing liquid: when ripe the albumen solidifies and is used in cooking, and affords an abundance of oil which is used in lamps and in Europe is manufactured into candles. The fibrous rind forms the coir of commerce, made into cordage and cables. A fibre is obtained from the sheaths of the leaves of a kind of palm (*Chamerops*) which grows in the Kangra hills up to 5,000 feet. The peculiar structure of the wood of the palms deserves attention, it appears formed of a series of hard stiff longitudinal fibres not interlaced or twisted but crossed at considerable intervals at various angles by similar fibres which proceed from the soft heart of the tree, to the outer part, probably to the leaf stem—a radial section of palmyra rafter shows this, the interstices are filled up with pith, the proportion of which increases with the distance from the outer part. The wood is used in England for veneers and inlaying. It is exported in large quantities from Ceylon, where it is used for rafters, pillars, and posts of native houses. The toddy of the cocoanut, the palmyra and the gomuti palms is obtained from the spathe. In the palmyra and cocoanut the spathe is cut across and the juice flows into a pot. In the gomuti, the spathe is wounded. With the date tree the stem is notched and sloped and a spout made of the branch. Of others of the palms of the E. Indies, the following mention may be made:—

Eugeissona truncata, Griffiths, is a stemless palm, growing in thick tufts, which are surrounded by the debris of the old leaves. Leaves numerous, the outer ones spreading,

fifteen to twenty feet in length. It grows in forests on the hills about Ching, Malacca, and is very common. It is also common in Penang where, according to Mr. Lewis, it is much used in making mats for sides of houses, for thatch and for the same purposes as those of *Nipa fruticans*; its Malayan name is Bertam.

Corypha elata, Griffiths, has a straight trunk, but often varying in thickness. A tree about thirty years old, when in flower, was seventy feet to the base of the inflorescence, another about sixty; circumference near the root eight feet, and about the middle of the trees five and a half or six; their whole length strongly marked with rough, dark-coloured, spiral ridges, and furrows, which plainly point out the spiral arrangement of the leaves. The lignous fibres, as in the order, are on the outside, forming a tube for the soft spongy substance within, of a dark chocolate colour, tough and hard, but by no means equal, in either quantity or quality, to the very serviceable wood of *Borassus flabelliformis*. This palm grows in Bengal flowering in March and April: the seeds require about twelve months to ripen. It is the Bujoor or Bujur-batool, of Bengal and is cultivated in the gardens about Calcutta. This palm is to be at once recognized by its black spirally marked trunk. From the other species of *Corypha* it is abundantly distinct by its long, obviously spirally placed ex auriculate petioles, and by the smaller dark-green flat lamina, with narrow linear-ensiform segments. The fruit is smaller. According to Roxburgh's drawing the inflorescence of this species is so dense that no part of the spadix or spathe is visible, and the outline is irregular pyramidal, some of the branches being much larger than others.

Corypha taliera, Roxb., has a trunk perfectly straight, about thirty feet high, and as near as the eye can judge equally thick throughout, of a dark-brown colour, and somewhat rough with the marks left by the impression of the fallen leaves. The leaves of this tree are employed by the natives to write on with their pointed steel styles and also to tie the rafters of their houses, for they are strong and durable, the wood does not seem to be applied to any useful purpose. It grows in Bengal, but it is scarce in the vicinity of Calcutta. It flowers at the beginning of the hot season, the seeds ripen nine or ten months afterwards. It is the Tara, Tillier or Tareet of Bengal. This species is so closely allied to *C. umbraculifera*, as to be difficult to distinguish when out of flower. The Botanic garden's specimens are distinguishable by the lamina of the leaf being conduplicate from the middle upwards, and by their posticous segments overlapping so that the whole becomes peltate. The leaves are very like those

of *Borassus flabelliformis*, but much larger. The petioles are biauriculate and without an obvious spiral arrangement, they separate at the top of the dilated part, and subsequently fall off, leaving a smooth trunk. The lamina is five or six feet long, fifteen feet broad, glaucescent; the segments are ninety or ninety-five in number, deeper and broader than in *C. umbraculifera*, the central ones being 3 to 3½ feet long.

Corypha umbraculifera, is very much like *C. taliera*. The leaves are, however, larger than those of the species alluded to, and in its native places they attain an immense size. It grows in Ceylon, the Malabar and Malay coasts. It is the Tala or Tala-gas, of the Singhalese, Condayari, Tamul, (Roxb.) Coddopana of Malabar (Rheede.) the Talipot palm of the English.

Licuala. Flowers hermaphrodite. Calyx and corolla each three-parted. Stamens six, filaments often united into a ring, distinct from the corolla drupe, (only one matured), one seeded. Albumen excavated in front. Embryo placed behind. The species of *Licuala* are shrubby, sometimes stemless, palms, of the East Indies as well as the Islands of the Eastern Archipelago. The stem in many is marked with rings, and sometimes rough with the persistent indurated leaves of the petioles of fallen leaves. The leaves are pinnately fan-shaped, with the petioles armed towards the margins with horny conical or often hooked prickles; pinnules wedge-shaped, with their apex more or less truncate or lobed, and the lobes bifid. Spadix spicately or paniculately branching.

Licuala paludosa, Gr., the trunk is from eight to twelve feet high, about 1½ inch in diameter, unarmed, and almost without marks of annuli, except towards the apex where they are incomplete. Crown of moderate size. Rete, or woody fibres rather stout, of a rich brown colour. It grows in Malacca in low sandy wet places along the sea-coast about Tanjō-cling Roondoor, and Pulo Bissar, associated with *Pandanus*, *Eugenia*, *Diospyros*, *Helospora*, &c. It flowers in February. The species approaches to *L. spinosa*, but is abundantly distinct by its smooth stem, (which does not look much like the stem of a palm), and by the short smooth turbinate flowers. The tracts of country in which it is found, form one of the peculiar marks of the Straits' Flora, and are highly contrasted with the muddy littoral tracts, which are covered as usual with mangrove jungle.

Licuala spinosa, Willd., is a stout palm, forming dense bushy tufts. Trunk two to four inches in diameter, eight or twelve feet high, marked with the scars of the fallen petioles, leaves six or seven feet long, petiole about four and a half feet long, obtusely trigonal, margins

armed throughout with stout conical somewhat curved aculei. It grows in Malacca, common in wet places, particularly in hedges. It is called in Malay, Plass, it flowers in the cold, and ripens its fruit in the hot season. It appears to vary a good deal; it is not improbable that two species lurk under this name. Some of the specimens have the trunk armed with the hardened bases of the petioles, with more slender spadixes, and considerably smaller fruit. It is a low palm, with a stout stem three or four feet high, marked below with the scars of the fallen leaves, above rough from the persistent bases of the petioles. It grows in the woody mountainous country to the eastward of and near the Chittagong mountains beyond the Ganges Himalayan range, below Darjeling, Rungpore. It is cultivated in H. C. Bot. Gardens, flowering in the cold season, fruiting in the hot season. It is the Kurud or Kurkuti of Bengal and the Chhattah Pat of the Assamese. It is the largest and finest species of the genus and is not likely to be confounded with any others. Its large peltate orbicular leaves, simple large pendulous spikes, and comparatively very large flowers, will at once distinguish it. In the leaves it is allied to *L. longipes*, but that species is almost stemless, the leaves are also dark green, and differently lobed. Martius' figure of the entire plant gives a much better idea of *L. spinosa* than of this species. The leaves are used for the same purposes as those of the Toko but are much coarser, and only made use of by the lower orders. The demand for them is very great, scarcely a single ploughman, cow-keeper or cooly, but has his Jhapee or Chhattah made of Chhattah Pat.

Licuala dentifida, Martius. It grows in Penang, its Malay name is Plass-tikooss. Its stems afford the well-known walking stick, the "Penang lawyer." These are prepared by scraping with glass, and polishing, each stem is well scraped, by which the epidermis is altogether removed; care must be taken not to take away much more, as the inside is like the substance of a rattan. It is on this account that the smaller, thinner sticks are so much sought for, and are so rare. The sticks are then straightened by fire. No other process is used. The plant seems to be confined within narrow geographical limits; it is not known, as Griffiths believed, about Malacca, where its place seem to be supplied by the following closely allied species. Martius, however, states it is to be found throughout the Malayan peninsula. Griffiths had an impression that under this species, as given by Martius, two distinct palms will be found; for, though the description by Martius agrees well with Griffiths' Penang specimens, yet the drawing of the spadix represents the parts nearly of the same size as in *L. spinosa*. *L. pumila*,

Blume, appears only distinguished from this, by the broader equal teeth of the pinnules (the intermediate ones of which are the broadest) being described as sixteen to twenty-one lines broad, and six to eight toothed, while the two innermost ones are said to be only an inch broad.

Licuala glabra, Griffiths, is a miniature palm, the trunk being from three to five feet high and rather more slender than that of the preceding. The petiole, the rete and the ligula are much the same as those of the preceding. It grows solitary on Goonong Miring, an offset of Mount Ophir. Flowers in February. Its Malayan name is Plass Goonoong. Griffiths first met with this species on Mount Ophir, he subsequently received specimens from the same locality. It is closely allied to the preceding, (Penang lawyer), from which indeed the leaves are scarcely distinguishable, except by the broad sinuses of the lobes, and their more obtuse points. The smooth inflorescence and flowers, however, at once distinguish it from both that species and *L. pumila* of Blume. Griffiths was not aware of its stem being used for walking sticks.

Licuala longipes, Griffiths, grows in Malacca, solitary, in dense forests, at Ayer Punnas (Rhim) Goonoong Miring, and Mount Ophir, but not above an elevation of a thousand feet, also on the Tenasserim coast in forests near Laineur to the south of Mergui. It flowers nearly all the year. And is the Plass Bhatto of the Malays. This, judging from Schultes' description, appears to be somewhat allied to *Blume* *L. ramosa*, quoted by Martius under *L. spinosa*.

Licuala triphylla, Griffiths, is a very small dwarf palm, the whole height not exceeding two and a half feet; the stem being about three or four inches long. It grows in Malacca in dense forests, at Ayer Punnas, (Rhim). The stature and leaves of this, will at once distinguish it. In the teeth of the pinnules it approaches *L. pumila*, and especially *L. longipes*.

Livistona spectabilis, Griffiths, is a lofty palm, fifty or sixty feet high. Trunk smooth or armed towards the base with the hard persistent bases of the petioles. It inhabits Malacca, is solitary in the low littoral tracts, adapted to rice cultivation. The Penang Malay name, is Sardang.

Livistona sinensis, Griffiths, is twenty or twenty-five feet high, with a stout obscurely annulated trunk. Crown round. Leaves much plicated, and also conduplicate along the centre. It grows in Southern China, according to Dr. Martius. It was cultivated in the Hon Co.'s gardens under the name *Livistonia mauritania*; said to have been introduced from the Mauritius in 1821.

Chamærops martiana, Griffiths. Trunk

twenty feet high, irregularly annulate, of irregular diameter. Crown hemispherical, rather thin. Leaves three feet long. Petioles two and a half or three feet long, unarmed, generally partly twisted. Spadices three or five feet long, very much branched, furnished at the base (under each primary branch) with spathes, peduncle about a foot long. Lowermost spathe one, or one and a half foot long, two-edged semi-bifid at the apex, the third or fourth supports a flower bearing branch. Spikes one, or one and a half inch long. It grows at Bunipa in the valley of Nipal, at an elevation of about five thousand feet above the level of the sea. Newar name, Tuggu.

Chamærops khasyana, Griffiths, is a palm of moderate height, nine or ten feet, the trunk five inches in diameter in the thickest parts, and is obscurely annulate. Under the crown, which is thick, is an oblong mass (two feet long) consisting of the flattened bases of petioles and their rete of stiff woody fibres. The leaves are about three and a half feet long. Petiole eighteen inches long, with irregular denticulate margins. It grows in the Khasya hills: on precipices at Moosai and Mamloo, altitude four thousand feet; not observed in flower or fruit. Takill Kemaon altitude 8,000, this species is closely allied to *C. Martiana*: it differs in its shorter, stouter stature, the petioles toothed throughout, in the nature of the rete, and the texture of the leaves which is more like that of *C. humilis*. The paleaceous tomentum is, however, much more developed, and the berries are bluish, not yellow. The divisions of the leaves are much the same, excepting the secondary segments of the central divisions, which are shallow, obtuse, and recurved.

Chamærops ritchiana, is a small palm, scarcely exceeding two or three feet in height, generally tufted, and generally almost stemless. There is scarcely any rete, but the bases of the petioles where they naturally cover each other, present a rust-coloured wool. It grows in the Khybur Pass, and generally in the low arid mountainous parts of eastern Afghanistan. Pushtoo name Maizurri. Not observed in flower or fruit. It is the only palm Griffiths met with in that country, and is of extensive use for making cordage, &c.

The *Phoenix* genus are palms of the East Indies, and northern parts of Africa, trees and shrubs, their stems marked with the scars of fallen leaves, or rough with the persistent bases of their petioles: in some cases stemless. The leaves are pinnate, the pinnules linear. The spadix appear from between the leaves, the spathes coriaceous and sheathing. Flowers yellowish white. Fruit edible, soft and reddish yellow or brown.

Phoenix acaulis. Stem none in plants ten years old; at this age when in flower, the whole body of the plant, including inflorescence but exclusively of the foliage is of an ovate form, and not exceeding six or eight inches in height from the surface of the ground. Leaflets or fronds pinnate; from two or six feet long. Leaves nearly opposite, rather remote fascicles; the superior ones folded, slender, ensiform, and about eighteen inches long lower ones small, straight, rigid, and ending in very sharp spinous points. Petioles (stips) near the base flat, towards the apex triangular, smooth, it grows in Behar, on elevated plains on the north side of the Ganges on a clayey soil. Chota-Nagpore, Burmah in plains between the valley of Hook-hoong and Mogam. Junglee Khujur.

Phoenix ouseleyana. The rete consists of a few rigid fibres. Leaves two and a half or three feet long. It grows in Chota-Nagpore, according to Col. Ouseley, and according to Major Jenkins, in Assam.

Phoenix pedunculata. Monœcious, soboliferous, generally stemless. Trunk, if any, rough. Common and very gregarious on open ground of the hilly country about Courtallum, Coonoor, Neilgherries, at an elevation of 6,000 feet of the ventral face.

Phoenix farinifera, Roxb. Trunk, the little it has, is only about one, or at most two feet high, and so entirely enveloped in the sheaths of the leaves that it is never seen, the whole appearing like a large round bush. It grows in dry barren parts chiefly of the sandy lands at a small distance from the sea near Coringa. Flowers in January, February; fruit ripens in May. Telinga name Cheltacita. Common on all the hilly country between the Ganges and Cape Comorin.

Phoenix sylvestris, Roxb., is a very handsome palm, often, when uninjured by extracting toddy, thirty-five to forty feet in height. Trunk rough from the persistent bases of the petioles. Crown about hemispherical, very large and thick. Leaves ten to fifteen feet long. Petioles compressed only towards the apex; at the base bearing a few channelled triangular short spines. Pinnules very numerous, densely fascicled, glaucous, rigid, ensiform, eighteen inches long, one inch and three lines wide, conduplicate at the base, then canaliculate, subulately acuminate, almost spinous pointed four fairous, some intermediately spreading others crossing these above and below in an ascending direction. Spadix two or three feet long; peduncle highly compressed. It is common all over India, all soils and situations seeming to suit equally well. It flowers at the beginning of the hot season. It is the most common palm of India. Beng. Khujur, Sansc. Tshurjura, Teling Peddouta. Griffiths was

unable to point out any distinction between this and *P. dactylifera*, the true date palm. It is confined chiefly to the lower plains. It begins to disappear about 20 miles North-west of Burdwan, and is scarcely seen in the hilly districts of Behar, where almost the only palms met with are *Phoenix acaulis* and *Borassus flabelliformis*. *P. dactylifera* is closely allied to *P. sylvestris*, and with *P. farinifera*, forms a complete transition from *P. sylvestris* to *P. acaulis*. *P. sylvestris* yields Tari, or palm wine during the cold season. The method of extracting it destroys the appearance and fertility of the tree. The fruit of those that have been cut for drawing off the juice being very small. The mode of extracting this juice is by removing the lower leaves and their sheaths and cutting a notch into the pith of the tree near the top, from thence it issues and is conducted by a small channel made of a bit of the palmyra tree leaf, into a pot suspended to receive it. On the coast of Coromandel this palm juice is either drunk fresh from the tree, or boiled down into sugar, or fermented for distillation, when it gives out a large portion of ardent spirit. Mats and baskets are made of the leaves. The Bengalees call this tree *Klu-jur*. They also boil the juice into sugar. In the whole province of Bengal about A. D. 1842, fifteen thousand maunds, or about five thousand tons was made annually. At the age of from seven or ten years, when the trunk of the trees will be about four feet high, they begin to yield juice, and continue productive for twenty or twenty-five years. It is extracted during the cold months of November, December, January and February; during which period, each tree is reckoned to yield from one hundred and twenty, to two hundred and forty pints of juice, which averages one hundred and eighty pints; every twelve pints or pounds is boiled down to one of goor or jagari, and four of goor yield one of good powder sugar, so that the average produce of each tree is about seven or eight pounds of sugar annually. Another statement presented to Griffiths gives the average produce of each tree as sixteen pints per day, four of which will yield two pounds of molasses, and forty of molasses will yield twenty-five pounds of brown sugar. This difference is so great, that he could not reconcile them, but he was inclined to give most credit to the first.

Phoenix paludosa, Griffiths. This palm forms very elegant impenetrable tufts. Trunk twelve or fifteen feet high, three and a half inches in diameter, annulate at the base, otherwise covered with the brown, retiferous, armed petioles. Leaves gracefully spreading, eight or ten feet long. Petiole covered with scurf, brownish-glaucous, in the lower three feet, bearing

irregularly spreading, hard, brown, triangular, channelled, rather long spines. It grows in the Sunderbuns, where it forms a considerable portion of the impenetrable woods which completely cover that extensive tract of country. Along the Salween, between Amherst and Moulmein, Penang, where it is known by the name Dangsá, Sanscrit name Hintala; Bengal, Hintal. The trunks of the smaller trees serve for walking sticks, and the natives have an idea that snakes get out of the way of any person having such a staff. The longer ones serve for rafters to their houses, and the leaves for thatch. It is well worth cultivation on account of its elegance, and its being adapted for bank scenery.

Areca.—Spathé 1 or 2 complete. Flowers monœcious in the same spadix, one feminine between two masculine. Stamens 3, or indefinite. Ovary 1 to 3 called-Ovula 1. fruit drupaceous or somewhat like a berry, sometimes oblique, one-seeded. Albumen ruminated. Embryo near the base. The areca palms are arboreal trees or shrubs, often unarmed. Trunk ringed. Leaves pinnately divided, seldom twice divided or bipinnate. Sheath coriaceous, striated. Spadix, axillary paniculate or racemously divided, rarely simple, often broken. Flowers often distichous or ranged in two rows, with a centrifugal expansion or evolution. Anthers linear. Fruit either drupes or berries, the former ovate, often orange, the latter globose and of bluish colour.

Areca catechu.

Foolfool,	ARAB. Pinang,	MALAY.
Gooa,	BENG. Goorvaka,	SANS.
Soopara,	HIND. Poka chettu,	TEL.

This is the most elegant of the Indian palms. The male flowers are delightfully fragrant. The trunk grows remarkably straight, often from forty to fifty feet high, and in general about twenty inches in circumference, equally thick in every part, and smooth. On the Malabar coast the common black pepper vine is usually trained up to this tree, which renders it more useful in those parts than any other. It is commonly cultivated, especially to the eastward, where it attains a much larger size than in Bengal. It is very extensively cultivated in most of the warmer and more humid parts of India, especially towards the sea, near which alone it comes to perfection. It thrives much more luxuriantly on the Tenasserim coast, and in the Straits of Malacca than in Bengal; the nut is also much more immoderately used by the Burmese and Malays than the Bengalees. Several varieties with particular names exist among the Malays, and merit perhaps as much attention as those of the cocoanut.

Areca triandra, Roxb.—is shrubby, throwing out offsets at the base. The stem is five to seven feet high, green, distinctly annulate

one and a half inch in diameter. It grows in the woods of Chittagong, Rungpore. Bengallee names Bunggoa, Ramgua, Runisupari, in flower most of the year.

Areca lawa, grows in the Andaman Islands, Buchanan Hamilton states that it is closely allied to *A. triandra*, and that the nuts are used instead of the betel-nut by the convicts confined on the island.

Areca nagensis, Griffith.—Trunk thirty or forty feet high, attached to the soil by innumerable black fibrous roots. Grows in Assam? and the Naga hills up to an elevation of eight hundred feet above the level of the sea, affecting banks of rivers. Name of the tree in Naga, Tal-pat; Singhpo name, Tangtaw; by its roots and fruit. This appears distinct, it is very scarce, and courts high situations generally on river sides.

Areca cocoides, Gr., is a lofty palm. Trunk forty feet high. Crown dark-green, ample. Leaves pinnate, petiole scurfy plano-convex: lamina eight or nine feet long, four or four and a half broad, in outline lanceolate acuminate. Cultivated at Malacca, but not commonly. It occurs in a garden at the Dutch Redoubt; also half way to Malim. Malayan name, Pinang Punowur. The aspect of this palm is very different from that of *A. catechu*, the size being much greater, the crown blackish-green, the leaves stiffer, and at a distance having a truncate appearance. The fruit is considered a medicinal kind of betel-nut, its native place is not traced, it may be Pinanga Calapparia of Rumphius?

Areca pumila, Gr. Stems ten or twelve feet in height, $1\frac{1}{2}$ to $1\frac{1}{2}$ inch in diameter, distinctly annulate. Leaves eight or nine feet long; sheaths subventricose, about two feet long, inside of a shining chesnut colour. Growing in a ravine of the dense forest near Ching, Malacca. Its Malayan name is Pinang Jirong, it is closely allied to *A. malaiana*, but is at once distinguishable by tetrastichous, not distichous, inflorescence, the sepals, number of stamens and the orange, not sanguineous, colour of the fruit.

Areca malaiana. Gr. An elegant palm, eight to twelve feet in height, having the appearance or habit of the preceding. Stem distinctly annulate, in diameter scarcely an inch, internodes generally subclavate. Crown composed of five to eight spreading leaves. Grows in forests, at Ayer Punnus, and Rhim, Malacca, where it is not uncommon. Malayan names, that of Malacca, Pinang Booreng; of Pinang, Kurdo. This species is at once distinguishable by the colour of the spadices and fruit; its nearest affinities are with *A. disticha* and *Dicksoni*. It varies in the degree of compression of the spikes, and also somewhat in size.

Areca dicksoni, grows to the height of sixteen or eighteen feet, with a very straight, simple trunk, of about two inches in diameter.

Areca gracilis, Roab., is the *Scaforthia gracilis* of Martius' palm. It grows on the hills near Sylhet, (where it is called Gooa, Supari and Ramgoa), Chittagong and the Eastern border of Bengal. Goalparah, Assam, where it is called Girgoa? also, about Kujoods, and Ningrew in Upper Assam, where it fruits in January; and in the mountains below Darjeeling.

Areca disticha, Roxb. Its stem is arundinaceous with distinct subclavate lengthened joints; varying in height from one and a half to three or four feet, parts lately exposed scurfy. It grows in Malacca in dense forests, at Ayer Punnus, not uncommon; and Pinang. Malayan name, Pinang Boorang Paday. It also occurs in the Khasyah mountains, at an elevation of 4,000 feet. Moosami, near Churra Punjee: also Griffiths thinks in Assam. It is closely allied to *A. disticha*, but is distinguishable by the more branched stouter spadix, the tetrastichous fruit, its larger size, and distinctly mammillate apex. The stigma, judging from one abortive pistillum is also 5-lobed. This plant varies much in size, Roxburgh describes the branches of the spadix as woolly: his drawing also, represents the petals as acute, not cuspidato-acuminate. In the Assam and Khasyah plants, the stem and leaves are much the same as in *A. gracilis*. The spadices more slender, and three or four times branched.

Areca paradoxa. Stem slender, five to seven feet high, three or four lines in diameter, annulate, upwards roughish with ferruginous down. Crown consisting of six or eight leaves. Dense forests near the base of Goooonong Miring, Mount Ophir, in fruit February 1841. The specimen is scarcely distinguishable, except in the form and structure of the fruit and seeds, from *A. disticha*. That structure, however, is so different as to suggest the probability of its constituting a new genus.

Areca tigilluria, Griffiths, is a very elegant palm. Trunk thirty or forty feet high, distinctly annulate, armed, surrounded with offsets at the base. Crown dense and graceful. Spadix of the fruit having branches one or two feet long, pendulous, purplish sanguineous, with an articulated appearance. It grows on the borders of paddy swamps, in Malacca where it is common. Malayan name, Nibong. Also in forests at Laineur to the South of Mergui. The trunk of this palm is in much request for house posts. Jack says, that there is only one spathe, and that the flowers are one male to two females, but that author does not notice any obliquity of the fruit.

Areca horrida, Griffiths, is the A. Nibung, Mart. Palm, t. 153, f. v. It is an elegant palm, thirty or forty feet in height, sending off offsets at the base. A third species of the section *Enoplus*, with the habit of this species but smaller, is common on the cliffs of the sea-shore a little to the north of Koondoor, near Malacca. Its Malayan name is Nibong Paddy.

Areca nibung, as a name, is scarcely tenable, the true Nibung being *Areca tigillaria*, Jack. *A. horrida* grows in Malacca. Common in densely-wooded valleys and ravines, at Ching and on wooded hills, at Laydang Soobubis, but rare. In woods at the base of Battoo Bakar. Malayan name Bhyass. This species is allied to *A. tigillaria*, but is very distinct in the spathes and fruit. The flowers also are much more crowded, and generally appear to have the usual arrangement, viz., one female between two male. The young spadices (from the contrast in colour between the spathes and their spines and the waviness and adpression of these) have the appearance of tortoise shell.

Bentinckia coddapana, Griffiths, is an elegant, slender palm, about twenty feet high. The trunk is about an inch in diameter. It grows in the mountains of Travancore (*Roxburgh and Wight*.) Flowers in June, seeds ripen eight or nine months afterwards. Telinga name, Coddapanna.

Slackia geonomaformis. The stem is slender two to four feet high, about half inch in diameter, and distinctly annulate. It is scarcely distinguishable at first sight from *Areca disticha*, and like it varies much in the size and shape of the pinnules.

Arenga.—Flowers monœcious, generally but not always in different spadices. Stamens indefinite. Ovary trilocular. Berry depressed and three-cornered at the apex, imperfectly three-seeded. Albumen even. Embryo dorsal. The species of *Arenga* are handsome arborescent palms flowering only once, seldom with creeping stems. Trunk ringed towards the apex surrounded by the scaly bases of the petioles. Leaves pinnate with copious black rigid fibres intermixed with the petioles, sometimes prickly. Pinules linear fasciculate and in several rows, or solitary and in two rows with auriculate or lobed base, and eroded, truncate, dentate or bilobed apex, lower surface white. Spadix nodding pendulous. Spikes pendulous often in bundles (fastigate) like the tail of a horse. Flowers large. Anthers mucronately apiculate. Berries green, round and large. Seed (cohering to the endocarp) often berried. Juice acid.

Arenga saccharifera, Labillardiere.

Saguerus gomutus, Rumph.

Saguerus Rumphii, Roxb.

Borassus gomutus, Lour.

Gomutus saccharifer, Spreng.

This is a handsome palm, reaching to the

height of thirty or forty feet. Crown oblong, very dense, of a sombre aspect. Leaves very large, twenty feet (or more) long, and ten broad, outline oblong ovate. Petiole very stout, channelled at the base, sprinkled with blackish scurf, grows in Malacca province, generally cultivated, but less common in the littoral districts. It is the Anowe of the Malays. It succeeds sufficiently well in British India, flowering throughout the year. This is one of the handsomest and most useful Malayan palms. It is very commonly cultivated in the interior, at Malacca, in lines of trees recalling to mind the form of gothic arches. The parts chiefly employed for useful purposes are the black fibres forming the rete, the juice and the young albumen; the former are twisted into ropes and cordage, renowned for its power of resisting wet; the juice is either drunk as toddy or made into sugar, which appears to be in great demand. The young albumen preserved in syrup forms one of the well-known preserves of the Straits. Mr. Lewis informed Griffiths that trees that have died after the ripening of the whole crop of fruit, which is the natural course, are almost hollow, and particularly adapted for making troughs, spouts or channels for water, and that they last extremely well underground.

Arenga westerhoutii, Griffiths. Leaves ample, linear-oblong in outline, twenty feet long, ten feet across in the broadest part, rete as in *A. saccharifera*. Grows in the Malacca peninsula at Naning, Pinang; Malayan names, Anœe kutaree of Malacca; the Langkup of Penang. The chief difference from *A. saccharifera* is in the leaves. *A. obtusifolia*, Bl., has the petioles furnished with marginal aculei. The langkup of Pinang may be distinct, the pinnæ being smaller and more truncate, the branches of the fruit spadix spreading short, and the fruit larger and more oblong.

Arenga wightii, is a monœcious palm, forming by means of suckers dense clumps, Trunk stout, as thick as a man's thigh, generally three to five feet high, rarely eight feet. Leaves eighteen to twenty-eight feet in length; the lower naked part of the petiole is six or eight feet long. Dense forests on hills about Coimbatore. This species approaches in its inflorescence closely to *A. Westerhoutii*. It was the first species found on the continent of British India, and was dedicated to Dr. Wight.

Caryota,

Leguster major, Rumph. | Schunda-panna, Rheede.

This genus has flowers monœcious, one feminine between two masculine. Stamens indefinite. Berry somewhat dry, often one-seeded. Albumen ruminated. Embryo dorsal. The *Caryota* species are elegant palms often lofty, frequenting woody mountains, and flowering but once, sometimes perennial. Trunk closely

riaged. Leaves bi-pinnate, large, reticulated, fibres slender. Pinnules wedge-shaped, obliquely eroded, on both sides of the same colour. Spadices nodding, pendulous. Spikes pendulous, often hanging down in bundles like the tail of a horse. Flowers feminine with three rudimentary stamens. Berries subglobose somewhat red, juice sour.

Caryota urens, is a lofty and elegant palm. The trunk is a foot in diameter, and thirty-five or forty feet high, with distinct distant annuli. The crown is rather thin, consisting of several ascending gracefully curved bi-pinnate leaves, of great size, being eighteen or twenty feet long and ten or twelve broad. It grows in sandy places in Malabar, (*Rheed.*) On hills at Cavilacutty, with teak and wild mango trees, at Velater in Malabar, where it is called evim-pannah, and at Dinagapore in Bengal and Assam, a native of the various mountainous parts of India, flowering time the hot and rainy season. Telinga, name Jerogoo; the Dinapore name Ramgnoh, Bon-khejur; Assam name, Bura flawan. This and the Phoenix sylvestris when allowed to reach their full size unutilated, are two of the handsomest and most useful palms of the peninsula of India. This tree is highly valuable to the natives of the countries where it grows in plenty, it yields them, during the hot season, an immense quantity of toddy or palm wine. Griffiths was informed that the best trees will yield at the rate of one hundred pints in twenty-four hours. The pith or farinaceous part of the trunk of old trees, is said to be equal to the best sago; the natives make it into bread, and boil it into thick gruel; these form a great part of the diet of those people; and during a famine, they suffered little while those trees lasted. Griffiths believed this substance to be highly nutritious; the gruel, is fully as palatable as that made of the sago from the Malay countries.

Caryota obtusa, Griffiths, is a very large palm; the diameter of the trunk being one and a half or two feet. The leaves are very large, pinnules cuncate, very unequal-sided, coriaceous, when dry remarkably striato-plicate; the outer side scarcely at all produced; the teeth short, and very obtuse. It grows on the Mishmee mountains in woods about Yen. A second species inhabits the Mishmee mountains, with the inflorescence of an orange-yellow colour. The "Semoong-koong" of Sikkim, is probably a species of *Caryota*.

Caryota sobolifera, is a very elegant palm, forming by its offsets very thick compact tufts. Stems twelve to fifteen feet high, and four or five inches in diameter, of greenish colour and distinctly annulate. It grows about Malacca and on Pulo Bissar in woody places. Malayan name, Tookkus, Doodoor of Penang, according

to Mr. Lewis. It was introduced into the Botanic Garden in 1816 from the Mauritius, where it flowers during the greater part of the year. Griffiths found no distinction between the Malacca and the Botanic Garden specimens, the former, however, were not observed to be soboliferous.

Harina caryotaules, a palm of Chittagong, where it is called Chilputta or Belputta, (*Roxb.*) This is a very elegant palm forming thicker tufts than the preceding, but the leaves are rather larger, and the lower ones are spreading; the petiole is much the same as that of the preceding. It grows in Assam, Sub-Himalaya, Darjeeling. Cultivated in the H. C. Botanic Gardens, flowering in May and June.

Harina nana, is a small erect palm, from three to five ft. in height. The trunk is slender, throwing out roots from the base, and covered with the sheaths of the leaves. Grows in Lower Assam, in woods about Gowhaty. Flowers in July and August. This species appears to be allied to *Orania regalis*, *Blume*, *Rumphia*, p. 85, and *Orania porphyrocarpa*, *Mart. palm*, p. 157. It differs from both in the number and the irregular shape of the pinnules, the crowded flowers, and three petalled females. In the shape of the fruit it is nearly intermediate.

Macrocladus sylvicola, is a handsome palm, about forty feet in height with somewhat the habit of *Cocos nucifera*. Crown subhemispherical, dense. Leaves pinnate, ample, twelve to fifteen feet long, spreading in every direction. Grows in Malacca, in forests at Ching. Malayan name, Ebool.

Zalacca edulis, Remusat.

Z. rumphii, *Wall. Pl. Asiat. Rav.* p. 14.

Z. wallichana.

Calamus zalacca, *Roxb. F. 1. 3. p. 773*.

This is a tufted short stemmed palm. Leaves varying in size, in marshy shady places being 18 to 20 feet in length. This species is common in swampy places about Malacca, the Tenasserim Provinces, as well as in Burmah. It is the Salac-koombar of Penang, according to Mr. W. T. Lewis. Male specimens of this species exist in the Botanic Garden Calcutta, but no female plants.

Zalacca affinis, found at Malacca near Ching, where it is known under the name of Salak batool, which means the true Salak.

Zalacca secundia, grows in forests about Kujoo, in Upper Assam. The Mishmee mountains, and on the lower ranges of hills on the borders of Upper Assam.

Zalacca macrostachya, grows in marshy, damp and exceedingly shady places at Ching near Malacca. It is the Rungum of the Malays of that place.

Zalacca glabrescens, grows in Penang where it is called salak.

Zalacca conferta, flourishes in very shady wet places in the great forests of Malacca, as at Ching and Katawn, where they are found in flower and fruit during most part of the year. It is the Asam-komber of Penang, and the Asam-paiah of the Malays of Malacca.

Sagrus konigii.

Metroxylon sago, C. Koning, An. Bot. 193.

M. lève. Mart. Palm, p. 215. (Excl. syn. Rumph at Roxb.

Sagrus rumphii, Hort. Kew. 5. 281.

The appearance of these palms is somewhat peculiar and not like that of the *Cocos nucifera* or cocoanut. This tree is called Rumbiya, it is cultivated about Malacca, generally on the edges of rice swamps. It is very common about Rumbiya, between Malacca and Ayer Punnus, whence the name of the place. It appears to differ sensibly from *S. lœvis*, of Dr. Jack, in the pairs of flowers consisting of a male and a hermaphrodite, in the size and exertion of the flowers, the coadunate ovaria, and the comparatively long style. It appears to differ from *S. Rumphii*, of Professor von Martius, chiefly in the spadices being smooth, and in the teeth of the calyx; but taking the phrase "*spadicibus lœvibus*" in what appears to have been the general acceptance in which it was employed, it may be the *S. Rumphii* of Willdenow, and Blume. Rumphius' figure of *Sagrus*, (Hb. Amb., 1, t. 17,) quoted by all authors as *S. Rumphii*, gives a very fair idea of this species. *S. Rumphii*, petioles *spadicibusque armatis, floribus exsertis masculo et foemineo, dentileus calycis ovatis acutis, staminibus floris foeminei anantherii, fructu depresso globoso*.

Sagrus lœvis, Rumph, grows in Sumatra and Malacca, W. Jack. In habit and character this tree recedes considerably from the true *Palmæ*. Its propagation by radical shoots exactly in the same manner as the common cultivated plantain, is peculiar, and is not observed in the true palms. The terminal inflorescence, and death of the tree after fructification, is another peculiarity. It is allied to *Calamus* by its retroversely imbricated fruit. This species of sago is abundant in many parts of Sumatra and at Malacca, and is employed in the preparation of sago for food. Considerable quantities are made at the Pogy Islands, lying off the west coast of Sumatra, where, in fact, it forms the principal food of the inhabitants. The sago of Siak is remarkably fine, and is also, Griffiths believed, the produce of this species. At the Moluccas the spinous sort is considered superior to this, but he was doubtful whether it exists in Sumatra. For making the sago, the tree must be cut before fructification commences, as it then becomes hard and dry.

Calamosagus laciniatus, appears to be intermediate between *Calamosagus* and *Zalacca*, having the habit of the former, the inflorescence

of the second, and in some measure, the seed of the last-mentioned genus, to which it approaches, as also the succeeding through *Zalacca glabrescens* and *Z. secunda*. A gummy matter is secreted from wounds in the spadix of this species. It grows in woods along the sea shores of the islands of the Mergui Archipelago.

Calamosagus harinaefolius, a palm of Malacca, brought by Griffiths from a place called Kussan, under the name of Rotang simote.

Calamosagus ochriger, is a climbing palm of a general glaucous tint. The diameter of the stem, including the sheath, is only five or six lines. It grows at Malacca under the Malayan name of Rotang donam.

Calamus castaneus, is a palm with a short erect or decumbent stem, forming thick bushy tufts.

Calamus macrocarpus, grows near Koreah-parah, one of the Bootea doocars.

Calamus schizospathus, Grows in the Khas-sya Hills, also Darjeeling.

Calamus arborescens, is a very elegant palm, in some cases stoloniferous. It grows in Pegu from whence the male plant was obtained by the Rev. Dr. Carey, and introduced into the Honorable Company's Botanic garden, Calcutta, in 1810, and called *C. hostilis*. It is a very handsome and well-marked species, distinguished by its erect stems, dark brown almost black spines, and the leaves which are white underneath, long and pendulous, and by the male spadices with the primary spathes armed. Griffiths was inclined to refer it to Roxburgh's *C. erectus*, had the whiteness of the under surface of the pinnules been mentioned in his description. It is closely allied to *C. longisetus*.

C. scipionum, Mart., is the well known cane. The plant does not appear to occur about Malacca itself, and Griffiths was informed that the canes are imported chiefly from Siak, on the opposite coast of Sumatra.

Calamus ornatus, Blume, is a very well marked species, especially by its stature and inflorescence: it appears to be more nearly allied to *C. schizospathus* than any other. Grows in the forests of Malacca, as about Durion Toongull. Its Malayan name, Rotang Ruga Bodak.

Calamus flagellum, is allied to *C. ornatus*, between which and *C. longisetus* it should at present be placed. It is also closely akin to *C. schizospathus*, which may probably be more of the same section.

Calamus exilis is a very slender species, the stem without sheaths being only about the thickness of a goose quill, with the sheaths three and a half to four lines in diameter. Grows at Malacca, Goonong Ladang. Malayan name, Rotang Goonong.

Calamus royleanus is a small elegant species, forming impenetrable bushes. It is the only species that extends so far north as to come within the limits of the Seharunpore and Dhoon Flora. It grows in the denser, moister parts of the jungles of Dehra Dhoon, chiefly towards the eastern extremity of the valley, as at Kur-ruck.

Calamus Roxburghii, grows in Bengal and the Coromandel coast, flowers during the rains, fruit ripens during the cold season. "Sanskrit, Vetro, vetus; Bengal, Bet, or Sanchi-bet." C. Roxburghii, is (C. Rotang of Roxb.) Its most obvious distinctions from the Soondee-bet, (C. Mastersianus) are in the size and colour, of the fruit, which in the latter has broad brownish lines, so as to look chequered with brown. The spikes and the branches too, are different.

Calamus tenuis, Roxburgh, is a beautiful delicate species; when divested of the sheaths of the leaves and cleaned, it is not thicker than a common quill, and of the colour of the common rattan. Flowering time, the rainy season. It grows in Eastern Bengal as at Sylhet; Assam, where it is known as the "Bet" proper.

Calamus leptospadix, grows in Khassya hills, between Nunklow Naogong, in flower and fruit, in November 1835. In the same locality the *Areca gracilis*, *Harina caryotoides*, and *Caryota urens* were observed.

Calamus fasciculatus. Stems rather slender, and not very long: sheaths at first covered with white meal, afterwards smoother and green, armed with spreading strong flat spines, solitary or in short series. Grows in Bengal (common about Calcutta in bamboo jungles), also at Cuttack, and many other places; Roxburgh says he never saw it to the southward of Ganjam. It is the Bura-bet of the Bengalees and grows in small thick bushy tufts. This species is easily distinguished from all the others by its habit, by the direction of the pinnules (in which respect it approaches to *Zalacca*), and by their spinous margins and keels. The male spikes are shorter and broader than in any other species Griffiths was acquainted with, and in the distinctness of the bracteoles it appears to be singular.

Calamus gracilis, is a native of the forests of Chittagong, where Roxburgh found it climbing over trees and bushes to a great extent, and in flower in the month of May. This species is uncommonly slender, when divested of the sheaths of the leaves and dry, scarcely as thick as a common quill, in texture firm and elastic, covered with a smooth straw-coloured crust as in the common rattan. Grows at Chittagong, is the Mapoori Bet of the hindoos of that district. From the tropical climates of Southern Asia, and from myriads of islands which form the various Archipelagos, products of palms are

sold in every city of the colder regions of the world; where they are ever beheld with unabated curiosity. The cordage and rigging of the ships, and thick mattings used on stair-cases are spun and woven from the husk of the cocoanut, and many articles of furniture are made from the woods of palms. Toys and ornaments are made from the kernels of the vegetable ivory palm of S. America. The stearic candles so well known, are composed of the fatty substance extracted from the oil palm and the cocoanut. The sago which ministers so powerfully to the recovery of the sick, and which is seen in such varied guise on our tables, is the pith of palms that flourish in many tropical regions. Everywhere we meet with numerous products of palms, either in a raw state or turned by the ingenuity of man to some useful purpose; and millions of people who never saw a palm are benefitted by the products of these useful trees. But if this be felt in remote regions of the cold north, in the tropical regions of Asia, Africa, America and Australia, where these elegant members of the vegetable kingdom flourish in all their native splendour, the inhabitants derive from them many of the necessities, comforts, and luxuries of life, and come more or less in contact with them in almost every action of daily life. In one region, the door of the house is made of the split stems of the *Pashiuba* palm (*Iriarte exorrhiza*), and in another the thickly matted leaves of the cocoanut and *palmyra* serve as a door for the gardens and parterres. The harpoon for catching the cow-fish, is formed of the black wood of the *Pashiuba barriguda* (*Iriartea ventricosa*.) The people eat the fruits the produce of many of this tribe of trees, and in the palm-wine and arrack from the various palms, they enjoy palatable, refreshing, and stimulating drinks. At least 440 palm trees are now known, whilst at Linnaeus' death only 15 species were known. In Ceylon there are fifteen species, viz. :—

<i>Areca</i> , 4	<i>Calamus</i> , 5	<i>Corypha</i> , 1	<i>Cocos</i> , 1
<i>Caryota</i> , 1	<i>Borassus</i> , 1	<i>Phoenix</i> , 2	

The date is cultivated in Beluchistan and Southern Afghanistan up to 4,500 feet, and a dwarf palm *Chamærops ritcheana* of Griffiths, perhaps identical with the *Chamærops humilis* of Europe, occurs abundantly in many places, but with a somewhat local distribution. A species of *Chamærops* is very closely allied to, if not identical with *P. martiana* of Nepal, ascends to 8,000 feet in the western Himalaya, where it is annually covered with snow: it is not found in Sikkim, but an allied species occurs in Afghanistan, called *P. ritcheana*. The dwarf palm of Southern Europe is a fourth species. There are upwards of twenty kinds of palm in the Khassya district, including *Chamærops*, three species of *Areca*, two of *Wallichia*, *Arenga*,

Caryota, three of Phoenix, Plectocomia, Licuala, and many species of Calamits. Besides these there are several kinds of Pandanus, and the *Cycas pectinata*. Palms of the Khassya hills amount to fourteen, of which the *Chamærops* and *Arenga* are the only genera not found in Sikkim. A species of *Calamus*, is the "Renoul" of the Lepcha. The fruit of all the Calami are eaten by the Lepcha and the stems of larger species are applied to various economic purposes. One species, climbs lofty trees, and extends some 40 yards through the forest: 6,500 feet is the upper limit of palms in the Sikkim Himalaya, and one species alone attains so great an elevation. Four other Calami range between 1,000 and 6,000 feet on the outer hills, some of which are found 40 miles distant from the plains. Among the other palms of Sikkim is the "Simong"—a species of *Caryota*, which is rare, and ascends to nearly 6,000 feet. In the Old Testament, the palm-tree is first mentioned as the tamar, in Ex. xv, 27 but afterwards frequently. Psalm xcii, 12, 13 and 14 says the righteous shall flourish like a palm tree, and in Canticles vii, and 7, the erect and slender form of woman is compared to the palm; how framed, O my love, for delights! Lo, thy stature is like a palm-tree, and thy bosom like clusters of dates. In the temple of Solomon were pilasters made in the form of palm-trees. A branch of a palm was a signal of victory, and was carried before conquerors in the triumphs. Allusion is made to this in Revelations vii, 9, and in this view they were borne before Christ in his way to Jerusalem, as in John xii, 13.—*Burton's pilgrimage to Meccah*, Vol. ii, p. 175; *Powell's Hand-book*, Vol. i, p. 512; *Hartwig*; *Griffith's Palms of British East India*, *Roeb. Fl. Indica*; *Seeman on palms*; *Hooker, Him. Journ.*, Vol. ii, pp. 267, 280-81; *Schow in Jameson's Edinburgh Philosophical Journal*; *Mr. H. Robinson, in Cal. Cat. Ex.*, of 1862; *Voigt Hortus suburbanus Calcuttensis*; *Royle, Ill. Himm. Botany*; *Bird-wood's Bombay Products*; *Hogg's Vegetable Kingdom*.

PALMA BRAVA, Nibong, Tagala of Mindoro, used by the wild tribes of Mindoro to form their bows and point their arrows.

PALMA CHRISTI.

Castor oil palm,	ENG.	Jarak,	MALAY.
<i>Ricinus communis</i> ,	LAT.	Tangan-Tangan,	TAG.
Kaliki, MADURESE;	SUN-		
	DA.		

The Castor oil plant, is called Palma Christi, Christ's palm, because where the true palms are not found, it is carried on Palm Sundays.

PALMA INDICA MAJOR, *Rum.* Syn. of *Cocos nucifera*, *L.* Cocoa-nut palm.

PALMANAIR, in lat. 13° 12' long., 78° 45' in the Carnatic, a large town on an open plain, west of Chittoor. The dāk bungalow

is 2,618 feet above the sea. It is situated twenty-five miles north of the Railway station of Goriattum, with a driving road the whole way from thence. As regards fever, occasional instances have given it a bad name, which the general statistics of health among Europeans and natives, if published, would rectify:—

Range of Thermometer at Palmanair in Dec. 1861.

PALM BOOKS. The books and separate leaves employed for writing on in Asia, are made from the leaves of the Talipot tree *Corypha umbraculifera*, also from the Tara, Tareet, or Tallier of the Bengalese *C. taliera*, *Roeb.*, and from the leaves of the Palmyra palm. All the Burman books are made of the leaf of a species of *corypha*, but the orders that are issued from the Burmese courts are written on strips of palmyra palm-leaf. Those used in Southern India for school-boys' books, for the accounts of shop-keepers, the orders of Collectors and village accounts are made of the leaf of the palmyra. The Ola, of the Tamil people, is the dried palmyra leaf prepared for writing on with a style.—*Mason*.

PALM-CAT, *Paradoxurus typus*, *F. Cuv.*

PALMETTO, see *Chamærops ritchiana*.

PALM-HOUT, *Dur.* Palm wood. See Box-wood.

PALMINE, may be prepared from castor oil and possibly from other oils also, by treating them with nitric or nitrous acids. A process is given in Brande's Manual of Chemistry, Vol. xi, p. 1257, and is supposed to be the substance which was about A. D. 1857 patented for the use of railway carriages in this country, and whether as regards its origin, the facility of making it, the abundance of the castor oil plant in India, its consistence and cheapness, it well deserves attention. The nitric or nitrous acid, Shore ka tezaab is usually obtained by distilling nitre, Shora, HIND., with sulphuric acid, Gundhuc ka tezaab; of which two materials, various proportions are employed. When nitrous or nitric acid is made to act upon castor oil, it is converted into a solid wax-like substance and

a similar, though much more rapid, result takes place when olive oil the Zeitoon ka tel of the bazaars, is similarly treated with nitrate of mercury; but it deserves notice that castor oil is the only one of the drying oils which is susceptible of this species of solidification. On adding nitrous acid to castor oil a yellow liquid is at first formed, and the time required for its solidification varies with the quantity of acid employed; when about a twentieth part of acid is used, it solidifies in seven or eight hours, and this or somewhat less, is the best proportion. If too much acid be used, a third part, for instance, or a half, the temperature rises to 130° or 140°; effervescence ensues and the oil becomes opaque, and instead of indurating remains viscid. Palmine thus obtained is yellow, but when purified by solution in boiling alcohol, it is white, of a waxy fracture and requires a temperature of about 150°, for its fusion. When this is kept for some months it occasionally acquires a resinous appearance and presents an almost vitreous fracture. A large and profitable trade might be had in Palmine made from the cheap oils of Southern Asia, the difficulty of transporting which is well known. The same effect is produced on this oil and on olive oil by adding the nitrate of mercury.

PALMIRAS POINT, a projecting headland in the north-western side of the Bay of Bengal.

PAL-MODECA, MALEAL. *Batatas paniculatus*.

PALM OIL.

Huile de palme,	Fr.	Aceite de palma,	Sp.
Huile de senegal,	"	Panam yenne,	TAM.
Palmol,	GER.	Thati nuna,	TEL.
Olio di palma,	It.		

This is a fatty substance, obtained from the fruit of several species of palms, as well as from that of the *Elais guineensis*, growing on the western coast of Africa. It has the consistence of butter, a yellowish colour, and scarcely any particular taste; and becomes rancid on being kept for any length of time. It is chiefly used in England for the manufacture of toilet soap, pomade-perfumery; also in medicine and surgery. The African palm oil of commerce, so much imported into England for the manufacture of Prices' patent stearic candles, is the produce of this *Elais guineensis*; *Linn.*, a native of Africa. Another species, *E. melanococca*, *Gartn.*, is a native of America: both species might be profitably introduced into India. The *Cocos butyracea*, and *Cocos nucifera* also yield palm oils.—*Seeman*; *McCulloch's Commercial Dictionary*.

PALMER, a term applied to the pilgrims from Palestine from the staff of the date palm branch which each brought back.

PALM-SUGAR, sugar made from the sap of palma. See Jaggery, Sugar.

PALM-TREE WOODS, the of palma, obtained from the East Indies, and imported to a small extent into Britain for fancy use. The palms furnish a great variety of woods, black, brown, prickly brown, and speckled. Notices of the palm woods will be found under the names of their respective trees, the principal of which are the *Areca catechu*; *Borassus flabelliformis*; species of *Calamus*; *Cocos nucifera*; species of *Corypha*, many products of which—their woods leaves and fruits—are largely used in India. The palm woods are, however, sparingly employed in England for cabinet and marquetry work and sometimes for billiard cues which are considered to stand remarkably well; they are also turned into snuff boxes, &c. The smaller kinds are imported under the names of Part ridge canes (called also Chinese or fishing canes), Penang canes from the island of that name, together with some other small palms which are used for walking sticks, the roots serving to form the knobs or handles. The knobs of these sticks exhibit irregular dots something like the scales of snakes, these arise from the small roots proceeding from the principal stem; which latter shows dotted fibres at each end of the stick, and streaks along the side of the same. The twisted palm sticks, are the central stems or midribs of the date palm; they are twisted when green, and stretched with heavy weights until they are thoroughly dry: they are imported from the Neapolitan coast but are considered to be produced in Egypt. The shells of the cocoa-nut and coquilla-nut, and the kernels of the areca or betel-nut, and those of the corosos or ivory-nut have likewise their uses in English workshops. But, only two or three varieties of the several hundred species are imported into Great Britain from the East and West Indies. They are known in England by the names, palm, palmetto palmyra, and nutmeg, leopard, and porcupine wood, &c., from their fancied resemblances; for, when they are cut horizontally, they exhibit dots like the spice, and when obliquely, the markings assimilate to the quills of the porcupine. The trunks of palms are not considered by physiological botanists to be true wood, they are all endogenes, and all grow from within, and are always soft and spongy in the centre, but are gradually harder towards the outside; they do not possess the medullary rays of the proper woods, but only the vertical fibres, which are held together by a much softer substance like pith or cement, so that the horizontal section is always dotted, by which they may be readily distinguished from all true woods. The colours and hardness of the two parts differ very materially.

The *Areca catechu*, or betel-nut palm, is re-

markedly perpendicular, it grows to the height of about 30 feet, and rarely exceeds 4 or 5 in diameter, it bears a small tuft of leaves, and the fruit is in clusters like grapes. The betel-nut is chewed along with quick-lime and the leaf of the piper betel, in the manner of tobacco. The general colour of the wood is a light yellow brown, the fibres are large, hard, and only a few shades darker than the cementitious portions.

The *Cocos nucifera*, or cocoanut palm, flourishes the best in sandy spots near the seabeach, and sometimes grows to 90 feet in height and 3 feet in diameter, but is generally less; it is rarely quite straight or perpendicular, and has broad pendant leaves from 12 to 14 feet long, in the midst of which is a sort of cabbage, which, as well as the fruit, the cocoanut, is eaten: the husk of the nut supplies the material for coir rope and matting. No part of this interesting tree is without its grateful service to the native of the tropic, the leaves are used for making baskets, mats, and the covering of his dwelling; he also obtains from this tree, oil, sugar, palm-wine and arrack, and although the upper part of the trunk is soft and stringy the lower supplies a useful wood, the fibres of which are of chestnut brown, and several shades darker than the intermediate substance; the wood is employed for joists, troughs for water, and many purposes of general carpentry.

The *Nieper palm*, *Caryota urens*, wood is much darker than either of the preceding; the fibres are nearly black and quite straight, and the cement is of a dark brown, but in other varieties with these black fibres, the softer part is very light-coloured and so friable that it may be picked out with the fingers; at the Isthmus of Darien, they use the fibres of some of the palms as nails for joinery work.

Palmyra wood, or that of *Borassus flabelliformis*, is largely used in Ceylon and the Eastern parts of the Peninsula of India, for the construction of flat roofs, the joists of which consist of two slabs, the third or fourth part of the tree, bolted together by their flat sides so as to constitute elliptical rafters. They are covered first with flat tiles, and then with a white concrete called chunam, consisting of shell lime, yolks of eggs, and jaggery (sugar,) beaten together with water in which the husks of cocoanuts have been steeped.

The *Picky pole* the *Cocos guianensis* of Jamaica, &c., a palm growing 40 feet high, and of small diameter, is said to be very elastic, and fit for bows and rammers. As before mentioned, the smaller kinds are imported into Great Britain under the names of Partridge canes (called also Chinese or fishing canes,) Penang canes from the island of that name, together with some other small palms which

are used for walking sticks, the roots serving to form the knobs or handles. The knobs of these sticks exhibit irregular dots something like the scales of snakes, these arise from the small roots proceeding from the principal stem; which latter shows dotted fibres at each end of the stick, and streaks along the side of the same. The twisted palm sticks are the central stems or midribs of the date palm; they are twisted when green, and stretched with heavy weights until they are thoroughly dry; they are imported from the Neapolitan coast but are considered to be produced in Egypt. The shells of the cocoanut and coquilla-nut, and the kernels of the areca or betel-nut, and those of the corosos or ivory-nut, have likewise their uses in English workshops.—*Symonds; Tredgold.* See Palmyra and Porcupine wood.

PALM WINE, or Toddy.

Tari, Sendi, Narelli, HIND.

Nera,
Kulloo,

MALAY.
TAM., TEL.

Tuwak, JAV., MALAY.

The fermented sap of several species of palms. Of those in the E. Indies, the chief are:

<i>Arenga saccharifera.</i>	<i>Cocos nucifera.</i>
<i>Borassus flabelliformis.</i>	<i>Phoenix dactylifera.</i>
<i>Caryota urens.</i>	" <i>sylvestris.</i>

When first drawn, palm-wine is refreshing, but in a short time passes on to the vinous or acetous fermentation, and in these stages spirits are distilled, sugars are made or vinegar obtained. In the prevailing dialects of the E. Indies, the spirit is called arrack, it is the cha of the Chinese, the sagwire of the Philippines the tuba of Manilla and Mindoro, and the tuac of Timor and the Moluccas, the sap of the palm, converted by distillation or fermentation into spirit or vinegar. When the spathes of the fruit bearing palmyra trees appear, the toddy-drawer climbing to the top of the tree, binds the spathes tightly with thongs to prevent their further expansion and thoroughly bruises the embryo flowers within to facilitate the exit of the juice. For several succeeding mornings, this operation of crushing is repeated, and each day a thin slice is taken off the end of the racemes to facilitate the exit of the sap and prevent it bursting the spathe. About the morning of the eighth day, the sap begins to exude, when the toddy-drawer again trims this truncated spathe and inserts its extremity into an earthen pot to collect the juice. These vessels are emptied morning and evening and the palmyra will continue for four or five months to pour forth its sap at the rate of three or four quarts a day but once in every three years, the operation is omitted and the fruit is permitted to form, without which the natives assert that the tree would pine and die. The tree during the first part of the season, yields a pretty large quantity of toddy or palm wine. This is either drank fresh drawn from the tree, or boiled

down into a coarse kind of syrup called jaggery, or it is fermented for distillation. The palm wine of the date tree *Phoenix sylvestris*, is obtained by notching the tree. The palm wines receive local names, according to the trees from which they are obtained.

Palmyra wine.

Palm-wine is mentioned in Exodus xxix, 40, and xxviii, 7, and it seems to be the same as the strong drink of Isaiah v, 11, and xxiv, 9. The Hebrew name is Siker, the Sikera of the Greeks from which seemingly comes the *Saccharum* of the Romans, all the palm-wines having a sweetish taste, though according to Jerom, in Hebrew, any intoxicating liquor was Sikera, obtained from grain, the juice of apples, honey, dates or any other fruit.

PALMYRA, also called Tadmor, a city built by king Solomon in the desert, to the S. E. of Jerusalem. Concerning the origin of Palmyra, rendered celebrated by the actions of Zenobia, whose capital it was, and by the reported magnificence of its existing remains, little certain is known. We read in Kings, i, 9 and Chron. ii, 8, that Solomon built "Tadmor in the Wilderness"; and Josephus assures us that the city, which was subsequently known under the name of Palmyra, by the Greeks and Romans, was one and the same place. It has again recovered its original appellation, being known to the wandering Arabs under that of Tadmor or Tadmoor. Notwithstanding this remote origin, it were idle to attribute an earlier date to the existing ruins of palmyra, than that of the establishment of the Greeks in Syria. The first mention of it in Roman history, is under Mark Anthony (see Appian, *De Bello Civil*, lib. 5), at which time it appears the inhabitants were noted for their riches and their commerce with the eastern nations. The description which Pliny gives of its situation, as compared with its present appearance, is singularly correct. He says, Palmyra is remarkable on account of its situation, the richness of its soil, and its agreeable streams. It is encompassed on every side by a vast desert of sand, which completely separates it from the rest of the world, and it has always maintained its independence between the two great empires of

Rome and Parthia, whose constant enmity it is, during their wars, to bring it over to their respective interests. It is distant 337 miles from Seleucia on the Tigris, 203 to the nearest part of the coast, and 176 from Damascus. He describes the first view of the ruins as singularly romantic, and remarkable on account of their great extent, but, on closer inspection, not answering to their first impressions. This opinion is confirmed by Burekhardt, who travelled in 1810. The entire ruins of Palmyra, when seen at a certain distance, is infinitely more striking than those of Balbec; but there is not any one spot so imposing as the interior view of the temple of Balbec. The temple of the sun at Tadmor is upon a grander scale than that of Balbec, but it is choked with Arab houses, which admit only a view of the building in detail. The architecture of Balbec is richer than that of Tadmor. From the time of Solomon till after the captivity of the Roman emperor Valerian by the Persians but little is known of it. It rose to the highest opulence and splendour under Odenatus, whose dominions extended from the Euphrates to the Mediterranean. But its chief interest is connected with the wife of Odenatus, Zenobia queen of the east. The increasing power attracted the notice and jealousy of Aurelian who having defeated her in two pitched battles, laid siege to Palmyra. Soon after the surrender of the city, the Palmyrenes revolted against the emperor, who in consequence entirely destroyed the city, and put the greater part of the inhabitants to death. He afterwards restored the temple of the Sun, and gave permission to the remnants of the Palmyrenes to re-build and inhabit their city. The pile of building on the left is the temple of the Sun, consisting of an immense court, of which the ruins are spread over a space of 220 yards. It is surrounded by a stately wall, adorned with pilasters within and without. Two rows of marble columns, of which about sixty remain entire, formed a colonnade within the court, which is now occupied by the Arab huts. The great colonnade which forms the principal feature in the drawing, extends more than half a mile in length, and probably was the main street in the city, from which others branched out laterally; it was entered by an archway, and terminated by a large building, of which the portico alone remains. Innumerable columns and ruins of temples, are scattered over the plain. Its peculiar interest is not confined merely to architectural details, but to its position in the desert, and its utter loneliness. Lord Lindsay says "an awful stillness,—a lifelessness pervades the ruins,—they stand so lonely and silent as when the last of the Palmyrenes departed and left the city of Zenobia to silence and decay."

This tree is very abundant, especially in sandy tracts near the sea. Its wood is used chiefly for rafters, joists and reapers, when of good age the timber is very valuable for this purpose, the trunk is split into 4 for rafters, into 8 for reapers, these are dressed with an adze. Those of the Jaffna palmyras are famous, and were largely imported in former times. From the structure of the fibres, it splits easily in the direction of its length, but supports a greater cross strain than any other wood : iron nails, however, rust rapidly in it. The fruit and the fusiform roots of the young trees are used in the Northern Circars as an article of food by the poorer classes. The leaves are used for thatching and coarse fibre. Jaggery and toddy are extracted from the tree, the former is extensively used in the manufacture of sugar in Vizianagrum and Rajahmundry. Very neat baskets of palmyra leaf are manufactured at Tinnevely. Some clean but brittle fibres were exhibited at the Madras Exhibition of 1855, by the Tinnevely, Madura and Travancore Local Committees and well twisted rope accompanied most of the samples, but the material is said to be stiff, brittle, and liable to rot when wet. Its chief uses are for securing thatch and tying bamboos, in building native huts. The palmyra tree is to be seen in almost all parts of India, and occasionally as far as 30° N. lat. It is, next to *Caryota urens*, the largest palm on the Madras coast, and it seems to thrive equally well in all soils and situations. The seed when young are eaten by the natives, being jelly-like and palatable. The tree, during the first part of the season, yields a pretty large quantity of toddy (palm-wine). This is either drank fresh drawn from the tree, or boiled down into a coarse kind of syrup called jaggery, or it is fermented for distillation. The wood, near the circumference of old trees, is very hard, black, heavy and durable. The dried, prepared, leaves are universally used for writing upon with an iron style. They are also employed for thatching houses, for making small baskets, mats, &c., and some also are formed into large fans. The fibres of the leaves are employed on the Madras side for making twine and small rope. They are about two feet in length, strong, wiry, and not unlike those of the Esparto of Spain. Near the base of the leaves is a fine down, which is used for straining liquids through, and also for stopping bleeding from wounds. The Palmyra wood, or Porcupine wood, is from the palmyra tree. The

Poonattoo of the Singhalese, is the dried pulp of fruit of the palmyra tree, dried in the sun, then smoked in their houses, and eaten as cakes, for soup or in curry, the centre and its top are soft and spongy, containing a kind of coarse farina, intermixed with the under fibre, and in Ceylon, these parts are laid out to attract for the sportsman, hares and wild hog. The palmyra forests of Tinnevely form a distinctive feature in the scenery of the province. And unromantic looking as is the palmyra, there is no tree in Indian forests so thoroughly useful to man. Its young root is as edible and nutritious as a carrot ; from its leaves are manufactured mats, fans, beautiful basket-work of every description, sandals, hats, umbrellas, sieves, thatch, water buckets, and the most lasting substitute for paper used by the natives. The juice is a pleasant nutritious drink ; and from it is produced an excellent sugar, and superior sugar-candy. The fruit when roasted is a wholesome food, and the pulp is, in hot weather, a most grateful refreshment. From the fibre of the leaf stalk, is manufactured an excellent cordage ; the timber of the trunk supplies the natives with a durable wood for building purposes, the refuse of the leaves, is their ordinary firing and the huge root of the old tree, when covered with a sheep-skin, forms an excellent drum ! Thousands of people subsist on the produce of this palm ; a considerable portion of the revenue of the province is derived from the tax upon it, and no small portion of the time and the patience of the Magistrates are wasted upon the quarrels and disputes of which it is a most fruitful source. There are about five millions of palmyras bearing tax, and the sum thus realised by Government grants is one lac and a half of Rupees, or about one Rupee per thirty trees. Proprietorship in palmyras consists of four classes, viz., 1. The ryot who is owner of the trees and the land upon which they grow. 2. The palmyra-climber who holds a puttah for trees growing on the land of another. 3. The climber who holds a puttah for trees growing on land belonging to Government, lying waste, but capable of being cultivated ; and 4. Climbers who hold puttahs for trees on land belonging to Government, but which cannot be cultivated, such as road-sides, &c. From this diverse proprietorship, from the manner in which the tax is assessed, oftentimes being in excess of the land tax, and from the practice of inspecting and assessing the tax once in three years, the proprietors are subjected to considerable inconvenience, and the Collector and his assistants to very much labour. The palmyra is of two sorts, the male which yields juice only, and the female which yields juice and fruit, and for doing which generous act, it is taxed exactly double the amount levied

on the male. One-fourth of the population of the northern provinces of Ceylon are supported by the produce of this tree.

Palmyra is a Sanscrit word corrupted, and affords the etymology of Solomon's city of the desert Tadmor. The p, by the retrenchment of a single diacritical point, becomes t; and the (l) and (d) being permutable, Pal becomes Tad or Tal, the palmyra, which is the Mor or chief of trees; hence Tadmor from its date trees. In Sanscrit, tal or tar, is the 'date-tree'; mor signifies 'chief.' In British India there are more than one 'city of palms' (Talpoor) and the tribe last ruling in Hyderabad, on the Indus, was called Talpoorie from the place whence they originated.—*Tennent's Ceylon M. E. J. R.*; *Royle's Fib. Plants*, p. 39; *Mason*; *Robinson's Travels*, Vol. ii, pp. 242, 352-354; *Toel's Rajasthan*, Vol. i, p. 97. See Semitic races.

PALMYRA-WOOD, is the trunk of the palm-tree *Borassus flabelliformis*, which is largely used in Ceylon and Southern India for rafters, joists, reapers, and other building purposes. The fruit and the fusiform roots of the young trees are used as food by the poorer classes. The leaves are used for thatching, and from the coarse fibre very neat baskets are made. Jag-gery, coarse sugar, and toddy are made from the sap. Palmyra is sometimes called nutmeg-wood by turners. Its fruit, of the size of an ostrich egg, grows in clusters. But the trees from which the toddy or palm wine are drawn, cannot bear fruit. The fibres of the petioles of the leaves (Palmyra nar) are employed on the Madras side for making twine and small rope. They are about two feet in length are strong and used for wood.—*Simmond's Dictionary*. See Kelingu, Olay, Punatu, Porcuine wood.

PALMYRA CLIMBER, Eng. *Anabus scandens*.

PALNAUD, the N. W. corner of the Guntoor collectorate, grows cotton.

PALO—? HIND. The starchy extract of root and stem of *Tinospora cordifolia*, *Miers*, the stem of which is macerated, and the solution evaporated to dryness.—*Simmond's Dict.*

PALODHERI: the Po-lu-Sha of Hwen-Thsang may be identified with Palo-dheri, or the village of Pali, which is situated on a dheri, or "mound of ruins," the remains of some early town.—*Cunningham's Ancient Geog. of India*, p. 51.

PALOGPONG IKAN, or ari-ari-ikan of the Malaya, loo-pa of the Chinese, appears to have formed an article of exportation from the islands of the Indian Archipelago as early as they became visited by the Chinese. When

these people commenced to settle in the Straits, they not only collected fish-maws there but also from distant localities, and Bombay, Ceylon, Madras, Bengal, Tenasserim and most of the Malayan islands contribute to the annual supply, which is bought up by Chinese dealers at Penang, Malacca, and Singapore, and re-exported to China. Since 1842, Mr. W. T. Lewis, Assistant Resident Counsellor of Pinang, made some very successful attempts to improve the production of isinglass in Prince of Wales' Island.—*Journal of the Asiatic Society of Bengal*, p. 445.

PALOLO, the name given to Balti, by the Dard race. See Balti, Bolor, India.

PALO MARIA, *Calophyllum inophyllum*.

PALONG. The Pa-long, Pa-on or Za-baing tribe are partially subject to, and located to the east of, the Mo-Meit (Mung Myit, Moun-g-m-ri) beyond the Ka-ren-ni, and along the Chinese frontier, as far as the latitude of Ba-mo (Mang-mo.) They are civilized and remarkably industrious, being good carpenters, dyers and blacksmiths. Their dhas or swords are exclusively used in and around Bamo. The Chinese who carry on the trade between Yun-nan and Burmah, by Ba-mo, describe the route, as passing across a range of hills inhabited by Ka-Khyeng and Palong, and then entering a Shan country, the Ko-pyi-doung of the Burmans. The Pa-long inhabit the valley south-east of Ba-mo, beyond the first mountain range. They approximate to the Shans, of whom they are probably an offshoot, they wear the same dress and are buddhist, but they have affinities with the Kha-khy-eng. The Pa-long seems to resemble the Anamese, in some respects. A race of the same name (Panong), but to which the Siamese apply the generic name of Ka or Kha, inhabit the mountains of Laos, bordering on Kamboja. They are a coarse and debased variety of the Anam and the Kambojan type. On the same side of the Mekong basin, but towards the sea, between 11° and 12° N. L., a hill tribe called Chong, preserve more of the ancient Australo-Tamulian character than the surrounding tribes. In the Chong, the hair, instead of being stiff or harsh as in the Mongolian, Tibetan and prevalent Ultra Indian and Malaya-polynesian race, is comparatively soft, the features are much more prominent and the beard is fuller. The Moi or Ka-moi, who, on the opposite side of the Mekong, occupy the broad expansion of the Anam chain towards Kamboja and appear to extend northwards along these mountains, marching with the Lau on the westward, are said to be black savages, with negro features. The Kambojans style them Kha-men. They are the Kho-men of Leyden and the Kha-men of Gutzlaff. See India, Paloung.

PALUDINIDÆ

PALOO, SINER. *Mimusops hexandra*, Roxb.

PALOO, a hard, fine, close-grained, heavy Ceylon wood: heart-wood deep red brown, recent layers reddish yellow; its compact, even structure, indicates that it is admirably adapted for turning work.—*Exhibition of 1851*.

PALUSTRE, see *Nasturtium*.

PALUTT, HIND. In music, a treble.

PAL-VALLI, or *Pal-Vulli*, MALEAL. *Chonemorphia malabarica*, Don., also *Ichnocarpus frutescens*, R. Brown.

PALVAR, see *Bendamir*.

PALWAL, HIND., SANS. *Trichosanthes dioica*.

PALWAN, HIND. *Andropogon annulatus*.

PAM, also *Pashm*, HIND., of *Kashmiri wool*.
PAMA, also *Thelu*, HIND. *Juniperus religiosa*, *J. squamosa*, the creeping juniper, *J. communis* and *J. excelsa*.

PAMAN, HIND. A kind of wheat, also called *vadanak*.

PAMANKE, HIND. *Boucerosia aucheri*.

PAMA-RATTI, TAM. *Anisomeles malabarica*, R. Br.

PAMAROONG or *Dondrekin* island in *Macassar* strait, near the coast of *Borneo*, is in lat. 0° 54' S., long. 187° 36' E.—*Horsburgh*.

PAMBAH, PERS. Cotton. *Gossypium indicum*, Lam.

PAMBAN MANCHE, TAM. Snake-boat of *Cochin*. See *Boat*.

PAMBASH, HIND. *Rheum emodi*.

PAMBHAN KANAK, HIND. *Triticum durum*.

PAMBU, TAM. A snake, a serpent. See *Serpent*.

PAMBU PARANDU, TAM. *Circæetus gallicus*, Gmel.

Pambao thalai neer cakai, TAM.

The *Darter*, *Plotus melanogaster*, or snake-headed *Water-crow*, has three, sometimes four eggs; young fledged and on the wing, some in *January*, others not till *April*.

PAMIR, a plateau at the headwaters of the *Indus*, almost 16,000 (15,600) feet above the

sea. It was encamped on by Lieut. Wood, of the Indian Navy. It is an extensive tract of elevated table land, known also as the Bam-i-danya or Roof-of-the-world, and is occupied by the black tents of the pastoral and free-booting Kirghiz, who occupy also the plain to the east of Badakhshan. The elevated expanse of Pamir, to the north of Hindoo-Koosh, observes Humboldt, is not only a radiating point in the hydrographical system of Central Asia, but is the focus from which originate its principal mountain chains, being common to India, China and Turkestan; and from it, as from a central point, their several streams diverge. The Pamir range is a grand branch of the Indian Caucasus. Chund, the bard, designates the range as the "Purbut Put Pamer," or Pamer. Lord of the Mountains. From Pahar and Pamer, the Greeks may have compounded Paropamisian, in which was situated the most remote of the Alexandrias. Baron de Bode names 19,000 feet as the altitude of the Pamir, or Tartaric Caucasus. From this plateau, the Oxus, Jaxartes, rivers of Yarkand and Kashgar, and the Gilgit branch of the Indus derive their headwaters.—*Tod's Rajasthan, Vol. i, p. 130; Baron Clement A. De Bode's Bokhara, its Amir, p. 24; Yule Cathay, ii, p. 562; Humboldt.* See Kashgar, Kush or Cush, Mountains.

PAMI, TEL. Turmeric.

PAMIDI PATTI, or Paidi patti, TEL. Gossypium, *R.* Pamidi means "valuable."

PAMIDI TANGEDU, or Paidi tangedu, TEL. Poinciana pulcherrima, *L.*

PAML, BENG. *Bignonia suaveolens, Roxb.*

PAMPANGA, see India.

PAMPARA PANASA, TEL. *Citrus decumana, Linn., W. & A., Roxb.*

PAMPARA PANASA, or Pamplimos, *Citrus decumana, L. W. & A. 343—R. iii, 393.*

PAMPENA, or Dundilapu chettu, *Calosanthus indica, Bl. W. & A., Bignonia ind., R. iii, 110.*

PAMPELMOUSE, or Pampelnose, *Citrus decumana, the pumalo.*

PAMPHIOONEA, URYA. *Bignonia chelonoides, Linn.*

PAMPI, TEL. *Curcuma longa, Roxb. Turmeric.*

PAMPKIN or Pumpkin, *White. Lagenaria vulgaris, Ser.*

PAMPOSH, HIND. *Nelumbium speciosum.*

PAMU, TEL. Snake, serpent.

PAMUKH, HIND. *Verbena officinalis.*

PAMULA GEDDA, TEL. *Circaetus gallinarius, Gmel.*

PAN, HIND. Chavica betel; betel-leaf, Piper betel, seriboo, *Miq.* This famous eastern masticatory, is a narcotic which takes the place of opium and tobacco in many Asiatic countries. Slices of the areca nut are wrapped in the fresh

leaves of the betel-pepper vine, with a small quantity of quicklime. The masticatory has an herbaceous and aromatic but astringent taste. All classes, male and female, chew it, and they allege that it strengthens the stomach, sweetens the breath, and preserves the teeth. It gives the lips, tongue, and teeth a reddish tinge. Piper betel, Betel pepper, is cultivated in spots by itself; it requires much water and care.—*Simmond's Dict.; Riddell.*

PAN, see Avataram, Rama, Saraswati.

PAN, also Paik hsan, BURM. *Crotolaria juncea.*

PAN-SHAW, BURM. China grass, *Rheea; Boehmeria nivea.*

PAN or Pun, HINDI. In Indian currency, is the fifth part of an anna. A sum of 80 Cowri shells: also a land measure of $3\frac{1}{2}$ cubits. It is the source of the Anglo-Indian coin, Panam, and seems to be derived from the SANS., Pana, money in general.—*Wilson.*

PAN, SANS. Leaf; pan and pat are the Sanscrit for a leaf; and hence panna, 'a leaf or sheet of paper,' and patera 'a plate of metal or sacrificial cup,' because these vessels were first made of leaves. There is a coincidence between the Sanscrit and Tuscan panna. That lovely subject by Raphael, the "Madonna impannata," in the Pitti palace at Florence, is so called from the subdued light admitted through the window, the panes of which are of paper.—*Tod's Rajasthan, Vol. i, p. 661.*

PAN, HIND., of Murree and Hazara, *Rhus cotinus.*

PAN, or Krok of Kanawar, *Picea webbiana, Picea pindrow, the silver fir.*

PANA, URYA. A wild predatory tribe, on the south borders of Orissa.

PANA, BENG. *Pistia stratiotes, also Salvinia imbricata.*

PANAGEUS, one of the Coleoptera of Hong Kong.

PANAI-NAR, TAM. *Borassus flabelliformis.*

PANAI MARAM, TAM. *Borassus flabelliformis.*

Panai maram kotte, TAM. Kernel of palmyra fruit.

Panai-nar, TAM. Fibre of *Borassus flabelliformis.*

PANAK, HIND. A painted stick for extending a web during weaving.

PANALA. The fort of Panala, with its sister fort of Pawungadli, stands on a ridge about 12 miles to the N. W. of Kolapur, forming part of, though more or less divided a range of hills that runs nearly due east from the Ghauts. Its elevation above the plain of Kolapur is calculated at 975 feet and that above the level of the sea at 2,772 feet. In the buddhist period, Panala and the neighbouring hills seem to have been favourite seats for Trog-lodyte recluses.

PANAX PSEUDO-GINSENG.

PANA MARA, MALEAL. *Borassus flabelliformis*.

PANAMBOO-VALLI, MALEAL. *Flagellaria indica*.

PANAM KALANG, TAM. Root or young shoot of the palmyra *Borassus flabelliformis*.

PANAM OLAY, TAM. A palm leaf prepared for writing on. Sec Olay.

PANANG, see Negros or Buglos islands.

PANASA CHETTU, TEL. *Artocarpus integrifolia*.

PANASA PANDU, SANS., TEL. Fruit of *Artocarpus integrifolia*.

PANAVERA TJERANA, also Karim-pola, **MALEAL.** *Trapa bispinosa*.

PANA WOOD, ANGLO-TAM. *Calosanthès indica*, *Blume*; *W. Ic.*

PANA WOODACH MARAM, TAM. *Calosanthès indica*.

PANAX, a genus of the Ivy tribe of plants, of the natural order *Hederaceæ*, viz.

aculeata, *Ait.*, China. *fruticosa*, *L.*, Java, *Moluccas*.
cochleata, *DC.*, Java, *cas.*
digitata, *Roxb.*, Sylhet. *palmata*, *Roxb.*, Chittagong.
fragrans, *Roxb.*, Khassya *quinquefolius*, China. ?

The species are herbs and shrubs and trees, having the leaves and inflorescence variable. The plants of this family are not possessed of very decided medical properties, though the ginseng, produced by *Panax quinquefolium*, has been more celebrated than plants of greater value. This plant produced in the mountains of Chinese Tartary, between 39 and 47°, was recognized from the description in Canada and Virginia, whence it is now exported to China. Subsequently the same plant or a species so closely allied to it, that Dr. Wallich has called it *Panax pseudo-ginseng*. The roots of all are said to possess medicinal qualities, and are much esteemed by the Chinese for their beneficial influence on the nerves.—*Eng. Cyc.*; *Riddell*, *Voigt*; *Pl. As. Eur.* t. 137; *Roule's Ill. Him. Bot.*, p. 233.

PANAX FRAGRANS.

Gooti-soona, HIND.

A shrub, with fragrant flowers of a green colour, a native of Nepal.—*Riddell*.

PANAX FRUTICOSUM, Linn.

The shrubby pana, is a native of the Moluccas and Java. It is used in China and Cochin-China as a febrifuge, and as an astringent tonic. It has a shrubby unarmed stem. It is a native of the islands of Ternate, Java, and Amboyna. Commonly grown in Indian gardens, and easily propagated from cuttings.—*Lindley's Flora Medica*; *Burnett's Outlines of Botany in Eng. Cyc.*; *Riddell*.

PANAX GUMMI, GER. *Opoponax*.

PANAX OBTUSUM, a shrub, cultivated in gardens.—*Riddell*.

PANAX PSEUDO-GINSENG. Dr. Wallich

PANAX QUINQUEFOLIUS.

has discovered in Nipal this species of *Panax* it is closely allied to *P. quinquefolius* and he published an account of it in the 4th volume of the Transactions of the Medical and Physical Society of Calcutta and in his *Plantæ Asiaticæ*, vol. ii, p. 30, t. 137.

PANAX QUINQUEFOLIUS.

Aureliana Canadensis. 5 leaved panax.
 Ginseng, CHIN.

The roots are about the thickness of the finger, like those of parsley, of a whitish yellow colour externally, white within, two to three inches long, wrinkled, or with rings, often divided into two branches, rarely into three or four, and these presenting a slight likeness to the human form, whence the Chinese name is derived: the parenchyme is formed of a horny and compact tissue, displaying some resinous points. Above the neck is a knotty twisted tissue formed by the remains of the old stalks. The odour is sweet, and weakly aromatic, the taste saccharine, somewhat like that of liquorice, subsequently bitter, and rather aromatic. The root of an umbelliferous plant, the *Sium ninsi*, is often mixed, in the druggists' shops, or mistaken otherwise for the ginseng; the essential difference consists in the ginseng having the neck covered with fibrous threads, the remnants of the cortical part of the stalk. The root abounds in gum and starch, and has a little resin and essential oil. The plant is about a foot high, with glabrous, straight, simple stalks, terminating in three leaves, each composed of six uneven leaflets, a little pedicelled, oval, lanceolate, acute, and toothed at the edge. The flowers are borne on a central peduncle, and disposed in an umbel. The berries are kidney-shaped, red, compressed, crowned with the calyx and stones, and containing two semi-circular seeds. The ginseng root is one of the substances which, without any obvious cause, has attained the highest celebrity and esteem among mankind for its alleged medicinal virtues. The Dutch were the first nation who made it known in Europe, where they brought it from Japan in 1640. The Japanese themselves were indebted for it to China. The plant grows in the great forests of Tartary between the 39th and 47th degrees of north latitude; it is also found in abundance in Virginia and Canada, a circumstance which has rendered the roots so common that they are now cheap in China, where they once sold for their weight in gold. The Chinese in their hyperbolic phraseology name the root, "the pure spirit of the earth," the "recipe of immortality," the "queen of plants," &c., and regard it as a panacea for all the diseases to which they are liable. It has a fusiform root more or less branched, of a whitish colour, and terminating in fibres. The stem is smooth,

round and green, often with a tinge of red, divided at the top into three petioles with a flower-stalk in their centre. The petioles are round, smooth, and swelling at their base. The leaves ternate, quinate, or septenato. The berries are kidney-shaped, of a bright red colour, and contain 2 semi-circular seeds. The flowers are of a yellowish colour. In China, it has been considered an invaluable drug from time immemorial. In A. D. 1709 the emperor of China commissioned 10,000 Tartars to go in quest of as much of this root as they could find: each one was to give two pounds of the best of it to the emperor, and to sell the rest for its own weight in fine silver. The roots enter into the composition of every Chinese medicine. It is reckoned a stimulant and restorative, and both rich and poor consider it a remedy for every disease. By Europeans and Americans however it is comparatively disregarded, and looked upon as a mere succulent, similar in its qualities to liquorice; hence the question arises, is the Chinese plant the same as the North American? For we cannot regard all that the Chinese say and practise as merely imaginary. The common names of the plant, are Genseng, Jinchén, or Nindsin, and signify 'wonder of the world,' or the 'dose for immortality;' and the Chinese firmly believe that its powers are almost miraculous.—*Eng. Cyc.*; *Royle's Ill. Him. Bot.*: *O'Shaughnessy*, pp. 373-74; *Smith*. See Ginseng.

PANAY, see India.

PANAY ISLAND, is a large island north of Negros, one of the Philippines, in lat. $10^{\circ} 25'$ and long. $122^{\circ} 6' E$.

PANAYALA, BENG., DUK. Flacourtia captharacta, TAM.? in Malabar Eriodendron aufractuosum. Panawla in Bombay, Flacourtia sapida.

PANAY-MARAM. Borassus flabelliformis.

PANAY PYROO, TAM. Phaseolus radiatus.

PANBOOL, ARAB. Piper betel.

PANBURRI, a branch of the Koli race in the west of India. The Mullar or Panburri or Choomli Koli, is respectable. He is employed in every Dekhan and Kandesh village as a member of the third division of the Balottah and supplies water to travellers, wearing on his head the choomli or twisted cloth, hence the name, on which to rest the water pot. This Koli is also found in the Hyderabad Balaghat, extending eastward to Khanbar, Indore and Bodin, between the Godavery and Hyderabad, also near Naldrug, and down the banks of the Bhimah and Kistnah to Alpur near Kurnool. The Mullar Koli are looked on as the most respectable tribe, and the Dhour the most degraded: the latter do not scruple to eat the flesh of animals that have died natural deaths. In Bombay island, as well as in Basscin, Salsette,

Tanna, &c., are christian Koli who formerly belonged to the Sone section, but were converted to the christian faith by the Portuguese during the time the latter had possession of Bombay. These Koli are cultivators, toddy-drawers, &c., and a great many of them sell game, which they snare and carry to Bombay. They are generally habited in a coarse jacket, which extends down to their back, and a small skull cap, cut in front, in the shape of a cone, with a lungotee to hide their persons.

PANCH, HIND. Five, from the Sanscrit. Pancha; hence, Pani, the hand, Pente, GR., Quinque, LAT., Cinq, FR. Panch is a frequently occurring word in compounds, as,

Panchait, a court of five, voluntarily assembled.

Panchala, the five artizan castes, goldsmith, carpenter, brazier, blacksmith, and stone cutter; also, five inferior castes, carpenter, weaver, barber, washerman and shoemaker.

Panchama, the 5th lunar day of each month.

Pancham Bandham, five servile tribes in Karnata, of whom are the Pareya, Bulwan, Chaklar and Toty.

Pancha maha patika, in hinduism, the five heinous sins, viz., killing a brahman, stealing gold, drinking spirits, intercourse with the wife of a spiritual preceptor and association with a person who has committed these sins.

Panchanga, a calendar, of five anga or subjects, 1 tethi or lunar day; 2 vara or solar day or day of the week; 3 nakshatra or lunar asterism of each day; 4 yoga, transits, conjunctions of the planets, eclipses, and 5 the karana or sub-divisions of the lunar day.

Punch, five, is said to be the origin of Punch who has himself, Judy, the dog, the devil and the child, also of the drinking punch with its five ingredients, spirits, water, sugar, the lemon and spice, or, according to another account, spirits, tea, sugar, lemons and water.

Panch Dravid, and Panch gaur are usually taken to indicate the hindoo arrangement of the Dravida and Gaur tongues also the Dravida and Gaur brahmins. The pandits named the five Dravida tongues, the Telinga, Kamatika, Mahratha, Gurjara, and Dravida or Tamil proper, but at present Dr. Caldwell displaces the Gurjara or Gujarathi and the Marathi, and considers the Dravida proper or Tamil, the Telinga, Talunga, or Telugu, and the Karnataka, Kannada or Canarese, to be the three principal languages of the Dravidian family, and he adds thereto the Malayalam, the Tulu, and the uncultivated Toda, Kota, Goud and Ku, making altogether nine Dravidian or Tamilian tongues.

PANCH GANGA GHAT, the five hindoo rivers to which pilgrimages are made. See Ramanandi or Ramawat.

PANCHAL.

PANCHA KARTTA, the five great gods or lords, the five faces of Siva.

PANCHAM, HIND., the dominant fifth in the musical scale.

PANCHIA VADDIUM, five musical instruments of Malabar, viz., Jenta, Chengalam, Ilatalom, sounded three times daily, before hindu princes.

PANCHADARA, TEL. Sugar.

PANCHIA SHIEGAM, a hindoo ceremony which consists of pouring milk on the lingam. The liquor is afterwards very carefully preserved and some drops are afterwards given in the Pancha Shiegam to dying people, that they may merit the delights of the Kalaissou.—*Sonne- rat's Voyage*, pp. 159-160. See Abishegam.

PANCHAEAN ISLAND, see Yavana.

PANCHAJANYA, see Sankasura.

PANCHIA KAVIA, see Hindu or hindoo.

PANCHAL, Panchala or Pancham bandam, the five artizan castes of the hindoos, viz.

	Canarese.	Hindustani.	Mahratta.	Tamil.	Telugu.
Goldsmith ...	Aksala.	Sonar.	Sonar.	Tattān.	Aasal'uru.
Blacksmith....	Kāmbāra.	Lohar.	Lohar.	Kārumān.	Kāmr'uru.
Coppersmith.	Kāntēgāra.	Tambagar.	Tambagar.	Kānār.	Kāntsar'uru.
Stone cutter.	Kassigāra.	Sangtrash.	Gondi.	Kūl-tāchān.	Kassi'uru.
Carpenter....	Bargia.	Barhai.	Sutar.	Tāchān.	Wād'oru.

In the south of India hindoos arrange themselves into right and left hand castes,

Left hand,

Panchala, five in number, viz.

Kammaranu or blacksmith.

Badige or carpenter.

Kansagar or brazier.

Kallurutiga or mason.

Akasale or goldsmith.

Beri-sethi, traders.

Devangada, weavers.

Ganigar, oilmakers.

PANCHALA.

Gollur, cashkeepers.

Paliwan and Palawan, cultivators.

Beda, hunters.

Madiga, leather workers.—*Wilson's Glossary*.

PANCHIALA, an ancient race who were ruling in India at the time of the Kuru and Pandava strife. They extended through the whole southern doab beyond Benares, as far as the river Karmanvati, which was for a time considered the frontier line of the two tribes. Canacubya, the modern Canouj, is one of the most ancient places in India; it gave rise, and gives a name, to one of the greatest divisions of the brahmin class. Its capital was perhaps the wealthiest visited by the first mahomedan invaders, and its wars with the neighbouring state of Delhi contributed to accelerate the ruin of hindoo independence. This kingdom appears in early time to have been called Panchala. It seems to have been a long, but narrow territory, extending on the east to Nepal (which it included), and on the west along the Chambal and Banas, as far as Ajmir. We know little else of its early history, except through the Rajput writings and traditions collected by Colonel Tod, and the inscriptions examined by Professor Wilson, with those translated and discussed by Principal Mill. The former relate that it was taken from another hindoo dynasty, A.D. 470, by the Rathor rajputs, who retained it until its conquest by the mahomedans in A.D. 1193, when they withdrew to their present seats in Marwar. The identity of Canouj and Panchala is assumed in Menu 11, 19. Its limits, as assigned in the Mahabharata are made out by connecting notes (vol. iii, p. 135, vol. iv, p. 142,) in the "Oriental Magazine." These boundaries, enlarged a little on the south and on the west, are the same as those assigned by Colonel Tod to the same kingdom at the time of the mahomedan invasion. According to the Mahabharata, the great kingdom of Panchala extended from the Himalaya mountains to the Chambal river. The capital of North Panchala, or Rohilkhand, was Ahi-chhatra and that of South Panchala, the Central Gangetic Doab, was Kampilya, now Kampil, on the old Ganges between Budaon and Farokhabad. Just before the great war or about 1430 B.C., the king of Panchala, named Drupada, was conquered by Drona, the preceptor of the five Pandu. Drona retained North Panchala for himself, but restored the southern half of the kingdom to Drupada. According to this account, the name of Ahi-chhatra, and consequently also the legend of Adi-Raja and the serpent, are many centuries anterior to the rise of buddhism. It would appear, however, that the buddhists must have adopted and altered the legend to do honour to their great teacher,

for Hwen Thsang records that outside the town there was a Naga-hrada, or "serpent tank" near which Buddha had preached the law for seven days in favour of the serpent king, and that the spot was marked by a stupa of king Asoka. At present, A. D. 1870, the only existing stupa at this place was called Chattr, and General Cunningham infers that the Buddhist legend represented the Naga king after his conversion as forming a canopy over Buddha with his expanded hood. He thinks also, that the stupa erected on the spot where conversion took place would naturally have been called Abi-chhatra, or the "serpent canopy." A similar story is told at Buddha Gaya of the Naga king Muchalinda, who, with his expanded hood, sheltered Buddha from the shower of rain produced by the malignant demon Mara. The great mound of ruins called Atranji-Khera is situated on the right or west bank of the Kali nadi, four miles to the south of Karsana, and eight miles to the north of Egta, or on the Grand Trunk Road.—*Bunsen, Vol. iii, p. 554; Elphinstone's History of India, Vol. i, p. 402; Cunningham's Ancient Geography of India, pp. 360, 365.* See Canouj, Canyacubya, Manu.

PANCHALI-KUDU, TEL. A native of Panchala.

PANCHAMI, see Naga, Serpent, Snake.

PANCHAMI RISHI, a hindoo festival, held about the beginning of September and is supposed to be in honour of seven Rishi or sages, represented by the seven stars of Ursa major or the Pleiades.

PANCHIA PANDAVA, the five Pandava, whose war with the Kuru is celebrated in the Mahabharata.

PANCHIA RATRAVA, see Vaishnava.

PANCHIA-TANTRA and Hetopadesa, are books in use throughout India, in all its languages, read by every hindu. They contain the original fables which Bed-pai, a brahmin, wrote for the benefit of Dabishlim, his king. They were translated into Pehlevi, in the 6th century in the time of Nousherwan, from that into Arabic by Abdullah bin Makaffa, about the middle of the 8th century, then into Persian, by Rudaki, about the close of the 9th century, who received 80,000 dirhems for his labours. About the middle of the 12th century (A. D. 1150) in the time of Bahram shah, a Persian prose translation was made and a subsequent second translation was made by Kashifi, and named the Anwar-i-Soheili. A Greek version was made by Simeon Seth, at the command of Alexis Commenes, and they appeared in Hebrew and Aramaic, Italian, Spanish, and German. The first English edition was in the 16th century then in French in 1644 and 1709, and they are the foundation of Æsop's fables.

Joannes Damascenus, a father of the Christian Church, lived at the court of the Khalif-al-Mansur, for whom Abdallah-ibn-al Mokaffa had translated the fables of the Pancha-tantra from Pehlevi into Arabic. Joannes wrote a religious novel called Barlaam and Josaphat into which he introduced a number of Eastern fables and took his principal hero Josaphat from the "Lalita-vistara," the life of the Buddha or enlightened, a portion of the sacred canon of buddhists. The story of Barlaam is, in its most striking points a mere repetition of the story of the Buddha, and Josaphat, the hero of the story, has been raised to the rank of a saint, both in the Eastern and Western Churches. And thus, though under a different name the sage of Kapela-vastu, the founder of a religion, which in the purity of its morals is nearer to christianity than any other religion and counts even now after an existence of 2,400 years, 455,000,000 of believers, has received the highest honours which the Christian Church can bestow. If Buddha lived the life which is there described, few saints in the Greek or Roman churches, are the equals of St. Josaphat, the prince, the hermit and the saint.—*Max Muller in Proc. Roy. Inst. Gr. Brit., June 1870.*

PANCHAYAT or Panchait, a native court of arbitration, originally consisting of, as the name implies, five members, but which may consist of any number. The Panchayet of India is identical with the Hebrew and Roman custom of elders sitting at the gate, the *γερονται* of the Greeks, in Ceylon, it is the Gam-sabawa.—*Tennent's Ceylon.* See India.

PANCHE BUNJEKA WANDLU, a Sudra race in Bellary. See Jungum.

PANCHE CHIETTU, TEL. Celosia argentea, L.—*W. Ic. 1767—R. i, 678.*

PANCHIGHAR, has ten small towns, it is celebrated for its groves of date trees, is occupied by the Gitchki tribe of Bralhui of peaceful and agricultural habits.

PANCHI, TEL. Conocarpus acuminatus, Roxb., Royle.

PANCH MUKI, five-faced, a name of Mahadeva.

PANCRATIUM AMBOINENSE. The Bunga Si-kudip, as it is called by the Dyaks of the southern branch of the Sarawak river, and amongst whom it is held in the greatest esteem, though known to all the tribes, is the plant described by botanists as the *Pancratiium Amboinense* or *Eurycles coronata*, a native of the Moluccas and other islands to the eastward; but as far as is at present known, a stranger to the flora of Borneo, in the western parts of which, the order Amaryllidæ, to which it belongs, is only represented by one species of *Crinum*, which is found on the

muddy banks of the river. By the Si-booyah Sea Dyaks, this plant is called Si-kenyang. By the Dyaks of the southern river, the bulbous roots of this plant are preserved with jealous care, being always taken up when the rice is ripe, and preserved amongst it in the granaries, to be planted again with the seed-rice in the following season. It bears a beautiful crown of white and fragrant flowers, which rise about a foot above the bulb.—*Lowe's Sarawak*, pp. 273-304.

PANCHSHIM, BENG. Lablabcultratus, DC. Kidney-beans.

PAND, HIND. Loranthus longiflorus, also Viscum attenuatum.

PANDA, HIND. Ailurus fulgens, Cuv.

PANDA, or Pmda, BENG., HIND. A hereditary priest of a hindoo temple, under whom the pujari serves. The proprietary or presiding priest of a hindoo temple of Siva usually though not invariably a brahman. The office is hereditary, and in some places, as at Benares, the Panda officiates only on particular occasions, the duties of daily worship being performed by inferior priests or pujaris in his employ. The term Panda is also applied to a priest who is stationary at any particular place or shrine. The word has been multiplied by the British, since the revolt of 1857, 8 and 9, Pandys being applied to all the rebels, from the circumstance of the first one who was executed at Barrackpore being of the name Mungul Pandys.

PANDAL, ANGLO-TAM, from Payal, TAM. an awning formed of grass, or leaves, or branches, or cloth, a platform, a canopy, a stage.

PANDAN, HIND.? A tree of Chota-Nagpore, furnishing a hard, red timber.—*Cal. Cat. Ex.* 1862.

PANDAN, HIND. A betel box.

PANDAN, MALAY: Screw-pine.

PANDANACEÆ, Lindl. an order of plants comprising, 2 gen., 16 species, viz., 12 Pandanus; 4 Freycinetia. The Pandanaceæ or Screw-pines abound in the Mauritius, Bourbon, India, the Straits and Burmah.—*Royle, Voigt.*

PANDANG. CEBEL., Annua sativus. Schult.

PANDAN ODORIFERANTE., FR. Pandanus odoratissimus.

PANDANUS, a genus of plants of the order Pandanaceæ, of which the following species are known.

- P. amaryllifolius, Roxb. Amboyna.
- P. candelabrum, Pal. Beauv. Guinea.
- P. caricus, Rumph. Moluccas.
- P. drupaceus, Pet. Th. Mauritius.
- P. edulis, Pet. Th. Madagascar.
- P. elegans, Pet. Th. Mascarchenas.
- P. fascicularis, Lam. Moluccas.
- P. foetidus, Roxb. Bengal.

- P. furcatus, Roxb. Malabar, Chittagong, Pegu.
- P. humilis, Rumph. Moluccas.
- P. lerani, Jones, Nicobar.
- P. marginatus, Roxb. Mauritius.
- P. moscatius, Rumph. Amboyna.
- P. odoratissimus, L. fil. All S. Asia.
- P. utilis, Bory. Madagascar.

The Screw-pines are remarkable for their gigantic Bromelia-like leaves, arranged in a spiral manner. Though abounding most in Mauritius and Bourbon, species are also found in the southern parts of India, as well as in the Straits and Burmah. The leaves are composed of tough longitudinal fibres, white and glossy, which enable them to be employed for covering huts, making matting, as well as for cordage, in the South Sea Islands; and in Mauritius for making sacks for coffee, sugar, and grain. The species which is best known in India is the Kora or Ketgee, the Caldera bush of the Madras Peninsula, called Pandanus odoratissimus by botanists, on account of the exquisite perfume of its flowers. This plant, as well as some of the other species, in the Mauritius is known by the name Vacoa or Baquois. It appears to be the Pandanus sativus of Du Petit Thouars, but which Mr. Henley mentions as P. Vacoa. He having observed the valuable uses to which the plant was applied in the Mauritius, recommended its introduction into India. P. odoratissimus grows to the height of thirty feet, when permitted to do so: but in general, the cropping of the leaves, which commence in the third year, keep the plant down to the height of from six to ten feet. The plant is remarkable for the fibrous aerial leafless roots which it sends down as supports for its stem, and which are employed for making brushes for common purposes. The leaves are cut every second year, beginning when the plant is three years old, and each plant yields enough for two large bags. The preparation must begin with the leaves immediately they are removed from the trees, and consists, first in splitting the leaves into fillets, which are from three-fourths to one inch broad at the base, but they taper to a point, and are from three to four feet in length. One of them will support the weight of a bag of sugar, or about 104 lbs. without breaking. The leaves of the other species with which there is acquaintance comparatively weak. On many of the Burmese boats, sails are made of large narrow leaves, sewed together. They are the leaves of a species of screw-pine that has a trunk like a palm, which is very abundant and usually grows near the sea. The fruit is used by the Karens to hackle their thread.—*Mason; Jour. Agric. Soc. of India*, 1843, p. 92, in *Royle, Fib. pt.*, p. 35; *Royle, Illustrations, Himalayan Botany*, p. 408; *Roxb. Fl. Ind. Vol. iii*, p. 741.

Its leaves.

This grows along the coasts of the Peninsula of India, and its leaves are extensively manufactured into mats, baskets and hats, at Pulicat, and other localities. The fibre of the leaf is white, soft, glossy, but possessed of little strength, and though but ill suited for cordage, it has been found well adapted for the preparation of a good quality of paper, also for mats, and sacks, good sacking is made from its leaves. Its fibrous aerial roots are much employed as paint-brushes. The leaves are cut every second year, beginning when the plant is two years old. Immediately on its removal from the trees, they must be split into fillets, three to four feet long from three-fourths to one inch broad at the base, tapering into a point. The people of the Mulgrave Archipelago, live almost exclusively on the juicy pulp and the pleasant kernels of the fruit. The dried leaves serve as thatch, the wood is hard and durable, the flowers are used in garlands and the red and yellow nuts as ornaments. Magulik is the Telinga name of the male plant and Goz doogoo that of the female. Caldera is the name they are known by amongst Europeans on the coast of Coromandel. It is a native of all the warmer parts of Asia: all soils and situations seem to suit it equally well; it flowers chiefly during the rainy season. This plant is much employed to make hedges, for which it answers well, but requires too much room. It grows readily from branches which renders it rare to find the full grown ripe fruit. The lower yellow pulpy part of the drupes is sometimes eaten by the natives during times of scarcity and famine; the tender white base of the leaves is also eaten raw or boiled, during the same melancholy periods. The fusiform roots already mentioned are composed of tough fibres which basket makers split and use to tie their work with, they are also so soft and

spongy as to serve the natives for corks. The leaves are composed of longitudinal, tough, useful fibres like those of the Pine apple. This plant is of extensive use in most parts of the island of Mauritius for its leaves, which are employed for the purpose of package bags for the transportation of coffee, sugar and grain from one place to another and for exportation. The preparation of the leaves for working into matting is simple and short: as soon as gathered, the spines or their edges and dorsal nerve are stripped off, and the leaf divided into slips of the breadth proper for the use they are required for: this operation is performed with the blade of a common straight knife, they are then laid in the sun for a few hours to dry when required for working into mats, the slips are passed under the blade of a knife applied with a moderate pressure to remove all asperities on their surface which gives them a polish and makes them plain and more convenient to the hands. The natives are fond of the scent of the flower which they place among their cloths: in the District of Ganjam, the flowers are said to be frequently tenanted by a small and very venomous snake. This plant grows abundantly in Travancore along the backwaters and canals, the fibres are extensively used, being good and strong. With the leaves, the natives of Southern India, and the inhabitants of the Friendly islands make a fine kind of mat to sleep on, which they stain yellow and red with Cassia leaves and Vatinga cuttlay. They are also used to make the common kind of umbrellas, called by the Tamools Talay elley kedri. Dr. Roxburgh, in his "Coromandel plants," tells us that the yellow, pulpy part of the drupe of this plant is sometimes eaten by the Indians, in times of scarcity, the fusiform roots are composed of tough fibres with which basket makers use to tie their work. They are, at the same time so soft and spungy as to be employed as corks. It is in mats of these leaves, that the fine furnitures of Madras are packed. The male flowers of the fragrant pandanus or screw-pine, are exceedingly fragrant, and great favourites with the Burniese. The flower is of a pale yellow colour and is offered up at the shrines of Mariama (Mariatale) and Vishnool, but is supposed not to be acceptable to Siva. The flower is constantly referred to by the Sanscrit poets, by the name Ketaka, and as the Keora and Ketgee of the hindooes. The Arabs call it Kazee, and Avicenna describes it under the name of Arnak. Oil impregnated with the odour of its flowers called Keore-ka-atr, costs two rupees the tola, and the distilled water are highly esteemed both for their odour and their medicinal use as stimulants. Dr. Roxburgh states that it is the tender white leaves of the flowers, chiefly those of the male, which yield the very

delightful fragrance for which this plant is so celebrated. The lower pulpy part of the drupes is sometimes eaten, as is also the terminal bud, like that of the cabbage-palm, and likewise the tender white base of the leaves, either raw or boiled, during times of scarcity. The leaves are composed of tough longitudinal fibres, white and glossy, a quality which adapts them for covering huts, making matting, as well as for cordage in the South Sea Islands, and in Mauritius for making sacks for their coffee, sugar and grain. This tree is often alluded to in select specimens of the Hindoo Theatre. In "Malati and Madhava" the latter says :—

Night ever friend to love now spreads its shade ;
Faint in the east the gentle moonlight gleams,
Pale as the palm's sear-leaf, and through the air
The slowly rising breezes spread around
The grateful fragrance of the Ketaki.

M. De Buffon calls it *Arbre indecent*. The hindoos use the flowers in all the ceremonies made in honour of Pulliar, Subramaniam, and Vishnu, but never in those of Siva.—*Eng. Cyc.*; *Graham's Catalogue of the Plants growing in Bombay and its vicinity*, p. 227; *Chow Chow*, p. 299; *Calcutta, Cat. Exhibition of 1862*; *Madras Ex.*; *Jurics Reports*; *Singapore, Cat. PANDANUS, Highland screw-pine. Smaller and finer mats in common use are fabricated from the leaves of this species of screw-pine, that grows in Tenasserim, on the highlands above tide-waters.—*Mason*.

PANDANUS FURCATUS, *Roxb.* Tha-bau, also Ta-gyet, also Tau-ta-kyet, *Burm.* Lowland screw-pine. The large coarse mats in universal use in Tenasserim, are made from the leaf of a species of screw-pine, that grows abundantly on the lowlands near tide-waters.

The Burmese give the following names to other species of Pandanus.

H-sat shwa gyee, *Burm.*, Pandanus, *sp.*

Yæ ta kyet, *Burm.*, Pandanus, *sp.*

—*Mason*.

PANDANUS SATIVUS, Baquais or Vacoa, is the general name given in the Mauritius to a species of Pandanus, the screw-pines. One of these appears to be the *P. sativus* of Du Petit Thouars, but, according to Mr. Henley, is *P. Vacoa*. It is described as growing to the height of 30 feet, when left unpruned. The leaves are cut every second year, beginning when the plant is three years old, and each plant yields enough for two large bags. The preparation of the fibre must begin with the leaves, immediately they are removed from the trees. This consists first, in splitting the leaves into fillets which are from three-fourths to one inch broad

at the base, but taper to a point, and are from three to four feet in length. One of them will support the weight of a bag of sugar, or about 140 lbs. without breaking. Mr. Henley states that the leaves of the other species with which he is acquainted, are comparatively weak. Dr. Roxburgh has described the purpose to which the species most common in the Mauritius is applied, and having observed the valuable uses to which the plant was put to there, he recommended its introduction into India, in some of the dry southern parts of which, it would, no doubt, though slow of growth, be a valuable acquisition, from the facility with which good sacking may be manufactured from its leaves. This has never yet been effected. The plant is remarkable for the aerial leafless roots which it sends down to support its stem, and which are of so fibrous a nature as to be employed for making paint brushes for common purposes. —*Fib. Pl. Royle*, p. 36; *Fl. Ind.*, c. iii, p. 741.

PANDANUS WOHLREICH, *GER.* Syn. of Pandanus odoratissimus.

PANDARAM, a devotee of the Siva sect, the officiating priest at the temples of Siva. This word seems properly to be Panduranga, or pale-complexioned, from these individuals smearing themselves with ashes. Pam also means song. In the South of India they are hindoos of the Sudra section worshippers of Siva of whom many are professed mendicants. The Siva worshippers among the Tamil are called Pandaram. These are not Vira Siva, nor do they wear the lingam or adore Basava. *Brown, on the Creed, Customs and Literature of the Jangams*, p. 7.

PANDARWASH, *HIND.* Boerhaavia diffusa.

PANDU. Vichitra Virya is said to have married Amba and Ambahka, daughters of the king of Kasi, who had issue, after his death, by his half brother Krishna dwaipa yana, or Vyasa, Dhritarashtra and Pandu, whose wives bore the five Pandava, viz :—

1. Yudishtira.
2. Arjuna, father of Parikshita.
3. Bhima.
4. Nakul and } who founded the Magadha
5. Sahadeva, } line.

Vichitra Virya had no male offspring. Of his three daughters one was named Pandeia; and Vyasa being the sole remaining male branch of the house of Santana, took his niece and spiritual daughter, Pandeia, to wife, and became the father of Pandu afterwards sovereign of Indraprestha. Arrian gives the story thus: "He (Hercules) had a daughter when he was advanced in years, and being unable to find a husband worthy of her, he married her himself that he might supply the throne of Indra with monarchs. Her name was Pandeia, she caused the whole province in which she was born, to

receive its name from her." This is the very legend contained in the Purans of Vyasa (who was Heri-cul-es, or chief of the race of Heri) and his spiritual daughter Pandeia, from whom sprang the grand race the Pandua, and from whom Delhi and its dependencies were designated the Pandua sovereignty. Her issue ruled for thirty-one generations in direct descents, or from 1120 to 610 before Christ ; when the military minister, connected by blood, was chosen by the chiefs who rebelled against the last Pandu king, represented as " neglectful of all the cares of government," and whose deposition and death introduced a new dynasty. Two other dynasties succeeded in like manner by the usurpation of these military ministers, until Viceramaditya, when the Pandua sovereignty and era of Yoodishtra were both overturned. Vichitra Virya died childless, and Vyasa begat two sons by his two widows, and a third son by a slave girl, whom the third widow, Amhika, substituted for herself. This practice of a relative raising children for a deceased childless relative is sanctioned by Manu, who says " on failure of issue, by the husband, the desired offspring may be procreated either by his brother or some other near relative, called Sapinda, on the wife who had been duly authorised." Pandu, also, when lamenting his childlessness, says to Pritha " in distress men desire a son from their oldest brother-in-law. Manu regarding the choice of a husband enjoins parents to select a handsome son-in-law, and adds, three years let a damsel wait, though she be marriageable, but after that term let her choose for herself a husband of equal rank. In the days of the Pandus, one mode of selecting a husband was the Swayamvara or self-choice ; where a girl chose her own husband. In the Mahabharata, the cases are mentioned of Pandu with Pritha, Yudhishtira with Devika, Sahadeva with Vijaya, Sivi and Devaki, Nala and Damayanti, Draupadi and Arjuna. Manu describes eight modes of marriage, viz., Brahma, Daiva, Arsha, Prajapatya, Asura, Gandharva, Rakshasa and the eighth and worst Paisacha, the first six for a brahmana, the four last for a warrior, and the same four, the Rakshasa excepted, for the third and fourth class. The five Pandava brothers married Draupadi, at the town of Kapila, or at one known as Kampilya. After being won by Arjuna, at her Swayamvara or tournament, she was taken to the house of their mother Kunti, who desired the brothers to retain her as their wife. Between that time and the interval of her marriage, Draupadi performed the usual household duties and ultimately, Kunti and Draupadi in one car and Yudhishtira and his brothers in another, the family proceeded to the town of Kampilya where the marriage ceremony was performed.

The five brothers had each a house and garden of his own, and Draupadi dwelt with each of them in turn for two days at a time, and it was agreed upon that another brother, under pain of being exiled for 12 years, should not enter where Draupadi was staying. But Arjuna broke the rule, and became exiled.

Virat, the capital of Matsya, is celebrated in hindoo legends as the abode of the five Pandu during their exile of twelve years from Dilli or Indraprastha. The country was famous for the valour of its people, as Manu directs that the van of an army should be composed of " men born in Kurukshetra near Indraprastha, in Matsya or Virata, in Panchala or Kanya Kubja, and in Surasena of the district of Mathura. The residence of Bhim Pandu is still shown on the top of a long low rocky hill about one mile to the north of the town. The hill is formed of enormous blocks of coarse gritty quartz which are much weather-worn and rounded on all the exposed sides, some of these blocks have a simple straight face passing onwards, the result of a natural split, of which advantage has been taken to form small dwellings by the addition of rough stone-walls plastered with mud. Such is the Bhim-gupha or Bhim's cave which is formed by rough walls added to the overhanging face of a huge rock about 60 feet in diameter and 15 feet in height. Similar rooms, but of smaller size, are said to have been the dwellings of Bhim's brothers.

On the death of Pandu, his nephew, Duryodhana, asserted the illegitimacy of his children, at Hastinapur, but Yoodishtra succeeded, and was invested in that capital with the seal of royalty, the five brothers, however, to escape Duryodhana's plots, abandoned their capital and sought shelter in various countries near the Indus, and it was while at the court of king Droopdeva in Kampil-nagara of Panchalika kingdom, that Arjuna's skill in archery carried of his daughter Droopdevi, who became the bride of the five brothers. On the occasion of Krishna visiting his Pandava relatives at Hastinapura, accompanied by his wives and singing and playing women, Satyabhama speaking with Draupadi, the polyandric wife of the Pandava, remarked to Draupadi, we who are so many thousands in number have all but one and the same husband in Krishna and we are all happy with him ; how comes it then that you have five husbands and are not ashamed before men ? To this Draupadi replied you are every one jealous of each other and are always talking of your suspicions one of another. But I never speak one word which all my five husbands may not hear alike and which would give to either the smallest offence. In hindoo mythology the five Pandu are regarded as five heroes or demi-gods, descended from the

ancient sovereigns of the countries of Hindustan bordering upon the Jumna, thus called "Panduan Raj, or the kingdom of the Pandu. Pandu, the father of the five heroes, was the son of Vyasa and Pandea. Their mother's name was Koonti, the sister of a prince of Mathura, who was the father of Heri and Baldiva, the Indian Hercules. Koonti, in consequence of the sins of the ancestors of herself and her husband, was doomed to experience the greatest curse that can befall a hindoo female, sterility. However, by a charm, she contrived to remove the anathema by enticing the gods to her bed. Thus, says Colonel Tod, from whose disquisition on the Hindoo and Theban Hercules has been extracted this account, she had by Dharmaraja, (Yama, or the Minos of the Greeks), Yudishtra; by Pavana, (Eolus) Bhima; by Indra, (Jupiter Caelus) Arjuna, and Nycula and Sydiva by Aswini Kumara (the Hindoo Esculapius,) or the sons of Surya, the twins of the Hindoo zodiac.—*Cunningham's Ancient Geography*, pp. 340, 342; *Mahabharata in Wheeler's Hist. of India*, p. 228; *Westminster Review*, April 1868; *Tod's Rajasthan*, Vol. i, p. 31; *Cole's Myth. The Osprey or Fish-hawk, is spread over all Europe, Asia and Africa. It is common along all the large rivers of India, and at most of the large lakes and tanks even far inland. It plunges from a great height into the water and can take up a fish of considerable size but the *Haliaetus leucogaster* frequently robs it of its prey. A northern poet says—

Soon as the sun, great ruler of the year,
Bends to our northern climes his bright career,
And from the caves of ocean calls from sleep
The finny shoals and myriads of the deep;
When freezing tempests back to Greenland ride,
And day and night the equal hours divide;
True to the season, o'er our sea-beat shore,
The sailing osprey high is seen to soar,
With broad unmoving wing; and circling slow,
Marks each loose straggler in the deep below;
Sweeps down like lightning! plunges with a roar!
And bears his struggling victim to the shore.
The long housed fisherman beholds with joy,
The well-known signals of his rough employ,
And as he bears his net and oars along,
Thus hails the welcome season with a song;

The Fisherman's Hymn;

The osprey sails above the sound,
The geese are gone, the gulls are flying;
The herring shoals swarm thick around,
The nets are launched, the boats are plying;
Yo ho, my hearts! let's seek the deep,
Raise high the song, and cheerily wish her,
Still as the bending net we sweep,
"God bless the fish-hawk and the fisher!"
She brings us fish,—she brings us spring,
Good times, fair weather, warmth, and plenty,
Fine stores of chad, trout, herring, ling,
Sheepshead, and drum, and old wives' dainty,
Yo ho, my hearts! &c.
She rears her young on yonder tree,
She leaves her faithful mate to mind 'em;
Like us, for fish, she sails to sea,
And plunging shows us where to find 'em,
Yo ho, my hearts! &c.—*Wilson*, p. 83.

PANDIYA, probably a word of Sanscrit origin, is the Pandion, the Oi Pandiones, of the Greeks, and was the titular name of an ancient

dynasty in Madura : the race were the Pandi or Pandiya ; the king, the Pandyan or Pandiya Deva. The Pandyan capitals were at Kurkhi, Kalyanapura, Kulasekara pattanam and Madura. The site of Kurkhi or Horkai is still a matter of dispute. It has been considered to be the Kolkhi of the Periplus identified by D'Anville with Kilakarai near Ramesseram, and by others with Korkai or Gorkai near the mouth of the Tambraparni. Two embassies were sent by the Pandyan king to Augustus, the first of which he received at Tarragona, the second is mentioned by Strabo. The friendship of the Romans was sought by only one other Hindoo prince, O Kerobothros, the king of Chera or Kerala, who was also a Dravidian. Strabo, Pliny, vi, 20, and Ptolemy, vii, mention that the Pandyan king sent an embassy to Augustus, and in the letter which the ambassadors took to Augustus, the Pandyan king of ancient Dravira, described himself as holding sway over six hundred kings. He sent valuable and curious presents, a man without arms and a serpent ten cubits long and Zarmanochegus accompanied the embassy.

The Chera was an ancient dynasty in the south of the Indian peninsula, the rise and fall of which, as also the extent of their dominions, are only vaguely known. They seem to have risen on the fall of the Pandya sovereignty, and to have ruled over Travancore and Coimbatore, and parts of Salem. The Chera princes seem to have been first established at Scandapura on the Malabar Coast ; and subsequently at Talcad or Dalavanpura on the Cauveri and Mudugondapatnam, perhaps the same as the modern village of Mudugondoor on the road from Seringapatam to Koonghal. The site of Scandapuram is unknown. Talcad is described by Buchanan as a place of some extent containing many buildings nearly covered with sand. The Carura regio Cerebothri has been supposed to indicate that Caroor in Coimbatore was one of the earliest sites.

The ancient kingdom of Kerala on the Malabar Coast was for some time subject to the Chera princes.

The whole of the early history of these southern dynasties, their wars, alliances, intermarriages and conquests ; their relations with Ceylon and with the Mahomedan colonies of Maabir and the Malabar Coast, are very little known. Elphinstone says that two persons of the agricultural class founded the kingdoms of Pandya and Chola, and that the first of these derives its name from its founder. It is uncertain when they first flourished, but there seem good grounds for thinking it was from the fifth century before Christ. As Strabo mentions an ambassador from king Pandion to Augustus, this ap-

pears from the "Periplus" and Ptolemy to have been the hereditary appellation of the descendants of Pandya. The Pandion of the time of the "Periplus" had possession of a part of the Malabar coast ; but this must have been of short duration ; the Ghats in general formed the western limit of the kingdom, which was of small extent, only occupying what we now call the districts of Madura and Tinnevely. The seat of the government, after being twice changed, was fixed at Madura, where it was in Ptolemy's time, and where it remained till the beginning of the 18th century. The wars and rivalries of all the Pandyan princes were with the adjoining kingdom of Chola, with which they seem, in the first ages of the Christian era, to have formed a union which lasted for a long time. They, however, resumed their separate sovereignty, and were a considerable state until the ninth century, when they lost their consequence and were often tributary, though sometimes quite independent, till the last of the Nacks (the dynasty with which the line closed) was conquered by the Nabob of Arcot in 1736. The several capitals of the Chola, were at Conjeveram, Wori-ur, Combaconum, Gangondaram and Tanjore. The whole history of this for sometime the most important power of the peninsula, is involved in great obscurity. There is no reliable information anterior to the ninth century, yet they must have been exercising sovereignty anterior to the time of Ptolemy who makes mention of Arcati Soren ; and, in the Mahawanso, there are frequent references to transactions with the Chola during the earliest periods of the Singhalese annals. The Tamil traditions also abound with stories of Adonda Chakravarti, who appears to have been a soldier of the prior Kurumbar tribes, but there are untrustworthy records forthcoming of his origin and actions neither have there been obtained any authentic accounts of the overthrow and extinction of any of the great southern States.—*Mr. W. Elliot ; Elphinstone's History of India*, pp. 412-413. See Baroach, India, Kerala, Narapati, Pandiva, Pandiya.

PANEE-SARA, BENG. *Grewia sepriaria*.

PANEI MARAM, TAM. *Borassus flabelliformis*.

PANEEYALA, BENG. *Flacourtia cataphracta*, *Roxb*.

PANEI-ERI, TAM. *Anabas scandens*.

PANEL, SIND. The leaves and stalks of the *Pogostemon patchouli* of Lepellitier, which are used as a perfume.—*Simmond's Diet*.

PANELA, a cake made of Indian corn meal.

PANEOLA PLUM. *Flacourtia sapida*.

PANE-TIGA, TEL. *Cassyta filiformis*, *Linn*.

PA-NGAN, BURM. A compact white wood of Amherst, used for boats and oars and for making musical instruments. It seems to be *Gmelina arborea*.—*Captain Dance*.

PANGAN, see Semang.

PANGARA, MAHR. *Erythrina indica*, *Lam*.

PANGASINAN, see India.

PANGERAN MAHOMED, see Kyans.

PANG-GILING, MALAY. Ant-eater.

PANGHULU, see Johore, Kedah or Quedah.

PANGI, TAM. *Gossypium*. Cotton.

PANGIACEÆ, *Lind*. A natural order of plants comprising two species of *Hydnocarpus*.

PANGIUM EDULE, see Kapyang.

PANGIUM RUMPHII. A tree of Java and the Moluccas.

PANGKAL-PINANG, see Tin.

PANGKONG, a district in lat. 33 to 34 N., and long. 78 to 79 E. On its south-east is part of lake Tso-Mogna Lari. See Tsho Rul.

PANGERAM KUNING, see Kyan.

PANGKONG LAKE, in Ruthog or Rudog, in N. L. 33° 43', is 85 miles long and about three miles in average breadth. The area is 250 square miles. The water is clear and extremely salt. The Rudok country lies to the east of Ladak and Rukchu. The lake stretches about eighty miles from east to west,—the whole length of the country,—at an elevation of 14,200 feet above the sea. The area of Rudok is 4,800 square miles, and its mean height 14,500 feet.

Tso-mo-ri-ri lake appeared to Moorcroft to be deeper and less clear than the lake of Pang-kung. It contained no fish, and was not much frequented by wild-fowl: the taste of the water was brackish. Mr. Gerard afterwards visited this lake which he calls Chuinonenil: he places it at an elevation above the sea of fifteen thousand feet, and observes, that whilst it is fed by several considerable streams, it has no efflux, and is kept at its level entirely by evaporation.—*Moorcroft's Travels*, Vol. ii, p. 51; *Cunningham*; *Thompson*.

PANGLIMA GAJAH, MALAY. The first word means a governor, or superintendent, and the other elephants. The office of superintendent of elephants at a Malayan court was one of considerable dignity.—*Journ. Ind. Arch*.

PANGOL, TAM. Literally boiled rice, a festival in the Tamil countries at the winter solstice, in which each family boils rice and on coming a boil proclaims Pongol! Pongol! Indra is worshipped in the South of India, in the Pongol.

PANGONG-TSO. The Changpa is a semi-nomade tribe, near the Pangong Tso pass. They dwell, in their grazing grounds under huts (gal-kol) made of yak hair. The people there call themselves Bot.

PANGOLIN.

Sikim scaly ant-eater.

This scaly ant-eater, the *Manis javanica* of naturalists, is met with in Harpeh, Kiangnan, and the southern Chinese provinces. It is dark-coloured, more than two feet long, and covered on the back, limbs, tail and every part of the body, except the belly, with moveable imbricated scales. The tail is long, and the tongue very mobile. It lives on flies, ants, &c., by catching them upon its out-stretched tongue. Sometimes it lies down as if dead, and as the flies collect upon its body, it closes on them with its scales, and entering the water feasts upon the prey which floats upon the surface of the water, drowned by the manœuvre. The scales, (*Chuen-shan-kiah* CHINESE), are roughly triangular, concavo-convex, and marked at the attached end with fine grooves, like those on shell-valves. They are brown and semi-transparent, those of the tail being the finest. They were formerly given in all sorts and conditions of disease, not excluding skin diseases. The principal use at the present time is to scratch itching surfaces, for which purpose they are fixed upon a length of bamboo as a kind of curry-comb. No ill consequences are said to follow the use of this instrument, which is largely called for amongst the prurient Chinese.—*Tickell; Elliot, Jerdon, Mammals of India; Wallace, Archipelago; Smith's Chinese Materia Medica*, p. 166.

PANGSHURA.

PANIC GRASS. *Panicum italicum*.

PANICHE-KAI MARAM, TAM. *Garcinia*, *species.*

PANICHIE, TAM., PORT. A tree of Ceylon and Travancore, from thirty to sixty feet high, and ten to twenty-four inches in diameter. In Ceylon it grows tall and straight, in Travancore it is not more than twenty feet high, and is curved. It produces a fruit which resembles externally the small russet apple: when pressed it yields a very glutinous juice, which is used as a substitute for glue; and may be considered in that country as very superior to glue for the use of joiners. In Ceylon this tree is converted into masts, yards, &c., for country vessels; and the native carpenters consider it the best sort of all the jungle woods for that purpose.—*Edey*, *Ceylon.*

PANIAR, see Polyandry.

PANICACEÆ, the Grass tribe of plants, the Gramineæ of Lindley, is an exceedingly numerous order, comprising both land and water plants but no marine ones. They occur in every soil, alone or along with other plants, and from the frigid zone to the tropics. Many tropical grasses are, like the bamboos, of considerable size, rising 50 or 60 feet high. It was estimated by Voigt, that the grasses in the East Indies are 1,300 in number. The grasses at the foot of the Himalaya form a jungle sufficiently high to conceal the elephant and the rhinoceros, and, in ascending the Himalaya, species of plants are met with of the same genera as found in proceeding from the equator to the poles, and many of the pasture grasses of Europe, form the grassy sward of

PANICACEÆ.

the Himalaya. The temperature of the cold weather months of the East Indies is the most favourable for the growth of the Cereal grasses, and cattle are fed on the green or dry stalks of the following,

<i>Paspalum scrobiculatum.</i>	<i>Penicillaria spicata.</i>
<i>Panicum miliaceum.</i>	<i>Sorghum vulgare.</i>

A wholesome and nourishing grain, an article of diet of the lower classes. There are several varieties of it, which yield from 50 to 60 fold; it delights in a light, tolerably dry, rich soil; the same ground yields two crops between the first of the rains in June, July, and the end of January, in the Circars, but only one crop in the northern provinces.

This Indian millet is grown in Europe. Seeds small, roundish, straw-coloured; pericarp brittle, with a round and partially pellucid grain, alimentary, but gives a heavy, disagreeable bread. The grain is however prized by the natives of India, who make cakes of it and also prepare it as porridge. For the purposes of pastry it is very little inferior to wheat, and when boiled with milk, forms a light and pleasant meal for invalids. It is grown in abundance in the southern part of Europe, particularly in Portugal, where it is termed Mitho Painco. It is rarely grown in the Punjab plains, but is commonly cultivated in the Himalaya, occasionally up to 6,500 feet.—*O'Shaughnessy*, p. 637; *Ainslie*, p. 220; *Dr. J. L. Stewart's, Punjab Plants*, p. 259.

PANICUM HELOPUS.

Julgantus, Hind.

PANICUM JUMENTOSUM or Guinea grass, has been cultivated to a considerable extent in India and Ceylon, with more or less success according to the care and attention bestowed on it. When well-manured and kept clear of weeds it grows luxuriantly and admits of being cut every six weeks or two months. A small patch, near Colombo, which, beginning with about three-quarters of an acre, was gradually extended to about an acre and a half, for seven or eight years, supplied 3 or 4 milch cows, and from 5 to 7 horses continually with all the grass required for their consumption and latterly left a surplus which was dried for bedding and hay. When first planted it frequently attains a height of even 9 feet, and a stalk taken promiscuously from a small patch planted in Combaconum measured 10 feet $4\frac{1}{2}$ in length, but when cut two or three times it grows thicker but not so high. It is exceedingly excellent feeding for horses and cattle, and is generally preferred by them to the ordinary country grass, though horses which are hard-worked seem to prefer the dry grass roots supplied by the grass-cutters. It should not be given to cattle fresh but the supply for one day should be cut the day previous, and it should not be cut too close to the ground, but the stalk ought to be left 7 to 9 inches high. It is a good plan to move the ground between the roots every time the grass is cut, and the ground should be heavily ma-

PANICUM SEMIVERTICILLATUM.

nured after every three or four cuttings. It is very hardy and may be easily propagated. It requires abundant moisture but will not live in a soil which is at all marshy. It answers best planted in small tufts 1 foot 9 inches to 2 feet apart, which rapidly spread into stools from 6 inches to 1 foot in diameter.—*Spry's Suggestions* p. 15; *Mr. Caldwell, in Litteris*. See Gramineæ, Grasses.

Cheena-glias,	

A well known species of Millet, cultivated in the south of Europe and in tropical countries. Two varieties are well known, one brown, the other yellow-coloured. It is imported into Britain from the Mediterranean chiefly for feeding poultry, but forming in the south of Europe as well as in India a portion of the food of the inhabitants. In the latter country it is cultivated in the cold weather with wheat and barley, and the only one of the small grains that is so at the cold season of the year. It is imported into England from Salonica and Kaffa, for feeding cage-birds, and when husked, is used as food in puddings. It is found in the Suttlej valley between Ranpur and Sungnam at an elevation of 6,000 to 9,000 feet. In the middle regions it is one of the chief crops.—*Dr. J. L. Stewart; Cleghorn's Punjab Report*, p. 66; *Ainslie Mat. Indica*.

PANICUM MILIARE, Lam.

Kungoo, HIND.	Nella-shama, TEL.
Kutkee of Multan.	Shanmulo,

This is cultivated in Europe and S. Asia seeds oval, slightly compressed, brilliant, about a line in length; bark or envelope blackish, brown or fair; parenchyme, white or sweet taste, in the peninsula of India, is generally cultivated on an elevated rich soil: the seed is one of the sorts of dry or small grain which forms an article of diet of the hindoos, who inhabit the higher lands, and cattle are fond of the straw. Alimentary, but the pericarp is very difficultly separated from the grain; chiefly used in a kind of gruel or bouillie. Does not appear to be common in the Panjab, but Edgeworth mentions it at Multan.—*O'Shaughnessy, Bengal Dispensatory*, p. 637.

PANICUM SEMIVERTICILLATUM, Rott.

Lupta, HIND.	Koodraywali chamy, TAM.
--------------	-------------------------

This grain is inferior to several of those hitherto mentioned and is eaten by the poor people in the districts in which it is cultivated; such as Coimbatore, and other dry grain countries.—*Ainslie*, p. 219.

PANIMAR, HIND. Land injured by inundation or drainage floods.

PANINI, a Sanscrit grammarian, said to have belonged to the third century B.C. 350. He is the most celebrated of those grammarians whose sutras have come down to us, though he himself tells us of many who preceded him. His is the most ancient of all the Sanscrit grammars. He founded the present system of Sanscrit. He lived B.C. 350.—*Bunsen, Vol. iii*, p. 565.

PANIONIUM, says Herodotus, is a sacred place on Mycale, situate towards the north, which, by the universal consent of the Ionians, is consecrated to the Heliconian Neptune. Mycale is a promontory projecting itself towards Samos. On this mountain the Ionians assemble from their different cities, to celebrate the Panionia. A bull was usually offered in sacrifice to Neptune, and if he bellowed during the performance of the rite, it was accounted an auspicious omen, as such a sound, resembling the roaring of the sea, was held to be particularly acceptable to the ocean-king.—*Milner's Seven Churches of Asia*, pp. 76-77.

PANI-PHAL, HIND. *Trapa bispinosa*, Roxb. Two spined water caltrops.

PANIPUT in L. 29° 23'; Long. 76° 59', in Hindostan, 78 miles N. W. of Delhi, is 936 feet above the sea. Paniput was described by Jacquemont as the largest town he had seen in Northern India except Delhi. It is well known as the scene of four famous battles. It is supposed to be the site on which the Kuru and Pandu chiefs contended for their lands, about 1,300 years before the Christian era when the decisive battle, known as the Kuru-kshetra, was fought between the Kaurava and Pandava, and has thrice since then been made the battle-field on which contests have been held, for supremacy over India. The emperor Babers fifth and last expedition, was into India, in 1525/1526, when, with an army of 12,000 men led from Cabul, he encountered and completely defeated the emperor Ibrahim Khan, Lodi, at Paneeput, and in May, Delhi yielded to him without resistance, and he soon after reduced to his power all the provinces of the empire. The emperor Akbar, grandson of Baber and son of Hamayun, had to defend his claim to India against Hen

the hindoo general of Sultan Adili. Hemu hearing of the death of Hamayun advanced with 100,000 men against Akbar who at Paneeput met Hemu completely defeated him and took him prisoner, and while bleeding from his wounds in Akbar's tent, Bahram struck off the captives head. This, the third great battle at this place, was fought in Akbar's presence by his general Bahram Khan against Hemu, a hindoo general, and the last representative of the House of Sur. The fourth decisive battle here, was fought in 1761, when Ahmed, the Abdalla, king of Cabul, inflicted a crushing blow on the Mahrattas, which indirectly cleared the way for the establishment of British supremacy. The Mahratta army at one time estimated at 500,000, lay entrenched for many weeks, during which pestilence and famine reduced their numbers, and at length when battle was given they were utterly overthrown. In the preceding operations and in the battle, their loss was estimated at 400,000 people, and it was their first great check in their career of conquest.—*Cal. Rev. Jan.* 1871; *Malcolm's Central India*, Vol. i, p. 59; *Wheeler's Hist. of India*, p. 275; *Rennell's Memoir*, pp. 68-9; *Asiatic Researches*, London, Fifth Edition, p. 91; *Pottinger's Travels*; *Beloochistan and Sind*, p. 283.

PANIAYALA, BENG., HIND. Flacourtia cataphracta.

PANICHAVAN, from pany, work.

PANICLED ACACIA, see Acacia.

PANIR, GUZ., HIND., MALAY., PERS. Cheese, Panir-gar a cheese maker.

PANIR, HIND. Withania coagulans. Its berries are used to curdle milk, &c. The selling price, 12 to 14 seers per rupee. The shrub is called akri. The berries are used medicinally, also to curdle milk, and given to horses. It is a small shrub with light-coloured leathery leaves, which is common west of the Indus and along the Salt Range (to 4,500 feet), and occurs in the southern Punjab, generally near houses or fields, seldom in the real desert. The Affghans use it for curdling milk to make cheese, whence its Persian name panirbad. The seeds are considered stomachic about Peshawar, and they probably possess anodyne or sedative properties. In home practice they are given to children for colic, are used in veterinary medicine, and are sold in most bazaars. Honigberger states that the bitter leaves of this plant are given as a febrifuge by the Lohani.—*Powell & Stewart*.

PANILBAD, PERS. Withania coagulans, —*Dun.*

PANIRAK of Trans-Indus. Malva parvifolia, Linn.

PANITSJICA MARAM, MALEAL. Embryopteris glutinifera.

PANI WARROOGOO, TAM. pilosum

PANJ, PERS. Five, Panjah, HIND., the extended hand carried on a pole in the moharrum.

PANJALI, HIND. The yoke of a plough.

PANJAY TANOA, a class of slaves in Coorg.

PANJERA, HIND., MAHR, Erythrina indica.

PANJGHUR, a western section of Beloo-chistan. See Kelat.

PANJAM—? the gum of the Embryopteris glutinifera, used for paying boats, &c.—*Simmond's Dict.*

PANJI, TAM. Cotton.

PANJIRAH, HIND. Erythrina indica.—*Lam.*

PANJRA or Panjur river, passes the station of Dhoolia.

PANJSHAH, a populous valley which affords a communication with Badakshan. It contains silver mines, which were worked by Abul Fazl. Silver and other metals it is believed abound in the secondary hills of the Caucasus.

PANJ-TAN, five holy persons of the shiah mahomedans, Mahomed, Ali, Fatimah, Husan and Hussain.

PANJAROO, HIND. An armlet, made of gold, silver, crystal, or shell, &c.—*Simmond's Dictionary*, see Bangles.

PANKA. The Ganda or Panka sect of hindoos, are Kibirpanthi or followers of Kabir, who is said to have appeared in the weaver caste, in the same country and at the same time, as Rai Das, both being disciples of Ramanand, and their doctrines being similar in many respects. They cultivate the land, but they are not generally esteemed as cultivators, while the few villages they hold as landholders are miserable in the extreme.

PAN-KAKROOL, BENG. Aspidium unitum.

PANKALANG KOTA, see Jakun.

PANKHA, HIND. A fan.

PAN KEE BEERA, HIND. Betel leaf parcel.

PAN KI HURRAY BANTNA, a ceremony.

PAN-KI-JAR, DUK. Alpinia galanga, Swz. Galangal.

PAN-KOOSHEE, BENG. Phyllanthus multiflorus.

PANK KROOL, BENG. Aspidium.

PANKTI-PAVANA. This term, rendered, taking precedence at festivals, means the purifier of the row, or range, or assembly:

that is, Jagaddhara says, in the place where there is food, or, in other words, they were Agra-bhojinah, the first-served at feast. He also quotes a text, without mentioning his authority, to show that the term implies a brahman who has read the Yajur, Sama, and Atharva-Vedas, and the word is similarly explained by Menu, III. 184.—*Hind. Th., Vol. ii., p. 11.*

PAN-LOUN, BURM. In Tavoy, a close grain-ed red wood: used for building.—*Dr. Wallich.*
PANMUHORI, seeds of *Fœniculum panmori-um*.—*Ben Phar.*

PAN MURICH, BENG. *Polygonum flaccidum*.

PANNA, HIND. An emerald.

PANNA, a range of hills in Bundelcund, south of the Bindyachal plateau. Average elevation between Kuttay Pass and Lohargaon, 1,050 feet. Elevation between Lohargaon and the foot of the hills near Patteriya, about 1,200 feet. Summit an undulating platform, about ten miles wide. Where deep ravines allow examination, an enormously thick bed of sandstone is found with primary rock superincumbent, itself overlaid by volcanic rocks. See Bandair Hills.

PANNAGAL, snake charmers in the Deva-loka.

PANNA MARAM, TAM. Palmyra tree. *Borassus flabelliformis*.

PANNAM KALANGOO, TAM. The first shoot from the planted palmyra nut, the germ of the future tree. The people of southern India and Ceylon have for many hundred years been in the habit of eating this. It is about the size of a common carrot though nearly white. It forms a great article of food among the natives for several months in the year; but Europeans dislike it from its being very bitter. Recent experiments have proved that a farina superior to arrowroot can be obtained from it, prepared in the same way, and 100 roots costing 2½d, yield one and a half to two pounds of the flour.—In Madras, 100 cost 1½d. *Simmonds' Comm. Products, p. 376.*

PANNAM OLI, TAM. Leaves of the palmyra tree, prepared for writing on.

PANNAM PALLAM, TAM. Fruit of the *Borassus flabelliformis*.

PANNAM KHALLOO, TAM. Toddy or palm wine of the *Borassus flabelliformis*.

PANONG, see India.

PANOON, a large tree of Lucknow, grows spontaneously in the Tarace; its timber is used for beams, &c.—*Cal. Cat. Ex. 1862.*

PAN-OOATHANA, HIND., a ceremony.

PANOPÆA.

PANORAMA. Panoramic representations of holy places are common in India in the form of long rolls fixed against a wall in compartments. Scenes from the Mahabharat and Ramayana, in illuminated and embellished portable scrolls, are very frequent. It is common, also, in the western provinces of India to meet with a kind of fresco-painting upon the walls of gardens, or enclosures of tanks, representing mythological or historical subjects.

PAN-PATRA, HIND., a cup, often seen figured in the hand of the goddess Devi, or Bhavani, for the purpose it is said of receiving the blood of victims.

PANRI, HIND. Stalk of the pan leaf; also shreds of the leaves dried.

PANRI, HIND. Leaves of a small plant imported from Bombay, considered refrigerant and to promote digestion: are sweet-scented and used by attars; one scr costs one and a half rupee.—*Genl. Med. Top., 149.*

PANIRU PUVVU, TEL. *Guettarda speciosa*, L.—*R., i, 686.*

PANSAL, see Pir Panjal Range.

PANSARI, HIND. A drug-vendor.

PAN-SA-YEIH, BURM. *Ixora coccinea*, Linn.

PANSEE, a mahomedan tribe or sect in Yunnan, who about A. D. 1862, rebelled against the Chinese dominion. The Pansee, most likely the oppressed at first, got into a quarrel resulting in bloodshed with their numerous fellow-subjects, fled in large numbers to the jungles, and commenced a dacoity war on the Chinese towns and villages. The mahomedans all held together, and attracted as many to their side as the prospect of booty would tempt, ab

any conquered place, to the unrestrained pillage of their forces. In A. D. 1863 their own numbers were small, not over twenty thousand, but their forces soon rose to two or three hundred thousand, among whom were Chinese, Shans and a few Ka-khyen. Any place that resisted after taking, the old and the adults were slain wholesale, the young men made muskellmans or slaves, the young women only had death exchanged for the harem. The whole of Yunnan fell in their hands, and the Shan states belonging to it accepted their suzerainty, but they exasperated their Shan subjects into open hostility. Their head, or king, was called Tuwysin and resided at Tali. The Ayebeing Bochup was the General and Commissioner in 1863, he conducted hostilities against an army of Chinese under Leesitagli, or Lioguanhan in the Nalookan mountains, between Mainla or Kaingai and the Pansee post Mopoo, two days from Momiru. The Commissioner of Momiru was Sophusyanjin. The Pansee seem the Panthay tribe.

PANSELA, SINGH. The dwellings of the buddhist priests in Ceylon.

PANSERI from five, and ser, a weight of five seers.

PANSH-AGNI, HIND., in hindooism, five fires: that is, one towards each cardinal point, close to the devotee, and the sun, on which he constantly looks, over his head; standing with uplifted arm, without aid or support, day and night, feeding on air, immovable on his right toe, upon the afflicted earth, &c.

PAN SHEET, BURM. *Impatiens balsamina*, Linn.

PAN-SHIOOLI, BENG. *Phyllanthus multiflorus*.

PANSIRA, HIND. *Wendlandia exserta*.

PAN SOOPAREE, HIND., from pan, betel leaf, and sooparee, areca nut. In India, the handing round of these to visitors, is a ceremonial equivalent to the English custom of cake and wine. On taking leave, the ceremonial is various. With the nabobs of the Carnatic, at whose court the editor was for some years Political Agent, the nabob would put a little atr on the visitor's handkerchief, then sprinkle it with rose water; then present a rose bouquet; then a "bheri" of pan supari; and, suspending a garland of jasmine round the neck, shook hands and dismissed the visitor. At the palaces, in Hyderabad, of the nobles Vikar-ul-Umra, Shams-ul-Umra and Sir Salar-Jung, the host accompanied the guest to the door and then presented one or more little phials with rose attar. See Betel.

PANSWAH, or Panshway, HIND. A small boat attached to a budgerow, used on the Ganges and Hooghly rivers, with an awning of matting over the stern. See Boat.

PANSY, *Viola tricolor*, Heartsease, may be raised from seed sown at the commencement of the rains, but will hardly repay the trouble.—*Jaffrey*.

PANTALEON, a Bactrian ruler, B.C. 170. See Greeks of Asia.

PANTALU, TEL. From Pandit, a school-master.

PANTASOK, in Kashmir, founded by Asoka.

PANTHA, a religious sect. See Pansee.

PAN-THAY, a mahomedan race who govern at Momin, 90 miles from Bamo, in Shan and Chinese territory.

PAN THEET YA, also Let touk, BURM? *Vateria roxburghiana*, *Wight*. In Tavoy, a good, white, rough wood; useful for boat-building.—*Dr. Wallich*.

PANTHEISM. See Siva.

PANTHEISTIC VEDANTA, see Vedas.

PANTHER, Leopard or pard of the E. Indies. *Felis pardus*, Linn. See Felidæ.

PANTHEUM MYTHICUM, see Saraswati.

PAN-THEY-YA, BURM. *Vateria lanceolata*, *McClelland*.

PANTHI, the follower of a religious sect.

PAN-PHIT-YA, BURM. *Vateria lanceolata*, *McClelland*.

PANTHOLOPS HODGSONII. The sous or Tibetan antelope, rarely comes so far south as Tooskee lake, its favourite haunts are among the lofty ranges northwards, it is met with in herds. It has two slit-like openings in the groin, forming pouches of a size capable of containing the clenched fist. They are strange appendages, and like the infra-orbital openings their uses seem by no means apparent.—*Adams*.

PANTIANG, LEPCHA. *Pandion haliaetus*, L.

PAN-TORASI, BENG. *Cenante stolonifera*.

PANTOR ISLAND, is about 27 miles long, and of considerable height. Its N. E. point is in lat. 8° 10' S., and long. 124° 15' E.—*Horsburgh*.

PANTUN, MALAY. Four lines of poetry. See Ber Beit.

PANUBUR, in the Aru islands, is a basket-measure what may contain half a picul.

PANUMBIA MARUM or Vunny marum, TAM. *Prosopis spicigera*.

PANWAR, HIND. *Cassia tora*.

PANYALA, BENG., of Behar, the small leaves and shoots of the *Flacourtia cataphracta*, which resemble rhubarb in flavour, and are used as gentle astringents.—*Simmond's Dict.*

PAN-YEN, BURM. *Andropogon muricatum*, *Retz*.

PA-NYOUNG, BURM. *Ficus indica*, Linn.

PAO, LEPCHA. This is a large bamboo, the prevailing plant near the base of the Sikkim valleys; it attains a height of 40 to 60 feet, and the culms average in thickness the human thigh; it is unarmed, deep green,

PAPARA BUDAMA.

or purplish and used as large water vessels. Besides this, there are nearly a dozen kinds of bamboo known to the Lepcha. Two species of hill bamboo, "Payong" and "Praong" of the Lepcha, replace the "Pao" of the foot of the hills. The former flowers abundantly, the culms, 20 feet high, being wholly a diffuse panicle of inflorescence. The "Praong" bears a round head of flowers at the apex of the lofty branches.

PAO, HIND. A quarter; Paola, quarter of a rupee.

PAONA or Pona a quarter: when placed before another number, as pou do, or pona-tin it means a quarter less two or three, i.e. $1\frac{3}{4}$ or $2\frac{3}{4}$.

PAO-D' AGILA, also Pao-d' aguila. Eagle wood.

PAO DE BRASIL also Pao de rainha, PORT. Brazil wood.

PAO DA RAINHA. Brazil wood. See *Cesalpinia*.

PAO DE ROSADA, PORT. Rose wood.

PAO DOCL, PORT. Liquorice root.

PAO-HO, BURM. *Cuon rutilans*.

PAO-KIA, CHIN., takers of a census. The official word used in the Chinese census is yeh-hu, literally fires-doors. Persons called Pao-kia, or "chiefs of ten fires," are appointed to collect the numbers of their tithing.—*Chine Moderne*, p. 187, in *Yule Cathay*, Vol. i, p. 117.

PAOO'TEE, a kind of lamp.

PAOON MINUT or Paoon mayz, HIND., the measuring for the wedding garments.

PAON, or Panu HIND. A foot.

PA-ON, see India.

PAOPA-DOUNG, an isolated mountain in Burmah, which the Burmese regard with some superstitious dread. They say it is impossible to ascend it, and describe it as the dwelling place of Nats and Bilus.—*Yule*, p. 27.

PAOREE, itself is 5,238 feet above the level of the sea. Serinuggur, the capital of Kashmir being in a valley, is found to be not more than 1,708 feet, if ascertained by contemporaneous observations at Paoree, but 1,834 feet if compared with the barometer at Calcutta.

PAPA, MALAY. *Carica papaya*.

PAPAS, PERS. *Solanum tuberosum*, W.

PAPAIA, BENG., HIND. *Carica papaya*, L.

PAPALI PANDU, TEL. *Carica papaya*.

PAPAN, TAM. Papati, fem. TAM. A common term amongst the Dravidian people for a brahman, Papan being the man and Papati a brahmini. See Par-pan.

PAPAR, HIND. A sweetmeat.

PAPAR, HIND. *Euonymus fimbriata* also *E. hamiltonii*.

PAPAR, HIND. A kind of biscuits. Papar-gar a maker of the papar. This is the Papadam of the English.

PAPARA BUDAMA or Verri puchcha, TEL.

PAPAVER RHÆAS.

Citrullus colocynthis, *Schrad.*—W. A. It is the Verri puchcha and Ete puchcha.

PAPARA PULIA MARUM, TAM. *Adansonia digitata*, Linn.

PAPATA or Tella papata, TEL. *Pavetta indica*, L.—W. and A. 1323—W. Ic. 148—*Ixora pavetta*, R. i, 385.—*Rheede*, v. 10.

PAPAT KALAM, HIND. *Viburnum cotinifolium*.

PAPAVERACEÆ, *Juss.* The poppy tribe of plants: they are annual or perennial herbs, rarely under-shrubs, with a milky juice. The total amount of species is 66, of which 28 have been found in Europe; 7 in the Levant; 9 in N. America; 5 in Mexico; 5 in India; 3 in Persia; 2 in Siberia; 2 in N. Africa; 3 in China and Japan; 1 in N. Holland; and 1 in S. Africa. Most of them are annuals, 21 perennials and chiefly mountainous, and 2 shrubby, of the five Indian species, two belong to Papaver, and three to Meconopsis. One of the latter, *M. nepalensis*, DC., especially its root, is according to D. Don, (*Pl. Fl. Nep.*, p. 98,) very poisonous. The other genera are: 1 Argemone; 1 Romeria; 1 Glaucium; 2 Chelidonium; 2 Chrysis. The most famed of these is the poppy, *Papaver somniferum*, from which opium is produced, its seeds are used in sweetmeats, its capsules used in fomentation and its pure and sweet oil is used in cooking and for lamps: an excellent lamp oil is also obtainable from the seeds of the *Argemone mexicana*. The E. Indian genera and species may be thus shown—

Papaver somniferum, L., Morea, Egypt, E. Indies.

var. (a) album.

(b) nigrum.

„ *persicum*, Lindl., Persia.

„ *amenum*, Lindl., N. India.

„ *glabrum*, Royle, Himalaya.

Argemone mexicana, Linn., all India.

PAPAVER CROCCEUM. This species, which is almost always variegated, is sown only as a border flower, for its large and handsome appearance. The scent is anything but agreeable. The seed should be sown where the plants are to remain, and six inches, the least space, allowed between each plant. They do not bear transplanting. The common cultivated species, from the capsule of which opium is procured, is of various colours, and when sown in beds, has a very pleasing effect. The seed (khash-khash) is commonly used by natives in confectionery having the taste of sweet almonds. It is propagated by seed only.—*Riddell*.

PAPAVER RHÆAS, the corn poppy, is an unimportant species found in gardens in upper India. The petals are of a beautiful red colour, and are used to colour a syrup, the *Syrupus rhæados* of the English pharmacopœia; no active or narcotic principle has been found in this species.—*O'Shaughnessy*, p. 171.

PAPAYER SOMNIFERUM, Linn.

<i>var. (a)</i> with black seed.	<i>var. (b)</i> with white seed.

This very important plant is a native of the south of Europe and Asia Minor, and is now naturalized by cultivation in India. It appears to have been one of the early cultivated plants, as Homer is thought to allude to it as growing in gardens. Hippocrates mentions two kinds, the black and white poppy, so the Arabs and Persians distinguish the khushhash abiaz or white, from the khushhash aswad, or black poppy. It was early cultivated, as it still is, in Egypt, also in India, Persia, Asia Minor, as well as in some parts of Europe. The garden poppy is probably a native of Persia. It has, however, been so long grown in gardens in various parts, that it is sometimes found apparently wild, especially in the southern parts of Europe. There are two distinct varieties, which, by some botanists, are considered to be distinct species: the dark, the red-flowered, and black-seeded is called by Gmelin, *P. somniferum*; and the white flowered with white seeds, *P. officinale*. The latter is characterised as having an ovate globose capsule; foramina under the stigma, either none or obliterated; peduncles solitary. The former (*P. somniferum*) has globose capsules, opening by foramina under the stigma; seed black; peduncles many. The flowers are usually red of different tints, though sometimes white. Dr. Royle states that he has seen only the white-flowered variety in the plains of India, and the red-flowered in the Himalaya, and both cultivated for the sake of the opium. The poppy is cultivated in many parts of Europe on account of its seeds, which yield a bland oil much esteemed in France; and in England chiefly on account of the capsules, which are used medicinally. It is extensively cultivated in Turkey and Asia Minor, Egypt, Persia, and India, on account of its inspissated juice, the opium of commerce, though this is occasionally prepared also in Europe. The cultivation of the poppy is very simple, though the weeding requires care, and the plants must not be crowded too much together. They are carefully watered and manured, the watering being more copious as the period of flowering approaches, and until the capsules are half-grown. The capsules are employed in medicine for the preparation of a sedative decoction and syrup, much used for children. They are devoid of odour; of slightly bitter taste. If collected before the green juice is removed, the capsules contain minute portion of all the active principles of

opium; for medicinal purposes those should be rejected which are marked with longitudinal and parallel cuts resulting from the extraction of opium. An infusion of poppy heads in cold water should strike a red colour with permuriate of iron.

Poppy oil.—The seeds of the poppy yield by expression 56 per 100 of a bland and very valuable oil, of a pale golden colour, fluid to within 10 degrees of the freezing point of water, Sp. Gr. 939; it dries easily, is inodorous, of agreeable flavour, is partially soluble (8 in 1,000) in alcohol, dissolves the oxides of lead. The mass from which the seed is expressed is found to be extremely nutritious to cattle; for all pharmaceutical purposes, this oil is equal to that of the olive, employed in European pharmacy, and accordingly recommended in Dr. O'Shaughnessy's formulae for hospital use. The natives consider the white as articles of food but the black are deemed more powerful, and are used in coughs and special diseases.

Opium is a valuable remedy, and important article of commerce. It is most extensively used by the natives especially in eye-diseases, in which it is either applied with a pencil of antimony, or fixed on the temple with plaster. Its application in disease by Europeans, is considered a most valuable narcotic and anodyne.

The poppy is cultivated throughout British India: it is grown in only two of the eight districts of Mysore, viz., in those of Bangalore and Kolar. The quantity of opium manufactured in the districts named above, during a period of 11 months (from April 1871 to February 1872) is shown by the accounts to have been about 362 Mysore maunds of 24 lbs. each. Also in 1870-71, opium to the value of Rs. 44,400 was manufactured in the Nundidroog Division of Mysore and 80 candies of opium were exported. It is not known how many pounds a Mysore candy of opium contains, but two candies are in use in Bangalore, one of lbs. 500 and the other of lbs. 336-12-4, and it would seem to be the lbs. 500 weight that forms the opium candy. In west Berar, the poppy is largely grown in the Maiker, or, as it is now designated the Buldanah district. When the editor saw it growing between Maiker, Janiphal and Bassein, he examined the processes for making opium, in which the people were busily occupied and exhibited an expertness betokening full experience. In 1870-71, 544 acres of land in the Buldanah district were under cultivation for opium.—*Eng. Cyc. O'Shaughnessy*, pp. 171-172; *Powell's Handbook*, Vol. i, p. 325.

PAPAYERO, It. Poppy seed.

PAPAW TREE, the *Carica papaya*, the Bati of the Malays, is not the pawpaw

of the Mississippi valley, *Porcelia triloba*, but is the pawpaw of South America and the West Indies. Europeans call it papaya, from the Portuguese papayo; and by the Portuguese it was probably introduced into India. The fruit resembles a melon in appearance, and often tastes no better than a good English turnip. The fruit and leaves of the papaw, or Mul-Kwa-tree melon, are eaten, after being cooked; the Chinese are aware of the supposed intenerating property of the exhalation from the leaves of this tree, and make use of them sometimes to soften the flesh of ancient hens and cocks by hanging the newly killed birds in the tree, or by feeding them upon the fruit beforehand.—*Mason: Williams' Middle Kingdom*, p. 284.

PAPAY, also Pepya, HIND. *Carica papaya*.

PAPAYACEÆ, the papaw tribe of plants, are natives of S. America, and comprise one genus and six species, of which one, the *Carica papaya*, is cultivated in India.

PAPAYA CARICA, *Gærtn.* Syn. of *Carica papaya*, *Linn.*

PAPAYA VULGARIS, *Lam.* Syn. of *Carica papaya*, *Linn.*

PAPCONDAN. Through a pass in the gneiss mountain of Papcondah the river enters the plains of the Eastern coast. In this district the sandstone re-appears, at an elevation little above that of the sea, but basaltic hills, several hundred feet in height, in which marine fossils have recently been discovered, exist almost within the delta formed by its sediment.

PAPEETA, BENG. Nut of *Strychnos sancti ignatii*, *Ben, Ph.*, p. 219.

PAPENBERG, an island notorious as the spot where many Portuguese and Japanese christians, were barbarously murdered.—*Hodgson's Nagasaki*, p. 33.

PAPER.

Nearly eighteen centuries have rolled away since the art of making paper from fibrous matter, reduced to a pulp in water, was first discovered by the Chinese. The leaves of some trees, and the skins and intestines of animals, had previously been made fit for writing on; wherever the Egyptian papyrus was introduced, all these things fell into disuse, except parchment. But when the Saracens conquered Egypt, in the seventh century, papyrus could no longer be procured in Europe, and parchment became extremely dear. In China, paper is largely made from the inner bark of the bamboo, from cotton and linen rags, and from rice-straw.

Anciently, in China, bamboo-leaves scorched before a flame were used to write upon, and this material still contributes largely to the manufacture of the finished article of the present day. In the times of the Ts'in and Han monarchs coloured threads of silk were used to record events, and the Chinese written character in constant use still retains the radical for silk. In the reign of the Han emperor Ho-ti, the bark of certain trees came into use, being boiled to a pulp, along with silk, old fishing-nets and hemp-fibres, to make a paper which came into general use. Then, as now, the materials employed varied greatly according to the locality. The use of printing-blocks in China, in the sixth century after Christ, led to the extensive making of paper, in which the Chinese have ever since continued to excel. The delicacy of their best proof-paper forming the original. "India-proof" of former days, the elegance, cheapness and general use of their commonest stationary-materials are amongst the most satisfactory proofs of a true civilization. Chinese paper is made from bamboo, rice-straw, wheat-straw, cotton, hemp, the bark of the *Ailanthus*, *Broussonetia* and other trees, and the refuse of silk-cocoons. Ho-chi, is rice-straw paper used for sacrificial burnings. Pi-tsze, is the mulberry-bark paper which has been long used in the Hankow Mission Hospital as a substitute for lint and old rag. It comes from Wu-chang-fu and Yun-yang-fu in Hupch. Wan-tsai hien, Fung-sin hien and Lin-chang hien, all in Kiangsi, make a paper called (Piau-sin) used for packing. Lin-yang hien in Hunan also supplies this article. Hwa-tsien paper from Fuhkien, and Sinchang hien (Kiangsi) is a rough paper for packing up drugs in. Hwang-pian paper, made in Kwang-sin-fu (Kiangsi) is the same: the Ho-chi, used in burning for the dead. Ta-tseh, Chung-tseh, made in Kwang-sin-fu, are used for account-books. Mau-pien and Lien-chi, are fine papers made in northern Fuhkien and in Yuen-shan hien (Kiangsi) and used for writing, printing and mounting pictures or scrolls. Kai-lien-chi, is a good, yellow, thin paper useful for wrapping up powders in dispensary-practice. Lah-tsien, is a waxed note-paper. Seven-lined and eight-lined paper, divided by perpendicular red lines, and stamped with curious coloured devices, are sold everywhere in great variety at small cost. The ashes of paper are given as an astringent, and the paper of an old book, or letter, after cutting out the printed characters, held in such commendable veneration in China, is a remedy for barren women! Much interesting matter on paper is to be found in Mr. Drew's "Kiang Report of Custom's Revenue" for 1 to which Dr. Smith was much indebted.

The Arabians, in the seventh century, either discovered or learned from the Chinese the art of making paper from cotton; this they carried to Spain, where they also made paper from linen and hemp. The oldest manuscript on cotton paper is one which Montfaucon saw in the French king's library, bearing the date of 1050, but supposed to belong to the ninth century. In Spain, flax being grown, linen rags were substituted for cotton, because the latter was only to be obtained by importation. Mr. Ottley, however, contends that paper was manufactured from mixed materials from a very early period; and that the notion of distinguishing the kinds by one sort being made of linen, the other of cotton, rags, is wrong; for one is as ancient as the other, and they were often intermixed. In the Tower of London, is a letter addressed to Henry III, (between 1216 and 1222) upon very strong paper, and certainly, in Mr. Ottley's judgment, was made, of mixed materials; while in several of the time of Edward I, written upon genuine cotton paper, of no great thickness, the fibres of cotton present themselves everywhere at the backs of the letters so distinctly that they seem as if they might even now be spun into thread. The antiquity of linen paper is a much disputed question. The earliest distinct instance found by Mr. Hallam, and believed by him to have been hitherto overlooked, is an Arabic version of the aphorisms of Hippocrates, the manuscript bearing the date of 1100. It does not appear whether it were written in Spain or brought from Egypt or the east. Peter, abbot of Clugni, in a treatise against the Jews, speaks of books "*ex rasuris veterum pannorum*," interpreted "of linen rags." "And," says Mr. Hallam, "as Peter passed a considerable time in Spain, about 1141, there can remain no rational doubt that the Saracens of the peninsula were acquainted with that species of paper, though perhaps it was as yet unknown in every other country," ("*Literature of Europe*," vol. i, p. 58). Andrés asserts, on the authority of the members of the Academy of Barcelona, that a treaty between the kings of Aragon and Castile, bearing the date of 1178, and written upon linen paper, is extant in the archives of that city. Andrés refers the invention to the Saracens of Spain, using the flax of Valencia and Murcia; and conjectures that it was brought into use among the Spaniards themselves by Alfonso X of Castile. Bagford speaks of a letter from the king of Spain to Edward I, which is on what he calls "a species of paper," and is of an earlier date by twenty years than any paper that had fallen under the notice of the Rev. J. Hunter, ("*Archæologia*," xxxvii, p. 448). In this article from the great abundance of accounts written on paper coming into England from the

Aquitanian possessions, and the small number of documents originating in England in the same early period, written on any other material than parchment or vellum, Mr. Hunter concludes that paper was a substance much more familiarly known in the south of France than in England; whence arises a strong probability that it is to the connection with the Aquitanian provinces, especially with Bordeaux itself, that is due the first introduction of this most valuable substance into England. Indeed, paper having the same mark being found in documents prepared at nearly the same time at Bordeaux and in England, seems to show either that England received paper from Bordeaux, or that Aquitaine and England were supplied from the same market. Whence we may also infer that we are to trace this most ingenious and admirable invention through Spain, and possibly the Moorish provinces, to the people, not yet ascertained, with whom it originated. ("*Archæologia*," xxxvii, p. 453-4). Mr. Hallam records his having seen in the Chapter-house at Westminster, a letter written from Gascony, about 1315, to Hugh Despenser, upon thin paper, to all appearance made like that now in use, and with a water mark. Among the Cottonian manuscripts several letters are written on parchment; and paper does not appear, at soonest, till near the end of the reign of Edward III, Sir Henry Ellis has said that "very few instances indeed occur before the fifteenth century of letters written upon paper." It is remarkable that the earliest linen paper was of very good manufacture, strong and handsome; and the first printed books are frequently beautiful in the quality of their paper. From Spain linen paper passed into France, about 1270, thence into Germany about 1312, and from Germany to England about 1320 or 1324. We may here remark that the use of linen or cotton, or the two intermixed, is the radical distinction of our modern paper from the other substances (such as the papyri, the palm-leaves, the fabric supposed to be formed from fibrous matter found in the mummies of Egypt) which were in ordinary use in Europe. It is commonly thought that Dartford is the place where paper was first made in England; but it is proved beyond doubt that a paper-mill existed in England almost a century before the date of the establishment at Dartford. In the "Household Book" of Henry VII, we read—

1498. For a rewarde geven at the paper mylne,
16s. 8d.

1499. Geven in rewarde to Tate of the mylne,
6s. 8d.

And, in the English translation of "*Bartholomæus de Proprietatibus Rerum*," printed by Wynkyn de Worde, in 1495, we read of John Tate the younger having lately, in

made the paper which was used for printing this book. The lines, which occur at the end of the volume, are as follows:—

And also of your charyte call to remembraunce
The soule of William Caxton, first printer of this
boke,
In Laten tonge at Coleyn (Cologne) hysself to
avaunce,
That every well-disposed man mote (may) be
broke,
Which late hathe in England doo make this
payer thynne,
And now in our Englysshe this boke is printed
inne.

We also gather from an early specimen of blank verse, entitled "A Tale of Two Swannes," written by William Vallans (it is believed, a native of Ware), and printed in 1590, that the mill belonging to John Tate was situated at Hertford. One of the notes in the poem states, that, "in the time of Henry VIII, viz. 1507, there was a paper-mill at Hertford, and (?) belonged to John Tate, whose father was Mayor of London." The author, however, is here mistaken in his chronology, as Henry VIII, did not begin to reign till 1509. The extract from the privy purse expenses of Henry VII, under the date of May 25, 1498, "for a rewarde geven at the Paper Mylne, 16s. 8d.," most clearly has reference to this particular mill, as the entry immediately preceding shows that the king went to Hertford two days before, viz., on the 23rd of May. And, in Herbert's edition of Ames's "Typographical Antiquities," we read that "this mill was where Seel or Seal Mill is now at the end of Hertford town, towards Stevenage; and that an adjoining meadow is still called Paper Mill Mead. This Seel Mill, so denominated from the adjoining hamlet, was erected in the year 1700, and is noted for being the first that made the finest flour, known by the name of Hertfordshire White. It stands upon the river Bean, in the middle of three acres of meadow-land, called Paper Mill Mead, so denominated in the charter of King Charles the First to the town of Hertford, for the fishery of a certain part of that river"—*A. Grayan, "Notes and Queries," No. 117, in Once a Week.*

The paper-mill at Dartford was established at least 110 years later than that at Hertford, in 1588, by John Spilman, "jeweller to the Queen," who was pleased to grant him a license "for the sole gathering, for ten years, of all rags, &c., necessary for the making of such paper." The particulars of this mill are recorded in a poem by Thomas Churchyard, published shortly after its foundation, entitled, "A description and playne discourse of paper, and the whole benefits that paper brings, with rehearsal, and setting forth in verse a paper-myl built near Darthforth, by an high Ger-

maine, called Master Spilman, jeweller to the Queene's Majyestie." The writer says:—

"(Then) he that made for us a paper-mill,
Is worthy well of love, a worldes good will,
And though his name be *Spill*-man by degree,
Yet *Help*-man now he shall be calde by mee.
Six hundred men are set at work by him, [bread;
That else might starve, or seeke abroad their
Who now live well, and go full brave and trim,
And who may boast they are with paper fed."

Sir John Spielman was knighted by Queen Elizabeth. He is buried in the church at Dartford, beneath a sumptuous tomb, which, in 1858, was restored by the "Legal Society of Paper-makers," the funds being subscribed by the trade in different parts of England, especially in the county of Kent. But we find a paper-mill mentioned by Shakspeare, who, in his play of Henry VI, the plot of which appears laid at least a century previously, refers to a paper-mill. In fact, he introduces it as an additional weight to the charges which Jack Cade is made to bring against Lord Say, "Thou has most traitorously corrupted," says he, "the youth of the realm in erecting a grammar school; and whereas, before, our forefathers had no other books but the score and the tally, thou hast caused printing to be used, and, contrary to the king, his crown and dignity, thou hast built a paper-mill." Mr. Herring tells us that North Newton mill, near Banbury, in Oxfordshire (then the property of Lord Say and Sele,) had been set down as the first paper-mill erected in this country, and that referred to by Shakspeare. Upon hearing this, Mr. Herring communicated with Lord Say and Sele, as to the plausibility of the supposition, when his lordship at once terminated the probability of this mill taking the precedence, even of Sir John Spielman's by informing him that the first nobleman succeeding to that title who had property in Oxfordshire, which he acquired by marriage, was the son of the first Lord Say, to whom Shakspeare makes reference: "Sir Richard Baker (who died in 1607) has an entry in his "Chronicle," that in the reign of James I, "coarse paper, commonly called white brown paper, was first made in England, specially in Surrey, and about Windsor." The making of paper in England had, however, made little progress even so late as 1662, when Fuller complained that the manufacture was not sufficiently encouraged, "considering the vast sums expended in our land for paper out of Italy, France, and Germany, which might be lessened were it made in our nation." But, in 1690, an Act was passed to encourage the making of paper for writing and printing in England, the manufacturers being taught by French refugees. Thomas Watson, a stationer, by the introduction of foreign improvements, in 1713, gave a great impulse to the manufacture.

Paper continued to be made by hand until early in the present century, when the Fourdriniers completed their self-acting machinery, which imitates and improves the hand-process, and makes paper of any size or length with a rapidity which leaves the other mode at an immeasurable distance. The invention was perfected at Tewin Water, in Hertfordshire, at a cost of 60,000*l*. Their patent right was, however, invaded, and they lost a considerable sum of money due to them from the imperial treasury of Russia; though, to enforce his claim, Henry Fourdrinier, at the age of seventy-five, with his daughter, made a special journey to St. Petersburg. The Fourdriniers then petitioned the British government, the revenue having benefited half a million a year by their inventions, when their claim was inadequately recognized by a parliamentary vote of 7,000*l*. It was then resolved to purchase, by the subscription of the paper-makers, annuities for the surviving patentee and his two daughters; ere this was done the father died, in his eighty-ninth year; but his two surviving daughters receive a small pension from the Crown. A sheet of paper nearly three miles long and four feet wide was made at Whitehall mills, Derbyshire, in 1830. Down to the beginning of the eighteenth century, cotton, flax, and hemp were the only materials, except rags, used in the manufacture of paper. Cotton and linen rags are now chiefly used for this purpose, because they are more easily and cheaply converted into pulp, and furnish a better article when finished than other fibrous materials. But the comparatively high price of rags, and the enormous demand for cheap paper, have compelled manufacturers to turn their attention to other sources of supply; and for a century and a half, past efforts have been unceasingly made to manufacture paper from the fibres of different species of vegetable substances. "The Exchange," for 1832, remarks regarding the attempts made to obtain paper from other materials than rags, that many thousands of inventors and manufacturers, many years of incessant labour, and millions of pounds sterling, have been expended in experiments upon wood, straw, and similar substances; but the problem of obtaining good paper, at a moderate cost, from raw vegetable fibre, is yet only partially solved. Neither straw, nor wood, nor any similar material, has superseded linen and cotton rags. The raw fibre of papyrus was used for thirteen centuries; the reign of rags has now lasted twelve and a half centuries; and it appears probable that the time for returning again to some cheap vegetable fibre is fast approaching. Probably the most practical of the above substitutes was straw, the first useful paper from which

was made in 1800, and used in a book printed by Burton, of London, a copy of which was presented by the Marquis of Salisbury to king George III. The work is entitled "An Historical Account of Substances used in Paper-making." Cobbett, in 1828, employed, experimentally, some paper made from the husks of Indian corn, but with little success. The substitution of straw in 1800 was regarded of great national importance, and highly deserving support. It was neglected for many years, but straw is now extensively used in paper-making in England, and on the Continent of Europe. New Zealand flax (*Phormium tenax*) has lately been tried, and found admirably adapted for making paper, which it is declared is superior both in strength and capability of finish, to the paper made from most of the rags now used.

Paper-making by machinery may be thus briefly described. The pulp is first made to flow from the vat upon a wire frame, or sifter, which moves rapidly up and down. Having passed through the sifter, the pulp flows over a ledge in a regular and even stream, and is received upon an endless web of wire-gauze, which moves forward with a shaking motion from side to side, assisting to spread pulp evenly, and allow the water to pass through the wire, by which means the pulp solidifies as it advances. Before the pulp quits the plane of the wire, it is pressed by a roller covered with felt, and is then taken up by an endless web of felt, which, gradually moving forward, absorbs a further portion of the moisture. It is again pressed between rollers, and after being passed over cylinders heated by steam, it is cut by machinery into sheets. Thus in two or three minutes the pulp, which is introduced upon the web at one extremity of the machine, is delivered at the other in the state of perfect paper. By this process twenty-five square feet can be made in one minute; or 15,000 square feet in a working day of ten hours. The average value of paper manufactured in Great Britain may be set down at 4,000,000*l*.

The subject of water-marks assists in elucidating the history of paper-making, and the mark of the manufacturer has often been found of use in detecting literary forgeries, and frauds in the falsification of accounts. One of the oldest water-marks in existence is an open hand, whose middle finger is connected by a straight line or stem with a star. This appears on a sheet of paper of the manufacture of Flanders, which at that time supplied all the paper needed for the correspondence of England. Upon a sheet of paper is written a letter, preserved in one of the museums at Venice, which was addressed to Francesco Capello, by king Henry VII, from "our manor of Woodstock," on the 20th

of July 1502. Mr. Herring, however, states its introduction at 1530, adding that it gave the name to "Hand" paper. Note paper once bore a tankard, but it has now the royal arms in a shield without motto or supporters. Post is marked with a postman's horn, in a shield with a crown. Copy has a fleur-de-lys only. Demy and several larger sorts, a fleur-de-lys in a crowned shield. Royal, a shield with a bend sinister, and a fleur-de-lys for crest. Mr. Herring traces the term cap to the jockey-cap, or something like it, in use when the first edition of Shakspeare was printed. The date given to Foolscap in the "Archæologia," xii, is 1661, and the traditional story related of its origin is that, when Charles I. found his revenues short, he granted certain privileges, amounting to monopolies; and among these was the manufacture of paper, the exclusive right of which was sold to certain parties, who grew rich and enriched the Government at the expense of those who were obliged to use paper. At this time all English paper bore, in water-marks the Royal arms. The Parliament under Cromwell, made jests of this law in every conceivable manner; and, among other indignities to the memory of Charles, it was ordered that the Royal arms be removed from the paper, and the fool's cap and bells be substituted. These were also removed when the Rump Parliament was prorogued; but paper of the size of the Parliament's journals still bears the name of "foolscap."

Mr. Herring relates that the practice of blueing the paper-pulp had its origin in an accidental circumstance. About the year 1790, at a paper-mill belonging to Mr. Buttenshaw, his wife was superintending the washing of some fine linen, when accidentally she dropped her bag of powder-blue into some pulp in a forward state of preparation, with which the blue rapidly incorporated. On Mr. Buttenshaw's inquiring what had imparted the peculiar colour to the pulp, his wife, presuming that no great damage was done, took courage, and confessed the accident, for which she was afterwards rewarded by her husband, who, by introducing to the London market the improved blue cake obtained for it an advance of four shillings per bundle.

The Chinese affirm that eighteen centuries ago they had discovered the secret and means of manufacturing paper; before that invention, they used to inscribe written characters on strips of bamboo, or sheets of metal, using a style, or pen of iron for the purpose of marking the characters; and this, they assert, had been the practice of their nation from the most remote ages. Before the art of paper-making had arrived at perfection, the Chinese adopted the practice of writing upon white silk, or cotton, with a bamboo pen; this was found a

more convenient method than writing either on strips of bamboo or sheets of metal, as the silk or linen could be folded into a small compass. Paper is manufactured in China from various materials, each province or district having its own peculiar manufacture, in Fokein province, paper is made from young soft bamboo, in the province of Che-keang, it is made from paddy straw, in the province of Kiang-nan, it is made from the refuse silk, and this paper is very fine and delicate, being highly valued for writing complimentary inscriptions upon. To size the paper and render it fit for ink, they make a glue, somewhat similar to isinglass, from fish bones, these they chop up very small, and soak the mass in water which is continually renewed: when all oily impurity is extracted they add a due proportion of alum, which has been dissolved. Over the vessel in which this mixture is, a rod is laid, a cleft-stick is used for holding the sheet of paper during the process of dipping; as soon as the paper has been sufficiently saturated, it is withdrawn, by gently rolling it round the stick which has been laid over the vessel; the sheet of paper is afterwards hung to dry either near a furnace, as before described, or in the sun. The Chinese are generally acknowledged to have been the first to have made paper from pulp. The Egyptian paper, or Papyrus, was made by gumming slices of vegetable tissue together under pressure, and what is called the Rice paper of China consists only of thin slices of the cellular tissue of a plant. The Arabs are supposed to have learnt the art in the eighth century from the Chinese, but much more probably from the hindooes, as they translated many of their works and adopted much of their science. The Arabs are further said to have introduced the art of paper-making into Spain in the ninth or tenth century. Paper was first made at Nuremburg in the year 1390, but in England not till the year 1450. There is no doubt, however, that the manufacture of paper from pulp has been known in China from very early times: it is said for at least 2000 years. They employ a vast variety of fibrous substances for this manufacture, and apply paper to a variety of uses little thought of in other countries. They make up an infinite variety of kinds, from the coarse, heavy, half-inch thick touch-paper, for retaining a slow, enduring fire, to the beautiful so-called India paper suited for the finest proof engravings. In the tea chests there is a lavish use of many thicknesses of paper. If a hut or boat is leaky over-head, the bed is protected by a large sheet of oiled paper. If a shopkeeper want to tie up a parcel, he seizes a strip of tough paper, and by rolling it on his thigh at once converts it into a strong pack-thread, and even a torn sail that

times patched with tough paper. In China it is the cheapest of materials in daily use, and the manufactures are very numerous. They make it of rice straw, of young bamboos, of different fibres, and of the bark of the paper mulberry; showing that the inventors of the art make use chiefly of unwoven fibres, though they also employ refuse cloth and silk, &c. British India, though hardly ever mentioned in histories of the art, is a country where considerable quantities of paper are made, though not generally of a good quality, as the thick ink in use does not so much require this. There are small manufactories of it in most part of the country, and to a considerable extent at such places as Ahmedabad, Lucknow, Aurungabad, &c. Jute, Sunn, Ambaree, Moorva, and old sacks and fishing nets are also employed, though in general the natives of India, prefer the Sunn fibre. The Himalayan process with the inner bark of the paper plant very much resembles that of the Chinese with the paper mulberry. It is probable therefore that the art was introduced from that country into the Himalaya, and not from India, into which it had probably been carried at a very early period, and from thence learnt by the Arabs, who would hardly else have used cotton, an Indian product. The hindoos themselves, according to Professor Wilson, still used, about the beginning of the Christian era, or as late as the age of their Dramas, the inner bark of the Bhurja or Birch (*Betula bhojputtur*) for writing on. In the southern regions of India he leaves of the Palmyra and of the Talipot are well-known to have been long used, as they still are, for writing on with a style. But the manufacture of paper from pulp has long been established in India, and before the Arabs began to make translations from the Sanscrit, at the same time that they did so from Greek writers. Dr. Buchanan, in his survey of the lower provinces of the Bengal Presidency, has given an account of the manufacture of paper from Pat or Jute (*Cochorus olitorius*) at Dinagapore, and in Behar, &c., from Sunn (*Crotalaria juncea*). It is also so made in other parts of the country, as well as from Hibiscus fibre. And there can be no difficulty in using the other numerous fibrous materials which India produces in such vast variety. It is objected by manufacturers of paper that pulp from unwoven fibres does not draw through the present machinery so well as that made from rags. A modification of machinery would remedy this. But it is probable that if the half-stuff were made from the clean bark without first separating the fibres, these might probably be so entangled as to answer some of the effects of the weaving. As rags have to be collected, cut, cleaned, and bleached, Dr. Royle thinks that the primitive

method of using the bark of suitable plants and trees will afford both a cheap and an effectual substitute. Bengal and the east coast of the Bay of Bengal, as well as Malabar on the west coast of India, are the places where the growth of suitable materials, from the warmth and moisture of the climate, is most abundant, and the conveyance by sea is at the same time most easy. In Arracan the price of bast, even made into rope, is but one rupee per maund, and Mr. Henley observed that it is to India we must look for extensive and cheap supplies, for it is there alone we find the necessary conditions of very low priced and intelligent labour, with an abundance of elementary suitable materials; and that as articles of small price are particularly sensitive of charges, such as of freight, &c., it is only by large operations that an average of low charges can be accomplished. Suitable materials being abundant, he proposed that it should be reduced to the state of half-stuff by the aid of the Dhenkee, found in almost every house in Bengal, being used for husking rice, the preparation of tobacco, of drugs, stuffs, and brick dust. Dr. Lyon Playfair, observes that the price of 2*d.* to 2½*d.* per lb. for a partially prepared pulp, is by most makers considered to be too high, and that materials should be looked for at 1*d.* to 1½*d.* per lb. roughly prepared pulp; but if bleached or in as far an advanced state with regard to colour and texture as cotton or linen rag, then 2½*d.* to 4*d.* per lb. might be obtained. The prices of rags range from 7*s.* to 34*s.* per cwt. 77,909 tons weight of paper were produced in 1853 in Great Britain. Paper is, in Europe, made chiefly from linen or cotton rags, but also from the refuse and sweepings of cotton and flax-mills, as also of the coverings of the cotton bales and of worn-out ropes. Paper is also made from the stems and leaves of many grasses, as from rice straw, and from the bamboo by the Chinese, and of late from common straw in Great Britain and even from wood shavings. The fibrous part of many Lily and Aloe-leaved plants have been converted into excellent paper in India, where the fibres of Tiliaceous, Malvaceous, and Leguminous plants are employed for the same purpose: as in the Himalaya, one of the Lace-bark tribe is similarly employed, and in China one of the Mulberry tribe, and the Nettle in Holland. Plants belonging to the same families are capable of yielding a very abundant and never-failing supply of sufficiently cheap and very excellent material for paper-making of all kinds. Some may be used without any further process of bleaching, but all are capable of having any colour they may possess destroyed by chemical means not excepting even the jute

canvas or gunny bagging because specimens of jute of a beautiful silk, white, both plain and manufactured into fabrics for furniture, &c., &c., were shown by the late Colonel Calvert at the East India House. As the Chinese make paper of rice straw, and of the young shoots of the bamboo, while the hindoos make ropes of *Saccharum munja* and *S. sara* strong enough for their Persian wheels as well as for towing lines, it is evident that these, and probably many others, contain a sufficiency of fibrous material for paper-making. The cultivated cereals cannot well be turned to much account, for their straw forms the chief food for cattle; but as Southern Asia abounds with grass jungles, which are in the autumn of every year burnt down in order that the young blades may spring up and afford pasturage for cattle, it is evident that there are many situations where a sufficiency might be cut down before it has become perfectly dried up, and converted into half-stuff for paper-makers and the refuse of the sugar-cane might be similarly employed. Of the sedges in India, some are employed for making ropes, as the *Bhabhur* or *Eriophorum cannabinum* is for making rope-bridges for crossing some of the hill torrents, and the *Cyperus tegetum*, is used in India for mat-making. As these plants as well as rushes grow together in large quantities, it would be quite possible in many places to turn them to profitable account. Many parts of the world abound in the Lily and Aloe-leaved plants which have been alluded to above, and of which the leaves contain much easily separable fibrous materials. These belonging to the genera *Agave*, *Aloe*, *Yucca*, *Sansevieria*, *Bromelia*, and others, all of which abound in white-coloured fibres, applicable to various useful purposes, and of which the tow might be used for paper-making, and considerable supplies obtained. Paper used to be made from the *Sansevieria* in Trichinopoly, some has been made at Madras, of the unbleached *Agave* alone, as also mixed with old gunny bags. And recently also, from the leaf of the *Pandanus*. The Arrow-root and Ginger tribes, containing such plants as the Arrow-root, *Tous les Mois*, *Tikkur*, &c., *Ginger*, *Turmeric*, *Cardamom*, &c., all have annual stems and leaves, which are the refuse of the present culture, and might yield an abundant supply of half-stuff. Among cultivated plants there is probably no one so well calculated to yield a large supply of material fit for making paper of almost every quality as the plantain (*Musa paradisiaca*) so extensively cultivated in all tropical countries on account of its fruit, and of which the fibre-yielding stems are applied to no useful purpose. The plant is common near the poorest huts and in the largest gardens, and is considered to yield a large quantity of nutri-

tious matter. Its fruit, in many places, supplying the place of bread, and in composition and nutritious value approaching most nearly to the potato, may, if produced in too large a quantity, be preserved in the same way as figs, or the meal may be separated, as it resembles rice most nearly in composition. Each rootstock throws up from six to eight stems, each of which must be yearly cut down, and will yield from three to four pounds of the fibre fit for textile fabrics, for rope-making, or for the manufacture of paper. As the fruit pays the expenses of the culture, this fibre could be afforded at a cheap rate, as from the nature of the plant, consisting almost only of water and fibre, the latter might easily be separated. It could be afforded for £9, 13s., 4d. per ton. Some very useful and tough kinds of paper have been made in India from the fibres of the plantain, and some of finer quality from the same material both in France and in England. All the indigenous plants are devoid of true bark, and simple pressure between rollers, and washing, would appear to be sufficient for the separation of the fibres of most of them. But true bark, of plants which possess it, requires to be stripped off, usually after the stems have been steeped in water, before their respective fibres can be separated from the rest of the vegetable matter. The flax plant abounds in fibre, but this is too valuable to be converted into paper. India, however, grows immense quantities of the plant, on account of its seed (linseed) which is both consumed in the country and exported in enormous quantities. But nowhere is the fibre turned to any account. This is no doubt owing to the climate not favouring the formation of soft and flexible fibre; but the short fibre which is formed, and might be easily separated, would be valuable for paper-making, and might add to the agriculturists' profits without much additional outlay. So some Malvaceous plants are cultivated on account of their fruits being used as articles of diet, as *Oklro* (*Hibiscus esculentus*), in the West Indies and in the United States. The *Ram turai* of India is closely allied to it, and is cultivated for the same purpose. Both plants abound in fine flexible fibre, which is not, but might be easily separated, and afford a considerable supply, especially if the cultivation was extended in the neighbourhood of towns. Paper is made from a species of *Hibiscus* in Japan, and *H. sabdariffa* is cultivated in India on account of its jelly-yielding calices. Numerous other species of *Hibiscus*, of *Sida*, and of other genera of this family, abound in warm climates; several are cultivated in different countries, as *Hibiscus cannabinus* in India, and *Sida tiliaefolia* in China, might be more so. They grow quickly,

and to a large size, and abound in fibrous material of a fine, soft, flexible quality : on which account they might be cultivated with profit, and the tow be useful to the paper-maker. The stems of cotton plants would also yield a supply. The *Tiliaceæ* are likewise remarkable for the abundance and fine quality of fibre which many of them contain. *Tilia europea* produces the enormous quantities of bast exported from Russia. *Corchorus olitorius* and *C. capsularis*, the leaves of both of which are used as a vegetable, yield the jute of commerce, as well as the gunny cloth and bags so largely used and exported even to America. Several species of *Grewia* abound in the jungles of Southern Asia, and most would yield a valuable fibre, as some of them already do, for commercial purposes. The Indian basts are cheap, and abound in fibre. Some of the *Leguminosæ* also abound in valuable fibre. *Crotalaria juncea* yields the common Sunn of India. *Sesbania aculeata* or *cannabina* yields the Danchi of Bengal ; while *Bauhinia racemosa* is used for making rope bridges in the Himalayas. The fibre of *Parkinsonia aculeata* was sent to the London Exhibition of 1851, expressly as being fitted for paper-making, but though colourless, it wants strength. Some paper is made from gunny bags in India. Several plants produce large quantities of a silky cotton-like substance, not applied to any use, such as the silk cotton tree, the mudar of India, several species of *Saccharum*, &c., which might be collected where labour is cheap, and would no doubt be well fitted for conversion into pulp for paper. The *Dogbanes* and *Asclepiads*, also deserve attention. The Nepal paper plant, *Daphne cannabina* has been mentioned above. Among the Nettle, the Mulberry, and Breadfruit tribes of plants, there are many which seem well calculated to yield material for paper-making. The Chinese, we know, employ the inner bark of *Morus*, now *Broussonetia papyrifera*. This, no doubt, produces some of the Chinese paper, which is remarkable for toughness. The refuse cuttings of the bush cultivation of the mulberry in Bengal might be turned to profitable account. The barks of many stinging (*Urtica*.) and of stingless (*Boehmeria*.) Nettles, abound in fibres remarkable for strength ; the tow of these might be converted into paper-stuff, if not required for mixing with wool, as might also the bark cloths. The weeds of tropical countries, which grow in such luxuriance, and among which are species of *Sida*, of *Grewia*, of *Corchorus*, of *Triumfetta* and of many other genera, might all yield an abundance of fibrous material. Some simple machinery for separating the fibre would greatly facilitate operations. A species of paper was manufactured at a re-

mote period in Egypt, from the papyrus or paper-reed, a plant growing freely on the banks of the Nile. A manufacture of paper from the bark of trees and other substances existed also in China, from a very early date ; but among the nations of antiquity, before the introduction of paper, such substitutes were used as lead, copper, brass, bricks, and stone, on which national edicts and records were written or engraved ; or tablets of wood, wax, and ivory, skins of fishes, intestines of serpents, backs of tortoises, and the inner bark of trees for ordinary purposes. Indeed there are but few sorts of plants that have not been used for making paper and books, and hence have arisen the terms *biblos*, *codex*, *liber*, *folium*, *tabula*, *tillura*, *philura*, *scheda*, &c., which express the several parts of the plant that were written on. The use of these was discontinued in Europe after the invention of papyrus and parchment, but they are still used in other parts of the world. The Egyptian papyrus was made by laying thin plates of bark, taken from the middle of the paper-rush, side by side, but close together, on a hard smooth table : other pieces of the same size and thinness were then laid across the first at right angles ; the whole was moistened with the water of the Nile, which was supposed to have some agglutinating property, (though this probably resided in the plant itself,) and pressure was then applied for a certain number of hours. Thus a sheet of paper was formed which required no other finishing than rubbing and polishing with a smooth stone, or with a solid glass hemisphere, and drying in the sun. This very simple process was rather a preparation of a natural paper, than a manufacture—properly so called. The process adopted by the Chinese comes more legitimately under that head. The small branches of the paper mulberry tree, are cut by them in lengths of about 3 feet, and boiled in an alkaline ley for the sake of loosening the inner rind or bark, which is then peeled off, and dried for use. When a sufficient quantity has been thus laid up, it is again softened in water for 3 or 4 days, and the outer parts are scraped off as useless ; the rest is boiled in clear ley, which is kept strongly agitated all the time, until the bark has become tender, and separates into distinct fibres. It is then placed in a pan or sieve, and washed in a running stream, being at the same time worked with the hands, until it becomes a delicate and soft pulp. For the finer sorts of paper the pulp receives a second washing in a linen bag ; it is then spread out on a smooth table, and beaten with a wooden mallet, until it is extremely fine. Thus prepared, it is put into a tub with a slimy infusion of rice, and a root called *oreni* ; then it is stirred until the ingredients are properly

blended : it is next removed to a large vessel to admit of moulds being dipped into it. These moulds are made of bulrushes cut into narrow strips, and mounted in a frame ; as the paper is moulded, the sheets are placed covered with a double mat. The sheets are laid one on the other, with a small piece of reed between ; and this, standing out a little way, serves afterwards to lift them up leaf by leaf. Every heap is covered with a board and weights to press out the water ; on the following day, the sheets are lifted singly by means of the projecting reeds, and are placed on a plank to be dried in the sun. This paper is so delicate, that only one side can be written on, but the Chinese sometimes double the sheets, and glue them together so neatly, that they appear to be a single leaf. This manufacture of the Chinese extended also to the making of sheets of paper from old rags, silk, hemp and cotton, as early as the second century of the Christian era, and is supposed to have been the source whence the Arabs obtained their knowledge of paper-making. The latter people first introduced the valuable art of making paper from cotton into Europe, in the earlier half of the twelfth century, and established a paper manufactory in Spain. In 1150, the paper of Xativa, an ancient city of Valencia, had become famous, and was exported to the East and West. Notwithstanding its fame, this paper was of a coarse and inferior quality, so long as its manufacture was confined solely to the Arabs, in consequence of their employing only mortars, and hand or horse mills for reducing the cotton to a pulp ; but when some Christian labourers obtained the management of the mills of Valencia and Toledo, the different processes of the manufacture were greatly improved. Cotton paper became general at the close of the twelfth and beginning of the thirteenth centuries, but in the fourteenth century, it was almost entirely superseded by paper made of hemp and linen rags. The paper made of cotton was found not to possess sufficient strength or solidity for many purposes ; a very strong paper was therefore made of the above substances, not weakened by bleaching, according to the present mode, which, by removing the natural gum, impairs the strength of the vegetable fibre. Some of these old papers, having been well sized with gelatine, are said to possess their original qualities even to this day. The manufacture of paper from linen rags became general in France, Italy, and Spain in the fourteenth century ; the first German paper-mill was established at Nuremberg in 1390. English manuscripts on linen paper, date as early as 1340 ; but it is believed that the manufacture did not exist in England until the end of the fifteenth century, when the Bartolomæus of Wynkyndde Worde appeared (1496,) in which it

is stated that paper of a superior kind was made for that work by John Tate, jun., at his mills in Stevenage, Hertfordshire. In 1770 the manufacture of fine paper was established at Maidstone, in Kent, by a celebrated maker, J. Whatman, who had worked as journeyman in some of the principal paper-mills on the Continent. Not long before this, wove moulds had been invented by Baskerville to obviate the usual roughness of laid paper, and these, attracting attention in France, led to the improvements which characterised the vellum paper of that period. Holland, too, contributed its share to the advancement of this manufacture, by inventing cylinders with steel blades, for tearing the rags, and thus facilitating their conversion into pulp, which by the old method of stampers only, was a very slow and defective process. In 1799 the first attempt to produce paper in an endless web was made in France by a workman in the employ of M. Didot. The invention was brought to England by M. Didot in 1801, and made the subject of patents, which in 1804 were assigned to the Messrs. Fourdrinier. Mr. Bryan Donkin the engineer, carried out the desired plans, and produced, after intense application, a self-acting machine or working model, on an improved plan, of which he afterwards constructed many others for home use and for exportation, which were perfectly successful in the manufacture of continuous paper. In the year 1851 Messrs. Donkin and Co. were constructing their 191st machine. In 1809 Mr. Dickinson, the celebrated paper-maker, invented another method of making endless paper. The Fourdrinier machines have been greatly improved by the inventions of Mr. T. B. Crompton, Mr. Brown, of Esk Mills, near Edinburgh, Mr. Ibbotson, of Poyle, and other skilful manufacturers, British and foreign ; so that Great Britain which was long dependent for its supplies on foreign countries, is not only able to produce an abundant supply for home use, but to export paper to a considerable amount. At one time there were serious apprehensions that the supply of linen rags would fail, and various researches were entered upon by ingenious individuals to find substitutes. A book written in German by M. Schaffers so long ago as 1772, [Sammtliche Papierversuche von Jacob Christian Schaffers, Prediger zu Regensburg, Regensburg, 1772,] contains 60 specimens of paper made of different materials. This ingenious person made paper from the bark of the willow, beech, aspen, hawthorn, lime and mulberry ; from the down of the asclepias, the catkins of black poplar, and the tendrils of the vine ; from the stalks of nettle, mugwort, dyer's weed, thistle, bryony, burdock, clematis, willow-herb, and lily ; from cabbage-stalks, fir-cones, moss, pots-

toes, wood-shavings, and saw-dust. Paper has been likewise made from straw, rice, hop-bine, liquorice-root, the stalks of the mallow, and the husks of Indian-corn. The fear of a failure of linen rags, and the consequent necessity for these experiments, were obviated by the discovery of chlorine. This powerful bleaching agent will restore many varieties of coloured linen to its original whiteness, as well as discoloured papers and manuscripts, so that the same substances may be used over and over again as a material for paper. It is amongst the white fibred plants, the Moorva, the Aloe, and the Agave, the pine-apple and the plantain of India, that boundless supplies of material may be found not only for paper-making, but for the finest as well as the coarsest textile fabrics. The oakum or two of these plants may be converted into paper and that made from the plantain is remarkable for fineness as well as for toughness. The Bahadur khani and Madhagari paper of Dowlatabad are famed.—*Once a Week*; Tomlinson; *Bombay Quarterly Review*, p. 265 of No. iv of 1855; *Chinese Materia Medica and Natural History* by F. P. PAPER PLANTS, the chief of these are,

Daphne cannabina.	Bambusa arundinacea.
Abelmoschus esculentus.	Broussonetia papyrifera.
Betula bhojputra.	Hydrangea, sp.
Cannabis sativa.	Oxytropis, sp.
Daphne cannabina.	Populus ciliata.
" oleoides.	Sterculia villosa.
Desmodium argenteum.	Wikstrœmia solicifolia.
Grewia oppositifolia.	

In consequence of the increasing scarcity of the materials for the manufacture of paper in Great Britain, a correspondence took place between the Treasury and the Board of Trade, which resulted in a memorandum, drawn up by Mr. J. Forbes Royle, on the materials for paper-making procurable from India. After mentioning the several matters from which

paper is made in Europe—such as linen or cotton rags, refuse and sweepings of cotton and flax-mills, the covering of cotton bales and worn-out ropes, and also the stems and leaves of many grasses, rice, straw, the bamboo used by the Chinese, and common straw lately used in Great Britain Mr. Royle observes that the fibrous part of many lily and aloe-leaved plants have been converted into excellent paper in India, where the fibres of tiliaceous, malvaceous, and leguminous plants are employed for the same purpose. As in the Himalayas, one of the lace-bark tribe is similarly employed, and in China one of the mulberry tribe, and the nettle in Holland, plants belonging to the same families as the above abound in India and other warm countries, and are capable of yielding a very abundant and never-failing supply of sufficiently cheap and very excellent materials for paper-making of all kinds. Some may be used without any further process of bleaching, but all are capable of having any colour they may possess destroyed by chemical means, and he would not, except the jute canvas or gunny bagging, because he had seen specimens of jute of a beautiful silky white, both plain and manufactured into fabrics for furniture, &c., as shown by the late Colonel Calvert at the East India House. As the Chinese make paper of rice straw, and of the young shoots of the bamboo, while the hindoo make ropes of different grasses (such as *Saccharum munja* and *Saccharum sara*), strong enough for their Persian wheels as well as for towing lines, it is evident that these and probably many others contain a sufficiency of fibrous material for paper-making.
